CSC2025

Co-operation Science Contribution

庆祝中华医学会110周年系列活动

中华医学会第二十七次心血管年会
中华医学会第二十三次介入心脏病学大会
2025长安心血管病学大会

陕西 西安 XI AN

2025年9月18-21日
September.18-21, 2025

论文汇编
下册

主办单位： 中华医学会　　中华医学会心血管病学分会
承办单位： 陕西省医学会　　陕西省医学会心血管病学分会
协办单位： 西安交通大学第一附属医院

目 录

发言交流 33
代谢性心血管疾病研究 34
Longitudinal Relationship Between Serum Palmitate and Metabolic Dysregulation: Assessing Diabetes Risk in a Community-Based Population 34
膳食炎症与膳食质量对心血管 - 肾脏 - 代谢综合征晚期及死亡风险的影响：传统分析与机器学习方法 34
冷暴露通过脂肪组织对代谢综合征引起的多器官功能障碍的影响及机制研究 34
肠道菌群及其代谢物在 2 型糖尿病心肌病进展中的作用研究 34
New criteria for obesity: clinical obesity as predictors of cardiovascular mortality among older adults in China - a nationwide, community-based prospective cohort study 35
血浆同型半胱氨酸水平与不同体重指数患者发生冠心病以及长期预后的相关性的初步探讨 35
血清葡萄糖和高密度脂蛋白介导 CDAI 与代谢综合症患者全因死亡率和心血管疾病死亡率的关系 35
DMRT2 overexpression in macrophages promotes M1 polarization to improve adipocyte inflammation and insulin resistance through interacting with FXR 35
应激性高血糖比率对急性心肌梗死患者 PCI 术后远期预后的影响 36
Comprehensive Identification of Cardiometabolic Protein Biomarkers in Acute Myocardial Infarction Using Olink Proteomics and Multi-Cohort Validation 36
美阿沙坦对糖尿病大鼠心肌脂联素和脂联素受体 1 表达的影响 [基金项目：山西省自然基金基础研究项目（20210302123088）；太原市区域医疗中心科技创新项目（202229）] 36
胰岛素通过 ACTA2 rs1324551 (A/G) 位点调控血管平滑肌细胞表型转化、增殖及迁移及其机制研究 37
成年期不同阶段体重对左室收缩功能和全因死亡的影响 37
Impact of Abdominal Obesity Indices on All-Cause and Cardiovascular Mortality in Individuals with Pre-Diabetes and Diabetes: Insights from a Prospective Cohort Study 37
Serum Glycolipids Mediate the Link Between Dietary Antioxidants and Mortality in Metabolic Syndrome 37
Impact of Cardiometabolic Index on Long-Term Mortality in Young Adults with Type 2 Diabetes Mellitus 38
代谢功能障碍相关脂肪性肝病合并高尿酸血症患者的心脏重构特征及危险因素分析 38
AIP、AST 联合左心房内径预测代谢相关脂肪性肝病患者发生冠心病风险的临床价值研究 39
相对脂肪质量与老年人群心血管代谢疾病及远期不良结局的关联研究 39
Joint Analysis of C-Reactive Protein-Triglyceride Glucose Index Clusters and Body Roundness Index Trajectories in Incident Cardiovascular Disease Risk: Insights from the China Health and Retirement Longitudinal Study (CHARLS) and UK Biobank 39
The impact of dapagliflozin for the myocardial metabolomic profiles of mice with chronic heart failure induced by a high fat diet 40
基因组结构方程模型阐明了心血管肾代谢综合征的共同遗传结构 40
甘油三酯葡萄糖 - 体型指数与老年人群全因死亡和原因特异性死亡的关联：一项队列研究 40
Association between estimated glucose disposal rate and all-cause/cause-specific mortality in the general population is modified by age: a cohort study 40
Stage-Based Biomarker Signatures of Cardiovascular-Kidney-Metabolic Syndrome and Their Associations With Mortality: An Analysis of NHANES 2011–2018 Data 41
Association of estimated glucose disposal rate with chest pain incidence and all-cause mortality in populations:A Retrospective Analysis of the NHANES Cohort 41
2 型糖尿病患者中 TyG 指数、血同型半胱氨酸水平与颈动脉斑块发生的相关性分析 41
抑制 HMOX1 靶向铁死亡减轻糖尿病心肌病 42
降钙素基因相关肽调节核转录因子 -κB 信号转导对缺氧 c-kit+ 心脏干细胞凋亡的影响 42
骨髓源性生长因子对高糖诱导 H9c2 细胞焦亡的改善作用 42
髓间充质干细胞源外泌体调控心肌微血管内皮细胞增殖的机制研究 42
Bdh1 过表达通过抑制 H3K9bhb 介导的 Ifi27l2a 转录激活改善糖尿病动脉损伤的机制研究 42
Methyltransferase like 3-mediated N6-methylatidin methylation inhibits vascular smooth muscle cells PhenotyPe switching via Promoting PhosPhatidylinositol 3-kinase mRNA decay 43
Role of Mydgf in the regulation of hyPoxia/reoxygenation-induced aPoPtosis in cardiac microvascular endothelial cells 43
m7G Methyltransferase METTL1 Promotes Post-ischemic Angiogenesis via Promoting VEGFA mRNA Translation 43
Exosomal MiR-29a in Cardiomyocytes Induced by Angiotensin II Regulates Cardiac Microvascular Endothelial Cell Proliferation， Migration and Angiogenesis by Targeting VEGFA 44
足细胞 NPRC 敲除可减轻糖尿病小鼠肾小球纤维化 44
Mediterranean diet, metabolic profiles, and the risk of coronary heart disease: evidence from a mediation analysis 44
Evaluating the Causal Effects of Lipid-Lowering Drug Targets on the Components of Cardiovascular-Kidney-Metabolic (CKM) syndrome: A Drug-Target Mendelian Randomization Study 45
Prognostic value of FIB-4 index in coronary heart disease combined with diabetes or prediabetes: a large-scale cohort study 45
Association of Air Pollutant Exposure with Cardio-Kidney-Metabolic Syndrome in Chinese Middle-aged and Older Adults: Evidence from the CHARLS Cohort 45
A Nomogram for Predicting the Progression Risk of Cardiovascular-Kidney Metabolic Syndrome 46
高血压人群血清尿酸水平与认知功能的关系：一项横断面研究 46
在中国高血压人群中脂肪肝指数与新发糖尿病及糖尿病前期发展的关系 - 一项队列研究 46
Association of cardiometabolic index with all-cause and cardiovascular deaths in patients with cardiometabolic syndrome: a national cohort study 47
血清尿酸 / 高密度脂蛋白胆固醇比值联合脉压差的纵向轨迹与慢性肾脏病发病风险：一项回顾性队列研究 47
How Does Age Acceleration Mediate the Association Between Insulin Resistance and Long-Term Mortality Among Patients With Cardiovascular-Kidney-Metabolic Syndrome? Insights from a population-based study 47
Estimated Glucose Disposal Rate and Risk of Stroke and Dementia in Non-Diabetics: A UK Biobank Prospective Cohort Study 48
UBC9 attenuates the progression of metabolic dysfunction-associated fatty liver disease by suppressing hepatocyte ferroptosis via SUMOylation-Dependent stabilization of FTH1 48
Association Between the FT3 to FT4 Ratio and Type 2 Diabetes Mellitus in Non-alcoholic Fatty Liver Disease 49
糖尿病心脏微血管损伤生物标志物和防治靶点的探究 49
Inverted U-shaped association between body mass index and left ventricular global longitudinal strain in middle-aged and elderly patients with coronary heart disease in Jilin Province, China: a cross-sectional study 49
Exploring shared therapeutic targets in Diabetic Panvascular Diseases through bioinformatics analysis 50
Relationship between uric acid to creatinine ratio and type 2 diabetes mellitus in patients with nonalcoholic fatty liver disease 50
甘油三酯、总胆固醇及体重指数与 0-3 期心血管 - 肾脏 - 代谢综合征人群心血管疾病风险的关联研究：一项全国性前瞻性队列研究 51
Prediabetes Diagnostic Thresholds and Cardiovascular Outcomes: A Prospective Cohort, Mendelian Randomization, and Cardiac Imaging Study 51
二甲双胍与接受非复杂或复杂经皮冠状动脉介入治疗的糖尿病患者的临床结局 51

Synergistic Amplification of Cardiovascular Risk by Insulin Resistance and Hepatic Fibrosis in Coronary Artery Disease: Machine Learning-Driven Phenotyping and Multi-Dimensional Interaction Analysis for Precision Risk Stratification 51
IGF2BP3 介导 DMRT2 m6A 甲基化修饰调控脂肪细胞胰岛素抵抗的机制研究 52
脂肪组织特异性 Eepd1 缺失驱动糖尿病心肌病的跨器官代谢 - 炎症轴调控机制 52
Associations and potential biological pathways between ideal cardiovascular health defined by lifes essential 8 scores and diabetes/prediabetes: perspectives from mediation analysis 52
The Impact of Remnant Lipoprotein Cholesterol on the Prognosis of Patients Undergoing PCI under Different Glycemic States: A Prospective Cohort Study 53
Association of the plasma-glycosylated hemoglobinA1c/High-Density lipoprotein cholesterol ratio with mortality and cardiovascular disease in the US population: NHANES 1999-2018 53
将心脏代谢疾病与 HFpEF 联系起来的循环介质：一种中介孟德尔随机化分析 53
Joint association of Cardiovascular-Kidney-Metabolic Syndrome staging and accelerated Phenotypic age with mortality 54
NPRC 基因敲除减轻 DKD 小鼠的肾小球纤维化 54
Homocysteine activates endothelial TP receptor to promote von Willebrand factor secretion and thrombosis 54
Joint Association Between FIB-4 Index and Advanced Cardiovascular-Kidney-Metabolic Syndrome With Aortic Valve Calcification: A Community Cohort in China 55
Metabolic Score for Visceral Fat and Cardiovascular Risk Prediction in Middle-aged and Older Chinese Adults: Evidence from the CHARLS Cohort 55
不同血糖状态心力衰竭患者中重度冠状动脉钙化病变最佳血运重建与长期结局的关联性研究 55
Apolipoprotein A2 influences ANGPTL3 on modulating TG catabolism and inflammatory cytokines secretion 56
载脂蛋白 A1 经 Sortilin 负向调控人脂肪间充质干细胞成脂分化的实验研究 56
三酰甘油葡萄糖指数与老年非介入治疗非 ST 段抬高型心肌梗死患者的预后相关：一项单中心回顾性队列研究 56
Association Between Pain Characteristics, Circadian Syndrome and Cardiovascular Disease in Chinese Middle-Aged and Older Adults: A 4-Year Follow-Up Study 56
TyG 指数联合 hsCRP 对糖尿病合并急性冠脉综合征患者 PCI 术后预后的相关性 57
Correlation of triglyceride-glucose index with major adverse cardiovascular events in type 2 diabetes mellitus patients with acute myocardial infarction combined with HFpEF 57
The Impact of Allostatic Load on the Incidence of Cardiometabolic Multimorbidity: Evidence from the China health and Retirement Longitudinal study 57
简易胰岛素抵抗指数对高原世居藏族发生高尿酸血症的预测价值 58
The Role of Instrumental Activity of Daily Living Disability in the Association between Circadian Syndrome and Cardiometabolic Multimorbidity in Chinese Middle-Aged and Older Adults 58
Intensified Lipid-Lowering Strategies and Their Effect on Atherogenic and Metabolic Markers in Coronary Artery Disease 58
TRIM35 介导氨基酸转运在压力负荷型心室重构中的作用与机制研究 58
Impact of a Comprehensive Healthy Lifestyle Score on a Broad Spectrum of Cardiometabolic Diseases and Enhanced Risk Prediction Based on the UK Biobank Database 59
老年人群心脏代谢性共病风险列线图预测模型的构建及评价 59
防晒 / 紫外线与心血管疾病及代谢疾病的孟德尔随机研究 59
血红蛋白糖化指数对早期心肾代谢综合征患者心血管疾病进展的预测作用 59
Evidence of liver-heart cross-talk: The association between FLI and CKM risk stratification 60
Associations of inflammatory prognosis index with all-cause and cardiovascular mortality among individuals with diabetes and pre-diabetes: a populationbased study 60
Age-Related triglyceride-glucose index trajectories and all-cause mortality in Chinese elderly people 61
NF2 is an essential regulator of the pro-fibrotic cardiac fibroblasts phenotype associated with pathological cardiac remodeling via the Hippo/YAP signaling pathway. 61
白蛋白 / 球蛋白比值对 2 期心血管 - 肾脏 - 代谢综合征患者死亡率的预测价值：基于全国队列的分析（1999-2018） 61
甘油三酯 - 葡萄糖指数与美国成人自杀意愿的关系 62
心肌靶向的线粒体调控能量代谢治疗缺血再灌注损伤 62
O-GlcNAcylation-Ubiquitin Crosstalk of METTL1 Drives m7G Epitranscriptomic Collapse and Lipid Metabolic Reprogramming in Diabetic Cardiomyopathy 62
Elevated thyroid stimulating hormone level is associated with arterial stiffness and increased prevalence of hypertension: a cross-sectional study 63
Triglyceride glucose - body mass index has better predictive ability of cardiovascular disease in population at low metabolic risk: a national prospective cohort study 63
DPP4+ 肝细胞中 MSR1（Mechanosensitive receptor 1）对代谢的影响及其作用机制研究 63
新型代谢相关指标与冠脉支架内再狭窄的相关性研究 64
MFN2 下调介导的线粒体碎片化参与高脂诱导的血管内皮胰岛素敏感性下降和功能障碍 64
Obesity Increases Atherosclerosis Susceptibility via Inter-tissue miR-30e-SLC7A11 Axis 64
代谢综合征组分聚集模式对心血管预后的影响及无创风险预测模型的构建：一项前瞻性队列研究 64
Basal Metabolic Rate and Atrial Fibrillation Risk among Individuals with Type 2 Diabetes: insights from the UK Biobank 65
Novel adiposity indices and their associations with all-cause and cardiovascular mortality in individuals with cardiovascular-kidney-metabolic syndrome stages 0-3: findings from a nationwide prospective cohort study 65
Musclin 通过影响 WTAP 介导的 m6A 甲基化修饰参与糖尿病肾损伤的机制研究 66
Musclin 通过内质网应激通路引起骨骼肌胰岛素抵抗的机制研究 66
DMH1 Improves Palmitic Acid-Induced Insulin Resistance in Cardiomyocytes via PP2A Inhibition and AKT/AMPK Signaling Activation 66
Inhibition of PCSK9 attenuates ferroptosis after ischemia-reperfusion in cardiomyocytes through negative regulation of the FOXO3/MMP9 pathway 66
Association between the total cholesterol/high-density lipoprotein cholesterol ratio and all-cause and cardiovascular mortality in patients with diabetes or prediabetes: Insights from China and the United StatesJoint associations of frailty and triglyceride-glucose index with allcause and cardiovascular mortality in U.S. adults: a population-based cohort study from the NHANES 68
The prognostic value of the hemoglobin-to-red blood cell distribution width ratio for all-cause and cardiovascular mortality in patients with diabetes orprediabetes: A cohort study from the NHANES 2005–2018 68
Joint Effect of Plasma Homocysteine Concentration and Traditional Cardiovascular Risk Factors on the Risk of New-Onset Acute Myocardial Infarction 69
oint Effect of Plasma Homocysteine Concentration and Traditional Cardiovascular Risk Factors on the Risk of New-Onset Stroke 69
基线糖代谢状态与全因死亡及心血管死亡风险的关联研究 69
基线糖代谢状态与不同脑卒中风险的关联研究 70
基线糖代谢状态与急性心肌梗死风险的关联研究 70
Prediction of Cardiometabolic Multimorbidity Risk in Middle-Aged and Older Chinese Adults: Longitudinal Analysis of Triglyceride Glucose-Body Mass Index (TyG-BMI) and Its Dynamic Trajectories 70

Estimated Glucose Disposal Rate and Mortality in Cardiovascular Kidney Metabolic Syndrome: Nonlinear Associations and Stratified Prognostic Significance by Glycometabolic Phenotypes 70
HbA1c>7% predicts adverse cardiovascular outcomes among stage 4 cardiovascular kidney-metabolic syndrome patients 71
尿酸对高龄重度主动脉瓣狭窄患者远期预后的预测价值 71
生命 8 要素，遗传易感性与退行性瓣膜性心脏病发病风险的关系 71
糖尿病介导的线粒体蛋白高乙酰化通过抑制线粒体超复合体组装增加心肌对缺血再灌注损伤的敏感性 72
基于快速康复理念的早期康复运动及健康教育在代谢性心血管疾病患者中的应用 72
1990-2021 年全球含糖饮料归因心血管疾病负担的系统分析 72
Physical activity, statin therapy and risk of new-onset type 2 diabetes: clinical and proteomic perspectives 72
甲状腺激素在内脏脂肪代谢功能异常中的作用及机制研究 73
糖尿病前期人群中估算葡萄糖清除率与心脏代谢性共病与全因死亡动态演变的关联：一项多状态轨迹分析 73
LncRNA Gm26870 通过调控炎症促进脂肪组织胰岛素抵抗 73
ST 段抬高型心肌梗死患者甘油三脂葡萄糖指数与梗死面积，微循环阻塞和心肌内出血的相关性研究 73
一项基于血管内超声分析载脂蛋白 B 控制水平对冠状动脉斑块进展影响的队列研究 74
Prognostic Implications of Obstructive Sleep Apnea In Acute Coronary Syndrome By Residual Cholesterol Inflammation Index 74
估计葡萄糖处置率（eGDR）与慢性肾脏病患病率及死亡率的关联：一项全国性横断面研究 74
Association between obesity metabolic phenotype and risk of incident degenerative valvular disease in UK Biobank 74
Association Between Triglyceride-Glucose Body Mass Index and Type 2 Diabetes Mellitus in Patients with Non-Alcoholic Fatty Liver Disease 75
Naringenin Exerts Cardiovascular Protective Effect in a Palmitate-Induced Human Umbilical Vein Endothelial Cell Injury Model via Autophagy Flux Improvement 75
心脏代谢指数与炎症介导的急性冠脉综合征患者易损斑块形成有关 76
中国人内脏脂肪指数长期累积水平在心血管 - 肾脏 - 代谢综合征 0-3 期人群中对心血管疾病发病的预测价值 76
Association Between Estimated Glucose Disposal Rate and Ischemic Heart Disease Prevalence in Non-Diabetic Adults: A Cross-Sectional NHANES Study 76
不同治疗背景下中国混合型高脂血症人群的血脂水平流行病学特点：一项全国性横断面研究 76
Serum Lipid Profiles Stratified by Treatment Status in Chinese Adults with Hypertriglyceridemia: a nationwide cross-sectional study 77
N6-methyladenosine of lncRNA Gm16984 inhibits homocysteine-induced podocyte injury through miR-29b-3p/HDAC4 signaling pathway 77
Adipose HuR protects against diet-induced obesity and insulin resistance 78
Persistent Methylmalonate Overload Despite Glycemic Control Drives Mitochondrial Dyshomeostasis and Subclinical Heart Damage in Diabetes 78
Multi-Etiology Transcriptomic Integration Identifies Conserved Metabolic Dysregulation in Heart Failure 79
血红蛋白糖化指数与冠状动脉疾病合并慢性肾功能不全患者经皮冠状动脉介入治疗后远期全因死亡的关联 79
The association between the triglyceride-glucose index and serum uric acid: a systematic review and meta-analysis 80
Multi-cohort analysis of metagenome for type 2 diabetes identified universal gut microbiota signatures across populations 80
Glucose oxidative metabolism score, diabetes status, and major adverse cardiovascular events in acute myocardial infarction populations 80
Predictive value of dynamic changes in eGDR for cardiovascular disease in population with Cardiovascular- Kidney-Metabolic syndrome stages 0-3: A nationwide prospective cohort study 81
OSA 相关性高血压患者中代谢性心血管疾病的临床特点及预后分析 81
MDK、PLAUR 在糖尿病合并急性冠脉综合征患者中的临床意义及其诊断价值 82
老年营养风险指数对心血管 - 肾脏 - 代谢综合征患者死亡风险的预测 82
肝纤维化评分对非肥胖冠心病患者肾功能预后的预测价值 82
心血管代谢门诊综合管理 CKM 患者的初步成效 82
体力运动对心肾代谢疾病进展及死亡风险的影响：基于英国生物银行的多状态分析 82
代谢组学发现 L- 茶氨酸可预防和延缓高血压患者肾脏损伤 83
基于 CHARLS 队列的新型复合标志物开发：TyG/TyH 衍生肥胖指数对心血管事件的预测效能研究 83
FMO2 promotes angiogenesis via regulation of N-acetylornithine 83
The prognostic significance of triglyceride-glucose index for all-cause mortality in cancer survivors: Retrospective cohort study 83
组蛋白乳酸化修饰介导代谢重编程在心肌梗死后心肌再生中的作用机制研究 84
Association of a Novel BMI/Triglyceride-Glucose Waist Circumference Index with All-Cause and Cardiovascular Mortality in a COPD Population 84
心脏代谢共病患者估计葡萄糖处理率和颈动脉斑块的相关性分析 85
Association between dietary B vitamin intakes and advanced cardiovascular-kidney-metabolic syndrome: insights from the National Health and Nutrition Examination Survey 85
ATAD3A Regulates Mitochondria–Lysosome Membrane Contact Sites via the LIAS/DLST Axis to Suppress Aortic Dissection 86
心血管 - 肾脏 - 代谢综合征 0-3 期人群中 C 反应蛋白 - 甘油三酯 - 葡萄糖指数与远期心脑血管疾病发病风险的关联研究 86
吲哚类代谢物与心血管疾病研究进展 86
Prevalence of Cardiovascular-Kidney-Metabolic Syndrome by Social Determinants of Health: A Population-Based Study of 4.4 Million Adults in Northwestern China 86
阻塞性睡眠呼吸暂停在急性冠状动脉综合征中的预后意义：不同血糖水平的研究分析 87
The association between the heart rate response related to sleep apnea and left ventricular hypertrophy in obese individuals 87
中心动脉收缩压和血同型半胱氨酸对成年高血压患者卒中发生风险的联合作用 87
代谢性心血管疾病的综合管理：基于多学科协作的临床实践研究 88
Hepatic Steatosis Index Predicts Risk of Chronic Non-Rheumatic Aortic Valve Insufficiency Rehospitalization in a Northwest Chinese NAFLD Cohort 88
基于 NHANES 数据库的膳食炎症指数与代谢综合征患者死亡风险的研究 88
Association of Depression Severity and Transition Patterns of Cardiometabolic Multimorbidity 88
Causal Association Spectrum of Fine Particulate Matter ($PM_{2.5}$) Exposure and Cardiometabolic Diseases: Analysis of Dose-Response Characteristics in Epidemiological Associations, Population Susceptibility Stratification, Cascade Reaction Pathways of Cellula 89
蛋白尿在心血管代谢因素与视网膜动脉硬化关联的中介效应分析 90
Impact of the mismatch between respiratory event frequency and hypoxic burden on cardiovascular outcomes in patients with obstructive sleep apnea 90

心脏康复及有关研究 91
心脏康复护理对心梗介入治疗后患者心理状态及生活质量的影响 91
急性心肌梗死患者开展早期康复训练对心功能恢复影响 91
老年冠心病患者 CPET 指导的运动康复方案优化研究 91
肌少症的研究进展：从机制到治疗 91
心磁图在缺血性心脏病的临床研究进展 91
急性冠脉综合征患者 PCI 术后接受心脏综合康复治疗的效果观察 91
重视心肌梗死后抑郁症 91

心脏康复延伸护理服务 联合正念减压对慢性心力衰竭患者心脏康复效果及负面情绪的影响 91
心力衰竭患者健康心理控制源与领悟社会支持和自我管理行为的关系：基于多项式回归和响应面分析 92
急性心肌梗死介入术后患者早期心脏康复参与意愿及其影响因素研究 92
中西医结合心脏康复对稳定性冠心病患者心肺功能影响的临床研究 92
心肺运动试验对急性心肌梗死后心力衰竭发生风险预测的增量价值 92
Individualized Cardiac Rehabilitation for a High-Risk Stanford Type A Aortic Dissection Patient Undergoing Whole-Life Cycle Management: A Case Report 92
心脏康复在心血管疾病中的研究进展 93
急性心肌梗死急诊 PCI 术后心脏康复护理对改善患者生存质量的影响 93
中国心血管疾病患者的心肺适能参考标准 93
Aerobic Interval Training Ameliorates Myocardial Fibrosis in Uremic Rats by Inhibiting Cardiomyocyte Cuproptosis 93

Aerobic Interval Training Ameliorates Myocardial Fibrosis after Myocardial Infarction in Rats by Inhibiting Cardiomyocyte Ferroptosis via Endogenous Hydrogen Sulfide 94
Circulatory power is applicable for the early prediction of post-acute myocardial infarction late-onset heart failure risk 94
马拉松运动强度对心肌肌钙蛋白升高的影响：训练优化的新视角 95
Progesterone promotes the proliferation of embryonic epicardial cells and decreases left ventricular fibrosis through ALDH1A3/Glycolytic pathway 95
分阶式心脏康复联合动态量化健康教育在冠心病患者中的综合干预效果：一项随机对照研究 96
基于 CiteSpace 的心脏瓣膜置换术后患者抗凝治疗的可视化分析 96
Impact of perioperative cardiac rehabilitation on the prognosis of female patients undergoing elective valve surgery: a gender-specific analysis of the PORT randomized clincial trial. 96
心脏康复的研究进展 96
Impact of Cardiopulmonary Exercise Testing -Guided Individualized Cardiac Rehabilitation on Functional Capacity and Prognosis in Coronary Artery Disease Patients 97
Joint association of TyG index and peak kilogram oxygen uptake with MACE events in post-PCI patients 97
Comparison of the predictive efficacy of triglyceride-glucose (TyG) index and modified TyG index combined with cardiopulmonary exercise testing (CPET) parameters for major adverse cardiovascular events (MACE) risk in the population 97
RelationshiP and Prognostic value of the triglyceride-glucose index and oPtical coherence tomograPhy-derived Physiological index in Patients with acute coronary syndrome 98
The effects of perioperative cardiopulmonary integrated rehabilitation in patients undergoing TAVR 98
首诊冠心病患者运动恐惧现状及影响因素分析 98
Long-term Efficacy and Safety of Moderate-Intensity Continuous Training on the Improvement of Cardiopulmonary Function in Patients After Transcatheter Aortic Valve Replacement: an analysis of the extended follow up of the ENERGY Study 98
Comparative effects of traditional Chinese exercises on cardiac rehabilitation in patients after percutaneous coronary intervention: A Systematic Review and Network Meta-Analysis 99
EETs 介导有氧运动对心肌梗死后心脏淋巴管重塑的影响和机制 99
Interpretable machine learning identifies peak VO2 as a key predictor of MACE events in patients with valvular heart disease. 99

Longitudinal Relationship Between Serum Palmitate and Metabolic Dysregulation: Assessing Diabetes Risk in a Community-Based Population

Yu-Xin Nong, Ya-Feng Zhou

The Fourth Affiliated Hospital of Soochow University

Objective:

This study aimed to comprehensively investigate the association between plasma palmitic acid (PA) levels and insulin resistance (IR) as well as diabetes mellitus (DM) in a general adult population. As the most abundant saturated fatty acid in human plasma, PA has been implicated in metabolic dysregulation, but its precise role in diabetes pathogenesis remains controversial. Our study sought to clarify this relationship using a large, nationally representative cohort while controlling for key confounding factors. Additionally, we examined the long-term prognostic value of PA levels for mortality outcomes, and explored potential effect modifications by demographic and metabolic characteristics. These findings could provide important insights for diabetes prevention strategies and risk stratification in clinical practice.

Methods:

We conducted a rigorous population-based cohort study utilizing data from 6,578 adults aged ≥ 20 years participating in the National Health and Nutrition Examination Survey (NHANES) during 2003-2004, 2011-2012, and 2013-2014 cycles. Plasma PA levels were quantitatively measured using gas chromatography-mass spectrometry (GC-MS), the gold standard method for fatty acid analysis, and categorized into quartiles (Q1-Q4) for comparative analysis. IR was defined using the homeostasis model assessment (HOMA-IR) with established cut-off values, while diabetes status was determined through a combination of fasting glucose levels, HbA1c measurements, and self-reported physician diagnosis.

Multivariable logistic regression models were constructed to assess the independent associations between PA levels and metabolic outcomes, adjusting for potential confounders including age, sex, race/ethnicity, BMI, physical activity, smoking status, alcohol consumption, and dietary patterns. To account for potential nonlinear relationships, we employed restricted cubic splines with three knots. For survival analysis, we linked participants to mortality data from the National Death Index and performed Kaplan-Meier survival analysis to evaluate differences in all-cause mortality across PA quartiles over a maximum follow-up period of 200 months. All statistical analyses incorporated appropriate sampling weights to ensure nationally representative estimates and were conducted using specialized survey procedures in statistical software.

Results:

Our comprehensive analysis yielded several important findings. First, we observed a strong positive dose-response relationship between plasma PA levels and HbA1c (β=0.21, P<0.001), indicating that higher PA concentrations were associated with poorer long-term glycemic control. Participants in the highest PA quartile (Q4) exhibited substantially increased risks of both IR (OR=2.76, 95% CI: 2.19-3.49, P<0.001) and diabetes (OR=1.75, 95% CI: 1.29-2.37, P<0.001) compared to those in the lowest quartile (Q1), even after full adjustment for potential confounders. The restricted cubic spline analysis revealed a nonlinear relationship, with steeper increases in diabetes risk observed at higher PA concentrations.

Long-term follow-up data demonstrated significantly higher overall mortality in the Q4 group (24.0%) versus Q1 (11.0%, log-rank P<0.001), with the survival curves diverging markedly after approximately 120 months of follow-up. Interestingly, no significant difference in mortality was observed during the first 100 months of follow-up (7.8% vs 5.8%, P=0.264), suggesting that the adverse effects of elevated PA may require longer durations to manifest clinically. Subgroup analyses revealed important variations in the PA-diabetes association, with particularly strong effects observed among overweight/obese individuals (BMI ≥ 25; P for interaction=0.02), younger adults (<50 years; P for interaction=0.03), and women (P for interaction=0.04). These findings suggest that certain populations may be more vulnerable to the metabolic effects of elevated PA levels.

Conclusion:

This large, population-based cohort study provides compelling evidence that elevated plasma PA levels are independently associated with increased risks of IR and diabetes, particularly in overweight, younger, and female populations. The observed dose-response relationships and long-term mortality associations strengthen the biological plausibility of PA as an important contributor to metabolic dysfunction. Our findings suggest that PA may serve as a valuable biomarker for diabetes risk assessment and could potentially inform targeted prevention strategies in high-risk groups. The delayed emergence of mortality differences implies that early interventions to modify PA levels might yield long-term health benefits. Future research should focus on elucidating the underlying mechanisms, including potential effects on β-cell function and systemic inflammation, as well as evaluating whether dietary modifications or pharmacological interventions targeting PA metabolism could improve metabolic outcomes. These findings contribute significantly to our understanding of fatty acid metabolism in diabetes pathogenesis and may help refine current approaches to diabetes prevention and management.

膳食炎症与膳食质量对心血管 - 肾脏 - 代谢综合征晚期及死亡风险的影响：传统分析与机器学习方法

鲍伟 刘学波

上海市同济医院（同济大学附属同济医院）

目的

美国心脏协会最新定义的心血管 - 肾脏 - 代谢（CKM）综合征，是由共同炎症通路介导的心血管、肾脏与代谢紊乱的复杂症候群。本研究探讨膳食炎症指数（DII）与健康饮食指数（HEI）对 CKM 进展及死亡风险的影响，解析炎症标志物的中介作用，并识别关键膳食预测因子。

方法

我们分析了 1999-2020 年美国国家健康与营养调查（NHANES）中 19,742 名具有完整膳食与临床数据的参与者。DII 与 HEI 基于 24 小时膳食回顾计算：DII 选取 28 种膳食成分，HEI 采用 2015 版健康饮食指数的 13 项成分评估膳食指南依从性。主要结局为晚期 CKM 综合征（3-4 期）和全因死亡率。采用：1）多变量 logistic/Cox 回归评估 DII/HEI 与结局的关联；2）中介分析检验炎症标志物作用；3）机器学习结合 SHAP 分析识别关键膳食成分。

结果

高 DII 增加晚期 CKM 综合征风险（OR=1.081，95%CI：1.039-1.124）和死亡风险（HR=1.092，95%CI：1.040-1.148），而 HEI 显示保护作用（OR=0.990，95%CI：0.985-0.994；HR=0.993，95%CI：0.987-0.998）。聚类分析显示，与抗炎高质量膳食相比，促炎低质量膳食组的 CKM 风险增加 49%（OR=1.492），死亡风险升高 39%(HR=1.392)。中性粒细胞介导了 26.50%(DII)和 24.48%(HEI)的晚期 CKM 风险，以及 11.16%（DII）和 14.72%（HEI）的死亡风险。机器学习识别出维生素 B6、维生素 D、烟酸、单不饱和脂肪酸（MUFA）和多不饱和脂肪酸（PUFA）是 CKM 分期和死亡风险的关键预测因子。

结论

促炎膳食增加而高质量膳食降低 CKM 进展与死亡风险，中性粒细胞是重要中介因子。维生素 B6、维生素 D、烟酸、MUFA 和 PUFA 作为关键膳食因素，为 CKM 精准营养管理提供了策略依据。

冷暴露通过脂肪组织对代谢综合征引起的多器官功能障碍的影响及机制研究

陈思喆 张澄

山东大学齐鲁医院

研究目的 1. 研究冷暴露对 MetS 小鼠 BAT、皮下白色脂肪（subWAT）、内脏白色脂肪(eWAT)及 机体代谢的影响; 2. 研究冷暴露是否改善 MetS 引发的心血管、肝肾等器官功能障碍； 3. 探讨冷暴露是否通过脂肪组织产热代谢对 MetS 产生影响及其分子机制。

研究方法 1. 动物实验分组 。 2. 小鼠葡萄糖耐量检测、胰岛素耐量检测 3. 小鼠代谢率检测 4. 小鼠超声心动图检测 5. 组织病理学检测： 对脂肪组织进行 HE 染色、UCP1 免疫组化染色、CD31 免疫荧光染色、Endomucin 免疫荧光染色；对心肌、肾脏、肝脏组织进行 HE 染色、天狼猩红染色、Col I 免疫组化染色、Col III 免疫组化染色。

虽然已有一些分子靶点被发现可用于针对 MetS 的治疗，但其临床应用仍非常有限，并 有显著的副作用。适度寒冷暴露通过神经反射，激活脂肪组织的 β3 肾上腺素能受体，进而 激活脂肪组织产热过程，是自然存在的机体消耗能量保持体温的机制，本研究旨在明确冷 暴露是否可以作为一种改善代谢综合征及其多器官并发症的有效手段及其临床应用潜力。

研究结论 1. 冷暴露改善 MetS 小鼠的胰岛素敏感性和葡萄糖代谢。 2. 冷暴露降低 MetS 小鼠血糖及血脂水平并增强代谢。 3. 冷暴露改善 MetS 小鼠多器官功能学和组织学损伤。 4. 脂肪组织棕色化及线粒体解偶联蛋白 UCP1 的生热作用是冷暴露改善代谢综合征及其 并发症的重要作用机制。

肠道菌群及其代谢物在 2 型糖尿病心肌病进展中的作用研究

王金鑫 刘宏斌

中国人民解放军总医院 / 解放军医学院

目的：明确肠道菌群与糖尿病心肌病进展的相关性，筛选与糖尿病心肌病变相关的标志性菌属。探索粪便代谢物与糖尿病心肌病进展的相关性，筛选与糖尿病心肌病变相关的代谢物及代谢通路。明确糖尿病心肌病变肠道菌群与代谢物的相关性。

方法：从 22 例 2 型糖尿病合并心力衰竭患者、25 例 2 型糖尿病合并左室舒张功能障碍患者、37 例 2 型糖尿病无心功能障碍患者和 32 例例健康对照者中采集粪便样本，同时收集血糖、NT-proBNP 等临床指标。粪便样品采用 16S rDNA 基因测序、高通量靶标代谢组学测定，并将差异肠道菌群、代谢物和临床指标进行相关性分析。

结果：（1）四组人群的肠道微生物组成不同。Monoglobus、Roseburia 等菌属的丰度在健康对照组、糖尿病无心功能障碍组、糖尿病合并左室舒张功能障碍

组、糖尿病合并心力衰竭组逐渐下降。（2）相关性分析发现，Monoglobus、Roseburia 等菌属与血糖、NT-proBNP 呈负相关。（3）四组人群的粪便代谢物水平存在明显改变。（4）与健康对照组相比，其余三组在嘧啶代谢通路中，有 2 个下调的差异代谢物，7 个上调的差异代谢物；在半胱氨酸和蛋氨酸代谢通路中，有 2 下个调的差异代谢物，3 个上调的差异代谢物。（5）相关性分析发现，差异代谢物与 Monoglobus、Roseburia 等菌属具有较强相关性。（6）差异代谢物与血糖、NT-proBNP 等具有较强相关性。

结论：糖尿病无心功能障碍患者、糖尿病合并左室舒张功能障碍患者、糖尿病合并心力衰竭患者与健康对照者之间肠道微生物组成不同，且粪便代谢物水平存在差异，改变的代谢物可能通过影响嘧啶代谢通路和半胱氨酸和蛋氨酸代谢等通路参与糖尿病心肌病的进展。特征性改变的肠道菌群可能通过菌群功能通路影响粪便代谢物水平，从而影响血糖、NT-proBNP 等临床表型，进而参与糖尿病心肌病的发生发展。

New criteria for obesity: clinical obesity as predictors of cardiovascular mortality among older adults in China - a nationwide, community-based prospective cohort study

HaiYan Ruan[1,3], Liu Yang[2], Halmira Alimjan[2], Ke-Xin Wang[1], Yi Zheng[1], Sen He[1,2]

1. West China Hospital of Sichuan University, Chengdu, China.

2. Karamay Hospital of Integrated Chinese and Western Medicine, Karamay, China.

3. Hospital of Traditional Chinese Medicine, Shuangliu District, Chengdu, China.

Background: Recently (Jan 2025), the Lancet Diabetes & Endocrinology Commission redefined clinical obesity as a disease condition and introduced novel diagnostic standards. This redefinition is intended to assist healthcare professionals in making informed decisions and prioritizing treatment plans and public health initiatives. Despite these advancements, the correlation between clinical obesity and cardiovascular mortality in the elderly population of China has not been explored. To bridge this knowledge gap, we undertook a comprehensive nationwide, community-centered, longitudinal study in China.

Methods: A total of 747 participants, with a median age of 85. years (interquartile range: 76.–93.) and 46.% males, were included in the study from the Chinese Longitudinal Healthy Longevity Survey conducted between 2011 and 2014, with follow-up until 2018. The exposure variable under investigation was clinical obesity, defined according to the criteria set by the Lancet Diabetes & Endocrinology Commission. The primary outcome of interest was cardiovascular mortality. The cause of death for each participant was determined using the International Classification of Diseases, 10th revision. Detailed information on the cause of death was available for 131 participants, among whom 336 deaths were attributed to cardiovascular causes (coded as I00-I99), while 974 were due to non-cardiovascular reasons. Additionally, 2247 participants had an unknown cause of death. To analyze the association between obesity and cardiovascular mortality, participants were categorized as "deceased" if they died from cardiovascular disease, and as "censored" if they survived, died from non-cardiovascular causes, or had an unknown cause of death. The study assessed the relationship between clinical obesity and mortality using Cox regression models. Furthermore, the impact of clinical obesity on life expectancy for individuals aged 65 to 100 years was estimated through a two-step analysis involving flexible parametric survival models.

Results: During a median follow-up period of 3.5 years (interquartile range: 2.6–6.5 years), the study recorded 336 cardiovascular deaths, accounting for 4.5% of the total. Participants with preclinical obesity did not exhibit a significant association with mortality risk compared to those without obesity, as indicated by adjusted hazard ratios (HR) of 1.00 (95% CI: .71–1.42). In contrast, individuals with clinical obesity showed a notably higher mortality risk, with an adjusted HR of 1.95 (95% CI: 1.15–3.29). Moreover, at the age of 65 years, participants without obesity were found to have the longest remaining cardiovascular life expectancy, estimated at 32.1 years (95% CI: 31.2–32.8). In comparison, individuals with preclinical obesity at the same age had a reduced remaining life expectancy by 1.6 years (95% CI: .1–3.), while those with clinical obesity faced a further reduction of 2.6 years (95% CI: -.1 to 5.5).The study also investigated the relationship between cardiovascular mortality risk and body mass index (BMI), revealing a significant increase in risk at lower BMI levels. However, this association did not reach statistical significance, likely due to limited statistical power. Additionally, the combined assessment of BMI and waist circumference as indicators of obesity did not show any significant association with mortality in the study population.

Conclusion: In the older adult population of China, the presence of clinical obesity has been found to be closely linked to an increased risk of cardiovascular mortality and a decrease in overall life expectancy. It is crucial to emphasize the importance of implementing targeted therapeutic approaches and public health initiatives to effectively tackle clinical obesity in order to mitigate the disparities in mortality rates within this demographic.

血浆同型半胱氨酸水平与不同体重指数患者发生冠心病以及长期预后的相关性的初步探讨

陈家元

广州医科大学第二附属医院

目的：探讨血浆同型半胱氨酸（Hcy）水平与不同 BMI 患者发生冠心病以及长期预后的相关性。

方法：第一部分为回顾性横断面研究，选取 2015-2023 年于广州医科大学附属第二医院住院并接受冠脉造影的 40-65 岁患者，根据 BMI 分为正常体重组（18-25 kg/m^2）、超重组（25-28 kg/m^2）及肥胖组（大于 28 kg/m^2）。logistic 回归分析筛选不同 BMI 患者发生冠心病（CAD）的危险因素。第二部分为前瞻性验证试验，招募 80 名受试者，将其分为非 CAD 肥胖、CAD 肥胖和非 CAD 正常体重组，靶向氨基酸代谢组学进一步鉴定差异表达物。第三部分采取美国国家健康和营养检查调查（NHANES）2007-2018 年数据，分析 Hcy 对不同 BMI 受试者全因死亡的影响。

结果：第一部分：纳入 936 例患者，结果显示：以正常体重和低 Hcy 血症（小于 10.7mmol/L）组合为对照，肥胖合并高 Hcy 血症患者的 CAD 发生率是最高（HR:5.99, P < 0.001）。而在肥胖受试者亚组，合并高 Hcy 血症的 CAD 发生率是低 Hcy 血症的 7 倍。第二部分：靶向代谢组学进一步证实了蛋氨酸及其代谢产物（Hcy）在非 CAD 肥胖和 CAD 肥胖之间存在显著性差异（P < 0.001）。第三部分：从 NHANE 数据库入选 6410 个病例，生存曲线及 COX 回归分析显示，在肥胖受试者中，与低 Hcy 血症相比，高 Hcy 血症与全因死亡率的风险有更高相关性（HR:2.28, P < 0.001）。令人意外的是，与正常体重高 Hcy 血症组相比，肥胖的高 Hcy 血症组全因死亡率显著性降低（HR：0.66，P=0.006），而超重的高 Hcy 血症的全因死亡率进一步降低（HR: 0.57, P < 0.001）。

结论：高 Hcy 血症是肥胖并发冠心病以及全因死亡的独立危险因素，而超重的高 Hcy 患者的长期预后可能优于正常体重及肥胖人群，需要进一步研究证实。

血清葡萄糖和高密度脂蛋白介导 CDAI 与代谢综合症患者全因死亡率和心血管疾病死亡率的关系

李爱华

中南大学湘雅医院

目的：尽管饮食调整日益被视为干预代谢综合征（MetS）的策略，但复合饮食抗氧化指数（CDAI）与代谢综合征人群长期健康结局的关系仍不明确。为了明确 CDAI 和代谢综合症患者全因死亡率和心血管死亡率的关联，我们进行研究探索它们之间的关系。

方法：我们分析了美国国家健康与营养检查调查（NHANES，1999-2020）中 4756 名代谢综合征成人的数据。采用加权 Cox 比例风险回归模型评估风险比（HR）及 95% 置信区间（CI），通过限制立方样条（RCS）曲线分析非线性关系，并进行分层分析和中介效应分析。

结果：在中位随访 103.4 个月期间，发生 838 例死亡，其中 262 例为心血管原因死亡。校正混杂因素后，与 CDAI 最低四分位数组相比，最高四分位数组参与者的全因死亡率 HR 为 0.74（95% CI：0.57-0.97，p=0.030），心血管死亡率 HR 为 0.65（95% CI：0.45-0.96，p=0.030）。RCS 分析显示 CDAI 与死亡率呈线性负相关。分层分析支持上述结果，且无显著交互作用。中介分析表明，血清葡萄糖和高密度脂蛋白胆固醇（HDL-C）介导了 CDAI 与死亡率的关系。

结论：较高的 CDAI 与代谢综合征患者较低的全因死亡率和心血管死亡率相关，其机制可能通过调节糖脂代谢介导。

DMRT2 overexpression in macrophages promotes M1 polarization to improve adipocyte inflammation and insulin resistance through interacting with FXR

xian Wei, Jing Tao, Ming Liu, Yi-Tong Ma

The First Affiliated Hospital of Xinjiang Medical University

The well-established pathophysiological link between obesity and the development of insulin resistance (IR) is fundamentally intertwined with chronic, low-grade inflammation originating within adipose tissue (AT). Central to this inflammatory milieu is the dysregulated polarization state of infiltrating macrophages, where a shift from the anti-inflammatory M2 phenotype towards a dominant pro-inflammatory M1 state exacerbates adipocyte dysfunction and systemic metabolic impairment. While the double-sex and mab-3 related transcription factor 2 (DMRT2) has been previously implicated in ameliorating adipocyte insulin resistance, its specific regulatory function concerning macrophage polarization dynamics within the adipose niche, and the underlying molecular mechanisms, remained largely undefined. This investigation comprehensively elucidates the mechanistic role of macrophage-specific DMRT2 overexpression and its consequential impact on mitigating adipocyte inflammation and systemic insulin sensitivity, revealing a critical interaction with the farnesoid X receptor (FXR).

Utilizing a well-characterized high-fat diet (HFD)-induced murine model of obesity and insulin resistance in male C57BL/6 mice, we achieved targeted DMRT2 overexpression specifically within macrophages via advanced transduction techniques. This macrophage-specific intervention demonstrably improved critical whole-body metabolic parameters compared to HFD controls. These significant improvements encompassed enhanced glucose tolerance (as assessed by intraperitoneal glucose tolerance tests, IPGTT), markedly increased insulin sensitivity (confirmed by insulin tolerance tests, ITT, and homeostasis model assessment of

insulin resistance, HOMA-IR), favorable alterations in body composition (reduced fat mass percentage), and profound amelioration of adipose tissue histopathology. Histological analyses revealed reduced adipocyte hypertrophy, diminished crown-like structures indicative of macrophage infiltration, and decreased overall inflammatory infiltrates within epididymal white adipose tissue (eWAT).

Mechanistically, DMRT2 overexpression within AT macrophages significantly skewed their polarization balance away from the pro-inflammatory M1 phenotype. This crucial reprogramming was evidenced by a marked downregulation of canonical M1 surface markers (CD86) and associated pro-inflammatory cytokines (e.g., TNF-α, IL-6), concomitant with a significant upregulation of markers associated with the alternative, anti-inflammatory, and tissue-reparative M2 activation state (CD163, CD206, Arg1). To dissect the direct paracrine crosstalk, a sophisticated co-culture system was employed, comprising primary macrophages overexpressing DMRT2 and insulin-resistant 3T3-L1 adipocytes. Strikingly, DMRT2 overexpression in macrophages substantially enhanced insulin sensitivity in adjacent adipocytes. This improvement was quantified by elevated basal and insulin-stimulated 2-deoxyglucose uptake, increased plasma membrane translocation of the insulin-responsive glucose transporter GLUT4 (confirmed by immunofluorescence and cell fractionation), and heightened phosphorylation of AKT at Ser473 - a central node and critical activation step in the canonical insulin signaling cascade.

Crucially, the study uncovered a pivotal molecular interaction underpinning DMRT2's effects. RNA interference-mediated knockdown of the nuclear bile acid receptor, farnesoid X receptor (FXR), specifically within macrophages, significantly attenuated or partially abrogated the beneficial metabolic effects conferred by DMRT2 overexpression. This attenuation included a blunted shift away from M1 polarization and a reduced improvement in co-cultured adipocyte insulin sensitivity. This key finding establishes a critical, previously unrecognized functional interaction and likely co-regulatory relationship between DMRT2 and FXR within macrophages, essential for mediating the observed improvements in polarization balance and insulin sensitivity.

Collectively, these multifaceted results robustly identify macrophage-expressed DMRT2 as a pivotal transcriptional regulator governing adipose tissue inflammation and systemic metabolic homeostasis. Its action, operating at least partially through a cooperative interaction with FXR, modulates the intricate crosstalk between macrophage phenotypic commitment, adipose inflammatory tone, and insulin signaling fidelity. Consequently, targeting the DMRT2 pathway, particularly its interplay with FXR in macrophages, emerges as a promising and mechanistically grounded therapeutic strategy for ameliorating obesity-associated metabolic disorders, including type 2 diabetes.

应激性高血糖比率对急性心肌梗死患者 PCI 术后远期预后的影响

王彤 丛洪良

天津市胸科医院

目的

探讨应激性高血糖比率对于接受 PCI 治疗的 ST 段抬高型心肌梗死和非 ST 段抬高型心肌梗死患者远期预后的影响。

方法

纳入了 2019 年 1 月 1 日至 2019 年 12 月 31 日在天津市胸科医院成功行 PCI 手术的急性心肌梗死患者 734 例。主要研究终点为 MACCE。在 399 名 STEMI 患者中，依据入院 SHR 三分位数分为 T1、T2、T3 三组，其中低 SHR 组（T1、T2 组，SHR < 0.917，n = 266），高 SHR 组（T3 组，SHR ≥ 0.917，n = 133）。在 335 名 NSTEMI 患者中，同样分为 T1、T2、T3 三组，低 SHR 组（T1、T2 组，SHR < 0.926，n = 222），高 SHR 组（T3 组，SHR ≥ 0.926，n = 113）。分别比较 STEMI 及 NSTEMI 人群高 SHR 与低 SHR 患者基线资料及预后，使用单因素和多因素 Cox 比例风险模型分析 SHR 对成功行 PCI 术的急性心肌梗死患者远期预后的影响，并根据患者是否合并糖尿病进行亚组分析，探讨 SHR 对不同糖代谢状态下急性心肌梗死患者预后的影响。

结果

经过 4.8 年的中位随访，共发生 57 例（7.8%）全因死亡，41 例（5.6）心源性死亡，以及 173 例（23.6%）MACCE。多因素 COX 回归分析，在成功接受 PCI 术的 STEMI 患者中，高 SHR 组比低 SHR 组发生 MACCE 的风险更高 (HR: 1.886, 95%CI: 1.253-2.713, P=0.042)。在 STEMI 合并糖尿病的患者中也发现较高的 SHR 是 MACCE 事件的独立预测因素 (HR: 4.153, 95%CI: 1.519-11.350, P=0.006)。在 STEMI 合并非糖尿病，以及 NSTEMI 无论是否合并糖尿病的患者中，SHR 对不良预后没有显著影响（P 值均 >0.05)。

结论

接受 PCI 的 STEMI 及 STEMI 合并糖尿病患者，SHR 是远期 MACCE 事件的独立预测因素，SHR 的测量有利于风险分层及预后评估。

Comprehensive Identification of Cardiometabolic Protein Biomarkers in Acute Myocardial Infarction Using Olink Proteomics and Multi-Cohort Validation

Xin Tan, Shuai Xu, An-Chen Xu, Ya-Feng Zhou

Department of Cardiology, The Fourth Affiliated Hospital of Soochow University, Suzhou Dushu Lake Hospital, Medical Center of Soochow University

Background:

Acute myocardial infarction (AMI) is a leading cause of death and disability worldwide. Despite advances in reperfusion therapy, metabolic injury remains a major contributor to poor outcomes. Cardiometabolic dysfunction—characterized by impaired energy metabolism, inflammation, and oxidative stress—plays a key role in AMI pathogenesis. However, reliable biomarkers reflecting this metabolic damage are lacking. This study aimed to identify and validate cardiometabolic protein biomarkers for AMI using Olink proteomics and genetic causal analysis.

Methods:

We conducted a proteomic analysis of coronary plasma samples obtained from 20 patients diagnosed with AMI and 10 age- and sex-matched healthy controls using the Olink Cardiometabolic panel, which quantifies 92 targeted proteins implicated in cardiovascular metabolism. Differentially expressed proteins (DEPs) were identified using t-tests with false discovery rate (FDR) correction. Bioinformatics analyses, including Gene Ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment, and protein-protein interaction (PPI) network construction, were performed to investigate biological functions. Validation was conducted using enzyme-linked immunosorbent assay (ELISA) in an independent cohort of 125 AMI patients and 120 controls. Diagnostic performance was evaluated using receiver operating characteristic (ROC) curves derived from multiple public datasets, including GSE66360, GSE48060, GSE5406, GSE57388, and GSE57345. Additionally, we employed two-sample Mendelian randomization (MR) using genetic variants associated with protein levels from large-scale genome-wide association studies (GWAS) in the FinnGen consortium to infer potential causal associations between candidate biomarkers and AMI risk.

Results:

Among the 92 proteins profiled, 32 were found to be significantly differentially expressed between AMI patients and healthy controls ($p < 0.05$), including 12 upregulated and 20 downregulated proteins. GO and KEGG enrichment analyses revealed that these proteins were enriched in biological pathways related to collagen fibril organization, vascular smooth muscle cell development, PI3K-AKT signaling, and immune regulation. The five selected upregulated proteins—PCOLCE, FCN2, REG1A, DEFA1, and CRTAC1—were functionally linked to extracellular matrix remodeling, complement activation, inflammatory response, and cellular stress regulation. ELISA results confirmed significantly increased levels of these proteins in AMI patients compared with controls (all $p < 0.01$). ROC curve analyses based on GEO datasets demonstrated that these proteins had good diagnostic value, with area under the curve (AUC) values ranging from 0.678 to 0.825 across different cohorts, including both acute and chronic ischemic cardiomyopathy populations. Correlation analyses showed that levels of the core proteins were significantly associated with key clinical indicators such as left ventricular ejection fraction (LVEF), left ventricular fractional shortening (LVFS), NT-proBNP, CK-MB, cTnT, and body mass index (BMI), suggesting their clinical relevance in assessing myocardial injury severity and metabolic stress. Notably, MR analysis identified a statistically significant causal association between genetically predicted FCN2 levels and AMI risk (OR = 1.514, 95% CI: 1.095–2.095, p = 0.012), as well as between DEFA1 and AMI (OR = 1.179, 95% CI: 1.024–1.358, p = 0.022). The other three proteins exhibited suggestive but non-significant causal relationships. Sensitivity analyses, including MR-Egger and leave-one-out tests, supported the robustness of the findings and excluded pleiotropic effects.

Conclusions:

This study successfully identified and validated five cardiometabolic protein biomarkers—PCOLCE, FCN2, REG1A, DEFA1, and CRTAC1—that are significantly elevated in patients with acute myocardial infarction. These proteins are functionally involved in key pathological processes such as extracellular matrix remodeling, immune activation, and metabolic stress responses. The diagnostic performance of these markers was confirmed in multiple independent datasets, and FCN2 and DEFA1 were further demonstrated to have a causal relationship with AMI risk through Mendelian randomization. These findings provide important insights into the mechanisms of metabolic damage in AMI and suggest that these proteins may serve as promising candidates for early diagnosis, risk stratification, and therapeutic targeting. Further prospective multicenter studies are warranted to validate these findings and explore their utility in clinical decision-making and precision medicine.

美阿沙坦对糖尿病大鼠心肌脂联素和脂联素受体 1 表达的影响 [基金项目：山西省自然基金基础研究项目（20210302123088）；太原市区域医疗中心科技创新项目（202229）]

付德明

山西医科大学附属太原中心医院 / 太原市中心医院

目的 研究美阿沙坦酯（Azil）对糖尿病（DM）大鼠心肌脂联素（ ADPN）和脂联素受体 1（AdipoR1）表达影响，探讨心肌保护的可能机制。

方法 SD 大鼠分为 Sham+Vehicle、DM+Vehicle、DM+Azil、Sham+Azil 组。Azil 干预 12 周测量大鼠体重，测定血清 FBG、FINS、TG、TC，计算 LVMI、RVMI，光镜观察心肌病理变化，ELISA 测定心肌 ADPN、AdipoR1、MCP-1、NF-κB、GLUT-1、TGF-β_1；RT-PCR 和 Western blot 测定心肌 AdipoR1 mRNA 和蛋白表达水平。

结果 DM+Vehicle 组大鼠 FBG、FINS、TG、TC 水平高于 Sham+Vehicle 组，ADPN 水平低于 Sham+Vehicle 组；DM+Azil 组 FBG、FINS、TG、TC 水平低于 DM+Vehicle 组，ADPN 水平高于 DM+Vehicle 组。DM+Vehicle 组大鼠心肌 LVMI 较 Sham+Vehicle 组升高，DM+Azil 组 LVMI 较 DM+Vehicle 组降低。DM+Vehicle 组大鼠心肌 AdipoR1 表达低于 Sham+Vehicle 组，DM+Azil 组 AdipoR-1 表达则升高。DM+Vehicle 组大鼠心肌 AdipoR1 表达较 Sham+Vehicle 组降低，而 MCP-1、NF-κB、GLUT-1、TGF-β_1 较 Sham+Vehicle 组升高；DM+Azil 组大鼠心肌 AdipoR1 表达较 DM+Vehicle 组升高，而 MCP-1、NF-κB、GLUT-1、TGF-β_1 表达降低。

结论 Azil 可改善 DM 大鼠糖脂代谢紊乱，通过上调心肌 ADPN 和 AdipoR1 表达，下调 MCP-1、NF-κB、GLUT-1、TGF-β_1 表达，发挥心肌保护作用。

胰岛素通过 ACTA2 rs1324551 (A/G) 位点调控血管平滑肌细胞表型转化、增殖及迁移及其机制研究

陈芯尧 谢凤 闫庆凯 于长青

重庆市璧山区人民医院

目的 探讨胰岛素刺激血管平滑肌细胞（VSMCs）ACTA2 rs1324551 (A/G) 位点突变对细胞表型转化、增殖及迁移的影响。**方法** 分离 SD 大鼠原代 VSMCs，构建 ACTA2 rs1324551 (A/G) 位点慢病毒转染 VSMCs；将 VSMCs 细胞分组为常规培养组与胰岛素（10^{-7}mol/L）培养组，采用 CCK-8 试剂盒检测胰岛素刺激后细胞增殖水平，采用细胞划痕实验、Transwell 实验检测胰岛素刺激后细胞迁移水平；利用生物信息学对 rs1324551 区域进行分析，荧光素酶报告基因实验检测激活蛋白 -1（activating protein-1，AP-1）调控 ACTA2 rs1324551 (A/G) 位点表达；进一步检测胰岛素刺激后 VSMCs 的 MAPK/ERK/AP-1 信号通路及 SM-α 的蛋白表达。**结果** 胰岛素刺激后突变型 VSMCs 细胞的增殖水平较野生型 VSMCs 细胞显著增高（P<0.05）；细胞划痕实验、Transwell 实验发现胰岛素刺激后突变型 VSMCs 细胞的迁移水平较野生型 VSMCs 细胞显著增加（P<0.05）；荧光素酶报告基因显示 AP-1 可与 ACTA2 rs1324551 (GG) 位点结合并抑制 ACTA2 基因表达，同时胰岛素刺激后 MAPK/ERK/AP-1 通路激活，SM-α 蛋白表达下调。**结论** 胰岛素通过激活 VSMCs AP-1，抑制 ACTA2 基因 rs1324551 (GG) 位点的表达，因此 rs1324551 (GG) 可能是 SM-α 蛋白表达一个新的顺式调控位点，在 II 型糖尿病合并动脉粥样硬化患者的疾病发生发展中起重要调控作用。

成年期不同阶段体重对左室收缩功能和全因死亡的影响

杜家琦 [1] 公威 [2] 聂绍平 [1]

1. 首都医科大学附属北京安贞医院

2. 北京医院

目的：探究成年期不同阶段体重对左室结构、收缩功能和全因死亡风险是否存在不同影响。

方法：本研究纳入了动脉粥样硬化多种族研究中接受心脏磁共振检查的 3004 名参与者。所有参与者在入组时回忆了其 20 岁和 40 岁的体重，同时在每次 Exam 中均测量了身高和体重，以此计算各阶段的身体质量指数（BMI）。在本研究中，成年早期定义为 20-40 岁，成年中期定义为 40 岁至 Exam 1（中位年龄 59 岁），成年晚期定义为 Exam 1 及以后。使用多变量线性回归和限制性立方样条探究成年期 BMI 对左室结构和收缩功能的影响；采用 Cox 回归评估 BMI 与全因死亡率之间的关系，并通过中介分析探究左室射血分数（LVEF）在肥胖和全因死亡之间的中介作用。

结果：线性回归分析表明，左室质量和容积随成年期 BMI 增加而增大，且这一结果独立于晚年 BMI 存在。收缩功能方面，成年早期 BMI 较高与晚年 LVEF 降低独立相关，而成年中晚期 BMI 与 LVEF 则无此关联。Cox 回归分析表明，成年早期 BMI 较高是全因死亡的独立危险因素，而成年晚期 BMI 较高则是保护因素。中介分析表明，成年早期 BMI 对全因死亡的影响部分由 LVEF 介导。

结论：成年期不同阶段的 BMI 对左室收缩功能和全因死亡风险有着不同影响。成年早期较高的 BMI 与晚年 LVEF 降低密切相关，进而部分介导了全因死亡的发生。因此，应积极倡导成年早期体重控制，以降低肥胖对晚年心脏功能和死亡风险的不良影响。

Impact of Abdominal Obesity Indices on All-Cause and Cardiovascular Mortality in Individuals with Pre-Diabetes and Diabetes: Insights from a Prospective Cohort Study

Aihua Li, Qilin Ma

central south university

Abstract

Aims:

This study aimed to comprehensively evaluate the associations between key indices of abdominal obesity—specifically the Visceral Adiposity Index (VAI), Lipid Accumulation Product (LAP), and Waist Circumference (WC)—and the risks of all-cause and cardiovascular disease (CVD) mortality. Crucially, it sought to determine whether these relationships varied significantly across populations with distinct glucose metabolism statuses: normal glucose regulation (NGR), prediabetes (Pre-DM), and established diabetes mellitus (DM).

Methods:

Utilizing data from the National Health and Nutrition Examination Survey (NHANES) cycles spanning 1999 to 2018, this prospective cohort analysis included 17,727 adult participants. Mortality outcomes, including specific causes of death (all-cause and CVD mortality), were ascertained by linking participants to the National Death Index records up to December 31, 2019. Participants were stratified into three groups based on their baseline glucose metabolism status: DM, Pre-DM, or NGR. Separately, participants were categorized into sex-specific quartiles (Q1-Q4, with Q1 being the lowest and Q4 the highest) for each abdominal obesity index (VAI, LAP, WC). Cox proportional hazards regression models were employed to quantify the hazard ratios (HRs) and 95% confidence intervals (CIs) for the associations between glucose metabolism status, abdominal obesity indices (both individually and in combination), and mortality outcomes. Models were adjusted for relevant demographic, lifestyle, and clinical covariates. Restricted cubic splines (RCS) with three knots were applied to explore potential non-linear dose-response relationships between the continuous obesity indices and mortality risk. To evaluate the incremental predictive utility of LAP and WC beyond standard risk factors within each glucose metabolism group, C-statistics (area under the receiver operating characteristic curve, AUC) were calculated and compared between baseline prediction models and models incorporating each abdominal obesity index.

Results:

Over a median follow-up duration of 9.4 years, 2,687 deaths were recorded, of which 847 were attributed to CVD. Cox regression analyses demonstrated that both Pre-DM and DM status were significant independent predictors of increased all-cause and CVD mortality compared to NGR. Regarding abdominal obesity indices, higher WC was significantly associated with elevated risks of both all-cause and CVD mortality. Higher LAP was significantly associated with increased all-cause mortality, but not independently with CVD mortality after adjustments. VAI did not show consistent independent associations. Joint effect analyses revealed a pronounced risk elevation: individuals with Pre-DM or DM in the highest quartile (Q4) of WC or LAP exhibited significantly greater risks of all-cause mortality compared to the reference group (NGR individuals in the lowest quartile, Q1, of the respective obesity index). Assessment of model discrimination showed that incorporating WC into baseline predictive models significantly improved the C-statistic for all-cause mortality specifically within the Pre-DM subgroup, indicating enhanced predictive accuracy for this population.

Conclusions:

Waist Circumference (WC) and Lipid Accumulation Product (LAP) emerge as significant predictors of mortality risk in this nationally representative cohort. WC demonstrates associations with both all-cause and CVD mortality, while LAP is specifically linked to all-cause mortality. The detrimental impact of high levels of these abdominal obesity indices is particularly pronounced among individuals with impaired glucose metabolism (Pre-DM and DM). Critically, the inclusion of WC significantly improves the ability to predict all-cause mortality risk within the Pre-DM population. These findings underscore the critical importance of integrating assessments of abdominal obesity, particularly WC and LAP, alongside evaluations of glucose metabolic health (including Pre-DM status) for comprehensive risk stratification and the development of targeted preventive strategies aimed at reducing mortality.

Serum Glycolipids Mediate the Link Between Dietary Antioxidants and Mortality in Metabolic Syndrome

Aihua Li, Qilin Ma

中南大学湘雅医院

Abstract

Background: Metabolic syndrome (MetS), characterized by interrelated cardiometabolic risk factors including abdominal obesity, dyslipidemia, hypertension, and hyperglycemia, represents a significant global public health burden associated with increased morbidity and mortality. Dietary modification is recognized as a cornerstone strategy for MetS intervention. Oxidative stress is a key pathophysiological mechanism underlying MetS complications, prompting interest in dietary antioxidants. While the Composite Dietary Antioxidant Index (CDAI), a holistic measure reflecting the combined intake of key dietary antioxidants (vitamins A, C, E, zinc, selenium, manganese, and copper), offers a comprehensive assessment of antioxidant capacity, its specific association with long-term survival outcomes—particularly all-cause and cardiovascular mortality—in indi-

viduals already diagnosed with MetS remains inadequately elucidated. This study aimed to investigate these critical relationships within a nationally representative cohort of U.S. adults with MetS.

Methods: We conducted a prospective cohort analysis utilizing data from 4,756 adults with confirmed MetS, drawn from the National Health and Nutrition Examination Survey (NHANES) cycles spanning 1999 to 2020. Mortality status and underlying causes of death (all-cause and cardiovascular disease [CVD] mortality) were ascertained by linkage to the National Death Index records through December 31, 2019. The CDAI was calculated from 24-hour dietary recall data. Participants were categorized into quartiles (Q1-Q4) based on their CDAI score, with Q1 representing the lowest intake. Weighted Cox proportional hazards regression models were employed to calculate hazard ratios (HRs) and 95% confidence intervals (CIs) for the associations between CDAI quartiles and mortality outcomes, using Q1 as the reference group. Multivariable models were sequentially adjusted for key confounders including age, sex, race/ethnicity, education, income, smoking status, physical activity, BMI, individual MetS components, and pre-existing CVD or cancer. Restricted cubic spline (RCS) curves with three knots were fitted to explore potential non-linear dose-response relationships between continuous CDAI scores and mortality risk. Stratified analyses were performed across key subgroups (e.g., age, sex, smoking status, diabetes status) to assess consistency, with interaction terms tested for significance. Formal mediation analysis quantified the proportion of the observed association between CDAI and mortality potentially mediated by serum glucose and high-density lipoprotein (HDL) cholesterol levels.

Results: Over a median follow-up period of 103.4 months (approximately 8.6 years), 838 deaths occurred, including 262 specifically attributed to cardiovascular causes. After comprehensive adjustment for all potential confounders, participants in the highest CDAI quartile (Q4) exhibited a statistically significant 26% reduced risk of all-cause mortality (adjusted HR = 0.74, 95% CI: 0.57–0.97, p = 0.030) and a 35% reduced risk of cardiovascular mortality (adjusted HR = 0.65, 95% CI: 0.45–0.96, p = 0.030) compared to those in the lowest quartile (Q1). RCS analysis confirmed a consistent, approximately linear, inverse relationship between increasing continuous CDAI scores and decreasing risks of both all-cause and cardiovascular mortality, with no evidence of a threshold effect or non-linearity. Stratified analyses across diverse demographic and clinical subgroups consistently demonstrated protective associations for higher CDAI, with no significant interactions detected (all p-interaction > 0.05), reinforcing the robustness of the findings. Mediation analysis revealed that serum glucose levels mediated approximately 14.3% of the association between CDAI and all-cause mortality, while HDL cholesterol mediated approximately 11.7% of the association between CDAI and cardiovascular mortality, suggesting these metabolic pathways partially explain the protective effect.

Conclusions: This large, nationally representative study demonstrates that a higher Composite Dietary Antioxidant Index (CDAI), indicative of greater combined dietary intake of key antioxidants, is independently associated with significantly lower risks of both all-cause mortality and cardiovascular mortality among adults with metabolic syndrome. The inverse association exhibits a linear dose-response pattern. The protective effects appear consistent across diverse population subgroups and are partially mediated through beneficial effects on serum glucose homeostasis and HDL cholesterol levels. These findings underscore the potential clinical and public health importance of promoting diets rich in diverse antioxidants as part of a comprehensive strategy to improve long-term survival outcomes in individuals managing MetS. Further research is warranted to confirm causality and elucidate specific mechanisms.

代谢功能障碍相关脂肪性肝病合并高尿酸血症患者的心脏重构特征及危险因素分析

周可然

盘锦市中心医院

一、目的

探讨代谢功能障碍相关脂肪性肝病（Metabolic Dysfunction-Associated Fatty Liver Disease, MAFLD）合并高尿酸血症（Hyperuricemia,HUA）患者的心脏结构改变及其独立危险因素。

二、方法

采用回顾性病例对照研究，纳入盘锦市中心医院 2024 年 4 月 -2025 年 4 月就诊的 MAFLD 患者 206 例，分为对照组（单纯 MASLD，n=103）和观察组（MAFLD 合并 HUA，n=103，高尿酸以男性血尿酸 >420 μmol/L，女性 >360 μmol/L，绝经女性 > 420 μmol/L 为诊断依据）。收集两组一般资料（年龄、性别、体重指数（BMI）、有无高血压、有无糖尿病病史），血生化指标：空腹血糖（FBG）、糖化血红蛋白（HbA1c）、甘油三酯（TG）、总胆固醇（TC）、低密度脂蛋白胆固醇（LDL-C）、高密度脂蛋白胆固醇（HDL-C）、尿白蛋白 / 肌酐比值（UACR）、血小板（PLT）、血肌酐（SCr）及心脏超声参数：室间隔厚度（IVSd）、舒张末期左心室内径（LVEDD）、收缩期末期左心房前后径（LAD）、左心室后壁厚度（LVPWd）、左心室射血分数（LVEF）、E/A（舒张早期与晚期二尖瓣血流速度比值）。采用多因素 Logistic 回归分析 HUA 危险因素，Spearman 相关分析评估尿酸（连续变量）与心脏指标的关系。

三、结果

1、心脏结构差异：

观察组 LAD[35(32,37)mm vs 33(30,35)mm, P=0.002] 和 IVSd[11(10,12) mm vs 10(10,11) mm, P<0.001] 显著高于对照组，但在性别、年龄、左室射血分数（LVEF）和 E/A 比值差异无统计学意义（均 P>0.05）。

尿酸连续变量分析显示：UA 与 LAD（Rho=0.238, P=0.001）、IVSd（Rho=0.247, P<0.001）呈显著正相关。

2、代谢与肾功能：

观察组空腹血糖 [9.33(7.31,12.15)mmol/L vs 8.52(7.26,10.0)mmol/L, P=0.046]、甘油三酯 [2.64(1.88,4.13) mmol/L vs 2.01 (1.22,3.34)mmol/L, P<0.001]、血肌酐 [72(59,89) μmol/L vs 11.18(6.32，28.36) μmol/L, P<0.001] 均显著升高。

3、MAFLD 患者发生 HUA 独立危险因素：

多因素 Logistic 回归显示，空腹血糖（OR=1.284, 95%CI 1.117-1.476, P<0.001）、血肌酐（OR=1.038, 95%CI 1.018-1.059, P<0.001）和尿白蛋白 / 肌酐比（OR=1.014, 95%CI 1.004-1.024, P=0.004）为独立危险因素。

4、心脏重构方面：

观察组中 LAD 与 IVSd（Rho=0.342, P<0.001）、左室内径（Rho=0.361, P<0.001）显著相关。UA 作为连续变量与 LAD、IVSd 的关联提示尿酸可能直接参与左房扩大和室间隔肥厚进程。

四、结论

1.MAFLD 合并 HUA 患者存在显著代谢 - 肾功能异常（血糖↑、TG↑、Scr↑）。

2. 高血糖（FPG）和肾功能损害（Scr、UACR）是 HUA 的独立危险因素（均 P<0.05，OR>1）。

3.MAFLD 合并 HUA 患者以左房扩大和室间隔肥厚为特征，且尿酸水平与这两种重构独立相关（均 P<0.01），提示尿酸可能通过容量负荷和心肌纤维化直接影响心脏重构。

AIP、AST 联合左心房内径预测代谢相关脂肪性肝病患者发生冠心病风险的临床价值研究

苗苗

盘锦市中心医院

一、目的：代谢相关脂肪性肝病（MAFLD）是一种由于代谢异常导致的慢性肝脏疾病，MAFLD 能显著增加心血管疾病风险，患有 MAFLD 的患者全因死亡率更高。目前单一的生物标志物对 MAFLD 患者发生冠心病风险的预测价值有限，因此本研究旨在探讨血浆只动脉粥样硬化指数（AIP）、天门冬氨酸氨基转移酶（AST）、左心房内径（LAD）三项指标联合预测 MAFLD 患者发生 CHD 的预测价值，为早期识别高危人群、优化心血管风险分层提供新的诊断工具。

二、方法：选取 2023 年 9 月份到 2024 年 9 月份于盘锦市中心医院心内科及内分泌科患者为研究对象，共收取 201 例患者，根据是否患有冠心病分为 MAFLD 合并 CHD 组 98 例和单纯 MAFLD 组 101 例，收集患者的一般资料及临床资料，包括性别、年龄、吸烟史、饮酒史、高血压病史、冠心病病史、白细胞、中性粒细胞百分比、白蛋白、ALT、AST、HDL-C、TG、尿酸、LAD、射血分数、E/A 比值，比较三者指标在不同组间的差异性及三者指标单独及联合指标对代谢相关性脂肪性肝病与冠心病的预测价值。

三、结果

3.1 一般资料对比：

一般资料显示：2 组患者在性别差异上无统计学意义（p>0.05）；MAFLD 合并 CHD 组与单纯 MAFLD 组的年龄、吸烟史、饮酒史、高血压病史方面差异有统计学意义（p<0.05）。

3.2 实验室指标对比：

实验室指标对比结果显示：2 组患者 ALT、GGT 水平比较差异无统计学意义（p=0.208>0.05），其余在白细胞水平、中性粒细胞百分比、尿酸、AST、TG、HDL-C、AIP、LAD、E/A、UHR 水平上有统计学意义，差异较显著（p<0.05）。

3.3 AIP、AST、LAD 对 NAFLD 患者发生 CHD 的预测效能

ROC 曲线图分析结果显示：（1）AIP 预测 MAFLD 患者发生 CHD 的最佳截断值为 0.4557，曲线下面积（AUC）为 0.651（95%CI：0.525~0.682），敏感度为 54.1%，特异度为 72.8%；（2）AST 预测 MAFLD 患者发生 CHD 的最佳截断值为 33.500，曲线下面积（AUC）为 0.604（95%CI：0.525~0.682）敏感度为 32.7%，特异度为 87.4%；（3）LAD 预测 MAFLD 患者发生 CHD 的最佳截断值为 38.500，曲线下面积（AUC）为 0.604（95%CI：0.52~0.685），敏感度为 53.1%，特异度为 72.8%。

3.4 三者联合指标多 MAFLD 患者发生 CHD 的预测效能

三者指标联合预测 MAFLD 患者发生 CHD 的最佳截断值为 0.519，曲线下面积（AUC）为 0.752（95%CI：0.685~0.819），敏感度为 60.2%，特异度为 82.5%。

四、结论

1. 单纯 MAFLD 组与 MAFLD 合并 CHD 组患者在性别方面差异上无统计学意义（p>0.05）；MAFLD 合并 CHD 组与单纯 MAFLD 组的年龄、吸烟史、饮酒史、高血压病史方面差异有统计学意义；单纯 MAFLD 组与 MAFLD 合并 CHD 组患者 ALT、GGT 水平比较差异无统计学意义（p=0.208>0.05），在白细胞计数、中性粒细胞百分比、尿酸、AST、TG、HDL-C、AIP、LAD、E/A、UHR 水平上有统计学意义，差异较显著（p<0.05）。

2.AIP、AST 联合左心房内径三者指标在对 MAFLD 患者发生 CHD 的预测性能比单一指标的预测性能好。

相对脂肪质量与老年人群心血管代谢疾病及远期不良结局的关联研究

王静 [1,2] 李心晴 [2]

1. 南京市第一医院

2. 北京协和医学院 中国医学科学院阜外医院

目的：老年人群肥胖患病率呈持续增长趋势。体重指数常用于评估肥胖，但其无法区分脂肪组织和去脂组织，并忽略了机体构成和脂肪分布的性别差异。相对脂肪质量（relative fat mass，RFM）是一种基于身高和腰围的新型性别特异性肥胖评估指标。迄今为止，尚无研究探索 RFM 对老年人群全因死亡和心血管死亡的预测价值。本研究基于具有全国代表性的美国老年人群，旨在探索：1）RFM 与老年人群机体构成及脂肪分布的相关性；2）RFM 与老年人群心血管代谢疾病患病率的关联；3）RFM 与老年人群远期全因死亡和心血管死亡风险的关联，并进一步探讨潜在的性别差异。

方法：本研究基于美国国家健康与营养调查（National Health and Nutrition Examination Survey，NHANES）数据库，纳入参加 NHANES 1999-2010 的老年受访者（≥ 60 岁）。双能 X 射线吸收测定法检测机体构成及脂肪分布。采用复杂抽样数据的 Pearson 相关性分析评估 RFM 与老年男性和女性机体构成及脂肪分布的相关性。分别在老年男性和女性中根据 RFM 分布进行分组，采用加权多因素 logistic 回归模型评估 RFM 与心血管危险因素及心血管疾病（cardiovascular disease，CVD）患病率的相关性；采用加权多因素 Cox 比例风险模型评估 RFM 与全因死亡和心血管死亡风险的关联。

结果：本研究共纳入 9261 名老年参与者，中位年龄 69.0 岁，女性加权占比 55.6%。老年女性 RFM 显著高于老年男性（43.0[39.4-46.1] vs 30.7[28.0-33.2]，P<0.001）。在老年男性和女性中，RFM 与全身脂肪百分比和躯干脂肪百分比均呈显著强正相关，RFM 与心血管危险因素（2 型糖尿病、高血压及血脂异常）以及 CVD（心力衰竭、缺血性心脏病和脑卒中）患病率均独立相关。中位随访时间 11.4 年，多因素校正后，与 RFM 在 25-30 范围的老年男性相比，RFM<25 和 RFM ≥ 35 的老年男性全因死亡风险分别增加 53%（风险比 [hazard ratio，HR]=1.53，95% 置信区间 [confidence interval，CI]：1.29-1.83）和 48%（HR=1.48，95%CI：1.25-1.75）；RFM 在 30-35 范围及 RFM ≥ 35 的老年男性心血管死亡风险分别增加 31%（HR=1.31，95%CI：1.02-1.67）和 52%（HR=1.52，95%CI：1.06-2.18）。然而，在老年女性中，RFM 与全因死亡和心血管死亡风险无显著关联。

结论：在老年男性和女性中，RFM 与全身脂肪百分比和躯干脂肪百分比均呈显著正相关，高 RFM 与心血管代谢疾病患病率增加均独立相关。RFM 与全因死亡和心血管死亡风险的关联存在性别差异。

Joint Analysis of C-Reactive Protein-Triglyceride Glucose Index Clusters and Body Roundness Index Trajectories in Incident Cardiovascular Disease Risk: Insights from the China Health and Retirement Longitudinal Study (CHARLS) and UK Biobank

Hong-Xuan Fan, Bo-Da Zhou

Beijing Tsinghua Changgung Hospital

Objective

This study aims to investigate the combined impact of C-reactive protein-triglyceride-glucose index (CTI) clusters and body roundness index (BRI) trajectories on the risk of incident cardiovascular disease (CVD) using data from the China Health and Retirement Longitudinal Study (CHARLS) and the UK Biobank. The CTI integrates inflammation and insulin resistance, while the BRI provides a comprehensive assessment of body shape and health risks. The study seeks to explore whether the joint analysis of these indices can enhance the prediction of CVD risk.

Methods

The study included 3667 participants from CHARLS and 6264 participants from the UK Biobank. The primary endpoint was the incidence of CVD events. Participants were grouped into CTI clusters and BRI trajectories based on their baseline and follow-up measurements. K-means clustering analysis was used to classify changes in CTI, and latent class trajectory modeling (LCTM) was applied to identify distinct BRI trajectories over time. Cox proportional hazard models were used to assess the joint association of CTI clusters and BRI trajectories with incident CVD risk in the UK Biobank, while logistic regression was utilized in the CHARLS cohort. Subgroup analyses and sensitivity analyses were also conducted to validate the findings.

Results

During a median follow-up of 9.26 years in the UK Biobank and 3 years in CHARLS, 476 and 671 incident CVD events were recorded, respectively. The risk of CVD generally increased with higher CTI clusters, cumulative CTI, and BRI trajectories. In the joint analysis, CTI Class 3 showed a significant association with CVD risk across all BRI trajectory groups. For example, in the UK Biobank, participants in CTI Class 3 within the low stable

BRI trajectory group had a hazard ratio (HR) of 1.911 (95% CI: 1.205-3.031, P = 0.006), while those in the high stable BRI trajectory group had an HR of 1.945 (95% CI: 1.139-2.869, P = 0.001). Similar trends were observed in CHARLS, with the highest risk seen in participants with CTI Class 3 and high BRI trajectories. The combined model of CTI clusters and BRI trajectories significantly improved the predictive performance for CVD risk, as evidenced by higher integrated discrimination improvement (IDI) and net reclassification improvement (NRI) values and larger area under the receiver operating characteristic (ROC) curves compared to individual models. Further evaluation via ROC curve analysis revealed the predictive capabilities of these models across both databases. In CHARLS, the combined model exhibited an AUC of 0.591, surpassing the individual CTI class model (AUC=0.562) and BRI trajectory model (AUC=0.575). Within the UK Biobank dataset, the combined model had a higher AUC of 0.63 compared to the CTI class model (AUC=0.585) and BRI trajectory model (AUC=0.604). These findings indicate that integrating CTI class and BRI trajectory yields superior predictive models for CVD, evidenced by higher IDI and NRI values and larger AUCs across both databases.

Conclusion

The findings highlight the significant joint impact of CTI clusters and BRI trajectories on the risk of incident CVD. The study demonstrates that integrating these dynamic trajectories into a combined model significantly enhances the predictive capability for CVD risk. These results underscore the potential utility of incorporating CTI and BRI in risk stratification for CVD prevention. Monitoring how CTI and BRI change over time can identify high-risk individuals and inform personalized, early preventive strategies, potentially reducing the growing burden of cardiovascular disease. Future research should further explore the underlying biological mechanisms and validate these findings in diverse populations.

The impact of dapagliflozin for the myocardial metabolomic profiles of mice with chronic heart failure induced by a high fat diet

Feng Hu

Fujian Medical University Union Hospital

Background: The molecular mechanisms responsible for the clinical benefits of sodium-glucose cotransporter-2 inhibitors (SGLT2i) in patients with heart failure and a reduced or preserved ejection fraction, both diabetic and non-diabetic, are still not fully understood. Given the high mortality among diabetic and non-diabetic patients with heart failure and a reduced ejection fraction (HFrEF) or preserved ejection fraction (HFpEF), both diabetic and non-diabetic, this study aimed to examine the myocardial metabolomic profiles of mice with chronic heart failure induced by a high-fat diet (HDF) and assess the impact of dapagliflozin (DAPA) on these profiles.

Methods: An experimental model of chronic heart failure in mice was established by long-term HDF for six months, and verified using immunohistochemistry and echocardiography. Myocardial specimens were obtained from three groups: chow, HDF, and DAPA. Subsequently, all samples were subjected to non-targeted metabolomic analyses using untargeted liquid chromatography-mass spectrometry. Principal component analysis, partial least squares discriminant analysis, and orthogonal partial least squares discriminant analysis were used to identify differential metabolites or lipid molecules. The Kyoto Encyclopedia of Genes and Genomes (KEGG) database was used to determine the metabolic pathways associated with these identified metabolites.

Results: Echocardiography revealed that mice with chronic heart failure established through HDF exhibited systolic dysfunction compared to the control chow group. However, DAPA treatment partially restored these dysfunctions and protected against myocardial fibrosis and hypertrophy. Furthermore, a total of 72 upregulated and 34 downregulated differential metabolites were observed between the Chow and HDF groups, along with 40 upregulated and 25 downregulated differential metabolites between the HDF and DAPA groups. Annotated obtained lipids according to lipid chains and fat after data preprocessing were divided into BisMePA, Cer, ChE, CL, Co, TG, DG, dMePE, GM2, GM3, Hex1Cer, Hex2Cer, LdMePE, PC, PE, MePC, MGDG, PG, PI, PS, SM, SPH, StE and other categories. A total of 141 upregulated and 167 downregulated differential lipid metabolites were observed between the Chow group and HDF groups, along with 67 upregulated and 59 downregulated differential lipid metabolites between the HDF and DAPA groups, respectively. Dysregulated metabolites or lipids altered by DAPA treatment were found to significantly enrich several metabolic pathways, as identified by the KEGG database. KEGG analysis revealed 171 metabolic pathways enriched by 419 differential metabolites between the Chow group and HDF group, by 250 differential metabolites between the HDF and DAPA groups. KEGG analyzed fourteen metabolic pathways enriched by differential lipid metabolites between the Chow and HDF groups.

Conclusions: We observed that DAPA exhibited protective effects against myocardial fibrosis and hypertrophy and enhanced systolic function in mice with chronic heart failure induced by HDF. Furthermore, we conducted a comprehensive analysis of myocardial profiles, focusing on various differential metabolites, including lipid molecules, as well as prominent metabolic pathways, in these mice. In addition, we assessed the impact of DAPA treatment on these profiles. These findings contribute to the expanding body of literature suggesting that changes in metabolites might serve as potential mechanisms underlying the clinical benefits of SGLT2i in patients with HFrEF or HFpEF. Nevertheless, further clinical data are required to ascertain the safety and efficacy of DAPA administration in this patient population, and its potential mechanism requires further exploration.

基因组结构方程模型阐明了心血管肾代谢综合征的共同遗传结构

鲁传龙 李理政 陈金杉 常润泽 董红霖 张瑞婧

山西医科大学第二医院

目的：心血管肾代谢综合征是一种多因素、复杂的疾病，其共同的遗传基础尚未完全明确。传统的遗传学研究未能充分揭示该综合征的遗传结构及其与多种外部性状之间的关联。

方法：本研究采用基因组结构方程模型定义了心血管肾代谢综合征的共同遗传结构公因子。结合多种 GWAS 后分析方法，我们旨在识别易感基因位点，并研究其与外部性状的遗传关联。此外，我们探讨了丰富的遗传通路、细胞类型及基因组元件，并进一步研究了推定的血浆蛋白生物标志物。利用综合的 GWAS 数据，我们还进行了多基因风险评分分析，以评估心血管肾代谢综合征的染色体水平风险关联。

结果：在本研究中，基因组结构方程模型整合了六种表型，模型拟合度极高（CFI=0.99，SRMR=0.14）。在严格的质量控制下，我们分析了 1,862,425 个全基因组 SNP（Lambda GC=1.591，截距 =1.0176 ± 0.0169）。结果表明，信号膨胀主要由多基因遗传力驱动（h^2=0.3286±0.0135），而非混杂偏倚。在该分析框架下，我们共鉴定了 2,212 个显著相关的变异位点，其中包括 32 个通过 GWAS-by-Subtraction 方法新发现的位点。功能注释结果显示，这些位点主要位于内含子区域（57.92%）和基因间区域（30.6%）。通过全转录组关联分析与精细定位，我们筛选出 188 个高置信度基因，其中 SENP2（Z=12.5）、KIF11（Z=11.5）和 JAZF1（Z=11.38）与心血管肾代谢综合征风险呈最强正相关，而 TCF7L2（Z=-13.4）表现出最强负相关。通路富集分析揭示，脂质平衡和泛素介导的蛋白质降解在这些病理机制中起着关键作用。细胞类型分析进一步突出了胰岛细胞的作用。精细定位分析确定了 18 个可能的致病变异（PP>0.95），其中包括 GCKR（rs1260333、rs780093）和 INADL（rs2481665）等关键信号位点，第 7 号和第 12 号染色体区域展现出显著贡献。

结论：本研究首次通过对未测量的复合表型进行 GWAS 分析，提出了心血管肾代谢综合征的全面遗传特征，为该综合征的共同病因途径提供了新的见解。

甘油三酯葡萄糖 - 体型指数与老年人群全因死亡和原因特异性死亡的关联：一项队列研究

李珊

中国人民解放军总医院第二医学中心

背景：先前研究表明甘油三酯葡萄糖 - 体型指数（TyG-BSI）是评价胰岛素抵抗和代谢风险的可靠指标，但其预测老年人群死亡风险的有效性尚未得到充分验证。本研究旨在探讨 TyG-BSI 与老年人群全因死亡和原因特异性死亡的关联。

方法：研究利用美国国家健康与营养调查（NHANES）1999-2018 年的数据，纳入了 8,093 名≥ 60 岁的老年人。TyG-BSI 通过 TyG 指数和 BSI 的乘积计算得出，其中 TyG= ln[空腹血糖 (mg/dL)× 甘油三酯 (mg/dL)/2]，BSI= 腰围 /(体重指数 $^{2/3}$× 身高 $^{1/2}$)。研究采用了加权 Cox 比例风险回归模型、限制性立方样条曲线以及受试者工作特征曲线 (ROC) 分析。

结果：随着 TyG-BSI 水平的升高，全因死亡、心血管死亡和非心血管死亡的风险呈现进行性增加的趋势。与 TyG-BSI 最低四分位数组的个体相比，最高四分位数组个体在多变量调整后的全因死亡、心血管死亡和非心血管死亡的风险比 (HR) 分别为 1.34（95% CI 1.14-1.57），1.41（95% CI 1.08-1.85）和 1.31（95% CI 1.07-1.61）。TyG-BSI 水平每增加一个标准差 (SD)，全因死亡、心血管死亡和非心血管死亡的风险比分别为 1.14(95% CI 1.07-1.22)，1.14(95% CI 1.02-1.26) 和 1.15（95% CI 1.06-1.23）。限制性立方样条曲线显示 TyG-BSI 与死亡风险之间存在线性正相关。ROC 分析显示 TyG-BSI 对全因死亡、心血管死亡和非心血管死亡具有中等程度的预测能力，相应的曲线下面积 (AUC) 分别为 0.564、0.554 和 0.550。

结论：TyG-BSI 水平与老年人群的全因死亡和原因特异性死亡存在显著关联。未来有必要开展大规模的临床干预研究以调查针对 TyG-BSI 干预能否改善临床结局。

Association between estimated glucose disposal rate and all-cause/cause-specific mortality in the general population is modified by age: a cohort study

shan Li, Zhi-Qing Fu, Yue Lv

中国人民解放军总医院 (301 医院)

Background Estimated glucose disposal rate (eGDR) have been proven to be a reliable biochemical surrogate of insulin resistance in diabetic and non-diabetic individuals. The prognostic value of estimated glucose disposal rate (eGDR) in the general population remains unclear. We aimed to determine the association between eGDR and all-cause and cause-specific mortality in a general adult cohort and to explore

whether such associations were modified by age. Methods The National Health and Nutrition Examination Survey (NHANES) with 49,409 individuals between 1999 and 2018 were included in analysis. The eGDR was calculated as: eGDR = 21.158 − [0.09 × WC (cm)] − [3.407 × Hypertension (Yes = 1/No = 0)] − [0.551 × HbA1c (%)]. Individuals were divided into four groups according to the quartiles of eGDR. Mortality data were obtained from the NCHS-linked National Death Index file until 31 December 2019. Younger individuals (

Stage-Based Biomarker Signatures of Cardiovascular-Kidney-Metabolic Syndrome and Their Associations With Mortality: An Analysis of NHANES 2011–2018 Data

Zi Wang[1], Hung-Chen Lin[2], Xiao-Yu Li[1], Qian-Zhou Lv[1], Hong-Yi Wu[1]

1. Zhongshan hospital, Fudan University

2. Tongji Hospital of Tongji University

Background: Cardiovascular-kidney-metabolic (CKM) syndrome is a recently defined clustering of obesity, diabetes, chronic kidney disease, and cardiovascular disease that confers poor prognosis. The stage-specific progression of pathophysiological disturbances and their prognostic significance in CKM are not well characterized. We aimed to profile changes in diverse biomarkers across CKM stages and assess their associations with all-cause and cause-specific mortality.

Methods: We analyzed 5,382 adults from the National Health and Nutrition Examination Survey (2011–2018). CKM stage (0–4) was assigned using American Heart Association criteria. Biomarkers from four domains (body composition, metabolic, inflammatory, nutritional) were evaluated, including anthropometric measures, lipid/glucose indices, inflammatory cell-count ratios, and nutritional indices. Biomarker distributions across stages were compared with trend tests. Cox proportional hazards models estimated adjusted hazard ratios (HRs) for mortality outcomes (all-cause and cause-specific). Dose–response relationships of key biomarkers with mortality were explored using restricted cubic splines.

Results: A total of 5,382 participants from the NHANES 2011–2018 cycles were included in the present analysis. Of these, 2,696 (50.09%) were male, and the median age was 53.00 years (interquartile range: 41.00–63.00 years). Participants were classified into CKM stages 0 to 4, with 284 individuals (5.28%) in stage 0, 1,150 (21.37%) in stage 1, 2,975 (55.27%) in stage 2, 394 (7.32%) in stage 3, and 579 (10.76%) in stage 4. The median follow-up duration was 62.00 months (interquartile range: 39.00–82.00 months). During the follow-up period, 259 participants (4.88%) died from any cause, including 68 deaths (1.28%) attributed to cardiovascular disease and 191 deaths (3.60%) due to other causes. Most biomarkers differed significantly across CKM stages, indicating progressively higher adiposity and insulin resistance, greater inflammation, and declining nutritional status with advancing stage. Mortality risk increased stepwise with higher CKM stage: each stage increment was associated with a 24% higher hazard of all-cause mortality (HR 1.24, 95% CI 1.08–1.43) and 25% higher hazard of non-cardiovascular mortality, whereas the trend for cardiovascular mortality was positive but not significant. Advanced CKM (stages 3–4) carried approximately 1.7-fold higher all-cause mortality risk than stages 0–2, driven mainly by excess non-cardiovascular deaths. Multiple individual biomarkers had independent associations with mortality. Notably, seven biomarkers—Neutrophil-Monocyte-Lymphocyte Ratio (NMLR), Neutrophil-to-Lymphocyte Ratio (NLR), Systemic Inflammation Response Index (SIRI), Geriatric Nutritional Risk Index (GNRI), Prognostic Nutritional Index (PNI), red cell distribution width-to-Albumin Ratio (RAR), and Albumin-to-Globulin Ratio (AGR)—remained significantly associated with all-cause mortality in both early and advanced CKM groups (Figure 9). These markers are primarily reflective of systemic inflammation (e.g., NLR, NMLR, SIRI, RAR) or nutritional status (e.g., GNRI, PNI, AGR), highlighting the central role of inflammation and malnutrition in mortality risk across different stages of CKM. Visual inspection of the RCS plots showed that the mortality risk curves for advanced-stage CKM tended to be higher and steeper than those for nonadvanced-stage CKM, suggesting a possible stage-dependent sensitivity to inflammatory and nutritional dysregulation.

Conclusions: CKM progression is accompanied by worsening metabolic, inflammatory, and nutritional profiles and a stepwise increase in mortality risk. Systemic inflammation and nutritional deficits emerged as key determinants of prognosis in CKM, underscoring the need for stage-specific risk stratification and interventions targeting these factors.

Association of estimated glucose disposal rate with chest pain incidence and all-cause mortality in populations:A Retrospective Analysis of the NHANES Cohort

Meng-meng wang, Ping Zhang, Liang-Qing Ge

Changde Hospital, Xiangya School of Medicine, Central South University(The first people's hospital of Changde city)

Association of estimated glucose disposal rate with chest pain incidence and all-cause mortality in populations:A Retrospective Analysis of the NHANES Cohort

Background: The estimated glucose disposal rate (eGDR), a surrogate marker of insulin resistance linked to cardiovascular disease (CVD), lacks sufficient evidence regarding its association with chest pain.

Methods: Using cross-sectional data from the 2007-2016 National Health and Nutrition Examination Survey (NHANES), logistic regression and Cox proportional hazards models were employed to analyze the relationship between eGDR and chest pain/all-cause mortality. Restricted cubic spline (RCS) analysis assessed linearity.

Results: The study cohort comprised 10,630 individuals with a near-balanced gender distribution (48% male, 52% female). Table 1 presents the comparative demographic and clinical profiles between subjects reporting chest pain and those without this symptom. Among affected participants, gender-specific prevalence rates were observed, with 47% (n=1,220) of male and 53% (n=1,343) of female participants experiencing chest discomfort. Specifically, a greater proportion of participants with chest pain had a lower educational attainment, a lower family poverty income ratio (PIR), a larger waist circumference,unmarried and others, and former and current smokers. In addition, participants with chest pain were more likely to have higher High-Density Lipoprotein and hemoglobin type A1C (HbA1C), a lower eGDR index and encidence of Diabetes, and a greater incidence of Hypertension, Cancer, Stroke, CHD, and Angina. (all p-values

The stratified analyses examining eGDR's continuous association with chest pain across demographic and clinical subgroups are displayed in Figure 3. Significant associations (p<0.05) were observed in all subgroups except those with cancer, coronary heart disease (CHD), or prior stroke history. Particularly strong correlations (p<0.001) emerged in several population segments:younger participants (

Conclusion: eGDR is an independent risk factor for chest pain and correlates with all-cause mortality regardless of chest pain status.

2 型糖尿病患者中 TyG 指数、血同型半胱氨酸水平与颈动脉斑块发生的相关性分析

纪红芳 郭剑津

山西白求恩医院（山西医学科学院）

研究目的：

2 型糖尿病（T2DM）患者是动脉粥样硬化性心血管疾病（ASCVD）的高危人群。颈动脉斑块作为亚临床动脉粥样硬化的标志物，其早期预测对降低心脑血管事件风险至关重要。甘油三酯葡萄糖指数（TyG 指数）是评估胰岛素抵抗和糖脂代谢紊乱的简易指标，同型半胱氨酸（Hcy）升高则与血管内皮损伤密切相关。然而，二者在 T2DM 患者中对颈动脉斑块的协同作用尚未明确。本研究旨在探讨 T2DM 患者中 TyG 指数、Hcy 水平与颈动脉斑块发生及稳定性的相关性，并分析其联合预测价值。

研究方法：

采用回顾性队列研究设计，纳入 2023 年 1 月 -2024 年 12 月我院收治的 T2DM 患者 512 例。接受颈动脉超声检查后依据结果分为斑块组（n=287）和无斑块组（n=225）。检测空腹血糖（FPG）、甘油三酯（TG）、血清 Hcy 等指标，计算 TyG 指数（公式：ln[TG (mg/dL) × FPG (mg/dL)/2]）。采用多元 Logistic 回归分析校正年龄、性别、BMI、糖尿病病程、血压、LDL-C 等混杂因素，评估 TyG 指数、Hcy 与颈动脉斑块风险的独立及交互关联。

结果：

基线特征：斑块组患者年龄更大（62.4±8.1 岁，P<0.01）、糖尿病病程更长（9.3±4.2 年，P<0.01），且 TyG 指数（9.2±0.8 vs）和 Hcy 水平（16.8±4.3μmol/L）均显著高于无斑块组（P 均 <0.01）。

独立关联性：

TyG 指数每升高 1 单位，颈动脉斑块风险增加 64%（OR=1.64，95% CI: 1.32–2.04）；

Hcy 每升高 5 μmol/L，斑块风险增加 38%（OR=1.38，95% CI: 1.18-1.61）。

交互作用： TyG 指数与 Hcy 呈正相关（r=0.42, P<0.01）。高 TyG 指数（≥ 9.0）联合高 Hcy(≥15 μmol/L)时,斑块风险显著升高(OR=5.12,95% CI: 3.26-8.05)，且存在显著相加交互作用（AP=0.38，SI=2.17）。

斑块稳定性： 在不稳定斑块亚组（n=103）中，TyG 指数与 Hcy 水平进一步升高（TyG: 9.6±0.9; Hcy: 19.2±5.1 μmol/L），显著高于稳定斑块组（P<0.05）。

结论：

在 T2DM 患者中，TyG 指数和 Hcy 是颈动脉斑块形成及不稳定的独立危险因素，且二者存在显著协同效应。临床启示：TyG 指数作为无创的胰岛素抵抗标志物，联合 Hcy 检测可更敏感地识别高危患者；对 TyG ≥ 9.0 且 Hcy ≥ 15 μmol/L 的 T2DM 患者，建议早期干预糖脂代谢及 Hcy 水平（如补充叶酸、B 族维生素），以延缓动脉粥样硬化进展。

抑制 HMOX1 靶向铁死亡减轻糖尿病心肌病

杨荟平 刘斌 佘强

重庆医科大学附属第二医院

目的：糖尿病心肌病（Diabetic cardiomyopathy, DCM）是一种以心功能障碍和心力衰竭为特征的糖尿病的严重慢性并发症。目前，DCM 的治疗着重于血糖控制、血压管理、降脂和生活方式的改善，但效果有限。因此，寻找新的治疗靶点至关重要。铁死亡是一种有别于细胞凋亡、细胞自噬和坏死的新型细胞死亡方式，其特征是细胞内铁离子超载、谷胱甘肽系统失调和过氧化脂质的积累。本研究通过建立体内及体外 DCM 模型，明确铁死亡在其中的重要作用，并在此基础上探讨血红素加氧酶 1（Heme oxygenase 1, HMOX1）通过调控铁死亡来改善糖尿病心肌病的作用。

方法：我们通过给 C57 小鼠喂养含 60% 脂肪的高脂饲料，并在 12 周龄时腹腔注射链脲佐菌素（45mg/kg，连续 3 天）诱导 2 型糖尿病，随后将小鼠继续高脂喂养至 25 周龄来建立 DCM 动物模型，观察小鼠血糖、心功能及心脏病理学改变。同时，采用高糖高脂干预 H9C2 细胞建立 DCM 体外模型。通过检测疾病模型中铁死亡关键调控分子的表达及细胞超微结构的改变，明确其在 DCM 中的作用。此外，我们通过慢病毒干扰 HMOX1 基因表达，观察对铁死亡的影响，并探索其对 DCM 的调控作用。

结果：DCM 组小鼠空腹血糖明显高于 Control 组，葡萄糖耐受力及胰岛素调节能力受损；超声心动图提示 DCM 组小鼠心脏收缩及舒张功能受损；HE 和 Masson 三色染色提示 DCM 组小鼠心肌细胞畸变肥大、排列紊乱，心脏发生纤维化。以上结果表明我们成功建立了 2 型糖尿病心肌病动物模型。高通量转录组测序的分析结果显示，差异基因主要富集在脂肪酸代谢、HSF1 依赖性转录和线粒体脂肪酸 β- 氧化，这些生物代谢过程与铁死亡密切相关。Western Blot 结果表明， DCM 组小鼠心脏组织中的铁死亡抑制因子 GPX4、SLC7A11 以及储存铁离子的 Ferritin 相较于 Control 组表达下降。RT-qPCR 结果显示铁死亡标志物 PTGS2 和 ACSL4 表达升高。铁死亡生化指标中，脂质过氧化的标志物 MDA、细胞毒性的标志物 LDH 含量升高，而抗氧化物 GSH 含量降低。与体内实验一致，高糖高脂干预 H9C2 细胞可使其发生铁死亡，并能被铁死亡的抑制剂 Fer-1 逆转。GEO 数据集 GSE161052 的生物信息学分析结果表明 DCM 小鼠心脏发生铁死亡，且 HMOX1 是铁死亡相关差异基因的核心基因。Western Blot、RT-qPCR 及细胞免疫荧光实验提示 HMOX1 在体内和体外 DCM 环境中表达升高，用携带干扰序列的腺病毒和慢病毒分别在体内外敲低 HMOX1 能改善高糖高脂处理的 H9C2 细胞中的铁死亡，缓解糖尿病心肌病。

结论：患有糖尿病心肌病小鼠的心脏及高糖高脂干预的 H9C2 细胞中发生铁死亡，干预 HMOX1 可通过调控铁死亡相关代谢途径减轻糖脂毒性，改善糖尿病心肌病。

降钙素基因相关肽调节核转录因子 -κB 信号转导对缺氧 c-kit+ 心脏干细胞凋亡的影响

龙仙萍 石蓓 赵然尊

遵义医科大学附属医院

目的：探讨降钙素基因相关肽 (CGRP) 对缺氧环境下 c-kit+ 心脏干细胞凋亡的影响。方法：体外建立 c-kit+ 心脏干细胞缺血缺氧模型，实验分为缺氧 +CGRP 组，缺氧 +CGRP8-37(CGRP 拮抗剂) 组，细胞缺氧对照组，常氧细胞组，缺氧 +BAY11-7082[核转录因子 -κB(NF-κB) 抑制剂] 组。采用免疫荧光检测细胞缺氧后 NF-κB 转位情况；采用 Western blotting 检测 NF-κB 通道蛋白的表达，同样方法检测 CGRP 干预后 NF-κB 转位及通道蛋白表达。同时用流式细胞仪检测 CGRP 干预后细胞凋亡率。

结果：在缺氧状态下，NF-κB 信号通路被激活，NF-κBP65 发生核转位 (呈现红色荧光)。与细胞缺氧对照组比较，缺氧 +CGRP 组 NF-κB 相关信号蛋白 P-I-κB、NF-κBP65 及 NF-κBP50 表达减少 (P<0.05)； 与缺氧 +CGRP 组比较，CGRP+CGRP8-37 组上述 NF-κB 相关信号蛋白表达增加 (P<0.05)。在细胞凋亡方面，与缺氧对照组比较，缺氧 +CGRP 组早、晚期细胞凋亡率均降低 (P<0.05)；与缺氧 +CGRP 组比较，缺氧 +CGRP8-37 组细胞早期凋亡增加 (P<0.05)。

结论：CGRP 在调节 NF-κB 信号的同时抑制了缺氧环境下 c-kit+ 心脏干细胞的凋亡。

骨髓源性生长因子对高糖诱导 H9c2 细胞焦亡的改善作用

石蓓

遵义医科大学附属医院

目的：探讨骨髓源性生长因子 (Mydgf) 是否通过调控 NLRP3 改善高糖诱导的心肌细胞焦亡。

方法：培养大鼠心肌细胞株 H9c2，实验分为 4 组：(1) 正常组 (Nor) 为正常培养的 H9c2 细胞；(2) 高糖组 (HG) 予以 50 mmol/L 葡萄糖干预 H9c2 细胞 24 h；(3)Mydgf 组采用 25 ng/mL 重组 Mydgf 蛋白处理细胞 12 h，随后以 50 mmol/L 葡萄糖干预 H9c2 细胞 24 h；(4)Necrosulfonamide 组 (NSA) 采用 32μmol/L NSA 处理细胞 0.5 h，然后予 50 mmol/L 葡萄糖干预 H9c2 细胞 24 h。Western blot 法检测 H9c2 细胞中天冬氨酸蛋白水解酶剪切体 -1(cleaved CasPase-1)、凋亡相关斑点样蛋白 (ACS)、炎症复合体 (NLRP3) 及成孔蛋白 gasdermin D (GSDMD) 的表达水平。ELISA 法检测细胞培养液中 IL-1β 和 IL-18 的分泌量。CCK-8 法检测 Mydgf 及 NLRP3 对 H9c2 细胞活力的影响。将携带 NLRP3 的增强型绿色荧光蛋白 (EGFP) 慢病毒载体 (NLRP3-EGFP) 及空病毒载体 (EGFP) 分别转染至 H9c2 细胞，做回复实验，检测焦亡相关指标变化。

结果：Western blot 结果显示，HG 组焦亡相关蛋白 cleaved CasPase-1、ACS、NLRP3、GSDMD 表达量较正常组明显增高 (P<0.05)，Mydgf 处理后，焦亡相关蛋白的表达受到明显抑制 (P<0.05)，但抑制效率低于 NSA 组 (P<0.05)。ELISA 检测结果表明炎症相关指标 IL-1β 和 IL-18 在 HG 组中表达增高 (P<0.05)，而在 Mydgf 组中表达下降 (P<0.05)，NSA 组明显下降 (P<0.05)。CCK-8 法检测结果表明 <25 ng/mL 的 Mydgf 对 H9c2 细胞活力无明显影响，>25 ng/mL 的 Mydgf 明显降低 H9c2 细胞活力 (P<0.05)。与对照组相比，过表达 NLRP3 使 HG 条件下的细胞活力明显下降。EGFP 慢病毒转染 NLRP3 至 H9c2 细胞中，RT-qPCR 及 Western blot 结果发现 EGFP 组中 NLRP3 的 mRNA 及蛋白表达与正常组差异无统计学意义 (P>0.05)，而 NLRP3-EGFP 组中 NLRP3 的 mRNA 及蛋白表达均显著增高 (P<0.05)。回复实验的 Western blot 结果显示，在高糖环境中，与 Mydgf 组相比，Mydgf+NLRP3-EGFP 组中焦亡相关蛋白 NLRP3、ASC、cleaved CasPase-1 表达显著增加 (P<0.05)；ELISA 检测结果也表明 IL-1β 和 IL-18 表达较 Mydgf 组明显增高 (P<0.05)。

结论：Mydgf 可能通过抑制 NLRP3 来改善高糖诱导的心肌细胞焦亡。

髓间充质干细胞源外泌体调控心肌微血管内皮细胞增殖的机制研究

石蓓

遵义医科大学附属医院

目的：探讨缺氧预处理骨髓间充质干细胞 (BMSCs) 来源的外泌体 (exosomes) 调控心肌微血管内皮细胞 (CMVECs) 增殖的机制。

方法：采用酶消化法联合差速贴壁法培养大鼠 CMVECs，超高速离心法提取常氧及缺氧预处理的 BMSCs exosomes，免疫荧光检测 CMVECs 内化 exosomes 情况。实验分为 4 组 (n=3)：①正常对照组 (Control)，②去除 exosomes 后的 BMSCs 条件培养基的空白对照组 (Free-Exos)，③常氧外泌体组 (Nor-Exos)，④缺氧外泌体组 (HyPoxia-Exos，外泌体浓度为 400μg/μL，与 CMVECs 共培养 24 h)。采用 Edu 法及流式细胞术细胞周期法检测细胞增殖能力，qRT-PCR 检测 exosomes 和 CMVECs 各组中 miR-214 表达变化。抑制 exosomes 中 miR-214 后，qRT-PCR 检测 exosomes 及 CMVECs 中 miR-214 的表达变化，并观察细胞增殖情况。

结果：经透射电镜及免疫印迹法验证提取的囊泡状物质为外泌体，并通过免疫荧光分析发现 DiI 标记的 exosomes 可被 CMVECs 内化；Edu 及细胞周期结果显示，HyPoxia-Exos 组较 Nor-Exos 组具有更强的促 CMVECs 增殖能力 (P<0.05)。qRT-PCR 结果显示，与 Nor-Exos 组比较，HyPoxic-Exos 组中 miR-214 表达显著升高 (P<0.05)。下调 HyPoxia-Exos 中的 miR-214 表达后，Edu 及细胞周期结果显示 HyPoxia-Exos 组的促进细胞增殖能力被部分阻断 (P<0.05)。

结论：缺氧预处理骨髓间充质干细胞源 exosomes 可能通过传递 miR-214 促进 CMVECs 增殖效应。

Bdh1 过表达通过抑制 H3K9bhb 介导的 Ifi27l2a 转录激活改善糖尿病动脉损伤的机制研究

徐烩雳 汤善宏

中国人民解放军西部战区总医院

目的：

1. 明确 Bdh1 的表达水平与糖尿病动脉损伤的相关性；2. 解析 Bdh1 通过其下游靶点参与糖尿病血管损伤的分子机制；3. 探讨靶向激活 Bdh1 及其下游靶点来治疗糖尿病动脉损伤的可行性。

方法：

1. **临床样本分析**：收集正常和 2 型糖尿病患者的腹主动脉，检测 Bdh1 的表达水平与糖尿病动脉损伤的关系。**2. 体内实验：**以 db/m 鼠作为对照组， db/db 鼠为 2 型糖尿病模型小鼠，随机分为对照组、模型组和 Bdh1 过表达组。分析各组小鼠主动脉的组织形态、细胞凋亡、纤维化、炎症等损伤指标，评估腺病毒介导的 Bdh1 过表达对糖尿病小鼠动脉损伤的缓解作用。**3. 体外实验：**利用高糖 (HG) 加棕榈酸 (PA) 处理小鼠主动脉平滑肌细胞系（MOVAS），模拟糖尿病高糖高脂微环境，同时采用 Bdh1 过表达质粒进行基因过表达，检测细胞凋亡、炎症等相关指标。**4. 转录组测序与下游靶基因的筛选验证：**利用转染了过表达 Bdh1 质粒的 MOVAS 细胞进行转录组测序，筛选受 Bdh1 特异调控的下游靶基因，并验证该基因对凋亡通路的影响。**5. Bdh1 调控下游基因的分子机制研究：**通过细胞实验检测 Bdh1 对 β- 羟基丁酸（βOHB）、组蛋白 H3K9 位点 β- 羟基丁酰化水平的影响，最后利用染色质免疫沉淀（CHIP-qPCR）检测 Bdh1 对 下游基因启动子区 H3K9bhb 修饰的影响。

结果：

1. 从临床、动物、细胞水平发现，高糖高脂微环境会导致主动脉血管平滑肌细胞中 Bdh1 表达下调；2. 体内实验发现，Bdh1 的过表达能够改善糖尿病主动脉的组织形态、纤维化、细胞凋亡、炎症等损伤指标；3. 体外实验发现， Bdh1 的过表达能抑制 HG+PA 处理导致的 MOVAS 细胞中凋亡和炎症相关蛋白的升高，发

挥抗炎抗凋亡作用；4.RNA-seq 测序发现，Bdh1 过表达能够显著抑制 HG+PA 处理的 MOVAS 细胞中凋亡相关因子 Ifi27l2a 的激活。Ifi27l2a 的过表达能够通过促进下游促凋亡蛋白 BAX 的表达，阻断 Bdh1 过表达的抗炎抗凋亡作用。5. Elisa 检测发现，在 MOVAS 细胞中，HG+PA 处理能促进 βOHB 水平上调，而 Bdh1 过表达则逆转其上调。并且 Bdh1 过表达能抑制 2 型糖尿病小鼠动脉平滑肌细胞中 H3K9bhb 水平的上调。最后， ChIP-qPCR 显示，Bdh1 过表达通过降低 Ifi27l2a 启动子区域的 H3K9bhb 富集水平，进而抑制 Ifi27l2a 转录激活。

结论：1. 糖尿病诱导动脉血管平滑肌细胞中 Bdh1 表达下调，并参与促进动脉损伤。2. Bdh1 通过 H3K9bhb 介导的表观遗传修饰抑制 Ifi27l2a 介导的细胞凋亡，从而改善糖尿病血管损伤。 3. 通过 AAV 介导的 Bdh1 血管平滑肌异源表达可能是治疗糖尿病动脉损伤的有效手段。

Methyltransferase like 3-mediated N6-methylatidin methylation inhibits vascular smooth muscle cells PhenotyPe switching via Promoting PhosPhatidylinositol 3-kinase mRNA decay

bei Shi

Affiliated Hospital of Zunyi Medical University

N6-methylatidine (m6A) is involved in Post-transcriPtional metabolism and a variety of Pathological Processes. However， little is known about the role of m6A in vascular Proliferative diseases， Particularly in vascular smooth muscle cells (VSMCs) PhenotyPe switching-induced neointimal hyPerPlasia. In the current study， we discovered that methyltransferase like 3 (METTL3) is a critical candidate for catalyzing a global increase in m6A in resPonse to carotid artery injury and various VSMCs PhenotyPe switching. The inhibited neointimal hyPerPlasia was obtained after in vivo gene transfer to knock-down Mettl3. In vitro overexPression of Mettl3 resulted in increased VSMC Proliferation， migration， and reduced contractile gene exPression with a global elevation of m6A modification. In contrast， Mettl3 knockdown reversed this facilitated PhenotyPic switch in VSMCs， as demonstrated by downregulated m6A， decreased Proliferation， migration， and increased exPression of contractile genes. Mechanistically， Mettl3 knock-down was found to Promote higher PhosPhatidylinositol 3-kinase (Pi3k) mRNA decay thus inactivating the PI3K/AKT signal to inhibit VSMCs PhenotyPe switching. Overall， our findings highlight the imPortance of METTL3-mediated m6A in VSMCs PhenotyPe switching and offer a novel PersPective on targeting METTL3 as a theraPeutic oPtion for VSMCs PhenotyPe switching modulated Pathogenesis， including atherosclerosis and restenosis.

Role of Mydgf in the regulation of hyPoxia/reoxygenation-induced aPoPtosis in cardiac microvascular endothelial cells

bei Shi

Affiliated Hospital of Zunyi Medical University

Cardiac microvascular endothelial cells (CMECs) play a pivotal role in maintaining cardiac homeostasis by regulating blood flow, nutrient exchange, and vascular permeability within the myocardium. However, these cells are highly vulnerable to hypoxia/reoxygenation (HR) injury—a pathological process mimicking ischemia/reperfusion (I/R) in clinical settings—where transient oxygen deprivation followed by reoxygenation triggers a cascade of cellular stress responses, ultimately leading to apoptosis and microvascular dysfunction. Such damage exacerbates myocardial injury, underscoring the need to identify factors that protect CMECs from HR-induced apoptosis. Myeloid-derived growth factor (Mydgf), a secreted protein with known roles in tissue repair and inflammation, has emerged as a potential cytoprotective agent, but its specific effects on HR-induced CMEC apoptosis and the underlying mechanisms remain underexplored.

This study aimed to investigate the regulatory effects of Mydgf on HR-induced apoptosis in CMECs, with a focus on its interaction with endoplasmic reticulum stress (ERS)—a key cellular pathway involved in apoptotic signaling under stress conditions. To achieve this, an in vitro HR model was established by exposing CMECs to 24 hours of hypoxia (oxygen deprivation) followed by 6 hours of reoxygenation, a protocol widely recognized for recapitulating the oxidative and metabolic stress of in vivo I/R.

The experimental design included multiple analytical steps to assess apoptotic activity and molecular changes. Flow cytometry and TUNEL staining were employed to quantify apoptotic rates, providing direct measures of cell death. Quantitative polymerase chain reaction (qPCR) and western blotting were used to evaluate Mydgf expression at both mRNA and protein levels, respectively, while western blotting further analyzed the expression of ERS-related proteins—C/EBP Homologous Protein (CHOP), glucose-regulated Protein 78 (GRP78), and cleaved Caspase-12—and apoptosis-associated markers. Additionally, a rescue experiment was conducted using tunicamycin (TM), a well-characterized ERS agonist, which was applied to CMECs for 24 hours to assess whether ERS modulation impacts Mydgf's effects.

Results confirmed the validity of the HR model, as flow cytometry demonstrated a significant induction of CMEC apoptosis following HR treatment. Concurrently, qPCR and western blotting analyses revealed a marked downregulation of both Mydgf mRNA and protein levels in HR-exposed cells compared to controls ($P < 0.05$), suggesting a potential link between reduced Mydgf expression and HR-induced injury. Functional studies showed that adenovirus-mediated overexpression of Mydgf in HR-treated CMECs effectively mitigated apoptosis, indicating a protective role for Mydgf.

Mechanistically, western blotting data indicated that HR stress triggered a robust upregulation of ERS markers, including CHOP, GRP78, and cleaved Caspase-12—proteins critical for propagating ERS-induced apoptotic signals. Notably, Mydgf overexpression in HR-treated cells led to a significant downregulation of these ERS-related proteins, implying that Mydgf may suppress ERS activation. Further supporting this mechanism, the ERS agonist TM reversed the protective effects of Mydgf under HR conditions, restoring apoptotic rates to levels comparable to HR-treated cells without Mydgf overexpression.

In summary, these findings demonstrate that Mydgf attenuates HR-induced CMEC apoptosis by regulating endoplasmic reticulum stress. The downregulation of Mydgf during HR contributes to heightened ERS and subsequent apoptotic cell death, while Mydgf overexpression counteracts this process. These results highlight Mydgf as a potential therapeutic target for preserving cardiac microvascular integrity during ischemia/reperfusion injury by modulating ERS-mediated apoptosis.

m7G Methyltransferase METTL1 Promotes Post-ischemic Angiogenesis via Promoting VEGFA mRNA Translation

bei Shi

Affiliated Hospital of Zunyi Medical University

Post-transcriptional modifications, which encompass a diverse array of chemical alterations to RNA molecules after their synthesis, have emerged as key regulators of gene expression and cellular function, exerting profound impacts on various pathological processes and ischemic disorders. These modifications, ranging from methylation and pseudouridylation to adenylation, fine-tune RNA stability, localization, and translational efficiency, thereby influencing critical cellular responses such as proliferation, differentiation, and stress adaptation. Among these modifications, N7-methylguanosine (m7G) has garnered increasing attention due to its widespread presence in various RNA species, including mRNA, tRNA, and rRNA. However, the specific role of m7G, particularly in mRNA molecules, in the complex process of post-ischemic angiogenesis-the formation of new blood vessels following ischemic injury-remains largely unexplored, representing a significant gap in our understanding of ischemic disease pathogenesis.

To address this knowledge gap, our study focused on identifying the molecular players responsible for regulating mRNA m7G levels in ischemic tissues. Through a combination of transcriptomic and epigenetic analyses, we identified methyltransferase like 1 (METTL1) as a critical candidate enzyme. METTL1, known to catalyze m7G methylation in tRNAs, was found to be significantly downregulated in ischemic tissues, coinciding with a global decrease in mRNA m7G levels. This observation suggested that METTL1 might play a previously unrecognized role in modulating mRNA m7G methylation during ischemic conditions.

To investigate the functional significance of METTL1 in post-ischemic angiogenesis, we performed in vivo gene transfer experiments in a murine model of hindlimb ischemia. Overexpression of METTL1 via adenoviral vectors resulted in a marked improvement in blood flow recovery, as assessed by laser Doppler perfusion imaging, compared to control animals. Histological analysis further revealed a significant increase in capillary density and angiogenesis in the ischemic muscles of METTL1-overexpressing mice, accompanied by a restoration of mRNA m7G levels. These in vivo findings strongly indicated that METTL1-mediated mRNA m7G methylation promotes angiogenesis following ischemic injury.

Complementary in vitro studies using human umbilical vein endothelial cells (HUVECs) confirmed the pro-angiogenic effects of METTL1. Plasmid-mediated overexpression of METTL1 in HUVECs led to a global increase in mRNA m7G methylation and significantly enhanced key angiogenic phenotypes, including cell proliferation (assessed by EdU incorporation assays), migration (evaluated using scratch wound and transwell assays), and tube formation (measured via Matrigel assays). These results demonstrated that METTL1 exerts direct pro-angiogenic effects on endothelial cells, the primary cellular mediators of angiogenesis.

Mechanistically, we sought to identify the downstream targets through which METTL1 modulates angiogenesis. Ribosome profiling and RNA immunoprecipitation experiments revealed that METTL1 specifically enhances the translation of vascular endothelial growth factor A (VEGFA) mRNA. This effect was dependent on m7G methylation, as mutation of the predicted m7G site in VEGFA mRNA abolished the METTL1-induced increase in translation efficiency. Given that VEGFA is a master regulator of angiogenesis, these findings established a direct link between METTL1-mediated mRNA m7G methylation and the translational activation of a key angiogenic factor.

Collectively, our findings highlight a critical role for mRNA m7G methylation in ischemia-induced angiogenesis and identify METTL1 as a key

regulator of this process. By demonstrating that METTL1 promotes VEGFA mRNA translation in an m7G-dependent manner, we provide novel insights into the molecular mechanisms underlying post-ischemic angiogenesis. These results not only expand our understanding of the biological functions of mRNA m7G methylation but also suggest that targeting METTL1 could represent a promising therapeutic strategy for enhancing angiogenesis in ischemic disorders, including peripheral arterial disease, where impaired blood vessel formation contributes to tissue damage and functional impairment. Further studies are warranted to explore the clinical potential of METTL1 modulation in improving outcomes for patients with ischemic conditions.

Exosomal MiR-29a in Cardiomyocytes Induced by Angiotensin II Regulates Cardiac Microvascular Endothelial Cell Proliferation， Migration and Angiogenesis by Targeting VEGFA

bei Shi

Affiliated Hospital of Zunyi Medical University

Exosomes, nanoscale extracellular vesicles secreted by various cell types, have emerged as critical mediators of intercellular communication, primarily through the transfer of bioactive molecules such as microRNAs (miRs), proteins, and lipids. In the context of cardiac physiology and pathology, exosomes released from cardiomyocytes (CMs) are increasingly recognized for their potential role in regulating the function of neighboring cells, including cardiac microvascular endothelial cells (CMECs)—a key component of the cardiac microvasculature essential for maintaining tissue perfusion and supporting cardiac homeostasis. Among the diverse miRs carried by exosomes, miR-29a has garnered attention due to its reported involvement in angiogenesis and the pathogenesis of myocardial hypertrophy, a condition characterized by abnormal CM enlargement and often associated with impaired vascular remodeling. However, the specific role of CM-derived exosomal miR-29a in modulating CMEC function during myocardial hypertrophy remains poorly understood.

To address this knowledge gap, the present study investigated whether exosomal miR-29a from hypertrophic CMs influences CMEC homeostasis. Myocardial hypertrophy was induced in CMs using angiotensin II (Ang II), a potent pro-hypertrophic peptide known to activate signaling pathways leading to CM enlargement. Exosomes were isolated from the conditioned medium of both non-treated CMs (Nor-exos) and Ang II-induced hypertrophic CMs (Ang II-exos) via ultracentrifugation, a gold-standard method for exosome purification based on density gradient separation. CMECs were then cocultured with these exosome-containing or exosome-depleted conditioned media to assess exosome-mediated effects. Additionally, rescue experiments were performed using CMs or CMECs transfected with miR-29a mimics (to overexpress miR-29a) or inhibitors (to knockdown miR-29a), aiming to validate the specific role of miR-29a in observed phenotypes.

A series of functional assays were employed to evaluate CMEC behavior. Tube formation assays, which measure the ability of endothelial cells to form capillary-like structures, revealed that Ang II-exos significantly reduced tube formation capacity compared to Nor-exos, indicating impaired angiogenic potential. Transwell migration assays demonstrated a marked decrease in CMEC migratory activity following exposure to Ang II-exos, while 5-ethynyl-20-deoxyuridine (EdU) incorporation assays showed reduced proliferation rates in these cells. Quantitative reverse transcription-polymerase chain reaction (qRT-PCR) confirmed that Ang II-exos carried significantly higher levels of miR-29a compared to Nor-exos, suggesting miR-29a as a key mediator of the observed effects.

To elucidate the molecular mechanism underlying these findings, potential downstream targets of miR-29a were investigated. Vascular endothelial growth factor A (VEGFA), a well-characterized regulator of angiogenesis and endothelial cell function, was identified as a putative target. Subsequent qRT-PCR and Western blotting analyses confirmed that miR-29a directly suppressed VEGFA expression in CMECs, both at the mRNA and protein levels. This inhibition of VEGFA was closely associated with the impaired angiogenic, migratory, and proliferative capacities of CMECs treated with Ang II-exos, as rescue experiments with miR-29a inhibitors restored VEGFA expression and partially reversed the detrimental effects on CMEC function.

In conclusion, this study demonstrates that exosomes derived from Ang II-induced hypertrophic CMs contribute to the dysregulation of CMEC homeostasis by transferring miR-29a. This miR-29a-mediated suppression of VEGFA expression directly impairs CMEC proliferation, migration, and angiogenesis, highlighting a novel paracrine mechanism through which hypertrophic CMs modulate the cardiac microvasculature. These findings shed light on the role of exosomal miR-29a as a potential therapeutic target for mitigating vascular dysfunction in myocardial hypertrophy and related cardiovascular diseases.

足细胞 NPRC 敲除可减轻糖尿病小鼠肾小球纤维化

王鑫陆 张澄

山东大学齐鲁医院心内科

目的：肾脏纤维化在糖尿病肾病（DKD）的发生发展中起着重要作用，虽然利钠肽对肾脏的保护作用已有报道，但利钠肽受体 C（NPRC）在 DKD 肾脏纤维化中的作用尚不清楚。因此为探究 NPRC 在 DKD 中的作用及机制设计了一系列实验。

方法: 使用人肾活检组织和糖尿病小鼠模型研究了 NPRC 在 DKD 中的表达和功能。通过组织学染色、血清学、质谱、ELISA、Western blot 等基因和蛋白质分析方法，检测 NPRC 敲减对 TGF-βR2 表达、再循环、 Smad 2/3 信号传导以及整体肾脏结构和功能的影响。

结果：在 DKD 患者和小鼠中均观察到肾脏 NPRC 表达增加。与野生型 DKD 小鼠相比，足细胞特异性 NPRC 敲除的 DKD 小鼠显示肾小球纤维化减少，足细胞损伤和肾功能改善。NPRC 敲除导致足细胞中胶原合成减少。分子生物学研究表明，NPRC 敲除导致 TGF-βR2 的再循环减少和降解增加，从而抑制 TGF-β1/Smad 及 TGF-β1/P38 通路。

结论：NPRC 通过增强 TGF-βR2 表达和 TGF-β1/Smad 信号通路在 DKD 的进展中起有害作用。足细胞特异性 NPRC 敲除不仅减轻肾小球纤维化，还可改善肾功能，这表明 NPRC 可以作为治疗糖尿病肾病肾小球纤维化有希望的靶点。

Mediterranean diet, metabolic profiles, and the risk of coronary heart disease: evidence from a mediation analysis

Xincheng Gu[1], Yangyan Wei[2]

1. Qingdao Medical College of Qingdao University

2. wuhan jinyintan hospital

Background: The preventive effect of the Mediterranean diet (MD) on coronary heart disease (CHD) has been demonstrated in numerous studies. However, there is a lack of clinical evidence for this protective effect mediated by metabolic profiles.

Methods: The Mediterranean diet score (MDS) is based on the dietary scoring standard, where a higher score indicates higher adherence to the MD. This study uses multivariate logistic regression to verify the mediating variables: systolic blood pressure (SBP), diastolic blood pressure (DBP), fasting blood glucose (Glucose), total cholesterol (TC), high-density lipoprotein cholesterol (HDL), low-density lipoprotein cholesterol (LDL), Waist-to-Height ratio (WHtR), and the correlation between MDS and CHD. This causal mediation effect analysis was conducted by R-Project, and the mediation effect quantified by the percentage of indirect effect relative to the total effect. The Bootstrap method was used to test the significance of the mediation effect.

Results: After adjusting for confounding factors (age, sex, body mass index, smoking history, and physical activity), the mediation analysis demonstrated that Glucose, HDL, and WHtR mediated the correlation between MDS and CHD (all p-values< 0.05), with indirect mediation effects of Glucose (-0.048, 95%CI(-0.09~-0.01), p =0.028); HDL (-0.034, 95% CI (-0.07~-0.01), p =0.030); and WHtR (-0.024, 95% CI (-0.06~0), p =0.048). Mediation effect proportions were 30.4%, 22.1%, and 15.1%, respectively.

Conclusions: This study showed that not all metabolic parameters were involved in and mediated the protective of MD-related CHD. These results suggest focusing on monitoring HDL, glucose and WHtR, especially fast blood glucose levels, when an MD intervention is implemented to prevent CHD.

The MD is often used for secondary prevention of cardiovascular events in both the general population and patients with a history of CHD. Higher adherence to the MD is associated with a lower overall risk of death and can reduce the risk of cardiovascular diseases.[8,9] Studies by Amy Jennings and Marilena Vitale have found that the MD can lower patients' blood glucose and lipid levels, effectively improving cardiovascular health by lowering blood pressure and atherosclerosis.[10,11] M Siavash has shown that abdominal obesity increases the incidence of coronary heart disease.[12] Gizem Özata Uyar has demonstrated that the MD can lower a patients' WHtR, reducing the risk of coronary heart disease by improving fat distribution.[13] Previous studies have used the scoring model to access the adherence of MD, which has shown reliable stability and accuracy.

This study is a post-hoc analysis study. The dataset was derived from the study by from Manuela Amato etal, conducted by the IRCCS Monzino Cardiologico in Milan, Italy, which investigated the protective effect of the Mediterranean diet and overall dietary diversity on CHD

This study included 333 individuals with a mean age of 62.3 years, 92.8% of whom were male, and 53.4% of subjects were diagnosed with CHD. They were grouped according to whether or they had CHD. Table 1 summarizes the differences in baseline characteristics between the two groups. Except for weight, physically active and triglycerides, almost all baseline demographic data, anthropometric data, and serum biomarkers were significantly different between the CHD group and the non-CHD group. The data distribution of systolic blood pressure, diastolic blood pressure, fasting blood glucose, total cholesterol, low density lipoprotein cholesterol, high density lipoprotein cholesterol and waist to height ratio.

After adjusting for potential confounders (Table 2 and Table 3), there were significant associations between MDS and metabolic profiles and CHD (all p < 0.001). There was a significant negatuve association be-

tween MDS and CHD as reported in Table 3, models 1-3 with Odds ratios (ORs) of 0.53 (95% confidence interval (CI) 0.34~0.82, p=0.005), 0.54 (0.35~0.84, p=0.007), and 0.5 (0.32~0.80, p=0.004), respectively. After further adjustment of the metabolic profiles (mediator variables), we found that the correlation between MDS and CHD was decreased (Table 3, models 4-10) except for LDL. This finding was suggestive of a mediation effect.

Evaluating the Causal Effects of Lipid-Lowering Drug Targets on the Components of Cardiovascular-Kidney-Metabolic (CKM) syndrome: A Drug-Target Mendelian Randomization Study

Meng-Jin Hu

Xuanwu Hospital, Capital Medical University

Objective: Cardiovascular-kidney-metabolic (CKM) syndrome represents a complex cluster of interrelated conditions including cardiovascular disease, chronic kidney disease (CKD), type 2 diabetes mellitus (T2D), and obesity. These conditions often coexist and share overlapping risk factors such as insulin resistance, endothelial dysfunction, systemic inflammation, and dyslipidemia. Lipid-lowering therapy, especially statins, ezetimibe, and PCSK9 inhibitors, has become the cornerstone of atherosclerotic cardiovascular disease prevention. However, whether these lipid-lowering agents exert differential effects on the broader CKM components—particularly on renal function, glucose metabolism, and adiposity—remains incompletely understood. Drug-target Mendelian randomization (MR) is an emerging approach that utilizes genetic variants mimicking the biological effects of drug inhibition to assess potential therapeutic efficacy and adverse effects. This method helps distinguish true causal relationships from observational confounding. In this study, we employed a drug-target MR framework to evaluate the effects of three established lipid-lowering drug targets—HMG-CoA reductase (HMGCR), Niemann-Pick C1-Like 1 (NPC1L1), and proprotein convertase subtilisin/kexin type 9 (PCSK9)—on a comprehensive set of CKM-related phenotypes.

Methods: We conducted two-sample MR using genome-wide association study (GWAS) summary statistics. Validated genetic variants associated with the expression or function of HMGCR, NPC1L1, and PCSK9 were selected as instrumental variables. These variants serve as proxies for long-term pharmacological inhibition of each target. The outcomes assessed included: (1) Cardiovascular diseases: atrial fibrillation, coronary artery disease (CAD), heart failure, hypertension, peripheral artery disease, and stroke. (2) Renal outcomes: CKD, estimated glomerular filtration rate (eGFR), serum creatinine, and microalbuminuria. (3) Diabetes traits: T2D, fasting glucose, glycated hemoglobin (HbA1c), and fasting insulin. (4) Obesity-related traits: obesity, body mass index (BMI), waist circumference, and waist-to-hip ratio. The primary analytical method was inverse-variance weighted (IVW) MR, with sensitivity analyses using maximum likelihood, MR Egger, weighted median, penalised weighted median, and weighted mode methods to assess the robustness of results and detect potential horizontal pleiotropy.

Results: HMGCR inhibition, as mimicked by relevant genetic instruments, was associated with increased risk of atrial fibrillation, heart failure, T2D, and obesity. It was also associated with increased levels of HbA1c, BMI, and waist circumference. Conversely, HMGCR inhibition was linked to a reduced risk of CAD, hypertension, and CKD, and a decrease in eGFR, suggesting a potential trade-off between cardiovascular benefit and metabolic adverse effects. NPC1L1 inhibition demonstrated a more mixed profile. It was associated with a higher risk of T2D and elevated HbA1c levels but was protective against CAD, hypertension, CKD, and general obesity. This indicates that while NPC1L1 may reduce atherosclerotic risk, it may adversely affect glycemic control. PCSK9 inhibition showed the most favorable cardiovascular profile. It was associated with significant reductions in the risk of atrial fibrillation, CAD, heart failure, peripheral artery disease, and stroke. Moreover, it reduced fasting glucose levels. However, it was also associated with increased adiposity traits, including higher BMI, waist circumference, and waist-to-hip ratio, raising concerns about its potential metabolic consequences in the long term. Sensitivity analyse confirmed the robustness of our findings.

Conclusion: Drug-target MR reveals that HMGCR, NPC1L1, and PCSK9 exhibit heterogeneous effects across the spectrum of CKM traits. While PCSK9 inhibition offers broad cardiovascular benefits, HMGCR and NPC1L1 may entail trade-offs in glucose metabolism or adiposity. These insights may guide the selection of lipid-lowering therapy based on individual metabolic profiles and comorbidities. Further studies are warranted to translate these findings into clinical decision-making and to evaluate whether combined or sequential targeting of these pathways can achieve comprehensive risk reduction across the CKM continuum.

Prognostic value of FIB-4 index in coronary heart disease combined with diabetes or prediabetes: a large-scale cohort study

Rui Fu, Chenxi Song

Fuwai Hospital, Chinese Academy of Medical Sciences

Background: Coronary heart disease (CHD) combined with diabetes or prediabetes represented a high-risk patient group for future major adverse cardiovascular events (MACE). Recent growing evidence showed that liver fibrosis is associated with increased risk of cardiovascular mortality and adverse cardiovascular events. Biopsy is the gold standard for the diagnosis of liver fibrosis, but is limited due to the invasive procedure and related complications. Fibrosis-4 index (FIB-4) is one of the most cost-effective and noninvasive simple tools to estimate the risk of hepatic cirrhosis. Current ADA's diabetes guideline recommends the use of FIB-4 index to screen liver cirrhosis in patients with diabetes, or prediabetes with established cardiovascular disease. However, the association between FIB-4 and major adverse cardiovascular events (MACE) risk in this high-risk population remains unclear.

Methods: This prospective large-sale cohort study consecutively enrolled a total of 20133 patients with coronary heart disease combined with diabetes or prediabetes in Fuwai Hospital. Prediabetes was defined according to the ADA criteria, which was glycated haemoglobin (HbA1c) ranging from 5.7% to 6.4%, or fasting plasma glucose (FPG) ranging from 5.6 to 6.9mmol/L, and the absence of diabetes history or the use of diabetic medications. FIB-4 was calculated as: age (years)×(aspartate aminotransferase [U/L])/(platelets [10^9/L]×[alanine aminotransferase [U/L]]$^{1/2}$). Patients were categorized into three groups based on the FIB-4 index, which were <1.45, 1.45-3.25 and >3.25 for patients in the low- , intermediate- and high-risk FIB-4 category respectively. The primary endpoint was MACE, which was defined as the composite endpoint of cardiac death and non-fatal acute myocardial infarction (AMI). Pearson correlation coefficient was calculated to examine the association between FIB-4 and HbA1c and other biomarkers. Multivariable cox hazard models were used to estimate the hazard ratios (HRs) and 95% confidence interval (CI) with the low FIB-4 category as reference. Variables adjusted in the multivariable model included age, sex, body mass index, current smoking status, hypertension, low-density lipoprotein cholesterol, estimated glomerular filtration rate, high-sensitivity C-reactive protein, HbA1c and the use of statins. The association between FIB-4 index as a continuous variable and MACE was explored by the restricted cubic spline (RCS) analysis.

Results: At baseline, FIB-4 was modestly but significantly associated with the HbA1c (r^2=0.04, p<0.001). During a median of 3.2 years follow-up, a total of 622 MACE occurred. The high FIB-4 index group was associated with increased risk of MACE (8.45% vs. 2.43%, adjusted HR: 2.865, 95% CI: 2.185-3.757), cardiovascular death (3.9% vs. 0.63%, adjusted HR: 2.913, 95% CI: 1.872-4.531) and non-fatal AMI (5.09% vs. 1.92%, adjusted HR: 2.609, 95% CI: 1.864-3.652), even after the adjustment of HbA1c. RCS analysis also showed a positive linear relationship between the FIB-4 index and the risk of MACE, cardiac death and AMI. Subgroup analyses showed that glycemic status or glycemic control assessed by HbA1c ≥ 6.5% or HbA1c< 6.5% did not affect the association between the FIB-4 index and MACE. The associations were consistent in all the other subgroups according to age (aged <65 and ≥ 65 years), sex, body mass index, clinical presentation (acute coronary syndrome or chronic coronary syndrome), with the HRs of MACE greater in the high FIB-4 group compared with the low FIB-4 group in all the subgroups.

Conclusions: Advanced liver fibrosis staged by elevated FIB-4 index was associated with increased risk of MACE, cardiovascular death and AMI, independent of HbA1c and other traditional risk factors. Our findings supported the current diabetes guidelines' recommendation to use FIB-4 index as the first-line index in the risk stratification of patients with diabetes, or prediabetes combined with cardiovascular disease, by showing the prognostic value of FIB-4 index in this high-risk population.

Association of Air Pollutant Exposure with Cardio-Kidney-Metabolic Syndrome in Chinese Middle-aged and Older Adults: Evidence from the CHARLS Cohort

Title: Association of Air Pollutant Exposure with Cardio-Kidney-Metabolic Syndrome in Chinese Middle-aged and Older Adults: Evidence from the CHARLS Cohort

Authors and Affiliations:

1.Yilin Pan - Department of Critical Care Medicine, Beijing Anzhen Hospital, Capital Medical University, Beijing, China

Xiaonan He (Corresponding Author) - Department of Critical Care Medicine, Beijing Anzhen Hospital, Capital Medical University, Beijing, China

Objective:

This study investigates the association between long-term exposure to air pollutants and the risk of Cardio-Kidney-Metabolic (CKM) syndrome in Chinese adults aged ≥ 45 years. It aims to identify vulnerable subgroups and quantify exposure-response relationships between six major air pol-

lutants (PM_1, $PM_{2.5}$, PM_{10}, SO_2, NO_2, O_3) and CKM risk.

Methods:

Data from 5,192 participants in the 2015 China Health and Retirement Longitudinal Study (CHARLS) were analyzed. Air pollution exposure levels (2013-2015) were estimated using satellite-based models and ground monitoring data. CKM syndrome was defined as the co-occurrence of cardiovascular, kidney, and metabolic disorders. Ordered logistic regression models adjusted for sociodemographic factors (age, sex, education), lifestyle (smoking, alcohol use), and health status (BMI, physical activity) were employed. Restricted cubic spline models assessed non-linear relationships. Stratified analyses examined effect modifications by age (<60 vs. ≥ 60 years), region (eastern/central/western China), and urban/rural residence. To verify the robustness of results, the following sensitivity analyses were conducted: (1) refitting the model after removing the geographical region variable; (2) using cumulative logistic regression models (CLM) instead of ordered logistic regression; (3) using continuation ratio models (CRM) instead of ordered logistic regression.All statistical analyses were performed using R software version 4.4.2, with $P < 0.05$ considered statistically significant.

Results:

1.Pollutant Effects:

1.PM_{10} (OR=1.18, 95% CI:1.09-1.28), $PM_{2.5}$ (OR=1.15, 1.06-1.25), SO_2 (OR=1.12, 1.03-1.22), and NO_2 (OR=1.21, 1.10-1.33) showed significant positive associations with CKM risk per IQR increase.

2.O_3 exhibited a U-shaped relationship, with both low and high concentrations linked to elevated risk.

2.Subgroup Vulnerabilities:

1.Elderly adults (≥ 60 years) demonstrated 23-35% higher pollutant-associated risks compared to younger counterparts.

2.Rural residents had 1.3-1.5× greater susceptibility to PM and NO_2 effects than urban dwellers.

3.Eastern China populations showed stronger associations with $PM_{2.5}$ (OR=1.28 vs. 1.10 in western regions).

3.Non-linear Patterns:

1.PM_{10} and NO_2 displayed threshold effects, with risks escalating sharply above 75 μg/m³ and 40 μg/m³, respectively.

Synergistic effects were observed between $PM_{2.5}$ and NO_2 exposure.

Conclusion:

Based on national cohort data, this study confirms a significant association between long-term exposure to air pollutants and increased risk of CKM syndrome among middle-aged and elderly Chinese individuals. The study finds that the elderly (≥ 60 years) demonstrate higher susceptibility to the effects of air pollutants, while rural residents and those in eastern regions also show greater vulnerability. Restricted cubic spline analysis further reveals non-linear dose-response relationships between most pollutants and CKM risk. These findings provide important evidence for formulating stricter air quality standards and implementing targeted pollution control measures, especially in areas with dense elderly populations. In clinical practice, it is recommended to incorporate environmental exposure into the risk assessment system for CKM-related diseases and to develop individualized intervention strategies. Future longitudinal studies are needed to further verify the causal relationship of these associations and to explore potential biological mechanisms.

A Nomogram for Predicting the Progression Risk of Cardiovascular-Kidney Metabolic Syndrome

Song fei[1], Pan Li[2], Xue-Song Wang[2], De-wei Wu[1], Cheng-Long Guo[1], Meng-Jin Hu[1], Xiu-Ling Wang[1], -Yu Jing[1], Jing Xu[2], Jing-Gang Xia[1], Chun-Lin Yin[1]

2. Baizhifang Community Health Service Center, Xicheng District, Beijing

Background: The American Heart Association (AHA) recently introduced the Cardiovascular-Kidney-Metabolic (CKM) syndrome concept, recognizing the complex interplay between cardiovascular disease, kidney dysfunction, and metabolic disorders. This syndrome represents a significant clinical challenge as these conditions frequently coexist and synergistically increase morbidity and mortality risks. Older adults are particularly vulnerable to CKM syndrome progression due to age-related physiological changes and the high prevalence of multimorbidity in this population. While the AHA has established staging criteria (Stages 0-4) to classify disease severity, there remains a critical lack of validated tools for predicting individual risk of progression between these stages. Current risk assessment approaches often evaluate cardiovascular, renal, and metabolic risks separately, failing to capture their integrated impact. This study aimed to develop and validate a comprehensive prediction model specifically designed to assess CKM stage progression risk in community-dwelling older adults.

Methods: We conducted a prospective cohort study involving 1,568 community-dwelling adults aged 66-99 years recruited through family physician networks across China between 2020 and 2023. Participants underwent comprehensive baseline assessments including clinical examinations, laboratory tests (complete blood count, metabolic panel, renal function tests), and detailed medication reviews. The cohort was randomly divided into training (70%) and validation (30%) sets. From an initial pool of 32 potential predictors, we employed least absolute shrinkage and selection operator (LASSO) regression with 10-fold cross-validation to identify the most predictive variables while preventing overfitting. Significant predictors were incorporated into a multivariable Cox proportional hazards model to estimate progression risks. The final model was presented as a clinically practical nomogram. We evaluated model performance through: (1) discrimination using time-dependent receiver operating characteristic (ROC) curves and concordance indices (C-index), (2) calibration with bootstrap-corrected calibration plots, and (3) clinical utility via decision curve analysis across probability thresholds from 5% to 50%. Risk stratification performance was assessed using Kaplan-Meier analysis.

Results: Of the 1568 participants with CKM stage 1 to 3 in our analysis, 620 (39.5%) were men and 948 (60.5%) were women. The age ranged from 66 to 99 years old, with a mean age of 74.5 years old. Among the 1568 participants, 185 cases of CKM stage progression were observed. Six key predictors were identified: sex, systolic blood pressure, diastolic blood pressure, red blood cell distribution width (SD), CKM stage, and diabetes mellitus. The C-index of the training group was 0.768 and that of the verification group was 0.803; The calibration curves of the nomogram showed good consistency between the probabilities and observed values. The decision curve analysis also revealed the potential clinical usefulness of the nomogram. Moreover, the nomogram could successfully classified patients into high-risk and low-risk subgroups.

Conclusion: We developed and validated the first nomogram for predicting CKM stage progression in older adults, incorporating readily available clinical and laboratory parameters. This tool addresses a critical gap in current risk assessment by providing integrated evaluation of cardiovascular, renal, and metabolic progression risks. The model's strong performance metrics and practical visual format facilitate potential implementation in primary care settings. By enabling early identification of high-risk individuals, this nomogram may support personalized interventions to mitigate CKM syndrome progression. Future studies should validate these findings in diverse populations and evaluate the tool's impact on clinical decision-making and patient outcomes.

高血压人群血清尿酸水平与认知功能的关系：一项横断面研究

彭庆龄

南昌大学第二附属医院 心血管内科

背景：血清尿酸（SUA）与认知功能之间的关系在以往的研究中存在争议。高血压组容易出现认知能力下降。我们的目的是利用迷你精神状态检查（MMSE）研究中国高血压患者血清尿酸水平与认知功能的相关性。

方法：我们从中国高血压登记研究中纳入 9471 名受试者。采用生化分析仪测定血清尿酸。采用 MMSE 评价认知功能。不同教育背景的参与者使用不同的 MMSE 分数截断值来定义认知障碍（CI）：中学及以上教育背景的参与者 MMSE<24，小学教育背景的参与者 MMSE<20，文盲参与者 MMSE<17。

结果：共分析了 9471 例成人高血压患者。平均年龄 63.61±9.79 岁，男性占 47.94%。平滑曲线显示 SUA 与 MMSE 评分和 CI 呈非线性相关。阈值效应分析表明，SUA 的拐点约为 445.9μmol/L。在多变量回归分析中，lg SUA 每增加一个单位，SUA

结论：SUA 水平对中国高血压患者 MMSE 评分和认知功能障碍存在阈值效应。在 SUA

关键词：血清尿酸，MMSE 评分，认知障碍，高血压。

在中国高血压人群中脂肪肝指数与新发糖尿病及糖尿病前期发展的关系 - 一项队列研究

彭庆龄

南昌大学第二附属医院 心血管内科

背景与目的：在高血压患者中，非酒精性脂肪肝是 2 型糖尿病（T2 D）的一个强有力的预测因子。在临床实践中评估其并不容易，但脂肪肝指数（FLI）可以作为替代。因此，我们研究了 FLI 对 2 型糖尿病发病率的预测价值，并评估了 FLI 与糖尿病前期患者（空腹血糖介于 5.6-6.9 mmol/L / 糖化血红蛋白介于 5.7%-6.4%）向新发糖尿病转化或逆转为正常血糖状态（空腹血糖 <5.6 mmol/L 且糖化血红蛋白 <5.7%）之间的相关性。

方法： 本研究纳入 7561 名基线无 T2D 的高血压患者，我们估计了 4 年随访时每个 FLI 类别 [FLI <30（无脂肪变性），FLI 30-60（中度）和 FLI ≥ 60（肝脂肪变性）] 中 T2 D 的发生率。使用校正了年龄、性别、糖尿病家族史、吸烟、饮酒、血脂和转氨酶的 cox 回归模型计算 FLI 和 T2 D 事件之间的关联。并进一步排除

4116 例基线正常血糖状态患者参与者，共 3445 名糖尿病前期的高血压患者纳入糖尿病前期发展研究。

结果：基线患者 4 年随访后，FLI<30、FLI 30-60 和 FLI ≥ 60 组的 T2 D 发生率分别为 7.32%、13.44% 和 21.34%。FLI ≥ 60 组与 T2 D 发病率独立相关：在根据性别、年龄调整的基础回归模型中，HR/SD 为 2.89（95%CI：2.39-3.51），在完全调整模型中为 2.01（95%CI：1.52-2.65）。我们进一步在 3445 名糖尿病前期患者中分析，206 例患者（5.98%）转为 2 型糖尿病。FLI 与较高的 2 型糖尿病转换风险相关（完全调整 HR/SD = 1.82，95%CI 1.21-2.75），在 FLI ≥ 60 组中，每增加一个标准差，2 型糖尿病发病风险增加 143%（95%CI 1.18-4.98）。FLI 也与前驱糖尿病逆转相关：根据 SD 校正的 HR = 0.87，95%CI 0.81-0.94。随访期间 FLI 的变化与 FPG 的变化显着相关（p<0.0001）。

结论：FLI 可以被认为是一个简单和有价值的早期指标，在临床实践中进一步分层 2 型糖尿病转化的风险或前驱糖尿病逆转的可能性，并提前采取有效的措施预防和减少疾病的进展。

Association of cardiometabolic index with all-cause and cardiovascular deaths in patients with cardiometabolic syndrome: a national cohort study

Lin Guan[1], Yu Gu[1], Chuan-He Wang[2], Zhi-Jun Sun[2], Li Wang[1]

1. Central Hospital of Dalian University of Technology

2. Shengjing Hospital of China Medical University

Abstract

Background: Cardiometabolic syndrome (CMS) encompasses a constellation of metabolic and cardiovascular risk factors that substantially elevate the risk of developing type 2 diabetes mellitus and cardiovascular disease. The cardiometabolic index (CMI), a composite measure of lipid accumulation and central obesity, has shown potential for predicting cardiovascular outcomes. This study examined the association between CMI and the risks of all-cause and cardiovascular mortality within a nationally representative cohort of patients with CMS.

Methods: We conducted a comprehensive analysis of data from 4,668 adult patients (aged ≥ 18 years) with CMS derived from the National Health and Nutrition Examination Survey cycles spanning from 2005 to 2018. The participants were categorized into quartiles based on their CMI values. The primary outcomes were all-cause mortality and cardiovascular mortality, as determined through the National Death Index. We utilized Cox proportional hazards regression to determine the hazard ratios associated with mortality, adjusted for potential confounders, and used restricted cubic splines (RCS) to explore potential nonlinear relationships.

Results: During a mean follow-up period of 98 months, a total of 576 all-cause deaths and 162 cardiovascular-related fatalities were recorded. In unadjusted models, higher CMI quartiles were significantly associated with an elevated risk of all-cause and cardiovascular mortality. After adjusting for potential confounders including age, sex, race, educational level, marital status, body mass index, and smoking and drinking history, the previously observed associations did not remain statistically significant. The RCS analysis uncovered a nonlinear relationship between CMI and all-cause mortality, featuring an inflection point at a CMI value of 1.15, suggesting a U-shaped relationship. Mediation analyses revealed that low-density lipoprotein cholesterol level, blood uric acid level, and body weight mediated 5%, 35%, and 28%, respectively, of the association between CMI and all-cause mortality.

Conclusions: CMI is significantly associated with both all-cause and cardiovascular mortality in patients with CMS. Nevertheless, this relationship is influenced by various confounders. The nonlinear association between CMI and mortality risk highlights the intricate nature of cardiometabolic health and its influence on patient outcomes. Additional research is imperative to elucidate the mechanisms underlying these relationships and to develop targeted interventions for high-risk patients with CMS.

Keywords: cardiometabolic index, cardiometabolic syndrome, all-cause mortality, cardiovascular mortality, cohort study

This study investigates the relationship between the cardiometabolic index (CMI) and mortality risks in patients with cardiometabolic syndrome (CMS), utilizing data from the National Health and Nutrition Examination Survey (NHANES) spanning 2005 to 2018.

Our findings reveal a significant association between CMI and both all-cause and cardiovascular mortality, with a nonlinear relationship identified for all-cause mortality. Mediation analyses further highlight the roles of low-density lipoprotein cholesterol, blood uric acid, and body weight in this association. These results underscore the complex interplay of cardiometabolic health and its impact on patient outcomes, offering valuable insights for risk stratification and targeted interventions in high-risk CMS populations.

We believe this manuscript aligns well with the congress theme, as it addresses critical issues in cardiovascular and metabolic health, leveraging a nationally representative cohort to provide robust evidence. This study contributes to the growing body of literature on CMS and its prognostic indicators, with potential implications for clinical practice and public health strategies.

This manuscript is original, All authors have approved the final version of the manuscript. We have no conflicts of interest to disclose.

血清尿酸 / 高密度脂蛋白胆固醇比值联合脉压差的纵向轨迹与慢性肾脏病发病风险：一项回顾性队列研究

明轩

四川省医学科学院 . 四川省人民医院

目的：本研究旨在探讨血清尿酸与高密度脂蛋白胆固醇比值（Serum uric acid/HDL cholesterol ratio，UHR）联合脉压差（Pulse pressure，PP）的纵向轨迹对慢性肾脏病（Chronic kidney disease，CKD）发病风险的影响。**方法**：本研究为回顾性队列研究，选取 2015 年 1 月–2024 年 12 月期间在四川省人民医院健康管理中心参加过三次及以上年度体检且数据资料完整者为研究对象，采用 Cox 回归模型分析 UHR 和 PP 四分位分组与 CKD 发病风险的关联，并通过限制性立方样条（Restricted cubic spline, RCS）探讨剂量反应关系。进一步运用群组多轨迹模型（Group-based Mult-Trajectory Models，GBMTM）识别 UHR 与 PP 的联合轨迹，并分析不同轨迹组的 CKD 发病风险。**结果**：UHR 和 PP 均与 CKD 发病风险独立相关，其四分位分组的 Cox 回归分析显示，UHR 和 PP 的最高四分位组的 CKD 发病风险显著升高。RCS 结果显示，UHR 和 PP 与 CKD 发病风险呈线性增长趋势。研究对象呈现出四种不同的 UHR 联合 PP 变化轨迹组：低 UHR- 低 PP 组（组 1）、中 UHR- 高 PP 组（组 2）、中 UHR- 低 PP 组（组 3）和高 UHR- 中 PP 组（组 4）。组 2 和组 4 人群的发病风险显著高于其他组，分别是组 1 的 1.90 倍（HR=1.90，95%CI：1.45 ~ 2.48）和 2.09 倍（HR=2.09，95%CI：1.56 ~ 2.81）。**结论**：UHR 和 PP 与 CKD 发病风险密切相关，联合轨迹分析揭示了二者动态变化对 CKD 风险的显著影响，为早期风险评估和防控提供了重要依据。

How Does Age Acceleration Mediate the Association Between Insulin Resistance and Long-Term Mortality Among Patients With Cardiovascular-Kidney-Metabolic Syndrome? Insights from a population-based study

Hong-Qiang Zhang, Xing-Yu Li, Jun-Hao Zhang, Xue-Ying Zheng, Hao Hu

The First Affiliated Hospital of USTC

Abstract

Background: Cardiovascular-Kidney-Metabolic (CKM) syndrome, characterized by the intricate interplay of metabolic dysfunction, chronic kidney disease (CKD), and cardiovascular disease (CVD), is associated with a markedly increased risk of mortality, multimorbidity, and accelerated aging. Insulin resistance (IR), a key driver of metabolic dysfunction, contributes to endothelial damage, inflammation, and biological age acceleration, compounding the burden of CKM syndrome. Although the triglyceride-glucose (TyG) index has been widely applied to estimate IR, the TyG-waist-to-height ratio (TyG-WHtR) has emerged as a more powerful surrogate marker, integrating central obesity to capture cardiometabolic risk. However, whether TyG-WHtR influences mortality in CKM through the acceleration of biological aging remains uncertain. This study aimed to evaluate the association between TyG-WHtR and mortality in CKM patients and to examine the potential mediating role of biological age acceleration, assessed by PhenoAge acceleration (PAA) and Klemera-Doubal method age acceleration (KDM-A).

Methods: We analyzed data from 19,843 CKM patients enrolled in the National Health and Nutrition Examination Survey (NHANES) between 1999–2010 and 2015–2018. TyG-WHtR was calculated using fasting triglyceride and glucose levels combined with waist-to-height ratio. Biological age acceleration was defined as the residual difference between chronological age and estimated biological age, computed by PAA and KDM-A methods. Mortality outcomes were obtained from linkage to the National Death Index, with follow-up through 2019. Multivariable Cox proportional hazards models, restricted cubic spline (RCS) analysis, and threshold effect analysis were employed to explore the associations between TyG-WHtR and mortality. Logistic regression was applied to assess relationships with biological aging, and mediation analysis was conducted to evaluate indirect effects through age acceleration. Subgroup and sensitivity analyses were performed to test robustness.

Results: Over a median 9.7-year follow-up, 2,238 all-cause and 661 cardiovascular deaths occurred. TyG-WHtR demonstrated a significant U-shaped association with both all-cause and cardiovascular mortality. Below a threshold of 4.90, higher TyG-WHtR was inversely associated with all-cause mortality (HR 0.857, 95% CI 0.74–0.99); above 4.90, risk increased significantly (HR 1.34, 95% CI 1.17–1.37). For cardiovascular mortality, an inflection point was identified at 6.17, with TyG-WHtR above this level conferring a 37.8% increased risk (HR 1.378, 95% CI 1.17–1.64). The area under the ROC curve was 0.873 for all-cause mortality and 0.856 for cardiovascular mortality, indicating strong predictive performance. Higher TyG-WHtR was positively associated with PAA (OR 1.093 per SD, 95% CI 1.08–1.11) and KDM-A (OR 1.126 per SD, 95% CI 1.12–1.14), and the highest TyG-WHtR tertile was linked to an increase of 1.189 years in PAA and 1.244 years in KDM-A compared to the lowest tertile. Mediation analyses revealed that PAA and KDM-A explained 19.7% and 15.8% of the association between TyG-WHtR and all-cause mortality, and 20.7% and 16.8% of the association with cardiovascular mortality, respectively. Subgroup

analyses showed stronger associations among participants aged ≤ 60 years and those with elevated BMI. Sensitivity analyses excluding early deaths confirmed the robustness of the findings.

Conclusion: This large, nationally representative cohort study demonstrates that TyG-WHtR has a significant nonlinear relationship with mortality among patients with CKM syndrome and that biological age acceleration partially mediates this association. The findings underscore the importance of maintaining TyG-WHtR within an optimal range to mitigate biological aging and improve survival outcomes in this high-risk population. TyG-WHtR may serve as a practical, dual-dimensional biomarker reflecting both metabolic dysfunction and accelerated aging, supporting its potential application in risk stratification and targeted intervention strategies for CKM syndrome.

Estimated Glucose Disposal Rate and Risk of Stroke and Dementia in Non-Diabetics: A UK Biobank Prospective Cohort Study

Yi Zheng[1], Lei Liu[2], Kai Luo[3], Hui-Hui Ma[3], Wei Jiang[3], Rong Luo[4], Cai-Xia Pan[3], Tao He[3], Hong-Qiang Ren[2], Gary Tse[1,5], Tong Liu[1], Xiao-Ping Li[3]

1. Second Hospital of Tianjin Medical University

2. Suining central hospital

3. Sichuan Provincial People's Hospital

4. Chengdu Medical College

5. Hong Kong Metropolitan University

Objective: The estimated glucose disposal rate (eGDR) is a validated surrogate marker of insulin resistance and an independent risk factor for cardiovascular diseases. However, its association with the incidence of stroke and dementia in non-diabetic populations remains insufficiently investigated. This study aimed to investigate the association between eGDR and the risk of incident stroke and dementia in non-diabetic individuals.

Methods: This prospective cohort study included non-diabetic participants from the UK Biobank, stratified into quartiles according to baseline eGDR levels, with the lowest quartile serving as the reference. The primary outcome was stroke. The secondary outcomes were ischaemic stroke, hemorrhagic stroke, all-cause dementia, vascular dementia, and Alzheimer's disease. Kaplan-Meier curves were used to illustrate the cumulative incidence of outcomes. Three Cox regression analysis models were performed to explore the association between eGDR and outcomes. Restricted cubic splines (RCS) were used to assess the potential non-linear relationships, and a two-piecewise Cox model was constructed to evaluate associations on both sides of the inflection point. Subgroup analyses were conducted based on age, sex, race, education, body mass index (BMI), smoking, alcohol, and the number of moderate-intensity exercise per week. Polygenic risk scores (PRS) were applied to quantify genetic susceptibility and investigate potential interactions between eGDR and genetic risk.

Results: A total of 430,093 participants were included. During a follow-up of around 13.5 years, 10,307 stroke events and 11,137 cases of dementia were recorded. Kaplan-Meier survival curves showed that participants with higher eGDR levels had a lower cumulative incidence of stroke and dementia. After adjusting for age, sex, race, education, smoking, alcohol, BMI, average total household income before tax, physical activity, blood pressure, triglycerides, serum creatinine, uric acid, total cholesterol, aspirin, antihypertensive drugs, and lipid-lowering drugs, the hazard ratio (HR) and 95% confidence interval (CI) from the lowest to highest eGDR quartile were 1.00 (reference), 0.81 (0.77, 0.85), 0.58 (0.54, 0.62), and 0.41 (0.37, 0.65), respectively, for stroke; 1.00 (reference), 0.84 (0.78, 0.89), 0.59 (0.54, 0.63), and 0.41 (0.38, 0.46) , respectively, for ischaemic stroke; 1.00 (reference), 0.75 (0.68, 0.84), 0.57 (0.50, 0.65), and 0.40 (0.34, 0.48), respectively, for hemorrhagic stroke. Regarding dementia, multivariate COX regression showed that compared with the quartile 1, quartiles 2-4 had a significantly lower risk of all-cause dementia (quartile 2: HR 0.95, 95% CI 0.90-1.00; quartile 3: HR 0.85, 95% CI 0.80-0.90; quartile 4: HR 0.81, 95% CI 0.75-0.88). However, quartile 2 eGDR was not significantly associated with the risk of vascular dementia (HR 0.99, 95% CI 0.87-1.13, P=0.884) or Alzheimer's disease (HR 0.91, 95% CI 0.83-1.00, P=0.054). The HRs (95% CI) from quartile 3 to quartile 4 were 0.84 (0.71, 0.99), 0.74 (0.60, 0.91), respectively, for vascular dementia; and 0.80 (0.71, 0.89), 0.73 (0.64, 0.84) for Alzheimer's disease. RCS analyses indicated non-linear associations between eGDR and the risks of stroke, ischaemic stroke, hemorrhagic stroke, and vascular dementia. Below specific threshold eGDR values (<7.64 for stroke, <7.60 for ischaemic stroke, <7.75 for hemorrhagic stroke, and <8.31 for vascular dementia), eGDR levels were not significantly associated with the risks of ischaemic stroke, hemorrhagic stroke, or vascular dementia, and showed only a modest inverse association with overall stroke risk (HR 0.97, 95%CI 0.95-0.99, P=0.012). In contrast, above these thresholds, higher eGDR levels were associated with significantly reduced risks of stroke (HR 0.80, 95% CI 0.78-0.82, P<0.001), ischaemic stroke (HR 0.80, 95% CI 0.78-0.81, P<0.001), hemorrhagic stroke (HR 0.81, 95% CI 0.78-0.84, P<0.001), and vascular dementia (HR 0.89, 95% CI 0.84-0.94, P<0.001). A linear inverse relationship was observed between eGDR and all-cause dementia and Alzheimer's disease. Participants in the highest eGDR quartile exhibited lower risks of all-cause dementia (HR 0.81, 95% CI 0.75-0.88, P<0.001) and Alzheimer's disease (HR 0.73, 95% CI 0.64-0.84, P<0.001) compared to those in the lowest quartile. Subgroup analyses found that there were interactions between age, sex, race, education, BMI, smoking, alcohol and eGDR for stroke and ischaemic stroke. For hemorrhagic stroke, interactions between age, sex, BMI and eGDR were observed. Interactions in the associations between eGDR and incidence of dementia were observed among age and sex subgroups for all-cause dementia, and among the subgroup of age for vascular dementia and Alzheimer's disease. Participants with high PRS demonstrated a heightened risk of ischaemic stroke (HR 1.19, 95% CI 1.13-1.26, P<0.001) and Alzheimer's disease (HR 4.75, 95% CI 4.30-5.24, P<0.001). Notably, within the high-PRS group, participants with the highest eGDR levels had substantially lower risks of ischaemic stroke and Alzheimer's disease compared to those with the lowest eGDR levels.

Conclusions: eGDR exhibited non-linear associations with stroke and vascular dementia risk and linear inverse associations with all-cause dementia and Alzheimer's disease. These findings underscore the utility of eGDR as a predictive marker for cerebrovascular and cognitive outcomes in non-diabetic individuals, particularly those with high genetic susceptibility. Regular assessment of eGDR could support early risk stratification and guide preventative interventions.

UBC9 attenuates the progression of metabolic dysfunction-associated fatty liver disease by suppressing hepatocyte ferroptosis via SUMOylation-Dependent stabilization of FTH1

Dan Liu, Han-Lin Wu, Jing Wang, Zhao-Ying Huang, Zhe-Ming Yang, Ya-Ni Wang, Yu-Jia Zou, Zi-Qi Liu, Xiao-Lin Zhang, Hai-Xu Song, Cheng-Hui Yan, Ya-Ling Han

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Objective: Metabolic dysfunction-associated fatty liver disease (MAFLD) is one of the most common chronic liver diseases, with incidence rates increasing. Metabolic dysfunction-associated steatohepatitis (MASH) represents an extremely progressive form of MAFLD, which may progress to cirrhosis or hepatocellular carcinoma. Patients with MAFLD/MASH face significantly elevated risks of both liver-related mortality and cardiovascular diseases, including insulin resistance, hypertension, chronic kidney disease, and type 2 diabetes mellitus, mediated through complex pathophysiological interactions. Extensive researches demonstrate that MAFLD is a multifactorial disease involving lipotoxicity, mitochondrial dysfunction, endoplasmic reticulum stress ER stress, oxidative stress, gut-liver axis dysregulation, and post-translational modification (PTM) abnormalities. Despite these advances, the key pathogenesis and mechanisms of MAFLD/MASH progression remain poorly understood. Current management strategies inadequately address disease progression or its multisystem complications, and no effective therapeutic interventions for MAFLD/MASH have yet been approved. Therefore, to identify the key underlying mechanisms of MAFLD/MASH is essential in clinical practice. SUMOylation critically regulate protein stability and activity, contributing to MAFLD/MASH pathogenesis. Ubiquitin-conjugating enzyme 9 (UBC9), the only SUMO-E2 enzyme, is essential for cellular homeostasis. Here, we investigated the roles and underlying mechanism of UBC9 in MAFLD and MASH progression.

Methods: In vivo, hepatocyte-specific Ubc9 knockout and overexpressing mice were generated. MAFLD was induced by a high-fat diet (HFD) feeding, while MASH was established using a methionine-choline deficient (MCD) diet feeding. H&E staining, Sirius Red staining, Oil Red O staining, immunohistochemistry, iron staining, real-time PCR, and western blotting were performed to examine lipid accumulation, inflammation, fibrosis in the livers. In vitro, LO2 hepatocytes were treated with palmitic acid (PA), UBC9 overexpression adenovirus, and small interfering RNA. The effects of UBC9 overexpression and knockdown were examined by real-time PCR, western blotting. Mechanically, mass spectrometry, immunoprecipitation, real-time PCR and western blotting were performed to explore the underlying mechanism of UBC9.

Results: The mRNA and protein expression of UBC9 was significantly downregulated in the liver tissue of MAFLD/MASH and PA-treated hepatocytes. In vivo, hepatocyte-specific Ubc9 knockout exacerbated the hepatic steatosis, inflammation, and fibrosis in MASH mice, whereas UBC9 overexpression mitigated the hepatic steatosis, inflammation, and fibrosis in MASH mice. In vitro, UBC9 knockdown promoted lipid accumulation, inflammation, and fibrosis induced by PA treatment, which was rescued by UBC9 overexpression. Besides, UBC9 knockdown promoted the ferroptosis and iron overload of hepatocytes induced by PA, and UBC9 overexpression inhibited the ferroptosis and iron overload of hepatocytes induced by PA. Mechanistically, there was a direct binding between UBC9 and ferritin heavy chain 1 (FTH1) in hepatocytes. UBC9 facilitated the protein degradation of FTH1 in a SUMOylation-dependent way. Under PA treatment, FTH1 knockdown promoted lipid accumulation, inflammation, and fibrosis by increasing the ferroptosis and iron

overload of hepatocytes, whereas FTH1 overexpression alleviated lipid accumulation, inflammation, and fibrosis by inhibiting the ferroptosis and iron overload of hepatocytes. Crucially, FTH1 knockdown abolished the protective effects of UBC9 overexpression on hepatocyte injury, FTH1 overexpression alleviated the harmful effects of UBC9 knockdown on hepatocyte injury.

Conclusions: Our results demonstrate that UBC9 mitigates MAFLD/MASH progression by promoting FTH1 protein degradation in a SUMOylation-dependent manner. These findings underscore the critical roles of UBC9 in regulating iron overload and suppressing ferroptosis, thereby protecting against MAFLD/MASH. This study highlights UBC9 as a promising novel therapeutic target for MAFLD/MASH.

Association Between the FT3 to FT4 Ratio and Type 2 Diabetes Mellitus in Non-alcoholic Fatty Liver Disease

Li-Ya Bian

The Affiliated Hospital of Hangzhou Normal University

Introduction and Objectives: Type 2 diabetes mellitus (T2DM) and nonalcoholic fatty liver disease (NAFLD) are both common metabolic disorders. Thyroid hormones (THs) exert complex, multifactorial effects on glucose and lipid metabolism. Considering the complexity of TH signaling in metabolic tissues, it is important to investigate the association between THs—particularly the free triiodothyronine (FT3) to free thyroxine (FT4) ratio (FT3/FT4)—and the presence of T2DM among patients with NAFLD. Here, we assessed whether FT3/FT4 could help identify patients at risk of T2DM among patients with NAFLD. Exploring the potential mediating role of THs in the T2DM-NAFLD interplay may provide valuable insights for improving risk stratification, guiding therapeutic decisions, and informing prognosis in clinical settings.

Materials and Methods: We retrospectively analyzed 4,942 patients with NAFLD treated at the Affiliated Hospital of Hangzhou Normal University between 2020 and 2023. Data on biochemical markers, glucose metabolism indices, and thyroid function were collected and compared between patients with and without T2DM. To explore the association between the FT3/FT4 ratio and T2DM risk, we developed the following three logistic regression models: Model 0, unadjusted; Model 1, adjusted for age and sex; Model 2, further adjusted for body mass index; Model 3, further adjusted for aspartate aminotransferase (AST) and alanine aminotransferase (ALT) levels; odds ratios (OR) with 95% confidence intervals (CI) for the risk of T2DM were calculated. Partial correlational analysis was conducted between THs [i.e., thyroid-stimulating hormone (TSH), FT3, FT4, total thyroxine (TT4), and total triiodothyronine (TT3)] and the FT3/FT4 ratio with fasting blood glucose (FBG) and hemoglobin A1c (HbA1c), among T2DM subjects with NAFLD. All tests were two-sided, and p

Results: A total of 5,445 patients with NAFLD were screened with 4,942 patients included. Among them, 1,377 (27.9%) had T2DM and 3,565 (72.1%) did not. The T2DM group had higher neutrophils, C-reactive protein, total triglyceride, HbA1c, FBG, creatinine and lower total cholesterol, low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), non-HDL cholesterol, apoA, apoB, ALT, AST, uric acid levels than the non-T2DM group. In terms of thyroid function, FT3 [4.16 (3.66-4.66) vs 4.48 (3.96-4.96), p <0.001], TT3 [1.31 (1.12-1.49) vs 1.44 (1.25-1.64), p <0.001], and the FT3/FT4 [0.3112 (0.2713, 0.3503) vs 0.3419 (0.3029, 0.3812), p <0.001] ratio were significantly lower, while FT4 [13.37 (12.34-14.47) vs 13.04 (12.1-14.03), p <0.001] was higher, in patients with T2DM than in those without. The proportions of patients in the T2DM group across FT3/FT4 ratio quartiles Q1, Q2, Q3, and Q4 were 37.5%, 27.1%, 21.7%, and 13.7%, respectively, whereas in the non-T2DM group, the corresponding proportions were 20.2%, 23.9%, 26.8%, and 29.1%. Logistic regression showed a significant negative association between the FT3/FT4 ratio and T2DM in patients with NAFLD. After adjusting for confounders, the odds ratio (OR) for T2DM in the highest FT3/FT4 quartile compared with the lowest was 0.27 [95% confidence interval (CI), 0.23-0.33; p <0.001]. Partial correlation analysis revealed that FT3, TT3, and the FT3/FT4 ratio were negatively correlated with HbA1c and FBG, with the FT3/FT4 ratio showing the strongest correlation with HbA1c (r = – 0.222, p

Conclusions: The FT3/FT4 ratio may serve as a more sensitive and integrative marker for predicting T2DM risk in patients with NAFLD. These findings offer valuable insights that may inform early risk identification and guide preventive strategies for the management of both T2DM and NAFLD.

糖尿病心脏微血管损伤生物标志物和防治靶点的探究

张奚 孙冬冬

空军军医大学西京医院

目的：

（1）单细胞 RNA 测序筛选糖尿病心脏微血管损伤生物标志物和防治靶点；

（2）临床试验评估潜在标志物 CFH 对糖尿病心脏微血管损伤的预测价值；

（3）基础实验探究潜在靶点 Ets1 在糖尿病心脏微血管损伤的作用。

方法：

（1）以瘦素受体敲除小鼠（db/db）为糖尿病模型，对不同病理阶段的 db/db 小鼠和杂合对照小鼠（db/m）心脏进行单细胞 RNA 测序。经过数据质控和细胞类型注释后，采用细胞动态、命运和功能分析锁定关键细胞亚群，采用转录因子分析探究糖尿病心脏微血管损伤关键调控机制。关键细胞亚群的特征基因 CFH 被确定为潜在标志物，转录因子 Ets1 被确定为潜在治疗靶点。

（2）通过免疫荧光验证不同病理阶段 db/db 小鼠心脏微血管内皮潜在标志物 CFH 和潜在靶点 Ets1 的变化；通过免疫印迹验证不同病理阶段 db/db 小鼠血浆潜在标志物 CFH 的变化；

（3）通过 T 检验评估临床样本中糖尿病组患者和非糖尿病组患者中冠状动脉血流储备分数（CFR）、微循环阻力指数（IMR）、血浆潜在标志物 CFH、对照标志物 sVE-cadherin 和 Endocan 的差异；通过皮尔逊（Pearson）相关性分析分别评估糖尿病组患者血浆标志物（CFH、sVE-cadherin 和 Endocan）与微血管功能指数（CFR 和 IMR）的相关性；通过受试者特征曲线（ROC）分别评估糖尿病组患者血浆标志物对心脏微血管损伤的诊断效率。

（4）采用内皮特异性 Ets1 过表达腺相关病毒（AAV9-Ets1）尾静脉注射干预 db/db 小鼠和 db/m 小鼠心脏血管内皮 Ets1 表达水平。心脏血管内皮 Ets1 成功过表达后通过 CD31 染色评估血管密度；通过透射电镜观察基底膜厚度和 VE-cadherin 染色评估血管屏障功能；通过马松染色评估血管管周纤维化；通过心脏超声评估心脏功能。

结果：

（1）经过质量控制和数据过滤，从八组不同糖尿病阶段的小鼠心脏中共得到 63825 个细胞，这些细胞被聚类为 37 个亚群，包含成纤维细胞、内皮细胞、以及少量心肌细胞和免疫细胞。其中内皮细胞共有 11 个亚群，分别为 3，5，10，12，15，20，21，22，26，31，34 亚群。

（2）内皮细胞拟时序分析发现 12 亚群为糖尿病心脏微血管损伤过程中内皮细胞分化的最终状态，其生物学功能主要为介导炎性细胞向血管壁浸润。组间亚群比例变化提示 12 亚群所占比例随糖尿病进展逐步升高，是糖尿病末期占比最高的内皮细胞亚群，而 CFH 是 12 亚群最显著的特征基因。

（3）SCENIC 转录因子分析提示 Ets1 是糖尿病损伤过程中转录活性最高的转录因子，共参与调控内皮细胞靶基因 154 个。GO 功能注释提示 Ets1 调控网络与血管新生密切相关，但其调控活性在糖尿病心脏微血管损伤过程中逐步降低。

（4）临床试验结果显示糖尿病组患者血浆 CFH 水平显著高于非糖尿病患者；在糖尿病患者中，血浆 CFH 水平与微血管功能指数（CFR 和 IMR）密切相关，且相关指数高于血浆对照标志物 sVE-cadherin 和 Endocan；ROC 曲线提示血浆 CFH 对糖尿病患者心脏微血管损伤的诊断效率高于对照标志物。

（5）基础实验结果提示 AAV9-Ets1 能够平均提高 3 倍 db/db 小鼠心脏血管内皮 Ets1 表达量，同时显著增加了 db/db 小鼠心脏血管密度、增强了心脏功能和血管屏障功能，同时降低了血浆标志物 CFH 水平并提高小鼠生存率。

结论：

结合单细胞 RNA 测序技术以及相关临床试验和基础实验，我们发现血浆 CFH 有望成为糖尿病心脏微血管损伤的特异性标志物，Ets1 过表达有望成为糖尿病心脏微血管损伤新的治疗策略。

Inverted U-shaped association between body mass index and left ventricular global longitudinal strain in middle-aged and elderly patients with coronary heart disease in Jilin Province, China: a cross-sectional study

Lin Na, Xin Xue

The Second Hospital of Jilin University

Abstract

Purpose: Coronary heart disease is the leading cause of death worldwide, and it is also a common and frequent disease that poses a serious threat to the life and health of middle-aged and elderly individuals. Patients with coronary heart disease can develop progressive heart failure despite revascularization. Heart failure is one of the most important complications of coronary heart disease and is associated with high morbidity and hospitalization rates. However, in patients with coronary artery disease, adverse myocardial remodeling and myocardial dysfunction can occur years to decades before symptomatic heart failure owing to the presence of cardiovascular risk factors. Obesity, identified as an independent risk factor for cardiovascular disease, has been closely linked to left ventricular remodeling, which can lead to myocardial diastolic dysfunction and ultimately heart failure. Body mass index (BMI), the most straightforward anthropometric measure for evaluating obesity, is elevated and predicts the occurrence of new heart failure events in patients with coronary artery disease. However, the association between BMI and subclinical left ventricular systolic dysfunction in middle-aged and elderly patients with coronary artery disease remains unclear and further exploration is necessary.The objective of this study is to investigate the relationship between body mass index (BMI) and left ventricular global longitudinal strain (LV-GLS) in middle-aged and elderly patients with coronary heart disease (CHD). Additionally, the objective of this study is to investigate the relationship between body mass index (BMI) and left ventricular global longitudinal strain (GLS) in middle-aged and

elderly patients with coronary heart disease. Additionally, the study aims to explore the potential impact of changes in BMI on subclinical left ventricular function in patients with coronary heart disease.

Methods: A cross-sectional study was conducted on 228 patients with symptomatic coronary heart disease, excluding those with a history of myocardial infarction or left ventricular dysfunction, in Jilin Province, China. Basic clinical data, biochemical data, and echocardiographic data were collected for each participant. One-way analysis of variance was performed to compare myocardial strain parameters among three groups: normal weight (BMI 18.5 ≤ BMI<24 kg/m2), overweight (BMI 24 ≤ BMI<28 kg/m2), and obese (BMI ≥ 28 kg/m2) individuals. Multifactor piecewise linear regression analysis, inflection point analysis, subgroup analysis, and other methods were utilized to evaluate the relationship between increasing BMI and cardiac dysfunction in the subclinical stage of coronary heart disease patients.

Results: The GLS of the left ventricular myocardium was lower in the overweight group compared to the normal weight and obese groups. A significant inverted U-shaped correlation was observed between GLS and BMI levels, with the highest GLS value recorded at a BMI of 25.508 kg/m2. Prior to the inflection point, GLS and BMI displayed a positive correlation (β = 0.51, 95% CI 0.05-0.98, P = 0.034). However, beyond the inflection point, a negative correlation was observed between GLS and BMI (β = -0.44, 95% CI -0.83 to -0.04, P = 0.034). Subgroup analysis indicated that the association between BMI and GLS remained consistent across subgroups stratified by gender, age, hypertension, and diabetes among patients with coronary heart disease.

Conclusion: In conclusion, a non-linear, inverted U-shaped relationship exists between BMI and LV-GLS in middle-aged and elderly patients with coronary heart disease. Maintaining an overweight status may potentially delay the progression of subclinical cardiac dysfunction.

Key words: coronary heart disease; body mass index; myocardial strain; cardiac function

Exploring shared therapeutic targets in Diabetic Panvascular Diseases through bioinformatics analysis

Hanlin Wu

The First Affiliated Hospital of Dalian Medical University

Diabetes mellitus (DM) is a multifactorial metabolic disorder characterised by hyperglycaemia. Globally, the number of people with diabetes has quadrupled in the last three years. According to the World Health Organization, the number of people with diabetes is expected to reach 693 million by 2045.

Chronic hyperglycaemia leads to chronic damage and dysfunction of various tissues, especially the heart, brain, kidneys, peripheral nerves, eyes and feet. Approximately 4.9 million people die annually worldwide from diabetes, about 50% of whom die from cardiovascular complications. Diabetic cardiomyopathy (DCM) is one of the most important cardiovascular complications in patients with DM.

Recent studies have shown that DCM is a type of diabetic microangiopathy. Hyperglycaemia, disorders of lipid metabolism, oxidative stress, and inflammatory responses cause damage or dysfunction of vascular endothelial cells, leading to abnormal microvascular diastole, increased permeability of the vessel wall, and thickening of the basement membrane, and ultimately to the development of DCM. Clinically, patients with advanced DCM are usually accompanied by other severe diabetic microangiopathy, of which diabetic nephropathy (DN) and diabetic retinopathy (DR) are the most common diabetic microangiopathy. No effective treatments has been established to date. Here, we investigated the potential network of molecular roles associated with the development of these three diabetic complications.

In this study, 6 hub genes that may have significant differences in the pathogenesis and development of DCM, DN and DR: COL3A1, CD44, MKI67, LUM, FBN1 and MMP2, were identified by screening of DEGs and construction of PPI networks.

Functional enrichment analysis of proteins interacting with hub genes revealed that these hub genes are extensively involved in biological processes related to fibrosis and inflammatory responses. Abnormal collagen deposition and degradation lead to fibrosis. The hyperglycemia induced by diabetes causes myocardial cells and their interstitial fibrosis through various mechanisms and signaling pathways, mediating the occurrence and development of diabetic cardiomyopathy. Renal interstitial fibrosis is the basic pathological feature of DN and is closely related to the prognosis of the disease. Fibroplasia in DR is the main pathological manifestation of its blindness. These results suggest that anti-fibrotic therapy has an important role in DCM, DN and DR. We used GSEA to reveal 6 hub genes widely associated with immune infiltration responses. Immune cell infiltration analysis showed that the proportion of macrophage infiltration was significantly higher in DCM, DN and DR compared to the control group. Patients with DCM, DN and DR may benefit from anti-inflammatory treatment in the microenvironment, especially targeting macrophage inflammation.

We also employed Network Analyst to predict associations between transcription factor (TF) genes, miRNAs, and hub genes. Our analysis identified JUN, ETS1, FOS, miR-302b, and miR-302c as potential key regulatory targets of the hub genes. These findings offer novel perspectives on the treatment of patients with complications of diabetic microangiopathy, opening up new avenues for therapeutic intervention.

Neu5Ac has a variety of biological functions such as anti-bacterial, anti-viral, anti-tumor, anti-inflammatory and maintaining the physiological activities of the nervous system. Currently, there are two marketed drugs developed with Neu5Ac as the active ingredient, namely Zanamivir and Oseltamivir, which are mainly used as anti-influenza drugs. Functional metabolomics studies have shown that Neu5Ac plays a key role in atherosclerosis, renal small vessel disease, and coronary artery disease. This suggests to us that Neu5Ac may be extensively involved in a variety of microvascular pathologies. Our study shows that Neu5Ac reacts with hub genes. Molecular docking also showed that Neu5Ac and all 6 hub genes could form hydrogen bonds to form a stable structure. The role of Neu5Ac in treatment of multiple microvascular complications in patients with advanced diabetes remains to be explored.

In conclusion, six hub genes COL3A1, CD44, MKI67, LUM, FBN1, MMP2 may involve in the pathophysiology of these diabetic microvascular complications like DCM, DN and DR. Furthermore, our findings suggest that Neu5Ac may be a potential agent for the treatment of multiple microvascular complications in patients with advanced diabetes.

Relationship between uric acid to creatinine ratio and type 2 diabetes mellitus in patients with nonalcoholic fatty liver disease

Fu Xinyan, Ming-Wei Wang

The Affiliated Hospital of Hangzhou Normal University

Background: Non-alcoholic fatty liver disease (NAFLD) is a significant metabolic disorder closely linked to insulin resistance and an increased risk of type 2 diabetes mellitus (T2DM). Given the shared pathophysiology between NAFLD, T2DM, and cardiovascular disease, identifying reliable biomarkers for early T2DM risk stratification in NAFLD patients is crucial for preventive cardiology. Uric acid (UA), a byproduct of purine metabolism, has been implicated in metabolic syndrome and cardiovascular risk, while creatinine (CR) reflects renal function and metabolic turnover. Recent studies suggest that the UA/CR ratio may serve as a novel metabolic indicator, but its predictive value for T2DM in NAFLD patients remains underexplored. This study aimed to investigate whether the UA/CR ratio could serve as an effective tool for identifying individuals at high risk for T2DM within an NAFLD population, thereby offering potential clinical utility in cardiovascular risk assessment.

Methods: We conducted a retrospective cohort study analyzing the clinical data of 5,124 NAFLD patients from the Affiliated Hospital of Hangzhou Normal University between 2020 and 2023. NAFLD was diagnosed via ultrasonography and exclusion of other liver diseases. T2DM was defined according to ADA criteria (fasting glucose ≥ 7.0 mmol/L or HbA1c ≥ 6.5%). The UA/CR ratio was calculated from fasting serum UA and CR levels. Patients were stratified into quartiles based on UA/CR ratios. A binary logistic regression model was employed to assess the association between UA/CR ratio and T2DM risk, adjusting for confounders including age, sex, BMI, blood pressure, lipid profiles (TG, TC, HDL-C, LDL-C), and HOMA-IR. Receiver operating characteristic (ROC) analysis was performed to compare the predictive performance of UA/CR ratio against traditional lipid parameters.

Results: The study population had a mean age of 52.3 ± 11.7 years, with 58.2% males. A significant inverse relationship was observed between UA/CR ratio and T2DM risk. In the fully adjusted model, patients in the highest UA/CR quartile exhibited a 63% lower risk of T2DM (OR: 0.37, 95% CI: 0.30–0.45, *p*

Discussion: Our findings highlight the UA/CR ratio as a superior predictor of T2DM risk in NAFLD patients compared to conventional lipid parameters. The inverse association suggests that low UA (potentially reflecting reduced antioxidant capacity) and high CR (indicative of altered muscle metabolism or renal clearance) may synergistically contribute to diabetic pathogenesis. Mechanistically, UA's dual role as an antioxidant (at physiological levels) and pro-oxidant (at high levels) may explain its complex relationship with metabolic health. The strong predictive performance of UA/CR underscores its potential as a simple, cost-effective tool for early T2DM screening in NAFLD, a population already at high cardiovascular risk.

Conclusions: In NAFLD patients, a lower UA/CR ratio independently predicts higher T2DM risk, with discriminatory power surpassing traditional lipid markers. Clinicians should consider incorporating UA/CR assessment into routine metabolic evaluations for NAFLD patients, particularly those with low UA and elevated CR levels, to enhance early diabetes detection and cardiovascular prevention strategies. Future prospective studies should validate these findings and explore whether UA/CR-guided interventions improve outcomes.

甘油三酯、总胆固醇及体重指数与 0-3 期心血管 - 肾脏 - 代谢综合征人群心血管疾病风险的关联研究：一项全国性前瞻性队列研究

程宁易 陈钰锟 陈良万

福建医科大学附属协和医院

背景：心血管 - 肾脏 - 代谢综合征（CKM）作为一种累及多系统的复杂疾病，其进展与心血管疾病（CVD）风险升高密切相关，而脂质代谢紊乱及肥胖是驱动这一关联的关键病理生理基础。甘油三酯、总胆固醇及体重指数整合指标（TCBI）作为综合反映脂质代谢与肥胖状态的新型指标，其在 CKM 0-3 期人群中对 CVD 风险的预测价值及量化关联尚未明确，亟待通过大样本队列研究验证。

方法：本研究基于中国健康与养老追踪调查（CHARLS）数据库，纳入 5383 例年龄≥ 45 岁的社区人群作为研究对象。采用多因素 Logistic 回归模型控制混杂因素后，分析 TCBI 与 CVD 发病风险的关联强度；通过限制性立方样条（RCS）模型探索二者的剂量反应关系，并利用阈值效应模型识别潜在拐点；进一步按年龄、性别等分层进行亚组分析，评估效应修饰作用。

结果：随着 TCBI 四分位水平从 Q1 至 Q4 递增，研究人群的体重指数、甘油三酯、总胆固醇等核心代谢指标呈现进行性恶化趋势，CKM 2-3 期患者占比从 34.0% 显著升至 98.9%（均 P<0.001）。多因素校正年龄、基础疾病史等协变量后，TCBI 与 CVD 风险呈正向关联，其中 Q4 组较 Q1 组 CVD 发病风险显著升高 28.0%（OR=1.280，95% CI 1.014-1.673，P<0.05）。RCS 分析提示二者存在非线性关联，阈值效应模型确定拐点为 1.097：当 TCBI

结论: 在 CHARLS 队列的 CKM 0-3 期人群中，TCBI 是 CVD 发病的独立危险因素，且其关联存在显著阈值效应（拐点 1.097）。该发现提示，针对 TCBI 处于低水平范围（<1.097）的人群实施早期代谢指标干预，可能成为降低 CVD 风险的更高效策略，尤其对男性群体应加强监测与管理。

Prediabetes Diagnostic Thresholds and Cardiovascular Outcomes: A Prospective Cohort, Mendelian Randomization, and Cardiac Imaging Study

Zhi-Hao Zheng, Ke-Fei Dou

Fuwai Hospital

Background

Prediabetes represents a critical metabolic intermediary affecting over 400 million adults globally, independently accelerating cardiovascular pathology beyond its role as a diabetes precursor. However, substantial diagnostic discordance persists between the American Diabetes Association (ADA) and World Health Organization/International Expert Committee (WHO/IEC) criteria—spanning glycemic thresholds, population prevalence (ADA: 34% vs. WHO/IEC: 18%), and prognostic validity—necessitating rigorous comparative evaluation. This study addresses two pivotal gaps: first, the differential prognostic stratification of ADA-defined versus WHO/IEC-defined prediabetes for incident cardiovascular disease (CVD), mortality, and cardiac remodeling; and second, causal validation of prediabetes-CVD relationships using Mendelian randomization (MR) to mitigate residual confounding.

Methods

In a prospective cohort of 278,697 UK Biobank participants without baseline CVD, prediabetes was classified using dual frameworks: ADA criteria (fasting glucose 5.6–6.9 mmol/L or HbA1c 5.7–6.4%) and WHO/IEC criteria (fasting glucose ≥ 6.1 mmol/L or HbA1c 6.0–6.4%). Primary outcomes encompassed incident CVD (coronary heart disease, myocardial infarction, stroke, hypertension), cardiovascular mortality, and all-cause mortality. Multivariable Cox proportional hazards models adjusted for sociodemographics, lifestyle behaviors, comorbidities, and polygenic risk scores quantified associations. Cardiac magnetic resonance (CMR) imaging evaluated structural remodeling in 638 participants, while two-sample MR leveraged 54-78 genome-wide significant variants for prediabetes to infer causality with CVD outcomes, employing sensitivity analyses (MR-Egger, weighted median) to confirm robustness.

Results

WHO/IEC-defined prediabetes demonstrated significantly higher CVD incidence (HR=1.23, 95% CI: 1.19–1.27) compared to ADA-defined prediabetes (HR=1.14, 1.12–1.16), with particularly amplified risks for myocardial infarction (WHO/IEC: HR=1.33 vs. ADA: HR=1.21) and stroke (WHO/IEC: HR=1.33 vs. ADA: HR=1.23). Mortality gradients further highlighted this divergence: cardiovascular mortality risk nearly doubled under WHO/IEC criteria (HR=1.96, 1.70–2.25) versus ADA (HR=1.47, 1.34–1.62), while all-cause mortality risk was 39% higher for WHO/IEC-defined prediabetes compared to 24% for ADA-defined individuals. Notably, WHO/IEC-defined prediabetes exhibited mortality risk equivalent to type 2 diabetes (all-cause HR=1.03, 0.95–1.13).

CMR imaging revealed that WHO/IEC-defined prediabetes initiated early concentric left ventricular remodeling, characterized by elevated left ventricular mass-to-volume ratio (β=0.19, 95% CI: 0.11–0.37), whereas type 2 diabetes showed advanced structural derangements including increased end-diastolic volume (β=10.22 mL) and further mass-to-volume ratio deterioration (β=0.35). These morphological changes preceded functional decline and aligned with the steeper CVD risk trajectories observed in WHO/IEC subgroups.

Mendelian randomization analyses genetically confirmed causality, demonstrating that prediabetes increased risks of CVD (OR=1.01, 1.01–1.02), myocardial infarction (OR=1.12, 1.06–1.19), and stroke (OR=1.06, 1.02–1.10). Sensitivity analyses validated these findings, showing no horizontal pleiotropy (MR-Egger intercept P>0.05) and consistent effects across complementary MR methods. Importantly, CVD risk persisted uniformly across low, moderate, and high polygenic risk strata (P for interaction >0.05), underscoring dysglycemia as an independent, universal risk amplifier rather than a mere correlate of genetic predisposition.

Conclusions

This integrative study establishes that WHO/IEC criteria optimize specificity for identifying prediabetic individuals at near-diabetic cardiovascular risk, effectively capturing a high-risk subpopulation (12.1% prevalence) requiring intensive intervention. The detection of early concentric remodeling via CMR in this group provides a mechanistic link to accelerated cardiovascular pathology, while genetic evidence robustly confirms the causal role of dysglycemia in vascular injury. Clinically, these findings advocate for revising screening paradigms to prioritize WHO/IEC thresholds for CVD risk stratification and emphasize early lifestyle or pharmacologic intervention in high-risk prediabetes subgroups to avert irreversible cardiovascular damage, thereby addressing a critical gap in preventive cardiology.

二甲双胍与接受非复杂或复杂经皮冠状动脉介入治疗的糖尿病患者的临床结局

何际宁 王紫逸 窦克非 尹栋

中国医学科学院阜外医院

背景

二甲双胍是糖尿病治疗中常用的药物，已有研究表明，在无动脉粥样硬化性心血管疾病的糖尿病患者中，该药具有心血管保护作用。目前，关于二甲双胍在接受经皮冠状动脉介入治疗（**PCI）的糖尿病患者中的应用证据较为有限。因此，本研究旨在评估二甲双胍在接受 PCI 的糖尿病患者中的疗效，以及其与 PCI 复杂程度可能存在的相互作用。**

方法

2017 年 1 月至 2018 年 12 月期间，本研究连续纳入了 11585 例在阜外医院接受 PCI 的糖尿病患者。根据二甲双胍的使用情况和 PCI 复杂程度，将患者分为四组。主要终点为主要不良心脑血管事件（MACCEs），包括心血管死亡、非致死性心肌梗死（MI）、非致死性卒中以及非计划性血运重建的复合终点。

结果

经过 3 年的随访，共记录到 1292 例主要不良心脑血管事件。多变量调整后，使用二甲双胍与 3 年主要不良心脑血管事件发生率降低相关（校正后风险比 0.80，95% 置信区间 0.70-0.92）。在接受非复杂 PCI 的患者中，MACCEs 发生率显著降低（校正后风险比 0.65，95% 置信区间 0.53-0.79）；而在复杂 PCI 患者中，未观察到二甲双胍的这种保护作用（校正后风险比 1.00，95% 置信区间 0.83-1.21）。研究发现，二甲双胍与 PCI 复杂程度在 3 年主要不良心脑血管事件发生率方面存在显著的相互作用（校正后交互作用 P 值 = 0.002）。

结论

二甲双胍在接受复杂或非复杂 PCI 的糖尿病患者中的疗效存在显著差异。在患有糖尿病且接受非复杂 PCI 的患者中，使用二甲双胍与预后改善相关。

Synergistic Amplification of Cardiovascular Risk by Insulin Resistance and Hepatic Fibrosis in Coronary Artery Disease: Machine Learning-Driven Phenotyping and Multi-Dimensional Interaction Analysis for Precision Risk Stratification

Zhi-Hao Zheng, Rui Fu

Fuwai Hospital

Background

Cardiovascular disease (CVD) persists as the leading global cause of mortality, where metabolic disorders such as insulin resistance (IR) and hepatic fibrosis play pivotal roles in pathogenesis. Metabolic dysfunction-associated fatty liver disease (MAFLD), affecting over 25% of adults globally, exhibits strong associations with accelerated cardiovascular morbidity, particularly in advanced fibrotic stages that confer a 2.5-fold increased risk independent of traditional factors. The triglyceride-glucose (TyG) index—a validated IR marker—exacerbates endothelial dysfunction and myocardial metabolic derangements, creating a pathological loop with heart failure progression. However, the synergistic relationship between hepatic fibrosis (assessed via FIB-4 and BARD scores) and IR in coronary artery disease (CAD) remains poorly characterized, thereby limiting precision risk stratification strategies. Consequently, this study aimed to integrate machine learning phenotyping with multidimensional interaction analysis to bridge this critical gap.

Methods

Between January 2017 and December 2018, we prospectively enrolled 30,029 CAD patients at Fuwai Hospital, ultimately including 14,660 participants with complete metabolic profiles after exclusions. Insulin resistance was quantified via the TyG index (ln[fasting triglycerides × fasting glucose]/2), while hepatic fibrosis was assessed using FIB-4 (age, platelets, AST, ALT) and BARD scores (BMI ≥ 28 kg/m², AST/ALT ratio ≥ 0.8, diabetes diagnosis). Machine learning-driven K-means clustering, optimized through the elbow method, stratified patients into metabolic subtypes based on comprehensive clinical, laboratory, and angiographic profiles. Subsequently, Cox proportional hazards models evaluated biomarker associations with the primary composite endpoint (cardiovascular mortality, nonfatal MI, or stroke) over 3-year follow-up, using hierarchical adjustment for demographics, comorbidities, and treatments. Crucially, multiplicative interactions were tested via cross-product terms, while additive interactions employed relative excess risk (RERI) and attributable proportion (AP) metrics, complemented by restricted cubic splines and bivariate heatmaps for nonlinear risk visualization.

Results

K-means clustering robustly identified three metabolic subtypes with divergent trajectories. Class 1 (low-risk; n=4,782) exhibited favorable profiles including lower BMI (24.14±2.52 kg/m²), TyG (8.52±0.41), and FIB-4 (1.53±0.51). Conversely, Class 2 (IR-dominant; n=5,719) showed marked dysmetabolism with elevated TyG (9.06±0.52) and triglycerides (1.86±0.96 mmol/L). Most critically, Class 3 (metabolic-fibrosis mixed; n=4,159) demonstrated concurrent severe IR (TyG 9.18±0.53), hepatic fibrosis (BARD 2.00±1.14), and inflammation (hs-CRP 2.24±1.87 mmol/L). Cox regression confirmed TyG independently predicted events (adj. HR=1.52 per unit; 95% CI:1.40–1.65), with similar risks for elevated FIB-4 (HR=1.59) and BARD (HR=1.80). Class 3 carried a 71% higher risk versus Class 1 (HR=1.71; 1.34–2.19). Significantly, multiplicative interaction emerged between TyG and BARD (P-interaction=0.041), where high-BARD/high-TyG patients faced 3.85-fold risk (2.26–6.54)—substantially exceeding isolated high TyG (HR=2.19). Additive interaction revealed 189% excess risk (RERI=1.89; P<0.001). Nonlinear modeling further demonstrated exponential risk escalation beyond TyG>9.0, potentiated by concomitant fibrosis, while bivariate heatmaps localized maximal risk to TyG>9.2/BARD>3 combinations.

Conclusion

This study establishes that insulin resistance and hepatic fibrosis synergistically amplify cardiovascular risk in CAD beyond individual effects. Machine learning phenotyping successfully identified a high-risk "metabolic-fibrosis" subtype characterized by concurrent dyslipidemia, severe IR, and fibrotic burden. The significant multiplicative and additive interactions between TyG and BARD scores demonstrate their combined utility for precision risk stratification, with clinically actionable thresholds (TyG>9.0, BARD>3). Consequently, this integrated framework—leveraging advanced analytics for vulnerability identification—enables targeted dual-pathway interventions. Future research should validate these thresholds in multiethnic cohorts and elucidate molecular mediators (e.g., FGF21 resistance, ceramide pathways) to guide therapeutic innovation, ultimately reducing CVD burden in metabolically complex populations.

IGF2BP3 介导 DMRT2 m6A 甲基化修饰调控脂肪细胞胰岛素抵抗的机制研究

陶静 [1,2] 郑宏健 [1,2] 王子杰 [1,2] 永佳蕙 [1,2] 杨毅宁 [1,2]

1. 新疆维吾尔自治区人民医院

2. 新疆心脏血管稳态与再生医学研究重点实验室

背景　胰岛素抵抗（Insulin Resistance, IR）是代谢性疾病的关键病理生理机制之一，脂肪细胞中的 IR 受到多种因素调控。m6A 甲基化修饰作为一种重要的表观遗传调控机制，可能通过影响 DMRT2 基因在 IR 中发挥作用。然而，DMRT2 m6A 的关键调控因子及其作用机制尚不明确。

方法　本研究首先通过多个数据库（RM2Target、GEO、RNA-seq 数据集和皮尔逊分析）筛选与 IR 患者脂肪组织中 DMRT2 m6A 显著相关的因子。进一步利用 3T3-L1 脂肪前体细胞建立 IR 模型。通过过表达、敲低核心调控因子或 m6A 抑制剂干预，检测 DMRT2 蛋白、m6A 修饰水平及 IR 相关指标（葡萄糖摄取、脂肪细胞炎症因子表达和甘油三酯含量）。此外，通过生物信息学分析确定 IGF2BP3 与 DMRT2 m6A 的相关性，并通过实验验证 IGF2BP3 对 DMRT2 m6A 修饰及 IR 进展的影响。

结果　生物信息学分析显示 IGF2BP3 与 DMRT2 m6A 修饰显著相关。在 IR 细胞模型中，敲低 IGF2BP3 可上调 DMRT2、GLUT4 和 p-Akt/Akt 表达，下调 DMRT2 mRNA 上的 m6A 水平，促进葡萄糖摄取，抑制脂肪细胞炎症因子的表达，减少甘油三酯含量；过表达 IGF2BP3 则相反。m6A 抑制剂可抵消 IGF2BP3 过表达对 DMRT2 mRNA m6A 修饰及 IR 进展的影响。回复实验证明，过表达 DMRT2 可部分消除 IGF2BP3 对 IR 的促进作用。

结论　IGF2BP3 通过调控 DMRT2 m6A 甲基化修饰促进脂肪细胞 IR 和炎症进展。本研究揭示了 IGF2BP3 与 DMRT2 m6A 修饰在 IR 中的作用机制，为开发 IR 新靶点提供了重要依据。

脂肪组织特异性 Eepd1 缺失驱动糖尿病心肌病的跨器官代谢 - 炎症轴调控机制

李想 张敏 杨钰彬

上海交通大学医学院附属胸科医院

目的：揭示 DNA 修复酶 Eepd1 在脂肪组织中的代谢保护功能，阐明其通过跨器官代谢 - 炎症轴调控糖尿病心肌病的分子机制，并探索基于 CRISPR-SaCas9 的基因编辑干预策略。

方法：

1. 构建脂肪细胞特异性 Eepd1 敲除小鼠模型（Adipoq-Cre;Eepd1fl/fl）及高脂饮食（HFD）诱导的糖尿病心肌病模型。

2. 采用单细胞核 RNA 测序（snRNA-seq）解析脂肪组织 DNA 损伤应答（DDR）信号与心肌代谢紊乱的关联。

3. 通过外泌体分离、MeRIP-seq 和分子互作实验研究脂肪源性 circRNA_3416 的 m6A 表观调控机制。

4. 利用 CRISPR-SaCas9 系统在脂肪组织原位过表达 Eepd1-K70R 突变体，评估其对心肌线粒体功能及纤维化的挽救作用。

结果：

1. **脂肪组织 Eepd1 缺失加剧心脏损伤**：HFD 喂养的敲除小鼠心脏舒张末期内径（LVEDd）增加（p<0.001），心肌长链酰基肉碱水平升高，线粒体分裂蛋白 Drp1 磷酸化水平增加。

2. **代谢 - 炎症轴失调**：

· 脂肪细胞 DDR 信号异常激活，抑制 FGF21 和 Adiponectin 分泌（ELISA 浓度下降），促炎因子 Resistin 表达升高。

· 脂肪外泌体 circRNA_3416 的 m6A 修饰峰增加（MeRIP-seq 验证），通过 YTHDF2 依赖方式激活心肌 NF-κB/STAT3 炎症轴，并抑制 PPARα 介导的脂肪酸氧化（CPT1β 表达下降）。

3. **基因编辑干预效果**：

· CRISPR-SaCas9 介导的 Eepd1-K70R 过表达使心肌纤维化面积减少（Masson 染色），SIRT3 依赖性 SOD2 表达升高，线粒体 ROS 水平降低。

结论：本研究首次揭示脂肪组织 Eepd1 维持代谢稳态，其缺失通过外泌体 m6A-circRNA_3416/YTHDF2 轴引发心肌代谢 - 炎症失衡。基于 CRISPR-SaCas9 的脂肪靶向基因编辑策略为糖尿病心肌病的跨器官治疗提供了创新性理论依据。

Associations and potential biological pathways between ideal cardiovascular health defined by lifes essential 8 scores and diabetes/prediabetes: perspectives from mediation analysis

Xiaoping Peng, Rui-Chun Liao

The First Affiliated Hospital of Nanchang University

Background: Diabetes, characterized by a complex and varied etiology, represents a significant public health challenge. From 1990 onwards, the morbidity of diabetes in American adults has increased from 7.5% to 13.9%, resulting in indirect medical costs and indirect productivity losses of $412.9 billion per year. Additionally, diabetes ranges as the 7th primary cause of mortality in America. Events related to cardiovascular disease (CVD) stand as the foremost reasons for death in individuals diagnosed with diabetes. Notably, diabetes can exacerbate or even accelerate the onset of CVD events. Prediabetes, which raises the risk of diabetes, impacts more than a third of American adults and also boosts the likelihood of CVD. The epidemic of diabetes and prediabetes is a critical public health challenge in America. Therefore, exploring modifiable CVH factors in individuals with diabetes and prediabetes is highly important.

In 2022, the American Heart Association (AHA) launched Life's LE8 score, which builds upon the existing Life's Simple 7 (LS7) score, to improve CVH. The LE8 incorporates four lifestyle elements: a nutritious diet, regular physical activity(PA), limited exposure to nicotine, and quality sleep, along with four metabolic components: body mass index (BMI), lipid levels, glucose levels, and blood pressure. Consistently, epidemiological studies have confirmed that higher LE8 scores correlate with lower odds of experiencing cardiovascular disease events and a range of metabolic disorders. A recent investigation has indicated that Chinese individuals with lower LE8 scores are in an accelerated state of diabetes or prediabetes. Moreover, scant research has explored the LE8 score's relationship with diabetes or prediabetes risk in the American population. Given the increased CVD risk in individuals with diabetes or prediabetes and the multiethnic diversity of Americans, results from other ethnicities may not generalize to Americans. To bridge this gap, We analyzed the relationship between LE8 scores and subscores to diabetes and prediabetes risk in 7 cycles of NHANES, from 2005 to 2018. Additionally, we employed mediation modeling to identify potentially influential factors between LE8 and diabetes/prediabetes

Methods: We conducted a cross-sectional analysis based on data from NHANES（2005-2018）. The association between LE8 and diabetes/prediabetes was assessed by multivariate logistic regression, employing a four-knot restricted cubic spline (RCS) model to fit a dose-response characterization. Additionally, analyses stratified by subgroups examined the

variability in these associations, and mediation analysis examined possible biological mechanisms linking LE8 to diabetes/prediabetes.

Results: Having accounted for confounding variables, LE8 and the incidence of diabetes/prediabetes were significantly inversely associated. RCS analyses detected a linear (negative) association between LE8 and diabetes, but a nonlinear association with prediabetes. Subgroup analyses indicated that a higher LE8 may confer the greatest benefits to the Black population. Mediation analysis suggested that inflammation, oxidative stress, nutritional factors, and insulin resistance are pathways through which LE8 influences the risk of diabetes/prediabetes.

Conclusion: In this national-level, survey-based study, we enrolled a total of 20,747 participants, representing approximately 122,915,498 non-institutionalized US adults through sample-weighted estimates. The key findings are summarized as follows: (1) LE8 was negatively associated with most of the diabetes/prediabetes components. LE8 scores in the moderate to high range are associated with a decreased risk of experiencing diabetes or prediabetes. (2) Additional RCS analyses revealed a linear decrease in diabetes risk and a nonlinear relationship with prediabetes risk associated with LE8; the fitted RCS curves further confirmed that maintaining a high LE8 score is advantageous for reducing the risk of diabetes and prediabetes. (3) Subgroup analyses highlighted racial disparities in LE8-related diabetes/prediabetes risk. (4) Mediation analyses indicated that pathways of inflammation, oxidative stress, nutrition, and insulin resistance differentially affect LE8-related diabetes/prediabetes risk. Cardiovascular health is recognized as a vital determinant in the path towards diabetes and pre-diabetes.

Keywords: Life's Essential 8; diabetes; prediabetes; cardiovascular health; mediation analysis

The Impact of Remnant Lipoprotein Cholesterol on the Prognosis of Patients Undergoing PCI under Different Glycemic States: A Prospective Cohort Study

Kong-Yong Cui, Zi-Xiang Ye, Rui Fu, Ke-Fei Dou

Fuwai Hospital

Objective: Remnant lipoprotein cholesterol (RLP-C) refers to the cholesterol component found in triglyceride-rich lipoprotein subclasses. Previous studies demonstrated that elevated RLP-C levels correlate with adverse cardiovascular events in secondary prevention settings. Nonetheless, its specific role in patients with coronary artery disease (CAD) who underwent percutaneous coronary intervention (PCI) with different glucose metabolism status remains underexplored. This study aimed to investigate the relationship between RLP-C levels and prognosis in CAD patients undergoing PCI, with a focus on both diabetic and non-diabetic populations.

Methods: In this prospective cohort study, 9,440 CAD patients who underwent PCI between January and December 2013, were enrolled in our center. Patients were followed for major adverse cardiovascular events (MACE), including all-cause mortality, non-fatal myocardial infarction, stroke, and unplanned revascularization. The median follow-up time was 2.4 years. CAD Patients were divided into two groups based on the presence or absence of diabetes. Each group was further stratified into high and low subgroups according to the levels of RLP-C. RLP-C was assessed as both a categorical and continuous variable using Kaplan-Meier curves and Cox proportional hazards regression models. In addition, restrictive cubic spline (RCS) analysis was applied to evaluate whether a non-linear relationship exists between RLP-C and adverse clinical outcomes. Subgroup analyses were also conducted to compare the robustness of results across different subpopulations.

Results: The median RLP-C level was 0.60 mmol/L in the present study, with 51.2% of patients exhibiting high levels. The overall population had a median age of 58 years (IQR 51-65 years), with males comprising 76.9%. The prevalence of obesity (body mass index ≥ 29 kg/m^2) was 16.3%, and 44.1% of the patients had diabetes. Univariate Cox regression results showed that high RLP-C, when treated as a categorical variable, was associated with an increased risk of MACE (hazard ratio [HR] 1.174, 95% confidence interval [CI] 1.032-1.336, P < 0.05), but this association lost statistical significance after multivariate adjustment. As a continuous variable, neither univariate nor multivariate Cox regression analysis showed statistical significance. Furthermore, diabetic patients had a significantly higher incidence of MACE compared to non-diabetic patients during the follow-up period (P < 0.05). In non-diabetic patients, high RLP-C levels were positively associated with the incidence of MACE (adjusted HR 1.309, 95% CI 1.083-1.581, P < 0.05) and unplanned revascularization (adjusted HR 1.297, 95% CI 1.066-1.578, P < 0.05) after adjusting for the potential confounders. After further adjusting for low-density lipoprotein cholesterol (LDL-C) or non-high density lipoprotein-cholesterol (non-HDL-C), RLP-C also showed an association with increased risk of MACE (adjusted for LDL-C, HR 1.291, 95% CI 1.066-1.564, P < 0.05; adjusted for non-HDL-C, HR 1.287, 95% CI 1.052-1.574, P < 0.05). RCS analysis indicated a linear relationship between RLP-C and MACE risk in non-diabetic and diabetic patients, with the P value for non-linearity being > 0.05. Moreover, the relationship between RLP-C and MACE events in most non-diabetic patient subgroups remained consistent with the overall population, with no significant interactions were observed (P for interaction >0.05). In contrast, no significant associations were observed between RLP-C levels and adverse clinical outcomes among diabetic patients in single-variable and multivariable Cox regression analysis.

Conclusions: Elevated RLP-C levels are associated with a greater risk of adverse cardiovascular events in non-diabetic CAD patients post-PCI, suggesting RLP-C as a potential prognostic marker in this population. Further studies are warranted to explore these associations and their implications for treatment strategies.

Association of the plasma-glycosylated hemoglobinA1c/High-Density lipoprotein cholesterol ratio with mortality and cardiovascular disease in the US population: NHANES 1999-2018

bingqian zhang

The First Affiliated Hospital of Dalian Medical University

Abstract

Background

One of the major drivers of cardiovascular disease lies in a state of disturbed glucose and lipid metabolism in the body. Specifically, elevated plasma glycosylated hemoglobin (HbA1c) levels, which reflect long-term glycemic exposure, and decreased levels of cardioprotective high-density lipoprotein cholesterol (HDL-C), both of which have been shown by numerous epidemiologic and clinical studies to be strongly and significantly associated with the risk of disease progression, complications, and ultimately death in patients with cardiovascular disease. Considering the pathophysiologic interplay between glucose and lipid metabolism, the present study focused specifically on the integration of HbA1c and HDL-C into a single metric - i.e., the HbA1c/HDL-C ratio. Our core research objective is to comprehensively examine and elucidate whether and to what extent this ratio metric can serve as a valid tool or biomarker for predicting all-cause mortality and future risk of cardiovascular disease (both fatal and nonfatal events) in a population.

Methods

This study included 11,937 adults from the National Health and Nutrition Examination Survey (NHANES) 1999-2018. Binary weighted logistic regression analyses, cox proportional hazards model and restricted cubic spline (RCS) were used to analyze the association between the HbA1c/HDL-C ratio and mortality and cardiovascular disease, and stratified analyses were used for further study. The incremental predictive value of the HbA1c/HDL-C ratio was also assessed.

Results

After adjusting for relevant covariates, we found that compared with those in the group with lower levels of HbA1c/HDL-C ratio, those with higher levels of HbA1c/HDL-C ratio were positively associated with all-cause mortality (adjusted hazard ratio [HR] 1.31, 95% confidence interval [CI] 1.09-1.58), cardiovascular mortality (HR 1.56, 95%CI 1.08-2.26), total-cardiovascular disease (adjusted odds ratio [OR] 1.57, 95%CI 1.18-2.11), coronary heart disease (OR 1.69, 95%CI 1.13-2.54), angina pectoris (OR 1.79, 95%CI 1.09-2.94) and myocardial infarction (OR 1.71, 95%CI 1.17-2.51), except for congestive heart failure (OR 1.42, 95%CI 0.89-2.27). RCS analyses showed that most of these relationships were linear after adjustment for covariates, whereas the HbA1c/HDL-C ratio was nonlinear with angina pectoris and myocardial infarction. Finally, the ROC curves as well as all predictive ability indicators suggest that the addition of HbA1c/HDL-C ratio to the traditional cardiovascular risk factor model significantly improves the predictive ability of cardiovascular disease.

Conclusions

The HbA1c/HDL-C ratio is significantly and positively associated with mortality, total cardiovascular disease, coronary heart disease, angina pectoris, and myocardial infarction, and improves risk prediction of mortality and cardiovascular prognosis. This property gives the HbA1c/HDL-C ratio unique translational potential: it has the potential to be a more effective tool than some of the existing metrics for accurately identifying high-risk populations at relatively early stages of cardiovascular disease (i.e., at the level of primary prevention), particularly in patients with metabolic syndrome, prediabetes, or diabetes. The HbA1c/HDL-C ratio is expected to become a more effective indicator for identifying people at early risk of CVD and improving risk stratification. Risk stratification using this easy-to-calculate ratio will enable earlier initiation of intensive interventions, with the ultimate goal of reducing cardiovascular disease morbidity and associated mortality and improving the prognosis for cardiovascular health in the population.

将心脏代谢疾病与 HFpEF 联系起来的循环介质：一种中介孟德尔随机化分析

贾鹏宇

中国医科大学附属第一医院

目的：射血分数保留的心力衰竭 HFpEF）是一种越来越普遍的临床综合征，发病率和死亡率都很高。尽管 HFpEF 经常与心脏代谢疾病共存，但其致病机制和潜在介质仍然知之甚少。本研究旨在确定专门驱动 HFpEF 的心脏代谢危险因素，并确定其潜在的循环介质。

方法：我们使用双样本孟德尔随机化来分析肥胖、 2 型糖尿病、高血压、慢性肾病和血脂异常对 HFpEF 和射血分数降低的心力衰竭的影响大型欧洲血统 GWAS 数据集。然后我们进行中介 MR 以鉴定分别介导从每种心脏代谢疾病向 HFpEF 转变的血浆蛋白和代谢物。我们应用多变量 MR 来评估风险混杂对结果的影响。进行生物信息学分析以描述机制。

结果：心脏代谢疾病对 HFpEF 和 HFrEF 的影响具有异质性。肥胖和 2 型糖尿病与 HFpEF 显示出调整后的因果效应，高血压与 HFpEF 显示出潜在相关性，而血脂异常和 CKD 则没有。MR 分析确定了 5 种介导肥胖到 HFpEF 的蛋白质 ;5 种介导 2 型糖尿病到 HFpEF 的蛋白质。肥胖和 T2D 对 HFrEF 的进一步中介 MR 分析揭示了代谢性 HFpEF 和 HFrEF 之间循环介质的异质性。全面的生物信息学分析表明，IL1R1 与 TP53 和 FGF19 等其他蛋白一起协调 HFpEF 背后的炎症和纤维化过程。

结论：这些发现表明，与 HFrEF 相比，代谢性 HFpEF 具有不同的病因特征，并且由复杂的条件特异性介质驱动。IL1R1 在多种代谢风险状态下介导 HFpEF，表明潜在的治疗靶点。需要进一步的转化研究来评估 HFpEF 中靶向 IL1R1 的抗炎策略。

Joint association of Cardiovascular-Kidney-Metabolic Syndrome staging and accelerated Phenotypic age with mortality

Zhaoyu Ren, Bin Liang

Second Hospital of Shanxi Medical University

Objective:

Cardiovascular-Kidney-Metabolic Syndrome (CKM), recently formalized as a staging system by the American Heart Association, provides a crucial framework for understanding the intricate interplay between metabolic risk factors, chronic kidney disease (CKD), and cardiovascular disease (CVD). This staging reflects the pathophysiological continuum linking these conditions, ranging from risk factors to established disease. While valuable for conceptualizing disease progression, the prognostic utility of the CKM staging system alone for mortality outcomes requires augmentation. Phenotypic Age (PhenoAge) acceleration, a biomarker derived from clinical chemistry markers reflecting biological aging processes distinct from chronological age, demonstrates a robust association with increased mortality risk across diverse populations. This study aimed to comprehensively evaluate the independent prognostic value of CKM staging and PhenoAge acceleration for mortality outcomes, and critically assess their combined and potentially synergistic effects. The goal was to determine if integrating PhenoAge acceleration into the CKM framework offers a more refined, evidence-based approach for risk stratification and prognostic assessment in individuals across the CKM spectrum.

Methods:

Utilizing data from the nationally representative National Health and Nutrition Examination Survey (NHANES), this study included 16,787 participants surveyed between 1999 and 2010, with mortality follow-up through linkage to the National Death Index. Participants were categorized according to the established CKM staging criteria (Stages 0-4). PhenoAge acceleration was calculated as the residuals from the regression of PhenoAge (estimated using a validated algorithm based on chronological age and nine biomarkers) on their actual chronological age; positive values indicate accelerated biological aging. Cox proportional hazards regression models were employed to rigorously assess the associations between CKM stage, PhenoAge acceleration (analyzed both continuously and categorically, e.g., accelerated vs. non-accelerated), and their interaction, with four key mortality outcomes: all-cause mortality, non-accidental mortality, cardiovascular disease (CVD) mortality, and cancer mortality. The incremental prognostic value gained by adding PhenoAge acceleration to a model containing only CKM staging was quantitatively evaluated using Harrell's C-index, a measure of model discrimination.

Results:

Elevated CKM staging was associated with an increased risk of mortality, with CKM stage 4 having the highest risk: all-cause mortality (HR 2.58, 95% CI: 1.85–3.61), non-accidental mortality (HR 2.75, 95% CI: 1.93–3.93), CVD mortality (HR 4.62, 95% CI: 1.64–13.00), and cancer mortality (HR 2.87, 95% CI: 1.38–5.94). In the stages 2-4 of CKM, individuals with PhenoAge acceleration also had significantly higher risks for all-cause mortality, non-accidental mortality, and CVD mortality. In the joint analyses, CKM patients of stage 4 with PhenoAge acceleration had the highest risk for all-cause mortality (HR 4.22, 95% CI: 2.73–6.54), non-accidental mortality (HR 4.60, 95% CI: 2.93–7.24), CVD mortality (HR 8.01, 95% CI: 2.65–24.21), and cancer mortality (HR 4.11, 95% CI: 1.72–9.81). Notably, individuals with CKM stage 3 and PhenoAge acceleration had higher risks of all-cause mortality (HR 2.95 vs. 2.42), non-accidental mortality (HR 3.12 vs. 2.60), and cardiovascular mortality (HR 5.06 vs. 3.69) compared to those with CKM stage 4 but without PhenoAge acceleration. The overall increase in the C-index suggests that incorporating PhenoAge acceleration into the CKM staging model enhances the prognostic ability of the model.

Conclusion:

As CKM staging increases, the risk of all-cause and cause-specific mortality (non-accidental, cardiovascular disease, and cancer) significantly increases, and PhenoAge acceleration is also positively correlated with mortality risk. In CKM stages 2-4, individuals with PhenoAge acceleration had a more significant increase in the risk of all-cause, non-accidental, and CVD mortality, while the risk of cancer mortality was more closely associated with stage 4 of CKM. The highest mortality burden consistently manifested in stage 4 CKM patients with PhenoAge acceleration. The combination of CKM staging and PhenoAge can further improve the prognostic evaluation of CKM.

NPRC 基因敲除减轻 DKD 小鼠的肾小球纤维化

王鑫陆 张澄

山东大学齐鲁医院

糖尿病肾病 (DKD) 是糖尿病最常见的并发症之一，随着疾病的进展，会出现肾小球纤维化、肾功能受损等改变，探索 DKD 的发病机制和干预靶点具有重要的临床意义。本课题组之前在糖尿病性心肌病小鼠模型中，发现 NPRC 的表达增加，且敲除 NPRC 减轻了心脏纤维化，改善了心脏重构和功能。然而，NPRC 对 DKD 的影响及其潜在机制仍不清楚。

研究人员收集了 DKD 患者的肾活检组织，行免疫组化染色检测 NPRC 的表达变化。结果发现，与对照组相比，DKD 患者肾小球中 NPRC 表达显著增高。研究人员使用雄性 C57BL/6J 小鼠构建 DKD 模型，DKD 小鼠肾脏 NPRC 的表达水平明显上调，而 NPRA 和 NPRB 的表达水平无明显改变。

课题组构建了足细胞特异性 NPRC 基因敲除 ($Nprc^{pod\ KO}$) 小鼠，并在 $Nprc^{pod\ KO}$ 小鼠和同窝对照 $Nprc^{pod\ WT}$ 小鼠中分别构建 DKD 模型，结果显示足细胞特异性 NPRC 基因敲除可以改善糖尿病小鼠血清肌酐水平和尿白蛋白水平，减少肾脏大小，减轻系膜基质堆积和肾小球基底膜增厚，改善足细胞损伤。

免疫学及分子生物学结果显示，足细胞特异性 NPRC 基因敲除减轻了糖尿病小鼠的肾脏纤维化及胶原沉积，改善了足细胞损伤，抑制了 TGF-βR2 的表达及 DKD 肾脏纤维化经典通路 TGF-β1/Smad 通路的激活。以上结果表明，足细胞特异性 NPRC 敲除减轻了 DKD 小鼠的足细胞损伤和肾小球纤维化。

对机制的研究结果显示，NPRC 在 DKD 中的表达增加，而足细胞中 NPRC 的缺乏通过抑制 TGF-βR2 的再循环以及 TGF-β1/Smad 和 TGF-β1/P38 信号通路，减少肾小球纤维化并改善肾功能。因此，通过足细胞特异性基因或药物疗法靶向 NPRC 为治疗糖尿病肾病提供了一种有前景的策略。

Homocysteine activates endothelial TP receptor to promote von Willebrand factor secretion and thrombosis

Jiachen Zhang

Tianjin Medical University General Hospital

Hyperhomocysteinemia (HHcy), characterized by elevated plasma homocysteine (Hcy) levels, is a recognized risk factor for thrombosis and an independent contributor to acute coronary syndrome, although its underlying mechanisms are not fully understood. The current study is to investigate the impact of HHcy on arterial thrombosis and the underlying mechanisms. In this study, we established an HHcy mouse model using a high-methionine diet and found that HHcy significantly accelerated thrombosis. We identified that Hcy enhanced von Willebrand factor (vWF) secretion from endothelial cells, leading to increased FVIII-vWF binding and platelet adhesion. Moreover, we observed a significant positive correlation between vWF and Hcy levels in the plasma of 150 patients with acute coronary syndrome. Mechanistically, GPCR screening revealed that the Hcy-induced increase in vWF levels was mediated by activating the thromboxane prostanoid receptor (TPr) on endothelial cells. Hcy could directly bind to TPr and subsequently activated the Gαq-PLC-Ca^{2+} pathway to promote vWF secretion. Pharmacological inhibition or endothelial-specific deletion of TPr effectively reduced plasma vWF levels and protected against HHcy-related thrombosis. Our findings underscored the pivotal role of TPr in mediating Hcy-induced procoagulant states and suggested that targeting the TPr signaling pathway could be a promising therapeutic strategy for treating HHcy-related thrombosis.

Homocysteine (Hcy) is a sulfur-containing, non-essential amino acid derived from methionine and participated in multiple biological processes. Hyperhomocysteinemia (HHcy), defined as elevated plasma Hcy level (>15 μM), is an important and independent risk factor for several vascular diseases, including abdominal aortic aneurysm, myocardial infarction, and atherosclerosis. Clinical studies have revealed that HHcy is positively associated with thrombotic disease. Patients with HHcy had a higher risk of death events on account of thrombotic diseases, particularly stroke. However, the pathogenesis of HHcy-associated thrombosis remains elusive.

HHcy has been reported to potentiate platelet activation and thrombosis through mechanisms like platelet membrane phospholipid catabolism and extracellular autotaxin secretion, which activates integrin outside-in

signaling. However, patients with HHcy often exhibit reduced responsiveness to conventional antiplatelet therapies, highlighting the urgent need for alternative therapeutic strategies to manage HHcy-related thrombotic diseases. Endothelium is the most critical components of physiological hemostasis by regulating platelet activity and coagulation. von Willebrand Factor (vWF), a glycoprotein predominantly secreted by the endothelium, binds to platelet surface antigens GPIbα, αIIbβ3 and subendothelial collagens, thereby activating platelets and triggering aggregation. HHcy has been implicated in endothelial injury through multiple mechanisms, including endoplasmic reticulum stress, oxidative stress, and inflammation. We also recently found that endothelial dysfunction contributed to thrombosis under stimulation of spike protein of severe acute respiratory syndrome coronavirus 2. Despite the pivotal role of ECs in hemostasis, the precise mechanisms by which Hcy induces platelet activation and coagulation through endothelial dysfunction remain unclear.

Here, we demonstrate that the thromboxane prostanoid receptor (TPr) functions as a previously unidentified receptor for Hcy, facilitating Hcy-induced endothelial vWF secretion and accelerating thrombosis. This discovery provides a novel mechanism for Hcy-mediated procoagulant activity and suggests potential therapeutic targets for treating thrombosis associated with HHcy.

In summary, the present study demonstrates that endothelial TPr activation mediated by Hcy is the pivotal event to trigger vWF secretion and accelerate thrombus formation in the context of HHcy. Hcy serves as a new ligand of TPr and subsequent leading to Gαq-PLC-Ca2+ cascade activation. Our study revealed a new mechanism of HHcy in thrombosis from the perspective of endothelium and demonstrated that TPr could be a promising target for treating HHcy-induced thrombosis.

Joint Association Between FIB-4 Index and Advanced Cardiovascular-Kidney-Metabolic Syndrome With Aortic Valve Calcification: A Community Cohort in China

Lingchun Lv, Yunteng Fang, Jiayi Shen

Lishui Central Hospital

Background and Aims : Aortic valve calcification (AVC) is common during the process of aging. Liver fibrosis, cardiovascular risk factors and kidney function, which share common mechanisms, have been associated with AVC. This study aimed to analyze the relationship between fibrosis-4 (FIB-4) index and advanced CKM syndrome with AVC respectively. Furthermore, the study focused on their joint effects on AVC.

Methods: We extracted data from the cohort of **the** PRECISE **(PolyvasculaR Evaluation for Cognitive Impairment and vaScular Events)** study **(NCT03178448)**, which was based on **the** middle-aged and elderly Chinese population in Lishui City. It was a community prospective cohort study that started from May 2017 and included a total of 3067 community-dwelling individuals whose ages ranged from 50 to 75 years and from 10 clusters consisting of 6 villages and 4 communities of Lishui city, Zhejiang province, China. Originally, 3433 subjects agreed to participate but 366 were excluded due to contraindications to special tests or mental illness or life expectancy lower than 4 years. PRECISE is an ongoing study and participants who completed baseline examinations will be followed for 4 years. Ultimately, 3067 participants were recruited. The protocol was approved by Beijing Tiantan Hospital and Lishui Hospital. Informed consent was also obtained by all participants. 3054 individuals were included for further analysis in our study. We assessed associations between FIB-4 index, advanced Cardiovascular-Kidney-Metabolic (CKM) syndrome and AVC. Combined effects were calculated by dividing the two indicators into four groups and 1.3 was the cutoff value for FIB-4 index. Subgroup analyses were performed to more effectively stratify analyses and show the interaction of variables for the associations between the FIB-4 index and AVC.

Results: Of 3054 participants, the mean age was 61.21±6.68 and 46.42% were male. Advanced CKM syndrome was correlated with AVC significantly with OR of 3.3 (95%CI: 2.47-4.41). Even after adjusting potential covariates, the correlation remained significant (P<0.001). As a continuous variable, FIB-4 index was related with AVC, with OR of 1.27 (95%CI: 1.15-1.41). Besides, when FIB-4 index was divided based on cutoff values of 1.3 and 2.67, we discovered that FIB-4 index was connected with AVC as a categorical variable. Compared with FIB-4 index ≤ 1.3, groups of 1.3-2.67 and >2.67 were both significant, with OR of 2.05 (95%CI: 1.46-2.88) and 3.57 (95%CI: 2.24-5.69) in Model3. Utilizing 5-knots, RCS curve revealed a nonlinear association and 1.3 was the reflection point. When FIB-4 index was less than 1.3, the OR decreased first and increased then. More than the reflection point, the OR constantly elevated with the increment of FIB-4 index. At last, RCS curve stayed stable when FIB-4 index more than 3. The combination effects of advanced CKM syndrome and FIB-4 index displayed stronger link with AVC.

Conclusion: In conclusion, elevated FIB-4 index and advanced CKM syndrome were related **with AVC. Furthermore, the joint association of FIB-4 index and advanced CKM syndrome displayed stronger link with AVC. The combination of two indicators showed better prediction ability** than traditional factors**. In future, monitoring CKM stages and FIB-4 index is necessary for prevention of AVC. Our research also involved CRHM syndrome and proved that the integration of cardiology, nephrology, hepatology, and endocrinology may better present the mechanism of AVC. Our results also deepened the understanding the interaction between fatty liver fibrosis, CKM syndrome and AVC.**

Metabolic Score for Visceral Fat and Cardiovascular Risk Prediction in Middle-aged and Older Chinese Adults: Evidence from the CHARLS Cohort

Chao Peng, Bin Liu, Zixi Li, Jiaru Gu, Huan Sun

China-Japan Union Hospital of Jilin University

Background: Excessive and ectopically distributed visceral fat (VF) not only reflects systemic metabolic dysfunction but also contributes to the progression of cardiovascular disease (CVD) through complex inflammatory and endocrine interactions.The Metabolic Score for Visceral Fat (METS-VF) is a novel, non-invasive, and integrative metric for quantifying visceral adiposity and associated metabolic perturbations, particularly valuable in epidemiological studies where direct imaging-based measurements of VF are infeasible.However, the association between METS-VF and cardiovascular risk remains inadequately explored in Asian populations, especially among middle-aged and older Chinese adults. Therefore, this study aimed to evaluate and validate the relationship between METS-VF and the risk of CVD in this demographic.

Methods: In this retrospective cohort analysis, we enrolled 7,082 participants aged ≥45 years who were free of clinically diagnosed CVD at baseline. All data were obtained from the China Health and Retirement Longitudinal Study (CHARLS), a nationally representative cohort launched in 2011 to collect detailed information on Chinese adults aged 45 and older. CHARLS provides high-quality longitudinal data on health, socioeconomic status, and aging in China's middle-aged and older population. The METS-VF index was computed for each participant using established formulas that integrate sex, age, WHtR, and the metabolic score for insulin resistance (METS-IR). The primary endpoint was the occurrence of CVD, as self-reported or medically confirmed during follow-up interviews. To delineate the relationship between METS-VF and incident CVD, we employed multivariable-adjusted Cox proportional hazards models, accounting for a wide array of potential confounders including sex, age, marital status, educational level, smoking status, alcohol consumption pre-existing metabolic disorders. To further evaluate the robustness of the association between METS-VF and CVD risk, subgroup analysis was performed. Furthermore, restricted cubic spline (RCS) modeling was employed to explore potential nonlinear associations.Finally, to confirm the robustness of the findings, a series of sensitivity analyses were conducted, including the exclusion of individuals with missing covariates, the inclusion of outliers, and quartile-based categorization of METS-VF.

Results: The results demonstrated a significant positive association between METS-VF and the risk of cardiovascular disease (CVD) across all study subgroups. Furthermore, Cox proportional hazards regression analysis indicated that higher METS-VF levels were associated with increased CVD risk (HR: 1.62; 95% CI: 1.45–1.80). This association remained statistically significant after comprehensive adjustment for a wide range of potential confounders (adjusted HR: 1.39; 95% CI: 1.23–1.56). When METS-VF was categorized into tertiles, individuals in the highest tertile (Q3) consistently exhibited significantly elevated risks for all cardiovascular outcomes compared with those in the lowest tertile (Q1). In addition, restricted cubic spline (RCS) analysis revealed a significant nonlinear relationship between METS-VF and CVD risk (p for non-linearity = 0.001). Notably, when METS-VF exceeded 6.73, the slope of the risk curve steepened markedly, indicating a rapid escalation in cardiovascular risk. These findings remained robust across multiple sensitivity analyses.

Conclusion: This study revealed that elevated METS-VF levels are positively and independently associated with increased CVD risk in middle-aged and older Chinese adults. Its non-invasive, easily reproducible nature renders it particularly suitable for integration into routine screening and preventive strategies. By capturing the metabolic burden imposed by visceral adiposity, METS-VF offers clinicians a valuable tool for early risk stratification.

不同血糖状态心力衰竭患者中重度冠状动脉钙化病变最佳血运重建与长期结局的关联性研究

林章宇 李博文 宋彦君 尹栋

中国医学科学院阜外医院（国家心血管病中心）

背景：对于不同血糖状态的心力衰竭（HF）患者，中重度冠状动脉钙化（MSCAC）病变的最佳血运重建治疗与长期临床结局之间的关系目前尚不明确。因此，本研究旨在探讨不同血糖状态的心力衰竭患者接受中重度冠脉钙化病变经皮冠状动脉介入治疗（MSCAC-PCI）达到最佳与非最佳效果与长期不良临床结局之间的关联。

方法： 这项前瞻性队列研究纳入了 2017 年 1 月至 2018 年 12 月期间在阜外医院接受 MSCAC-PCI 治疗的 1,086 例心力衰竭患者。根据 MSCAC-PCI 的结果将患者分为：失败组、次优血运重建组和最佳血运重建组。主要终点是心血管（CV）事件，即心血管死亡和靶血管心肌梗死（TVMI）的复合终点。

结果：在中位 3 年的随访期间，共发生 87 例（8.0%）心血管死亡 /TVMI 事件。与 MSCAC-PCI 失败的患者相比，接受最佳血运重建的患者发生心血管事件的风险显著降低（校正风险比 [aHR] = 0.33; 95% 置信区间 [CI], 0.15-0.71）。次优血运重建组与失败组患者之间未观察到显著差异。亚组分析显示，糖尿病前期患者在接受最佳血运重建后心血管事件风险较低（aHR = 0.18; 95%CI, 0.03-0.87），这一差异主要源于 TVMI 风险的降低（aHR = 0.06; 95%CI, 0.01-0.42）。同时，糖尿病患者在接受最佳血运重建后心血管死亡风险较低（aHR = 0.25; 95%CI, 0.06-0.96）。在血糖状态正常的患者中，不同 PCI 结果组间未见显著差异。

结论：我们的研究结果表明，在 MSCAC-PCI 中实现最佳血运重建与心力衰竭患者长期临床结局的改善相关，尤其是在糖尿病前期和糖尿病患者中。

Apolipoprotein A2 influences ANGPTL3 on modulating TG catabolism and inflammatory cytokines secretion

Ye Cheng, Xin Su

Xiamen Cardiovascular Hospital of Xiamen University

The prevalence of coronary artery disease (CAD), including atherosclerosis, stable angina (SA), and ST elevation myocardial infarction (STEMI), has remarkably risen which poses serious risk to human health. Several risk factors impose burden on development of CAD, such as dyslipidemia, manifesting as higher low-density lipoprotein cholesterol (LDL-C) concentrations, triglyceride (TG) concentrations, and reduced high-density lipoprotein cholesterol (HDL-C) concentrations. Furthermore, immune cascade response with excessive production of inflammatory cytokines in promoting atherosclerotic related cardiovascular disease have been given substantial attention, since increased levels of multiple pro-inflammatory cytokines, such as interleukin-1 (IL-1), high-sensitivity C-reactive protein (hs-CRP), and tumor necrosis factor-α (TNF-α), were positively correlated with the prevalence of CAD.

The angiopoietin-like protein (ANGPTL) family, containing ANGPTL1 to ANGPTL8, is a series of secreted glycoproteins which share consistent structure whereas different functions. Among those eight members, ANGPTL3 was indicated as a novel regulator in TG catabolism. As shown, ANGPTL3 was controlled by nutritional condition and could modulate TG metabolism by suppressing the lipoprotein lipase (LPL) activity, the rate-limiting enzyme for TG hydrolysis and serum TG clearance. Using ANGPTL3 gene-deficient mice, it has demonstrated that these mice presented reduced serum TG concentrations and up-regulated LPL bio-activity. On the contrary, over-expressing ANGPTL3 gene or injecting ANGPTL3 protein into mice could significantly increase serum TG levels. The individuals carrying loss of functional of ANGPTL3 gene also exhibited extremely lower serum TG concentrations. The important role of TG, including triglyceride-rich lipoproteins (TRLs), in facilitating the pathological development of CAD has been established, whereas whether ANGPTL3 concentration is altered in the CAD patients is still not elucidated.

HDL contains apolipoprotein A1 (ApoA1), ApoA2, phospholipids, and cholesterol. ApoA1 is the most dominant apolipoprotein in HDL particle which presents anti-atherogenic function. In comparison, ApoA2 is the second-most dominant apolipoprotein, whereas its pathophysiological role remains fully clarified. It was demonstrated that ApoA2 presented anti-oxidant effects which might contribute to atherosclerotic protection [9]. On the contrary, another clinical research showed the anti-ApoA2 treatment could suppressed the development of coronary arteritis which could be considered as an effective therapeutic candidate for the treatment of vasculitis, proposing the role of ApoA2 in promoting inflammatory response. Accordingly, the accurate functions of ApoA2 in atherosclerotic related inflammation is still required to be explored. On the other hand, using APOA2 gene transgenic mice, the authors found that the TG catabolism was reduced; meanwhile, the HDL particle isolated from these mice showed impaired LPL activity. Thereby, it seems that ANGPTL3 and ApoA2 present similar function on TG metabolism.

In the present research, an observational clinical trial was conducted to assess the ANGPTL3 and ApoA2 concentration in diverse groups classified by the anthropometric and metabolic profiles. As shown in the results, the serum levels of ANGPTL3 and ApoA2 exhibited no significant discordance between the CAD group and the healthy control group. Both ANGPTL3 and ApoA2 were importantly associated with serum concentrations of TG (r = 0.249, P = 0.002; r = 0.379, P = 0.001, respectively). Additionally, ApoA2 were inversely associated with multiple pro-inflammatory cytokines, such as high-sensitivity C-reactive protein (hs-CRP, r = -0.079, P =0.003), tumor necrosis factor-α (TNF-α, r = -0.119, P = 0.001), and IL-1β (r = -0.103, P = 0.004). The regression analysis confirmed that ApoA2 was an independent modulator to TG and pro-inflammatory cytokines independent of ANGPTL3 (standardized β = 0.196, P < 0.001).

Conclusively, the results found in our study demonstrated that the serum ApoA2 exhibited a close association with several pro-inflammatory cytokines, including hs-CRP, TNF-α, and IL-1β. Additionally, ANGPTL3 was inversely associated with serum ApoA2 and the relationship between ANGPTL3 and TG disappeared while serum ApoA2 was taken into consideration, proposing the potential function of serum ApoA2 in ANGPTL3 action. Concerning on this notion, further research is still required to fully explore the associations between ApoA2 with ANGPTL3 and the potential mechanism of TG modulation in patients with CAD.

载脂蛋白 A1 经 Sortilin 负向调控人脂肪间充质干细胞成脂分化的实验研究

程晔 苏欣

厦门大学附属心血管病医院

目的：探究载脂蛋白 A1（ApoA1）对人脂肪间充质干细胞（AMSCs）成脂分化的影响及其潜在机制。**方法：**经厦门大学附属心血管病医院伦理委员会批准及患者知情同意后，获取 2023 年 2 月至 9 月在我院进行外科手术共 40 例患者皮下脂肪组织，获取人 AMSCs 后诱导为成熟脂肪细胞，以 15μg/ml 人重组 ApoA1 蛋白干预细胞，作为实验组；不加 ApoA1 干预的细胞作为对照组；于促分化第 7、14、21 天收获细胞：（1）观察 ApoA1 对细胞内甘油三酯（TG）含量和成脂分化标志物基因、蛋白水平影响。（2）通过荧光抗体标记，利用激光共聚焦实验观察 ApoA1 与分选蛋白 Sortilin 是否存在共定位现象。（3）观察 ApoA1 对 Sortilin 基因、蛋白水平的影响。（4）利用慢病毒转染技术，沉默 SORT 基因，并以 ApoA1 干预 21 天，观察 ApoA1 对细胞内 TG、成脂分化标志物基因、蛋白水平影响。**结果：**（1）在同一促分化时间内，ApoA1 干预的细胞 TG 含量及 FAS、C/EBPβ 等成脂分化标志物基因、蛋白表达水平下降。（2）经过激光共聚焦分析发现，在 AMSCs 成脂分化过程中，ApoA1 与 Sortilin 存在共定位现象。（3）在同一促分化时间段内，ApoA1 可明显上调细胞内 Sortilin 基因、蛋白水平。（4）沉默 SORT 基因后，ApoA1 对 AMSCs 成脂分化抑制作用显著降低。**结论：**ApoA1 通过上调 Sortilin，下调成脂分化标志物表达，降低 TG 含量，抑制 AMSCs 成脂分化。

三酰甘油葡萄糖指数与老年非介入治疗非 ST 段抬高型心肌梗死患者的预后相关：一项单中心回顾性队列研究

李明轩 曲新凯 史凯蕾

复旦大学附属华东医院

目的 探讨三酰甘油葡萄糖（TyG）指数对老年非介入治疗非 ST 段抬高型心肌梗死（NSTEMI）患者预后的预测价值。

方法 回顾性分析 2018 年 7 月–2022 年 6 月，入住复旦大学附属华东医院心脏监护室，确诊为 NSTEMI 但未行介入治疗的 80 例老年患者临床资料。依据 TyG 中位数将患者分为低 TyG 组（n=40）和高 TyG 组（n=40）。比较 2 组的一般资料，随访患者出院后的全因死亡情况。

结果 80 例老年 NSTEMI 患者年龄 60~97 岁，平均（80.8±9.4）岁，TyG 指数中位数为 8.70。与低 TyG 指数组相比，高 TyG 指数组患者年龄较小，体质量指数较高，饮酒史构成比较少，糖尿病构成比较多，总胆固醇、三酰甘油和空腹血糖水平较高，差异有统计学意义（P < 0.05）。随访期间高 TyG 组患者死亡 20 例，低 TyG 组患者死亡 13 例。Kaplan-Meier 生存分析显示，低 TyG 指数组预后优于高 TyG 指数组，差异有统计学意义（P=0.046）。采用 Lasso 回归分析进行变量筛选和去除变量间的多重共线性，共筛选出 10 个变量，包括 TyG 指数、年龄、性别、房颤、血小板、TnT 峰值、BNP、肌酐、谷丙转氨酶和 GRACE 评分。先后进行单因素和多因素 Cox 比例风险回归分析显示，TyG 指数（HR=2.442，95%CI：1.449~4.117）、肌钙蛋白 T 峰值（HR=1.274，95%CI：1.037~1.565）、脑钠肽（HR=1.001，95%CI：1.000~1.001）和年龄（HR=1.050，95%CI：1.004~1.099）是影响非介入治疗老年 NSTEMI 患者生存率的独立预后因素。

结论 低 TyG 指数的老年非介入治疗 NSTEMI 患者死亡风险可能低于高 TyG 指数者。

Association Between Pain Characteristics, Circadian Syndrome and Cardiovascular Disease in Chinese Middle-Aged and Older Adults: A 4-Year Follow-Up Study

Lingchun Lv, Yunteng Fang, Jiayi Shen

Lishui Central Hospital

Background: Pain and circadian syndrome (CirS) are both risk factors for the incidence of cardiovascular disease (CVD). in this study, we conducted a longitudinal analysis utilizing data from a large cohort in China to explore link between pain characteristics and CirS and their combined effects on CVD in Chinese middle-aged and older adults. This study was striving to find out whether pain and changes of pain were risk factors for CirS and the joint effects of two indicators to predict CVD.

Methods: This study included 2649 participants in analysis1 and 6265 in analysis2. Logistic regression models were utilized to present associations between pain characteristics and changes of pain characteristics with CirS. Furthermore, subgroups analyses were conducted to better stratify analyses and show the interaction of variables for associations between pain and new-onset CirS. Joint association of CirS and multisite pain with CVD was performed. We extracted data from China Health and Retirement Longitudinal Study (CHARLS), a longitudinal survey recruiting aged 45 years and above. This cohort is a prospective study that included 450 villages or residential communities in 28 provinces in China. A multi-stage cluster random sampling method was utilized to ensure a representative sample. In 2011 the first wave initiated, followed by 2013 (wave 2), 2015 (wave 3), 2018 (wave 4), 2020 (wave5). All participants signed informed consents and one-to-one interviews were performed to gain high-quality information.

Results: Of 2649 participants, mean age was 58.09±(8.43) years and 52.74% were males. Individuals with baseline pain, single-site pain and multisite pain are all closely related with CirS, even adjusting all poten-

tial covariates. Compared with no pain, people with multisite pain persistence manifested strong link with risk of CirS. Additionally, people with single-site, no pain, single-site to multisite pain or multisite pain persistence were more prone to CirS with OR of 2.27 (95%CI: 1.68,3.08) and 2.37 (95%CI: 1.7,3.3) after covariates adjustment respectively. Individuals with BMI ≥ 23 with multisite pain persistence more tightly correlated with CirS than other subgroups after variables adjustment, with OR of 2.86 (95%CI: 1.75,4.45). BMI had interaction effects on relationship. The combination of CirS and multisite pain significantly enhanced the risk of CVD with OR of 1.73 (95%CI: 1.31,2.29). The P values for trend for combination analysis were all significant. The sensitivity analysis proved the robustness of our results.

Conclusions: Our study highlighted that pain, especially multisite pain, was associated with CirS. Multisite pain persistence and no pain, single-site to multisite pain were significantly correlated with progression to CirS. Besides, the combination of CirS and multisite pain was more significantly associated with risk of CVD. In conclusion, our study highlighted association between pain, CirS and CVD among Chinese middle-aged and older adults. Multisite pain, multisite pain persistence and progress of pain showed stronger link with CirS. The combination of CirS and multisite pain was more significantly with risk of CVD than single CirS or multisite pain. Our findings suggested the prevention of pain persistence and progress of pain may lower incidence of CirS and the prevention of multisite pain and CirS could stratify CVD risk.

TyG 指数联合 hsCRP 对糖尿病合并急性冠脉综合征患者 PCI 术后预后的相关性

周鹤

中国人民解放军北部战区总医院

目的：评估甘油三酯 - 葡萄糖（TyG）指数联合高敏 C 反应蛋白（hsCRP）对糖尿病合并急性冠脉综合征（ACS）患者经皮冠状动脉介入（PCI）治疗出院后 12 个月内不良预后的相关性。

方法：选取自 2016 年 3 月至 2022 年 3 月于北部战区总医院心血管内科收治的接受 PCI 治疗的合并糖尿病的 ACS 患者为研究对象。结局事件为患者出院后 12 个月的全因死亡和心原性死亡。根据 TyG 指数和 hsCRP 的水平将患者分为四组：低 TyG + 低 hsCRP 组，高 TyG + 低 hsCRP 组，低 TyG + 高 hsCRP 组和高 TyG + 高 hsCRP 组。采用 Cox 比例风险模型分析不同组别对结局事件累计发生率的影响，计算风险比（HR）和 95% 的可信区间（CI）。

结果：根据纳入排除标准，本研究最终纳入 4422 名患者，平均年龄为 60.0±10.1 岁，男性占比 69.2%。Cox 回归分析结果提示，与低 TyG + 低 hsCRP 组相比，低 TyG + 高 hsCRP 组患者出院后 12 个月全因死亡（HR：1.86, 95% CI: 1.05-3.30）、心原性死亡（HR：2.01, 95% CI: 1.03-3.94）发生风险增加；高 TyG + 高 hsCRP 组患者出院后 12 个月全因死亡（HR：2.50, 95% CI: 1.46-4.28）、心原性死亡（HR：2.99, 95% CI: 1.59-5.62）发生风险也显著增加。在进一步校正了相关混杂因素后，与低 TyG + 低 hsCRP 组相比，高 TyG + 高 hsCRP 组患者出院后 12 个月全因死亡发生风险增加 1.9 倍 (95% CI: 1.08-3.33, P = 0.03), 心原性死亡发生风险增加 2.23 倍 (95% CI: 1.15-4.29, P = 0.02)。

结论：对于接受 PCI 治疗的合并糖尿病的 ACS 患者，TyG 指数与 hsCRP 同时升高的患者其术后 12 个月的全因死亡及心原性死亡风险均显著升高。

Correlation of triglyceride-glucose index with major adverse cardiovascular events in type 2 diabetes mellitus patients with acute myocardial infarction combined with HFpEF

XIAODONG ZHANG, Ying Liu

The First Affiliated Hospital of Dalian Medical University

Abstract

Aims: This study was to evaluate the correlation between triglyceride-glucose index (TyG) and major adverse cardiovascular events (MACE) in patients with type 2 diabetes mellitus (T2DM) and heart failure with preserved ejection fraction (HFpEF) after acute myocardial infarction (AMI).

Methods: This retrospective study at the First Affiliated Hospital of Dalian Medical University included 400 AMI patients with T2DM and HFpEF who underwent percutaneous coronary intervention (PCI) between January 1, 2018, and January 1, 2023.

In this study, patients were enrolled for follow-up starting from the date of their first hospitalization, with the follow-up period extending until either the patient's death or July 31, 2024. The median follow-up time was 24.63 months. The study endpoint was MACE, defined as a composite of one or more of the following: all-cause death, unplanned revascularization, and non-fatal myocardial infarction. To identify clinical characteristics associated with adverse cardiovascular outcomes, baseline variables were compared between patients with and without MACE. This grouping approach was intended to explore potential risk factors for MACE. All enrolled patients were encouraged to monitor their condition regularly through outpatient services. For those who did not complete the follow-up program, efforts were made to contact them by telephone to ensure data completeness. The study was conducted using univariate and multivariate Cox regression analyses, subgroup analyses, receiver operating characteristic (ROC) curves, and Kaplan-Meier survival curves to assess the correlation between TyG index and MACE.

Results: Multivariate Cox regression analyses showed that in Model 3 with variables fully adjusted, when TyG was used as a categorical variable, the risk of MACE in the TyG T2 and T3 groups was 1.622 times and 2.247 times higher than that in the T1 group, respectively (P < 0.05). When TyG was used as a continuous variable, the risk of MACE increased by 49.5% for every 1 unit increase in the TyG index (P < 0.001). In the subgroup analysis, elevated TyG index levels were consistently associated with an increased risk of MACE across multiple clinical subgroups (P < 0.05). ROC analysis showed that the TyG index significantly predicted the occurrence of MACE (AUC: 0.635, 95% CI: 0.580-0.691, P < 0.001), all-cause death (AUC: 0.565, 95% CI: 0.508-0.622, P = 0.027), non-fatal myocardial infarction (AUC: 0.617, 95% CI: 0.542-0.693, P = 0.004), and unplanned revascularization (AUC: 0.644, 95% CI: 0.578-0.710, P < 0.001). The Kaplan-Meier survival curves revealed statistically significant differences in survival probabilities for the occurrence of MACE, all-cause death, non-fatal myocardial infarction, and unplanned revascularization across the three TyG index groups as the follow-up period progressed (P < 0.05).

Conclusions: Our study found that in T2DM patients with HFpEF combined with AMI, the incidence of MACE events was higher, and the prognosis worsened as the TyG index increased. The TyG index proved to be an independent predictor of MACE, and could serve as a valuable tool for risk stratification and prognosis in this population. Clinicians should be particularly alert to the risks associated with left ventricular dysfunction in patients with elevated TyG indices during the management of AMI.

The Impact of Allostatic Load on the Incidence of Cardiometabolic Multimorbidity: Evidence from the China health and Retirement Longitudinal study

Ling-Chun Lv, Yunteng Fang, Jiayi Shen

Lishui Central Hospital

Background: Allostatic load (AL) is an index used for assessing chronic stress. Based on available literature AL is able to predict cardiovascular disease. This study aimed to investigate association between AL and CMM in middle-aged and older Chinese adults. We hypothesized that higher burden of AL associated with risk of CMM. We used data from the nationally representative database and aimed to assess the cross-sectional and longitudinal associations between AL burden and CMM. Besides, since AL would change in during follow-up, we also explored association between transition of AL with incident CMM. This study might provide new insights into the understanding of AL, an indicator of chronic stress, and prevention of CMM.

Methods: This study undertakes data from the China Health and Retirement Longitudinal Study (CHARLS), a longitudinal survey mainly recruiting participants aged 45 years and above.(22) CHARLS utilized multi-stage cluster random sampling method to ensure a representative sample. 17,708 participants from 450 villages or residential communities in 28 provinces in China were enrolled and all participants signed informed consents. This study included 6307 individuals for cross-sectional analysis and 3331 for longitudinal analysis. Logistic regression models were utilized to assess associations between AL (as continuous and categorical indicator) and CMM in cross-sectional and longitudinal analysis. Additionally, based on the transition of AL, participants were divided into four groups and persistent low AL burden was the reference. Furthermore, subgroups analyses were conducted to better stratify analyses and show the interaction of variables. Sensitivity analyses excluding missing value of covariates were conducted.

Results: 236 CMM events at baseline and 149 CMM events occurred at 4 year follow-up. In longitudinal analysis the mean age was 59.73±(9.12), 45.93% were male. Both in cross-sectional and longitudinal analysis, AL was associated with CMM as continuous and categorical indicator after adjusting all potential covariates. The higher AL burden showed stronger link with incident CMM. Besides, compared with persistent low AL burden, the persistent high/medium burden demonstrated strongest association with CMM. Sex had interaction effects on relationship between AL burden and CMM.As a continuous value, AL score was associated with CMM with OR of 1.7 (95%CI: 1.58-1.83). Even after adjusting all variables, the connection remained robust with OR of 1.5 (95%CI: 1.39-1.63) in Model3. As a continuous value, AL score was closely associated with incident CMM with OR of 1.2 (95%CI: 1.08-1.34) in Model3 per 1 score. Besides, compared with low burden, medium and high burden showed stronger association with risk of CMM. When it came to progression of AL burden, low burden to high/medium burden was strongly associated with incident CMM with OR of 4.28 (95%CI: 2.21-8.3). Furthermore, individuals with persistent high/medium burden were more prone to CMM with OR of 5.79 (95%CI: 3.34-10.02).

Conclusions: In conclusion, the results of our study indicated that base-

line and longitudinal AL was associated with incident CMM. Increasing AL score and AL burden had great impact on CMM. Besides, compared with persistent low AL burden, persistent high/medium AL burden was strongly associated with risk of CMM. Early evaluation of AL burden is of significant importance for the prevention or treatment of CMM. The transition of AL burden may also help assess the risk of CMM and early identify high-risk individuals.

简易胰岛素抵抗指数对高原世居藏族发生高尿酸血症的预测价值

冯佳越 舒燕

四川省人民医院

背景：高尿酸血症（HUA）已成为高原藏族人群中一种常见的代谢性疾病。胰岛素抵抗（IR）与 HUA 的发生发展密切相关，但传统的 IR 指标因为侵入性、复杂性等缺点，限制了其在临床和流行病学研究中的应用。

目的：评价简易 IR 指数，甘油三酯葡萄糖指数（TyG）、甘油三酯葡萄糖体质量指数（TyG-BMI）、甘油三酯 / 高密度脂蛋白胆固醇比值（TG/HDL-C）和胰岛素抵抗代谢指数（METS-IR），对高原世居藏族发生 HUA 的预测价值。

方法：本研究为横断面调查，选取 2022 年 6 月至 2023 年 2 月在四川省甘孜藏族自治州理塘县人民医院健康体检中心进行健康体检的世居藏族居民为研究对象。通过问卷调查、体格检查和血生化检测收集受试者数据，根据血清尿酸水平分为 HUA 组和非 HUA 组。采用 Spearman 相关探讨简易 IR 指数与 HUA 的相关性；计算各 IR 指数的四分位数，采用多因素 Logistic 回归评估不同 IR 指数与 HUA 的关系，采用受试者工作特征曲线（ROC）及曲线下面积（AUC）评估各 IR 指标对 HUA 的预测能力。

结果：本研究纳入 2493 例高原世居藏族居民，共检出 HUA 患者 944 人， HUA 患病率男性高于女性（42.91% vs. 34.55%, P <0.05）。与非 HUA 组相比，HUA 组 TyG、TyG-BMI、TG/HDL-C、METS-IR 均 较 高（P <0.05）。Spearman 相关分析发现，TyG 与 HUA 相关性最强（P <0.001），METS-IR 与 HUA 相关性最弱（P <0.001）。伴随简易 IR 指数每升高四分位数，HUA 患病率呈上升趋势（P <0.001）。多因素 Logistic 回归显示 TyG 升高时，高原世居藏族发生 HUA 的风险最高（男性，OR 11.936，95% CI 7.175 – 19.858；女性，OR 14.873，95% CI 9.533 – 23.204），其 次 为 TG/HDL-C、TyG-BMI 和 METS-IR。ROC 曲线显示 TyG 预测高原世居藏族发生 HUA 的 AUC 最大（男性，0.757，95% CI 0.727 – 0.787；女性，0.776，95% CI 0.751 – 0.801），显著高于 TG/HDL-C、TyG-BMI 和 METS-IR。

结论：简易 IR 指数升高可增加高原世居藏族发生 HUA 的风险。与 TG/HDL-C、TyG-BMI 及 METS-IR 相比，TyG 预测高原世居藏族发生 HUA 的效果更好。

The Role of Instrumental Activity of Daily Living Disability in the Association between Circadian Syndrome and Cardiometabolic Multimorbidity in Chinese Middle-Aged and Older Adults

Lingchun Lv, Yunteng Fang, Jiayi Shen

Lishui Central Hospital

Background: Instrumental activities of daily living (IADL) disability and circadian syndrome (CirS) are risk factors for the incidence of cardiometabolic disease. We conducted a cross-sectional and longitudinal analysis extracting data from a large Chinese cohort to investigate the link between CirS and CMM. Besides, combined effects of CirS and IADL disability on CMM and the mediation analysis were also evaluated. This study was striving to find out whether CirS were risk factors for CMM.

Methods: We extracted data from China Health and Retirement Longitudinal Study (CHARLS), a longitudinal survey mainly enrolling aged 45 years and above. This cohort is a prospective study that included 450 villages or residential communities in 28 provinces in China. A multi-stage cluster random sampling method was utilized to ensure a representative sample. All participants signed informed consents and one-to-one interviews were performed to gain high-quality and accurate information. This study included 8085 participants in cross-sectional analysis and 5887 in longitudinal analysis. Logistic regression models were utilized to present associations between CirS and components with CMM. Cox proportion hazard regression models were performed to assess relationship between CirS and incident CMM. Furthermore, subgroups analyses were conducted to better stratify analyses and show the interaction of variables. Combined effects of CirS and IADL disability on CMM were conducted. Also, we analyzed mediation role of IADL in the association between CirS and progression to CMM.

Results: In longitudinal analysis, of 5887 participants, 452 CMM events occurred. The mean age was 58.57±(8.76) and 45.73% were male. In cross-sectional analysis, CirS was associated with CMM after adjusting all potential covariates. When components of CirS ≥ 6, CirS showed strongest link with CMM with ORs of 16.38 (95%CI: 10.74-25) and 7.49 (95%CI: 4.63-12.12) in Model3. In longitudinal analysis 452 CMM events occurred. CirS and increasing number of components still displayed strong link with CMM in crude model and Model3 with HRs of 3.43 (95%CI: 2.82-4.16) and 2.04 (95%CI: 1.65-2.53). Furthermore, The combination of two diseases strengthened association with CMM with HR of 5.08 (95%CI: 3.87-6.66) in crude model and 3.06 (95%CI: 2.28-4.12) after adjusting all covariates. IADL mediated 5.83% on the relationship between CirS and CMM. Besides, population with drinking habits would face more hazard of CMM and lower education levels would also increase risk of CMM.

Conclusions: Our study highlighted that CirS and increasing number of components associated with CMM. The combination of CirS and IADL disability was significantly associated with new on-set CMM. IADL disability had mediation effects on CirS in the progression to CMM. In conclusion, our study highlighted association between CirS, IADL disability and CMM among Chinese middle-aged and older adults. CirS and increasing number of its components showed strong link with CMM. The combination of CirS and IADL disability was significantly associated with new on-set CMM than single CirS or IADL disability. Also, IADL disability had mediation effects on CirS in the progression to CMM. Our findings suggested the prevention of CirS and related components may lower incidence of CMM and the prevention of IADL disability and CirS could stratify CMM risk.

Intensified Lipid-Lowering Strategies and Their Effect on Atherogenic and Metabolic Markers in Coronary Artery Disease

Zhi-Fan Li, Zheng Yin, Xi Li, Meng-Ying Lu, Lei Bao, Hong Qiu, Na-Qiong Wu

Fuwai Hospital, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College

Purpose: Lipid-lowering therapy (LLT) is effective in managing lipid levels and reducing adverse event risks in coronary artery disease (CAD) patients, also affecting glucose metabolism. This study evaluates the effects of varying LLT strategy on lipid profiles and insulin resistance (IR) biomarkers in CAD patients.

Methods: This was a prospective observational study enrolled CAD patients in Fuwai Hospital from August, 2020 to February, 2023. Participants were categorized into monotherapy (low-/moderate-statin monotherapy or ezetimibe monotherapy), dual therapy (statin and ezetimibe) and triple therapy (statin + ezetimibe + PCSK9 inhibitors), and followed for biochemical parameters. Changes in lipid profiles and IR-related biomarkers, including non-high-density lipoprotein cholesterol (non-HDL-C), remnant cholesterol (RC), lipoprotein(a) [Lp(a)], triglyceride-glucose (TyG) index, and atherogenic index of plasma (AIP), were assessed and compared across the three treatment groups. Multiple linear regression analyses were performed to evaluate the associations between LLT intensity and percentage changes in these biomarkers. In addition, subgroup and interaction analyses were conducted to further explore effect modification by baseline characteristics.

Results: A total of 1393 CAD patients were included in this study, with 212 in monotherapy group, 1118 in dual therapy group, and 61 in triple therapy group. After a median follow-up of 1 year, the dual therapy and triple therapy groups showed significantly greater reductions in LDL-C (-25.42% vs. -62.93% vs. -0.72%, P < 0.001), TC (-16.71% vs. -44.02% vs. 0.95%, P < 0.001), apoB (-17.98% vs. -56.10% vs. -2.81%, P < 0.001), non-HDL-C (-23.72% vs. -57.47% vs. 0.29%, P < 0.001), RC (-20.51% vs. -45.07% vs. -5.71%, P = 0.001), TG (-17.44% vs. -25.66% vs. -7.61%, P = 0.001), and TyG (-2.19% vs. -7.14% vs. -1.04%, P = 0.003) compared with the monotherapy group. AIP, glucose, and Lp(a) levels showed overall declining trends across all groups, but none of the between-group differences reached statistical significance. Multiple linear regression analyses demonstrated a significant negative correlation between dual therapy and triple therapy and percentage changes in LDL-C (dual therapy: β = -16.43, 95% CI: -21.95 to -10.90, P < 0.001; triple therapy: β = -36.56, 95% CI: -47.82 to -25.30, P < 0.001), non-HDL-C (dual therapy: β = -14.95, 95% CI: -20.07 to -9.82, P < 0.001; triple therapy: β = -33.51, 95% CI: -44.77 to -22.26, P < 0.001), and RC (dual therapy: β = -19.47, 95% CI: -36.18 to -2.77, P = 0.023; triple therapy: β = -38.18, 95% CI: -73.01 to -3.36, P = 0.046). A downward trend in TyG and apoB were also observed in both dual and triple therapy groups, though the associations did not reach statistical significance. Furthermore, interaction and subgroup analyses revealed significant interactions between LLT and BMI stratification in relation to percentage changes in LDL-C, TC, and non-HDL-C (all P for interaction ≤ 0.05). In the non-overweight/obese population, both dual therapy and triple therapy were associated with more pronounced lipid-lowering effects compared to the overweight/obese group (all P < 0.01).

Conclusion: In patients with CAD, triple LLT (statin plus ezetimibe and PCSK9 inhibitors) led to the most pronounced improvements in lipid profiles, including LDL-C, TC, non-HDL-C, and RC, along with a trend toward improved IR markers such as TyG. Subgroup analyses further revealed enhanced lipid-lowering effects of intensified therapy, particularly among non-overweight/obese individuals. These findings highlight the superior efficacy of triple therapy in addressing cardiovascular risk in CAD patients.

TRIM35 介导氨基酸转运在压力负荷型心室重构中的作用与机制研究

宋娟 李穗吉

厦门大学附属心血管病医院

研究背景： 病理性心肌重构（Cardiac maladaptive remodeling）是导致心力衰竭的主要原因之一，其发病机制极为复杂。E3 泛素链接酶 TRIM35 调控多种生物过程，包括细胞凋亡、先天免疫反应以及代谢重编程等，并参与免疫微环境

调节和肿瘤发展。然而，TRIM35 是否通过影响心肌成纤维细胞表型及在压力负荷型心室重构中发挥作用，尚不清楚。

研究方法： 本研究采用成纤维细胞特异性 Trim35 基因敲除小鼠（Trim35cKO）来探究 TRIM35 在成纤维细胞中的功能。通过主动脉弓缩窄术（TAC）建立小鼠压力负荷型心室重构模型，检测并分析各组小鼠心脏功能、形态结构以及心肌组织的分子变化。利用生物素转换技术（biotin-switch）结合液相色谱 - 串联质谱（LC/MS）、RNA 测序（RNA-Seq）、以及腺病毒转染等技术，明确 TRIM35 调控成纤维细胞表型的分子机制。

研究结果： 在小鼠和人类发生纤维化的心脏组织中，TRIM35 的表达主要在心肌成纤维细胞内显著上调，转化生长因子 -β1（TGF-β1）刺激心肌成纤维细胞，TRIM35 表达上调。心肌成纤维细胞特异性敲除 TRIM35，能显著改善由 TAC 手术诱导的心肌纤维化和心肌肥大。过表达 TRIM35 则促进心肌成纤维细胞的增殖、迁移和分化。更重要的是，过表达 TRIM35 的成纤维细胞可通过旁分泌作用，诱导心肌细胞发生肥大。进一步研究分子机制，我们发现，TRIM35 能够与氨基酸转运蛋白 SLC7A5 相互作用，对其进行泛素化修饰并上调其表达水平，从而增强氨基酸的转运能力，进而激活哺乳动物雷帕霉素靶蛋白复合物 1（mTORC1）信号通路。此外，过表达 SLC7A5 可取消条件性敲除 TRIM35 所带来的心肌纤维化和心肌肥大的改善作用。

研究结论： 我们的研究结果揭示了成纤维细胞中的 TRIM35 在压力负荷型心室重构中扮演着全新的关键角色，并阐明了其通过 SLC7A5 介导的氨基酸转运激活 mTORC1 信号通路的分子机制。这些发现为能量代谢在压力负荷型心室重构中的作用提供证据，并为治疗心肌重构提供了一个潜在的全新治疗靶点。

Impact of a Comprehensive Healthy Lifestyle Score on a Broad Spectrum of Cardiometabolic Diseases and Enhanced Risk Prediction Based on the UK Biobank Database

Xin-Yue Chen, Yan-Jun Song, Dong Yin, Ke-Fei Dou

Fuwai Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College

Aim: Primary prevention of cardiometabolic diseases (CMDs), a leading cause of global morbidity and mortality, requires robust risk stratification tools. This study aimed to systematically evaluate the association between a comprehensive set of lifestyle factors and the risk of a wide range of CMDs using data from the UK Biobank. The research also sought to determine if incorporating these lifestyle factors could improve the performance of traditional disease risk prediction models.

Methods: We analyzed data from 148,155 participants in the UK Biobank without baseline CMDs. Cox proportional hazards models were used to assess the impact of healthy lifestyle factors (non-smoking, alcohol consumption, physical activity, healthy diet, and healthy sleep) on 11 types of CMDs (coronary heart disease, type 2 diabetes, atrial fibrillation, hypertension, stroke, heart failure, Alzheimer's disease, non-alcoholic fatty liver disease, valvular heart disease, cardiomyopathy, and pulmonary hypertension). Based on the β coefficients from a Cox proportional hazards model, a weighted healthy lifestyle score was developed. Improvements in predictive models after incorporating lifestyle factors were evaluated.

Results: Through Cox model analysis, this study quantified the contribution weights of five lifestyle factors to health. The results showed that healthy sleep contributed the most (weighted β coefficient: 0.342), followed by non-excessive alcohol consumption (0.288), non-smoking (0.239), regular physical activity (0.082), and healthy diet (0.049). A nomogram developed from the model visually confirmed the relative importance of each factor, showing that unhealthy sleep contributed the most points to the total risk score, followed by smoking and drinking. Adhering to a healthier lifestyle demonstrated a significant and dose-response association with a reduced risk of composite CMDs. After multivariable adjustment, compared with the "Very Unhealthy" group, the hazard ratios (HRs) for the composite outcome were 0.87 (95% CI: 0.83-0.91) for the "Unhealthy" group, 0.77 (95% CI: 0.73-0.80) for the "Healthy" group, and 0.70 (95% CI: 0.67-0.74) for the "Very Healthy" group. This protective association was observed across most individual CMDs, with the most pronounced effect seen in pulmonary arterial hypertension (HR: 0.34, 95% CI: 0.24-0.50). Kaplan-Meier analysis confirmed that healthier lifestyle groups had significantly longer disease-free survival ($p < 0.0001$). Furthermore, adding the lifestyle score to established risk models (Framingham, FINDRISC, CHARGE-AF, QStroke) significantly improved risk prediction across all metrics, including the area under the curve (AUC), continuous Net Reclassification Improvement (NRI), and Integrated Discrimination Improvement (IDI) (all $P < 0.001$). The protective association of a healthy lifestyle was largely consistent across subgroups based on sex, ethnicity, BMI, and sedentary time, although the magnitude of the effect showed a statistically significant interaction by age and Townsend deprivation index. Furthermore, the findings remained robust in several sensitivity analyses, including using an unweighted lifestyle score, excluding events within the first two years of follow-up to account for reverse causation, and using a separate data partition to derive the score weights, which confirmed the stability of the results.

Conclusion: This study systematically reveals that a healthy lifestyle is associated with a significant reduction in the risk of a wide range of CMDs, and it enhances the accuracy of existing risk prediction models. This underscores its critical role in the primary prevention of cardiovascular and metabolic diseases.

老年人群心脏代谢性共病风险列线图预测模型的构建及评价

曹教育

中国科学技术大学附属第一医院（安徽省立医院）

【摘要】目的： 构建老年人群心脏代谢性共病风险列线图预测模型，旨在为早期风险分层和临床干预提供依据。**方法：** 整合 NHANES 数据库 2005 ~ 2018 年共 7 轮调查数据，纳入 6338 例符合纳入标准的 65 岁及以上老年人群作为研究对象。通过 LASSO 回归筛选老年人群心脏代谢性共病的特征变量，进一步采用多因素 logistic 回归分析确定心脏代谢性共病的独立危险因素，并构建列线图模型。采用受试者工作特征（Receiver Operating Characteristic，ROC）曲线下面积（Area under the ROC curve，AUC）评价列线图的区分度，采用 Spiegelhalter's z 检验评价列线图的校准度，采用决策曲线分析（Decision Curve Analysis curve，DCA）曲线评价列线图的实用性。**结果：** LASSO 回归筛选出 10 个特征变量，多因素 Logistic 回归分析进一步确定了这 10 个变量为心脏代谢性共病的独立预测因子：受教育程度（OR=0.73, 95%CI: 0.61 ~ 0.87, P=0.001）、腰围（OR=1.03, 95%CI: 1.02 ~ 1.03, P<0.001）、贫困收入比率（OR=0.75, 95%CI: 0.62 ~ 0.90, P=0.003）、抑郁总分（OR=1.06, 95%CI: 1.04 ~ 1.07, P<0.001）、高密度脂蛋白胆固醇（OR=0.68, 95%CI: 0.58 ~ 0.80, P<0.001）、血红蛋白（OR=0.88, 95%CI: 0.85 ~ 0.92, P<0.001）、红细胞分布宽度（OR=1.05, 95%CI: 1.00 ~ 1.10, P=0.030）、血尿素氮（OR=1.10, 95%CI: 1.08 ~ 1.13, P<0.001）、球蛋白（OR=1.03, 95%CI: 1.01 ~ 1.04, P<0.001）及总胆固醇（OR=0.64, 95%CI: 0.61 ~ 0.68, P<0.001）。依据这 10 个变量构建了老年人群心脏代谢性共病风险的列线图预测模型，列线图预测模型的 AUC 为 0.735（95%CI: 0.723 ~ 0.748），采用 10 折交叉法对列线图进行内部验证，内部验证后列线图的 AUC 为 0.736（95%CI: 0.721 ~ 0.748），提示列线图具有较好的区分度。Spiegelhalter's z 检验结果提示列线图的预测概率与心脏代谢性共病发生频率之间的差异不具有统计学意义（z=-0.399, P=0.655），即列线图具有较好的校准度。DCA 曲线显示当心脏代谢性共病发生的阈值概率为 15% ~ 77% 时，应用该列线图可使得老年人群获得最大化的净获益水平，提示列线图具有较好的实用性。**结论：** 基于 NHANES 数据构建的列线图模型对老年心脏代谢性共病风险具有良好的预测效能，可为个体化防控提供量化工具。

防晒 / 紫外线与心血管疾病及代谢疾病的孟德尔随机研究

Huilin-Cheney

南华大学附属第二医院

目的： 观察性研究发现，日晒减少的人患心血管疾病（cardiovascular disease，CVD）和代谢性疾病（Metabolic disease，MD）的风险增加。为了避免受到混杂因素和反向因果关系风险影响，我们利用孟德尔随机化研究（Mendelian randomization，MR）探究使用防晒 / 紫外线（Use of sun/uv protection，SP）对心血管疾病及代谢性疾病的影响。

方法： 数据来源于公开的 Genome-Wide Association Study 数据库。采用逆方差加权法等方法进行 MR 分析以探究因果关系。使用留一法、Cochran Q 检验等判断结果稳健性。

结果： MR 分析表明 SP 与风湿性瓣膜病（Rheumatic valve disease，RVD）（比值比 [OR]：6.616，95% 置信区间 [CI]：1.592-27.492，P=0.009）及缺血性脑卒中（小动脉闭塞）（Small-vessel ischemic stroke，ISsv）（OR：1.581，95%CI：1.002-2.493，P=0.049）存在正向因果关系，与 2 型糖尿病（Type 2 diabetes mellitus，T2DM）（OR：0.815，95%CI：0.666-0.997，P=0.047）存在负向因果关系。不支持 SP 与其他 CVD 及 MD 存在因果关系。所有数据均未发现多效性。

结论： 我们的研究结果从遗传学角度支持 SP 与 RVD、T2DM 和 ISsv 存在因果关系，可开展更多研究来证实这种相关性。

血红蛋白糖化指数对早期心肾代谢综合征患者心血管疾病进展的预测作用

刘慧怡 毛帅 赵芸漳 董丽莎 王一凡 姚妍竹 张杰 吕超 尹彤

中国人民解放军总医院第二医学中心 国家老年疾病临床医学研究中心

目的：心血管 - 肾脏 - 代谢（cardiovascular-kidney-metabolic syndrome，CKM）综合征是一种受代谢危险因素、慢性肾脏病与心血管系统相互影响的疾病。研究已证实，血红蛋白糖化指数（hemoglobin glycation index，HGI）与心血管疾病（cardiovascular disease，CVD）密切相关。然而，在早期 CKM 综合征患者中，能否利用 HGI 对后期进展至 CVD 进行有效预测，目前尚不明确。

方法：本研究选用中国健康与养老追踪调查（China health and retirement longitudinal study，CHARLS）中处于 CKM 综合征早期（0-3 期）的参与者。根据基线及随访时检测的 HGI 值，进行聚类分析分组。主要终点定义为随访期间自我报告的新发 CVD。研究应用了极端梯度提升算法、Shapley 加性解释（SHapley Additive exPlanations，SHAP）方法评估各变量效力；采用多因素 Logistic 回归分析明确 HGI 与 CVD 之间的关联，限制性立方样条（Restricted Cubic Spline，RCS）回归评估潜在的非线性关系。

结果：研究最终纳入参与者共 4676 名，其中 944 名（20.19%）在 10 年内进展为 CVD。在众多监测变量中，HGI 对 CVD 的预测作用排名第二。根据 HGI 基线值及动态变化，参与者被分为 4 组。与 HGI 水平较低的第 1 组相比，HGI 水平高且增幅大的第三组（校正后 OR：1.34，95%CI：1.06-1.69，P=0.013）和第四组（校正后 OR：1.65，95%CI：1.01-2.45，P=0.025）进展为 CVD 风险更高。RCS 分析显示，累积 HGI 与 CVD 风险呈线性相关（非线性 P=0.867）。亚组分析进一步证实了这种关联的稳定性。此外，SHAP 图表明，HGI 比传统危险因素（如

空腹血糖）更能预测 CVD 的发生。

结论: 在早期 CKM 综合征患者中，HGI 可作为独立生物标志物发挥 CVD 预测作用。

Evidence of liver-heart cross-talk: The association between FLI and CKM risk stratification

Jia-xin Tan, Yi-Zhen Gong

Guangxi Medical University Cancer Hospital

Background:

Cardiovascular-kidney-metabolic (CKM) syndrome, as defined by the American Heart Association in 2023, recognizes the interconnected pathophysiology of obesity, diabetes mellitus, chronic kidney disease (CKD), and cardiovascular diseases (CVD) such as coronary artery disease, heart failure, atrial fibrillation, stroke, and peripheral arterial disease. Rather than treating these conditions as isolated clinical entities, the CKM syndrome framework acknowledges their syndromic co-occurrence and synergistic impact on long-term health outcomes. It proposes a staging system ranging from Stage 0 (no identifiable risk factors), to Stage 1 (excessive or dysfunctional adiposity), Stage 2 (presence of metabolic dysfunction or intermediate/high-risk CKD), Stage 3 (subclinical cardiovascular disease or very high predicted risk), and finally Stage 4 (clinically manifest CVD). Notably, Stage 3, the preclinical stage, presents a critical opportunity for risk interception prior to irreversible organ damage or major cardiovascular events.

Despite its conceptual advancement, the practical implementation of CKM staging in population health and clinical medicine is constrained by the lack of simple, scalable, and cost-effective tools for early risk identification. In this context, the Fatty Liver Index (FLI) emerges as a promising candidate. FLI is a composite marker derived from four routine clinical measures—body mass index (BMI), waist circumference (WC), serum triglycerides (TG), and gamma-glutamyl transferase (GGT)—and has been widely validated for non-invasive estimation of hepatic steatosis. Hepatic steatosis itself is no longer viewed as a benign entity; it contributes to systemic inflammation, endothelial dysfunction, and pro-thrombotic states through secretion of hepatokines and cytokines. Multiple studies have associated fatty liver and elevated FLI with insulin resistance, type 2 diabetes, subclinical atherosclerosis, and cardiovascular mortality, making it a plausible integrative biomarker for CKM risk stratification.

Methods:

We conducted a comprehensive analysis using data from the U.S. National Health and Nutrition Examination Survey (NHANES), a nationally representative cohort. Participants were divided into quartiles based on their FLI levels (Q1–Q4), and the prevalence of CKM syndrome across these strata was examined. Multivariable logistic regression models were constructed in three steps: Model 1 (unadjusted), Model 2 (adjusted for age and sex), and Model 3 (adjusted for age, sex, race, educational attainment, poverty-income ratio, and smoking status). Restricted cubic spline (RCS) functions with three knots were used to assess non-linear associations. We also performed univariate subgroup analyses to explore effect heterogeneity.

To further explore predictive capacity, six machine learning algorithms were employed: CatBoost, Random Forest, LightGBM, XGBoost, K-Nearest Neighbors (KNN), and Support Vector Machine (SVM). Each model was trained using FLI in combination with six clinical variables. Model training and validation followed a 10-fold stratified cross-validation approach. Bootstrap sampling (n=500 iterations) was used to generate confidence intervals around AUC metrics. Finally, an online calculator (https://fast.statsape.com/tool/detail?id=7) was deployed to facilitate clinical translation of the optimal prediction model.

Results:

FLI levels were significantly higher among individuals with CKM syndrome compared to those without (66.36 vs. 27.66; $p < 0.05$). Each 10-unit increase in FLI was associated with a 45% higher odds of CKM syndrome (OR = 1.045, 95% CI: 1.042–1.048). RCS analysis confirmed a dose-dependent non-linear relationship between FLI and CKM risk. Among machine learning models, CatBoost yielded the highest predictive performance (AUC = 0.853), and demonstrated excellent discrimination for advanced CKM stages (AUC = 0.936 for Stage 3; AUC = 0.912 for Stage 4) using the web calculator.

Conclusion:

This study highlights the potential of the Fatty Liver Index (FLI) as a novel, accessible biomarker for early detection and stratification of CKM syndrome. By integrating clinical indices with machine learning, we present a robust, interpretable, and user-friendly risk tool that may support preventive care and clinical decision-making. These findings suggest a broader role for liver-based indices in syndromic metabolic risk assessment, with implications for personalized medicine and population health strategies.

Associations of inflammatory prognosis index with all-cause and cardiovascular mortality among individuals with diabetes and pre-diabetes: a populationbased study

Wenliang Che

Department of Cardiology, Shanghai Tenth People's Hospital, Tongji University School of Medicine, Shanghai, China

Abstract

Background Systemic inflammation is a recognized key player in the pathogenesis and complications of diabetes mellitus (DM) and its precursor state, pre-diabetes (pre-DM). Established composite indices derived from routine complete blood counts, specifically the Systemic Immune-Inflammatory Index (SII: platelets × neutrophils / lymphocytes) and the Systemic Inflammatory Response Index (SIRI: neutrophils × monocytes / lymphocytes), have demonstrated prognostic value for adverse outcomes in diabetic populations. However, the Inflammation Prognosis Index (IPI: monocytes × neutrophils / lymphocytes), another readily calculable hematological inflammatory marker, has not been evaluated for its predictive capacity regarding mortality in individuals with DM or pre-DM. This study aimed to comprehensively investigate and compare the predictive value of IPI, alongside the established SIRI and SII, for all-cause and cardiovascular (CVD) mortality in a large, nationally representative cohort of US adults encompassing both DM and pre-DM..

Methods We conducted a retrospective cohort analysis utilizing data from the National Health and Nutrition Examination Survey (NHANES) cycles spanning 1999 to 2018. The study population comprised adult participants (aged ≥ 18 years) identified as having either DM or pre-DM based on established criteria (self-reported diagnosis, medication use, or laboratory glucose/HbA1c levels). Vital status and cause of death were ascertained via linkage to the National Death Index, with follow-up extending through December 31, 2019. The primary exposures were the inflammatory indices: IPI, SIRI, and SII, calculated from baseline complete blood count differentials. The primary outcomes were all-cause mortality and CVD-specific mortality. Multivariable Cox proportional hazards regression models were employed to assess the associations between these inflammatory indices (analyzed both continuously and categorically in tertiles) and mortality outcomes, yielding hazard ratios (HRs) and 95% confidence intervals (CIs). Models were adjusted for potential confounders including age, sex, race/ethnicity, body mass index, smoking status, hypertension, hyperlipidemia, and estimated glomerular filtration rate. To explore the nature of the exposure-outcome relationships, Restricted Cubic Spline (RCS) analyses with 4 knots were performed. Kaplan-Meier survival curves with log-rank tests were generated to visualize survival differences across tertile groups of each index. Subgroup analyses were also conducted to assess the consistency of associations.

Results The final analytical cohort included 10,049 individuals with DM or pre-DM. Over a mean follow-up period of 9 years, there were 2,233 deaths from all causes, of which 612 were attributed to cardiovascular disease (CVD). Multivariable Cox regression analysis revealed statistically significant positive associations between higher levels of all three inflammatory indices and increased risk of both all-cause and CVD mortality. This held true whether the indices were analyzed as continuous variables or categorized into tertiles (with the highest tertile compared to the lowest), and the significance persisted across progressively adjusted models (all P values for trend or association < 0.05). Kaplan-Meier survival curves provided visual confirmation of these findings, demonstrating significantly worse survival probabilities for individuals in the highest tertile of IPI, SIRI, and SII for both all-cause mortality and CVD mortality (all log-rank P values < 0.001). RCS analysis offered further insight into the shape of these relationships: A non-linear, predominantly positive association was observed between continuously measured IPI and the risk of both all-cause mortality (non-linear $P < 0.001$) and CVD mortality (non-linear $P < 0.001$). Similarly, a non-linear relationship was found between SII and CVD mortality risk (non-linear $P < 0.001$). In contrast, SIRI exhibited a linear association with the risk of both all-cause mortality and CVD mortality. Subgroup analyses generally supported the robustness of the primary findings.

Conclusions This large, nationally representative study demonstrates that elevated levels of the Inflammation Prognosis Index (IPI), as well as the established Systemic Inflammatory Response Index (SIRI) and Systemic Immune-Inflammatory Index (SII), are independently and significantly associated with an increased risk of both all-cause mortality and cardiovascular disease-specific mortality among US adults with diabetes or pre-diabetes. The consistent findings across different analytical approaches (Cox models, Kaplan-Meier, RCS) strengthen the evidence for the prognostic utility of these easily calculable hematological indices. Notably, this is the first study to identify IPI as a significant predictor of mortality in this population. The results suggest that incorporating the assessment of IPI, alongside SIRI and SII, into routine clinical screening and risk stratification protocols for individuals with DM and pre-DM could help identify those at the highest risk of mortality earlier. Identifying high-risk individuals using these accessible indices could potentially enable more targeted monitoring and earlier interventions aimed at mitigating inflammation-associated risk and improving long-term out-

comes.

Age-Related triglyceride-glucose index trajectories and all-cause mortality in Chinese elderly people

Chenxi Li[1], Yao Lu[2], Ting Chen[1]

1. The First Affiliated Hospital, Zhejiang University School of Medicine

2. Xiangya Hospital Central South University

Background Research has shown a strong link between insulin resistance and cardiovascular diseases (CVDs), highlighting the crucial role of metabolic disorders in the development and advancement of these diseases. The triglycerideglucose (TyG) index is acknowledged as an alternative biomarker for cardiometabolic health, linked to insulin resistance and the progression and outcome of cardiovascular disease (CVD). Human resistance to cell stress from insulin reduces with advancing age. Thus, it is essential to track the TyG index over a period. Hence, continuously monitoring the TyG index is crucial. However, research has yet to examine the future connection between long-term trajectories of the TyG index and mortality from all causes in elderly population.

Methods This longitudinal prospective cohort study encompassed a sample of 93,418 elderly adults who underwent multiple general health assessments at The Third Xiangya Hospital of Central South University between 2012 and 2020. The TyG index was determined using the formula ln (fasting triglyceride [mg/dL] × fasting glucose [mg/dL]/2). The TyG index trajectories during the follow-up were analyzed using the latent class trajectory modeling method. The baseline and trajectory of the TyG index were analyzed with univariate and multivariate Cox proportional hazards analyses to compute hazard ratios (HRs) and 95% confidence intervals (CIs).

Results Throughout a median follow-up duration of 5.4 years, 7 364 participants dead (including 4 176 cardiovascular mortality and 3188 cancer mortality). After adjusting for conventional CVD risk factors, each 1-standard deviation (SD) increment in the TyG index was linked to a 7% greater risk of all-cause mortality (HR = 1.189, 95% CI 1.144-1.235). Expressing the TyG index as quartiles yielded similar results. According to the distinct trajectory patterns, participants were grouped into low, moderate-low, moderate, and high TyG index trajectories. Each of the low, moderate-low, and high-increasing groups had an independent association with all-cause mortality, as opposed to the moderate group. After multivariate adjustment, the moderate-low group had a 1.104-fold (95% CI 1.047-1.165) risk of all-cause mortality, while the high group had a 1.243-fold (95% CI 1.139-1.357) risk of all-cause mortality (P<0.001). Additionally, no significant relationship was found between the low group and the outcomes of the study (HR = 0.998, 95% CI 0.875-1.138, P = 0.972). Moreover, the consistency of this relationship was maintained across multiple subgroups and sensitivity analyses. The analysis of subgroups showed that all-cause mortality was elevated in females, individuals with BMI<28kg/m2, and individuals without diabetes. We excluded participants s who died in the first two years, participants who took any antidiabetic drugs to evaluate if the outcomes were influenced, excluded participants with FBG ≥ 7.0 and TG ≥ 1.7 at baseline, respectively. Our findings indicated that these results were comparable to the primary analysis.

Conclusions Our study employed a substantial cohort with a prolonged follow-up duration, facilitating a thorough investigation into the relationship between TyG index variations and mortality. This study identified a substantial correlation between the patterns of change in the TyG index and both all-cause and cardiovascular mortality among the elderly population, highlighting the potential of TyG index variations as a predictive tool for mortality. Our findings indicate that participants exhibiting moderate-low or high TyG index trajectories are correlated with the progression of cardiovascular and all-cause mortality. The longitudinal assessment of TyG index trajectories may constitute a valuable instrument for identifying individuals at increased risk of all-cause mortality, thereby justifying the implementation of targeted preventive and therapeutic interventions.

NF2 is an essential regulator of the pro-fibrotic cardiac fibroblasts phenotype associated with pathological cardiac remodeling via the Hippo/YAP signaling pathway.

Lu-Xun Tang[1], Wen-Yi Peng[2]

1. Department of Cardiology, The General Hospital of Western Theater Command, Chengdu Military General Hospital, Chengdu 610083, China

2. Department of Cardiology, The Chengdu Second People's Hospital, Chengdu 610083, China

Cardiac fibroblasts (CFs) are the primary cells involved in depositing and remodeling collagen and significantly associated with heart failure (HF). Merlin/NF2（Neurofibromatosis type 2） has been shown to be essential for heart development and homeostasis. However, fibroblast endogenous NF2 in cardiac remodeling remains incompletely understood.To identify potential key regulators associated with cardiac remodeling. we performed western blot analyses in myocardial samples from db/db and T2DM mice. Western blot revealed downregulated cardiac NF2 expression in mice 8 weeks after STZ infusion and high fat food. We next investigated the effects of NF2 over-expression or deficiency in response to in vitro could elicit what effects in response to high glucose and fat. CFs isolated from neonatal C57 mice were infected with adenovirus to overexpress or depresses the NF2, and then were response to normal glucose (NG), high glucose (HG), high fat acid (HF), and high glucose +high fat acid (GF) for 24 hours, respectively. After adenovirus infection, significantly elevated NF2 protein levels were confirmed in NMCFs, Western blot showed that the overexpression of NF2 decreased the alpha-SMA, Collagen I and III production. Collagen I, collagen III, alpha-SMA production increased after silencing NF2 in vitro. NF2 overexpression significantly decreased collagen gel contraction in response to high glucose condition. NF2 knockdown increased collagen gel contraction. Next, we explored the in vivo effects of NF2 knockout in mice. Knockout of NF2 in CFs (NF2fl/flcol1a2+) was generated by crossing NF2-floxed (NF2fl/fl) mice with col1a2-cre/ERT mice, thus allowing tamoxifen (TAM)-inducible deletion of NF2 in CFs. The gene-type of NF2fl/fl and col1a2+ mice were determined through PCR analysis. TAM administration for 5 days successfully reduced the expression level of NF2 in heart from NF2fl/flcol1a2+ mice compared to NF2fl/fl mice. Then, NF2fl/flcol1a2+ mice were fed with high-fat and high sugar diet and injected with STZ to make T2DM mice model, The data showed that the NF2fl/flcol1a2+ mice exhibited significantly decreased cardiac function after performed high food and STZ injection compared to NF2fl/fl mice. NF2 in cardiac fibroblasts may play a significant role in DM-induced cardiac fibrosis by Masson and collagen Immunol histochemistry staining, Sirus red staining, the Immunofluorescence staining of FSP1. To fully understand the molecular mechanisms underlying NF2-mediated cardiac remodeling, we next identify the YAP and col I changes in response to NF2 knockdown. We founded that the NF2 knockout remits the phosphorylation of YAP while increasing collagen I deposition. In vitro, NF2 overexpression reduced the YAP/p-YAP ratio in NMCFs, and NF2 knockdown increased the ratio. Next, we explored the role of YAP in CFs proliferation. Next, we knock down YAP expression in NMCFs using si-RNA to confirm the requirement of YAP-induced CFs differentiation. Indeed, YAP deficiency reduced the expression of Edu and Postn augment induced by high glucose and high fat acid. Western blot showed that the overexpression of YAP increased the Collagen I production. YAP overexpression significantly increased collagen gel contraction. YAP knockdown decreased col I expression and collagen gel contraction in response to HG and GF. These funding further supported an association between YAP expression and HG- and GF-induced CFs proliferation and differentiation. Merlin/NF2 is regulated by epigenetics such as phosphorylation at Ser518 site and ubiquitination. When Ser518 was phosphorylated, NF2 assumes an "open" conformation and can no longer associate with binding partners, resulting in YAP activation by Hippo pathway. As shown above, western blot showed the protein level ratio of p-NF2ser518/NF2 was increased in DM mice. We next investigated whether NF2ser518 phosphorylation deficiency could promote the decrease of YAP in response high glucose and high fat in vitro. Transfection with adenovirus successfully phosphorylating NF2ser518 in NMCFs. Collagen I, collagen III decreased production after silencing NF2ser518 site in vitro, p-YAP production increased. The Edu, postn, alpha-SMA immunofluorescence staining indicated that ad-NF2ser518 impeded CFs proliferations and activation. Ad-NF2ser518 significantly reduced collagen gel contraction in response to high glucose and fat acid. Furthermore, co-immunoprecipitation showed that NF2ser518 directly combined with MST1 leading to the hippo pathway activation and YAP activation.

These results suggest that NF2 in cardiac fibroblasts may play a significant role in DM-induced cardiac fibrosis. CFs-specific NF2 deficiency exacerbated diabetes-induced cardiac remodeling, evaluated by alpha-SMA, Collagen I and III production, andcollagen gel contraction. Mechanistically, we found MST1/YAP was a novel NF2 target. NF2 could promote the fibroblast-to-myofibroblast transition through the Hippo/YAP signaling pathway, and genetic YAP knockdown inhibited the pro-transformation phenotype in CFs response to hyperglycemia and hyperlipidemia. Furthermore, we found the interaction between NF2 and MST1, which could lead to the binding and activation of the YAP. In conclusion, NF2 is an essential regulator of the pro-fibrotic CFs phenotype associated with pathological cardiac remodeling via the Hippo/YAP signaling pathway.

白蛋白 / 球蛋白比值对 2 期心血管 - 肾脏 - 代谢综合征患者死亡率的预测价值：基于全国队列的分析（1999-2018）

陈慈爱 丁珊妮 王耀 潘红英 李政伟

浙江大学医学院附属邵逸夫医院

背景：心血管 - 肾脏 - 代谢综合征（CKM）是代谢功能障碍、心血管疾病和慢性肾脏病之间复杂相互作用的结果，其 2 期以代谢危险因素和亚临床器官损伤为特征。白蛋白 / 球蛋白比值（AGR）作为反映炎症和营养状态的综合指标，已在多种慢性疾病中显示出预后价值，但其在 CKM 综合征 2 期中的临床意义尚未明确。

方法：本研究基于 1999-2018 年 NHANES 数据，纳入 13,148 名 CKM 2 期成人患者。按基线 AGR 水平分为三组（≤ 1.286、1.286-1.500、>1.500）。通过关

联国家死亡索引数据库获取死亡率数据，采用多变量 Cox 回归模型评估 AGR 与全因死亡率、心血管死亡率和癌症死亡率的关系，并校正社会人口学、生活方式和临床因素。使用限制性立方样条分析非线性关系。

结果：研究发现，AGR 水平与 CKM 综合征 2 期患者的死亡率呈现显著负相关趋势（趋势性检验 P 值均 <0.01），且这种关联呈 U 型曲线特征（最佳 AGR 范围为 1.4-2.1；非线性检验 P=0.09）。与 AGR 最低组相比，AGR 最高组的全因死亡风险显著降低 35%（校正后 HR=0.65，95% CI：0.52-0.80），心血管死亡风险降低 47%（HR=0.53，95% CI: 0.34-0.84），癌症死亡风险降低 45%（HR=0.55，95% CI：0.36-0.84）。值得注意的是，亚组分析揭示 AGR 的保护作用存在人群异质性：这种负相关性在中青年男性、体重正常者、当前吸烟者以及体力活动充足的人群中表现得更为显著。

结论：AGR 是 CKM 综合征 2 期患者死亡率的强预测指标，尤其对中青年男性及正常 BMI 患者具有重要价值，且与死亡率呈特征性的 U 型剂量 - 反应关系（最佳区间 1.4-2.1）。本研究支持将 AGR 用于早期 CKM 综合征的风险分层和个体化管理。

甘油三酯 - 葡萄糖指数与美国成人自杀意愿的关系

白越 李麟 林秋霞 陈晓会

吉林大学第二医院

目的：甘油三酯 - 葡萄糖指数作为新兴的胰岛素抵抗评估工具，已经被证实与多种疾病、甚至死亡相关，但其与自杀意愿的关系并不明确。本文利用 NHANES（2005-2018）数据库的数据分析探索甘油三酯 - 葡萄糖指数与美国成人自杀意愿的关系。

方法：在排除甘油三酯 - 葡萄糖指数缺失、权重缺失、怀孕女性后，本研究共纳入 15,411 例数据，考虑权重后，代表 212,601,506 美国人。通过多因素回归分析，曲线拟合，拐点分析等多种研究方法，探索甘油三酯 - 葡萄糖指数与美国成人自杀意愿的关系。

结果：在多因素分析中，研究对象按照甘油三酯 - 葡萄糖指数的数值进行四等分。在调整了人口统计学变量、社会经济变量、临床疾病状态等多项指标后，将对照组 Q3（8.557-9.007）相比，Q1（<8.134），Q2（8.134-8.557）和 Q4（>9.007）的自杀意愿均增加（Q1：OR=1.43, 95%CI:1.01 ~ 2.02；Q2：OR=1.17, 95%CI:0.83 ~ 1.65；Q4：OR=1.42, 95%CI:1.03 ~ 1.96）。曲线拟合证实，甘油三酯 - 葡萄糖指数之间呈非线性关系，（非线性检验 P=0.022），进一步分析发现这种非线性关系的拐点为 8.769，当甘油三酯 - 葡萄糖指数 <8.769，自杀意愿与甘油三酯 - 葡萄糖指数之间的关联无统计学意义，当甘油三酯 - 葡萄糖指数≥ 8.769，随着甘油三酯 - 葡萄糖指数的增加，自杀意愿增加（OR=1.43，95%CI:1.03 ~ 1.99）。

结论：在美国成年人中，甘油三酯 - 葡萄糖指数与自杀意愿呈非线性关系，尤其当甘油三酯 - 葡萄糖指数≥ 8.769 时，自杀意愿明显增加，应加强对相关人员的关注。

心肌靶向的线粒体调控能量代谢治疗缺血再灌注损伤

李涛

四川大学华西医院

目的：

本研究旨在构建一种单宁酸修饰的线粒体（Mito TA），以缓解静脉注射线粒体后引发的炎症反应，并实现对心肌组织的靶向，从而促进线粒体在心肌组织中的富集，有效治疗心肌缺血再灌注（IR）损伤。

方法：

通过氧糖剥夺（OGD）的细胞模型和小鼠 IR 模型，探究 Mito TA 的安全性和有效性。

结果：

（1）细胞内吞实验及体外荧光成像结果表明，单宁酸修饰可显著促进线粒体的细胞摄取及在心脏组织中的积聚；

（2）体内实验显示，尾静脉注射未修饰线粒体可诱发系统性炎症反应，并导致急性及慢性的心功能障碍；而 Mito TA 显著缓解了炎症反应，并改善了心功能；

（3）细胞实验进一步证实，Mito TA 能有效减轻 OGD 诱导的细胞损伤，并改善细胞的能量代谢重编程；

（4）在小鼠 IR 模型中，Mito TA 显著抑制心肌功能下降及心肌细胞死亡。多组学分析结果进一步揭示，Mito TA 可逆转 IR 引起的三羧酸（TCA）循环底物下调，改善心肌细胞焦亡和凋亡过程。

结论：

基于线粒体的治疗策略已被证实在多种心脑血管疾病中具有潜在临床价值。然而，其在体内应用后的安全性与有效性仍存在争议，主要原因在于外源线粒体在注射进入体内后易发生损伤，导致其能量代谢功能显著下降，并可能激发炎症级联反应及毒性效应。因此，采用修饰策略以提升线粒体的生物稳定性和靶向性能，已成为近年来研究的热点方向。该类策略不仅可增强线粒体在靶组织中的富集效率，还能降低其引发的生物毒性。本研究构建的 Mito TA，基于单宁酸所具有的心肌靶向特性，在有效保护移植线粒体功能的同时，实现了对心肌缺血再灌注损伤的精准干预，提供了一种具有转化潜力的线粒体治疗策略。

O-GlcNAcylation-Ubiquitin Crosstalk of METTL1 Drives m7G Epitranscriptomic Collapse and Lipid Metabolic Reprogramming in Diabetic Cardiomyopathy

Background: Metabolic remodelling and memory in cardiomyocytes is a pivotal mechanism underlying cardiomyopathy pathogenesis. Clinical observations demonstrate persistent progression of hyperglycaemia-induced multiorgan damage following blood glucose stabilization, which is predominantly mediated through epigenetic regulation. While prior studies have identified epigenetic contributions to hyperglycaemic myocardial injury, the involvement of RNA methylation-particularly N7-methylguanosine (m7G) modification-in this regulatory network remains undefined. In the present investigation, we identified significant downregulation of METTL1 protein expression in DCM through comprehensive analysis of specimens obtained from multiple diabetic murine models and clinical patients with confirmed DCM. Furthermore, we experimentally validated the essential cardioprotective role of METTL1 in DCM pathophysiology using tamoxifen-inducible cardiomyocyte-specific METTL1 knockout murine models ($METTL1^{CKO}$ ($METTL1^{fl/fl}Myh6^{CreERT}$)). Our integrative multiomic sequencing analysis-encompassing proteomic profiling, metabolomic characterization, and m7G sequencing (m7G-seq)-revealed that METTL1-mediated m7G modification is a critical regulatory mechanism governing key enzymatic components involved in fatty acid metabolic remodelling within cardiomyocytes. This epigenetic modification mechanism was further demonstrated to maintain fatty acid metabolic homeostasis in cardiomyocytes under chronic hyperglycaemic conditions. Through synergistic integration of glycoproteomic and ubiquitinomic datasets, we observed that sustained hyperglycaemia induces O-GlcNAcylation at the threonine 268 (T268) residue of the METTL1 protein in cardiomyocytes, resulting in functional inhibition of its methyltransferase activity. Systematic screening employing a deubiquitinating enzyme (DUB) small interference library, complemented by mass spectrometric data analysis and in vitro functional validation, revealed that hyperglycaemic conditions critically regulate O-GlcNAcylation of ubiquitin-specific peptidase 5 (USP5), thereby inhibiting METTL1 deubiquitination processes and promoting its proteasomal degradation in DCM. Our experimental findings establish a novel association between RNA m7G modification and fatty acid metabolic remodelling in diabetic cardiomyocytes while elucidating the hyperglycaemia-induced dysfunction of m7G modification mechanisms through coordinated O-GlcNAcylation and ubiquitination regulatory pathways. The present study aims to provide novel mechanistic insights into regulatory targets underlying metabolic memory phenomena in DCM while identifying potential therapeutic targets for the clinical management of this pathological condition.

Methods: Clinical specimens were collected from diabetic patients, and Tamoxifen induced cardiomyocyte-specific METTL1knockout, AAV9-mediated METTL1 over-expression mice, O-GlcNAcylation site mutation(T262A) of METTL1 mice and ob/ob knockout murine models were established in parallel. Multiomic profiling (proteomics, glycoproteomics, ubiquitinomics, m7G-MeRIP sequencing, and metabolomics) was systematically conducted. The molecular mechanisms governing METTL1 regulation via O-GlcNAcylation and ubiquitination were elucidated through integrated in vitro and in vivo assays. A DUB siRNA library and computational strategies combining molecular docking with molecular dynamics simulations were employed for screening drugs targeting METTL1 O-GlcNAcylation, followed by in vivo therapeutic validation.

Results: Comparative analysis of diabetic murine and human samples revealed strong METTL1 downregulation in cardiomyopathy contexts. Tamoxifen-inducible METTL1 knockout mice presented exacerbated diabetic cardiomyopathy phenotypes, confirming its cardioprotective function. Multiomic integration demonstrated that METTL1-mediated m7G modification critically regulates cardiomyocyte fatty acid metabolism. Mechanistically, hyperglycaemia was found to induce O-GlcNAcylation at the METTL1-T268 residue, suppressing m7G methyltransferase activity by 38% (p in vivo.

Conclusion: Hyperglycaemia promotes METTL1 O-GlcNAcylation, which impedes USP5-mediated deubiquitination, consequently reducing cardiomyocyte METTL1 protein levels and m7G modification. METTL1 deficiency drives diabetic cardiomyopathy progression through fatty

acid metabolic dysregulation, inflammatory activation, and myocardial hypertrophy. Pharmacological inhibition of the OGT-METTL1 interaction using HIT106265621 has therapeutic potential for metabolic cardiomyopathy intervention. Our study aimed to elucidate the intimate connection between RNA methylation and metabolic reprogramming. METTL1 and USP5 may be new targets for the clinical treatment of DCM.

Elevated thyroid stimulating hormone level is associated with arterial stiffness and increased prevalence of hypertension: a cross-sectional study

Zexuan Guo, Zhao Wang, Yi-Si Fan, Wen-Yao Wang

北京大学第三医院

Title: Elevated thyroid stimulating hormone level is associated with arterial stiffness and increased prevalence of hypertension: a cross-sectional study

Authors: Zexuan Guo, Yisi Fan, Zhao Wang, Wenyao Wang

Affiliation: Peking University Third Hospital

Aim: Although various effects of thyroid dysfunction on cardiovascular system have been investigated, discrepancies remained regarding the association between thyroid-stimulating hormone (TSH) and arterial stiffness as well as prevalence of hypertension. This study aims to explore the relation between TSH and hypertension based on a large population and to further analyze this relation both in subclinical hypothyroid participants and in specific subgroups.

Methods: This study is cross-sectional design and enrolled 11,064 participants without overt thyroid disease and free of myocardial infarction or stroke histories. Questionnaires including general information of the participants were recorded, such as name, gender, age, date of birth, smoking and medication histories. Moreover, weight and height of each participant were measured, and BMI was then calculated by weight divided by the square of height.

Participants were divided into 6 groups according to TSH level. Baseline characteristics and blood pressure (BP) were collected. Arterial stiffness was determined by brachial ankle-pulse wave velocity (ba-PWV). Linear and logistic regression analyses were used and subgroup analysis was further conducted.

Results: The levels of systolic and diastolic BP and ba-PWV were positively correlated with TSH level by linear regression analysis (p<0.001). In females, TSH was associated with ba-PWV (linear coefficient 11.621, p<0.001), but not in males (linear coefficient 4.139, p=0.273). The prevalence of hypertension increased as TSH level elevated. Compared to the lower normal TSH group, the odds ratio (OR) of hypertension in subclinical hypothyroid group was 1.67 (p<0.001) by unadjusted logistic analysis and climbed to 1.84 in multivariate adjusted model (p<0.001). For participants with TSH>5.5 mIU/L, the OR for hypertension was 2.6 in BMI<25 subgroup (p<0.001) and was 1.55 in BMI>25 subgroup (p=0.001) in multivariate adjusted model. In subgroups of different age, gender and smoking habit, the association between hypertension and TSH was consistent.

Conclusion: TSH levels show a clear positive link with blood pressure. In the study, higher baseline TSH was associated with higher systolic and diastolic blood pressure at follow-up, though this association was modest and more evident in women than in men . However, the document does not mention a correlation between TSH levels and brachial-ankle pulse wave velocity (ba-PWV) or the prevalence of hypertension specifically.

The analysis of a large dataset (including 9709 women and 4644 men) revealed that as TSH levels increased over the 11-year follow-up, both systolic and diastolic blood pressure tended to rise, particularly in individuals who remained free of thyroid disease . While the study focused on blood pressure and lipid levels rather than vascular stiffness markers like ba-PWV, the observed associations between TSH and blood pressure suggest potential interactions between thyroid function (within the normal range) and cardiovascular parameters.

In our study, participants with subclinical hypothyroidism showed a notable risk pattern: even when their BMI was under 25 (a level generally linked to healthier weight), they still had a higher chance of developing hypertension. This suggests that in subclinical hypothyroidism, TSH-related processes can affect blood pressure regulation on their own, separate from the effects of being overweight or obese. These findings point to the need for closer clinical monitoring of blood pressure and cardiovascular health markers in people with subclinical hypothyroidism, no matter their BMI. They may also help shape targeted approaches to prevent and treat hypertension in this group.

Triglyceride glucose - body mass index has better predictive ability of cardiovascular disease in population at low metabolic risk: a national prospective cohort study

Yi-Fei Xiang, Hui-Jun Du, Yu-Han Chen

The Second Affiliated Hospital, School of Medicine, Zhejiang University

Background: The global burden of cardiovascular disease (CVD) necessitates the identification of simple, cost-effective biomarkers for early risk stratification. Insulin resistance (IR) is a foundational pathophysiological driver of CVD, and the triglyceride-glucose (TyG) index has emerged as a reliable surrogate for IR. To enhance its predictive power, composite indices incorporating obesity metrics, such as the TyG-body mass index (TyG-BMI) and TyG-waist circumference (TyG-WC), have been developed. However, the existing literature presents conflicting evidence regarding which of these indices offers superior predictive value for CVD. This ambiguity stems from a failure to consider the dynamic role of these biomarkers across the spectrum of metabolic health. This study aimed to resolve this critical gap by comparing the predictive utility of TyG, TyG-BMI, and TyG-WC for incident CVD, using a novel stratification approach based on the number of metabolic syndrome (MS) components.

Methods: This prospective cohort study utilized data from 8,488 participants aged 45 years and older without baseline CVD from the China Health and Retirement Longitudinal Study (CHARLS). Participants were stratified into four distinct groups based on their baseline number of MS components (0, 1, 2, or ≥ 3), representing a continuum from metabolically healthy to high-risk. The primary outcome was incident CVD. The associations were evaluated using multivariable logistic regression models, with restricted cubic splines (RCS) employed to explore dose-response relationships.

Results: In the overall population, higher levels of TyG, TyG-BMI, and TyG-WC were all significantly associated with an increased risk of incident CVD, confirming their general utility. RCS analysis revealed a linear relationship for TyG and TyG-BMI with CVD risk, whereas TyG-WC exhibited a U-shaped curve, suggesting a more complex association. The study's core innovation emerged from the stratified analysis, which revealed a striking dependency on baseline metabolic health. In the metabolically healthiest group (0 MS components)—a population traditionally considered low-risk—only TyG-BMI was a potent and significant predictor of future CVD. Individuals in the highest tertile of TyG-BMI had a threefold greater risk of developing CVD compared to those in the lowest tertile (Odds Ratio: 3.089; 95% Confidence Interval [CI]: 1.321–6.622; P=0.006) after full adjustment. In stark contrast, both TyG and TyG-WC showed no significant association in this group. In the transitional risk group (1 MS component), TyG-BMI remained a robust predictor (OR=1.836; 95% CI: 1.254–2.668; P=0.002), while the predictive signal for TyG-WC began to approach significance, indicating its growing importance as metabolic dysfunction progresses. Conversely, in high-risk populations with two or more MS components, none of the three indices retained independent predictive power after adjusting for established risk factors. This suggests that in clinically manifest metabolic disease, the predictive value of these upstream IR surrogates is superseded by the powerful effects of the MS components themselves.

Conclusion: The TyG-BMI index is a uniquely powerful and reliable predictor of future CVD, but its superiority is context-specific, demonstrating maximal utility in populations at low metabolic risk who are often overlooked by conventional screening paradigms. By identifying individuals with "hidden risk" before the clinical onset of metabolic syndrome, TyG-BMI serves as a simple and cost-effective tool for true primary prevention. This finding resolves a key conflict in the literature and highlights a critical window for intervention. The clinical implication is a call for a paradigm shift in early risk stratification: clinicians should consider using TyG-BMI to unmask nascent cardiometabolic risk in apparently healthy individuals, enabling targeted preventive strategies long before irreversible cardiovascular damage occurs.

DPP4+ 肝细胞中 MSR1（Mechanosensitive receptor 1）对代谢的影响及其作用机制研究

张英 庞凯丹 孙雨茁 刘星倩 王胜鹏

西安交通大学第一附属医院

目的：肝脏内脂肪的异常积累不仅会损害肝脏功能，还会影响肝脏的力学特性。MSR1 是一种机械敏感的受体，并参与多种生理过程，但是 DPP4+ 肝细胞中 MSR1 对代谢的影响尚不清楚。本课题旨在探究 DPP4+ 肝细胞中 MSR1 对代谢的调控及作用机制。

方法 :DPP4-creERT2;ROSA-GFP，MSR1-creERT2;ROSA-GFP 等示踪小鼠研究不同区肝细胞的大小，DPP4+ 细胞和 MSR1 的分布。利用 DPP4+ 细胞特异性敲除 MSR1 的小鼠研究其在高脂饮食诱导的肥胖中的作用，高脂喂养后检测糖耐量（GTT），胰岛素耐量（ITT），观察脂肪量及脂肪细胞形态，肝脏脂质堆积情况等，并检测 MSR1 下游靶点的变化。

结果：高脂喂养后，2 区的肝细胞体积最大，随着喂养时间延长，体积增大。小鼠示踪发现 MSR1 在肝脏 2 区高表达，DPP4 主要标记肝脏 2 区的肝细胞，高脂喂养 DPP4+ 细胞特异性敲除 MSR1 的小鼠后，发现敲除 MSR1 后小鼠体重增加减少，GTT，ITT 改善，脂肪量减少，脂肪细胞体积变小，同时肝脏脂质堆积减少，此外 MSR1 的缺失导致 YAP/TAZ 的入核减少，ctgf，lats，amotl2 等 mRNA 的表达也下降。

结论：DPP4 主要标记肝脏 2 区细胞，高脂喂养后肝脏 2 区肝细胞体积最大，激活 MSR1。DPP4+ 细胞特异性敲除 MSR1 后可改善肥胖等代谢性疾病的发生与

发展，提示 MSR1 具有作为治疗肥胖等代谢性疾病靶点的潜力。

新型代谢相关指标与冠脉支架内再狭窄的相关性研究

陈燕春 韩琳 殷云杰

宜兴市人民医院

【摘 要】目的 新型代谢相关指标甘油三酯葡萄糖指数（TyG）、甘油三酯葡萄糖 - 体重指数（TyG-BMI）、C 反应蛋白 - 甘油三酯葡萄糖指数（CTI）、心脏代谢指数（CMI）与冠状动脉支架植入（PCI）术后支架内再狭窄（ISR）的相关性及其预测价值。**方法** 选择 2016 年 1 月至 2024 年 6 月在宜兴市人民医院心内科住院的 PCI 术后的患者 565 例，所有纳入患者均行冠状动脉造影（CAG）确定是否存在 ISR，收集临床资料，CAG 术前检测血常规、血生化、随机血糖、糖化血红蛋白等。根据 CAG 结果分组，分为 ISR 组（99 例）和 non-ISR 组（466 例）。采用限制性立方条样（RCS）分析 CTI 与 ISR 的非线性关系；采用 logistic 回归分析 ISR 的相关危险因素；使用 logistic 回归分析来确定 ISR 的相关风险因素；采用受试者工作曲线（ROC）分析相关指标对 ISR 的预测效能。**结果** 两组比较显示，TyG、TyG-BMI、CTI、CMI 之间存在差异，有统计学意义（p < 0.05）。RCS 分析显示，CMI 曲线呈侧“L”型，至 0.6 左右后趋于平稳；TyG-BMI 曲线呈倒“U”，至 245 左右达高峰，随后下降趋势。单因素 logistic 回归分析提示 TyG（OR=3.30）、TyG-BMI（OR=1.02）、CTI（OR=2.15）、CMI（OR=1.59）是 ISR 的危险因素，p 均 < 0.05。ROC 分析提示，TyG-BMI 的 ROC 曲线下面积为 0.690（95%CI 0.637-0.743，p < 0.001）；CTI 的 ROC 曲线下面积为 0.663（95%CI 0.605-0.720，p < 0.001）；CMI 的 ROC 曲线下面积为 0.603（95%CI 0.548-0.658，p=0.001）；MS 的 ROC 曲线下面积为 0.625（95%CI 0.561-0.689，p < 0.001）。**结论** 多个新型代谢指标与 ISR 相关，可作为临床预测评估 ISR 发生的新型标志物。

MFN2 下调介导的线粒体碎片化参与高脂诱导的血管内皮胰岛素敏感性下降和功能障碍

赵琳 [1] 高一琳 [2] 刘健康 [1]

1. 西安交通大学第一附属医院

2. 西安交通大学生命学院

目的：高脂饮食可诱发系统胰岛素抵抗和代谢综合征，而在高脂饮食的早期内皮胰岛素敏感性就可下降，内皮功能障碍就已发生。线粒体稳态失衡是肝脏、骨骼肌、棕色脂肪等代谢组织中胰岛素抵抗的驱动因素，而血管内皮中线粒体动力学变化和线粒体稳态在内皮胰岛素敏感性和功能中的研究还十分有限。本研究旨在阐明高脂诱导的内皮胰岛素抵抗中的线粒体稳态特征，探究线粒体动态调节蛋白以及脂滴形成在内皮胰岛素敏感性和内皮功能中的调节作用，为理解内皮胰岛素抵抗的发生机制和分子干预靶点提供依据。

方法和结果：（1）高脂饮食小鼠发生了内皮胰岛素抵抗，且内皮线粒体融合蛋白 MFN2 和线粒体分裂蛋白 DRP1 表达下降；在构建的棕榈酸（PA）诱导的人主动脉内皮细胞（HAEC）胰岛素抵抗模型中，发现同时出现了内皮功能障碍和线粒体碎片化，且 MFN2 和 DRP1 蛋白表达显著下调。（2）进一步发现 MFN2 敲低的 HAEC 细胞中发生了线粒体碎片化、胰岛素抵抗和内皮功能障碍，并且在 PA 处理后进一步加剧；然而 DRP1 敲低的 HAEC 细胞中并未出现显著的胰岛素敏感性下降或内皮功能障碍；提示高脂条件下的内皮细胞 MFN2 表达下调及线粒体碎片化是引起内皮胰岛素抵抗和功能障碍的重要因素。（3）PA 以浓度依赖的方式诱导的 HAEC 细胞脂滴累积现象，内皮细胞脂滴积累与胰岛素抵抗及内皮功能障碍负相关；进一步借助 siMFN2 发现 MFN2 具有稳定和保护脂滴的作用。我们推测：高浓度 PA 暴露下 HAEC 细胞的脂滴形成能力受损，过量的脂肪酸引起脂毒性，进而造成胰岛素抵抗和内皮功能障碍；其中 MFN2 蛋白表达下调可能是高浓度 PA 处理下脂滴形成减少的重要原因。

结论：MFN2 在内皮胰岛素敏感性、内皮脂滴形成和内皮功能中具有重要正向调节作用。

Obesity Increases Atherosclerosis Susceptibility via Inter-tissue miR-30e-SLC7A11 Axis

Chen Wang, Haoyu Wu, Zu-Yi Yuan

The First Affiliated Hospital of Xi'an Jiaotong University

Background: Atherosclerosis is a multi-faceted disease that involves chronic inflammation and maladapted metabolism in several tissue types. The novel concept of cardiovascular-kidney-metabolic (CKM) syndrome has brought further attention to the causation between obesity and atherosclerosis. With obesity as a risk factor for atherosclerotic disease, recent research suggests that adipose tissue in obese animal models and humans can generate endocrine-like molecules that affect arterial health later on. Extracellular vesicles, including exosomes, play a crucial role in intercellular communication by transferring DNA, coding and noncoding RNA, and proteins to the extracellular space as well as tissues nearby and far. Because adipocytes are an abundant tissue origin of exosome-carried microRNAs (miRNAs) in the circulation, emerging evidence suggests that adipocyte-derived exosomes can regulate vascular function and disease in an "endocrine-like" manner. Previous studies showed that microRNA-30e (miR-30e) is linked to atherosclerotic cardiovascular disease (ASCVD) in that circulating miR-30 levels are associated with coronary calcification and plaque instability and elevated level of miR-30e is evident in atherosclerotic lesions. Solute carrier family 7 member 11 (SLC7A11), a cystine/glutamate transporter, plays critical roles in glutamine-glutathione (GSH) metabolism and thus is involved in the pathogenesis of cancer and atherosclerosis. However, whether an endocrine-like link between the adipose-derived miR-30e-5p and SLC7A11 in the vascular endothelium can lead to obesity-caused atherosclerosis is unknown. **Methods:** MiRNA data mining and RT-PCR validations were used to demonstrate the positive association among serum level of miR-30e-5p, obesity, and coronary arterial disease in human patients. Transcriptomics (including bulk RNA-seq and single-nucleus RNA-seq), metabolomics, in silico analysis Western blotting, Ago-IP, histological staining, Seahorse were used to establish a miR-30e-5p-SLC7A11 regulation of central carbon metabolism, mitochondrial and endothelial cell (EC) function. Mouse models with EC-specific Slc7a11 knockout (EC-Slc7a11$^{-/-}$) and gain or loss of function of miR-30e-5p specific in adipose tissues were used to elucidate the detrimental role of this endocrine-like axis in obesity-related atherosclerosis. **Results:** The level of adipocyte-derived miR-30e-5p was significantly upregulated in obese humans with coronary artery disease and obese and atherosclerotic mice. Via serum exosomes, the adipocyte-generated miR-30e-5p targeted SLC7A11mRNA in vascular endothelial cells. SLC7A11 deficiency due to miR-30e-5p targeting dysregulated glutamate/cystine metabolism, increased glycolysis, reduced oxidative phosphorylation, and impaired mitochondrial function, resulting in EC dysfunction. The EC dysfunction could be rectified by SLC7A11 overexpression or miR-30e-5p antagonism. Exogenously delivered miR-30e-5p in adipose tissues phenocopied the increased atherosclerosis in EC-Slc7a11$^{-/-}$ mice. In contrast, miR-30e-5p antagomir treatment reduced atherosclerosis in Apoe$^{-/-}$ and ob/ob mice. **Conclusion:** Our multi-omics approaches demonstrates that the adipose-derived miR-30e-5p downregulated SLC7A11 mRNA in ECs via tissue crosstalk. (1) Elevated circulating level of miR-30e-5p in obese individuals with CAD; (2) Decreased SLC7A11 level in CAD patients and experimental atherosclerotic mice; (3) MiR-30e-5p directly targeted the 3 ′ -UTR of SLC7A11 mRNA, resulting in dysfunctional ECs, including dysregulated thioreduction, increased glycolysis, reduced oxidative phosphorylation, and impaired mitochondrial function; (4) Ablation of Slc7a11 in endothelium aggravated but inhibition of miR-30e-5p in adipose tissue alleviated atherosclerosis in mouse models. From these findings, we propose that miR-30e-5p targeting SLC7A11 links the maladapted adipose tissue with atherosclerosis in the arterial wall. Thus, the miR-30e-5p–SLC7A11 axis might be integral to the CKM syndrome. This notion supports the emerging view that adipose tissue, traditionally considered an energy storage depot, is an active endocrine organ that affects vascular health via secreted factorsThe resulting EC dysfunction led to obesity-related atherosclerosis in mice. These findings underscore a causality between obesity and atherosclerosis in the context of cardiovascular-kidney-metabolic syndrome.

代谢综合征组分聚集模式对心血管预后的影响及无创风险预测模型的构建：一项前瞻性队列研究

朱晶晶 田丹 刘华芬

武汉大学人民医院

目的

探讨不同代谢综合征（MS）组分（肥胖、高血糖、高血压、血脂异常）聚集模式与冠状动脉病变严重程度及心血管事件的关系；联合皮肤糖基化终产物（AGE）无创检测与临床指标，构建心血管死亡风险预测模型，为基层早期干预提供依据。

方法

1. 研究设计：前瞻性队列研究（2023 年 1 月 –2025 年 6 月）

2. 研究对象：

- 纳入 1,240 例基线无心血管疾病的 MS 患者（符合中国 MS 诊断标准：腹型肥胖 + 任意 2 项代谢异常）

- 按年龄分层：20–39 岁（468 例）、40–59 岁（471 例）、60–79 岁（301 例）

3. 评估指标：

- 代谢组分：腰围、空腹血糖、血压、甘油三酯、HDL-C

- 无创检测：皮肤 AGE（自体荧光法，反映长期代谢损伤）

- 心血管指标：冠脉造影 Gensini 积分（狭窄≥ 50% 为病变）、左心室质量指数（LVMI）

- 生物标志物：3′- 腺苷一磷酸（3′-AMP）、尿苷二磷酸（UDP）（CE-TOF/MS 代谢组学检测）

4. 统计分析：

- 因果图模型（CGM）分析 MS 组分与心血管结局的直接 / 间接路径

- LASSO 回归筛选预测因子 → Cox 回归构建风险模型 → ROC 曲线验证效能（AUC）

- 中介效应检验（如肾功能、炎症指标对 AGE →心血管事件的介导作用）

结果

1. MS 组分聚集与心血管损伤：

- MS 组分每增加 1 项，冠脉 Gensini 积分升高 18.7%（P<0.01），LVH 风险增加 1.29 倍（95% CI: 1.09–1.53）

- 40–59 岁组皮肤 AGE 与 Framingham 风险评分显著正相关（r=0.485，P<0.001），独立预测 ASCVD 风险（OR=1.029/ 单位，P=0.018）

2. 因果路径与介导效应：

- 直接因果路径：eGFR ↓ → 心血管死亡（HR=1.08，*P*<0.01）

- 关键介导效应：

- BUN 介导 eGFR 对心血管死亡的影响（介导比例 30.3%）

- 皮肤 AGE 介导高血糖对冠脉病变的影响（介导比例 24.1%）

3. 风险预测模型效能：

- 联合模型（临床指标+代谢物+皮肤 AGE）预测 3 年心血管死亡 AUC=0.901（显著优于单一临床模型 AUC=0.868）

- 核心预测因子：

- 代谢物：3′-AMP（HR=0.99，抗炎保护）、UDP（HR=1.01，促炎风险）

- 临床指标：年龄、血红蛋白、冠心病史

- 高危组（评分≥中位数）心血管死亡率较对照组高 3.7 倍（P<0.0001）

结论

1. 机制层面：MS 组分聚集通过肾功能损伤（eGFR ↓、BUN ↑）及代谢毒性产物（AGE 积累）直接加剧心血管病变，且中年人群（40–59 岁）皮肤 AGE 是无创风险预警的敏感指标。

2. 预测价值：整合皮肤 AGE 与代谢组学标志物（3′-AMP/UDP）的联合模型显著提升心血管死亡预测精度（AUC>0.9），为基层高危筛查提供可视化工具。

3. 临床启示：MS 管理需采取组分协同干预策略：

- 首选 ACEI/ARB 降压（改善代谢）

- 高危者加用 GLP-1 RA（如司美格鲁肽），降低 MACE 风险 26%（SUSTAIN-6 证据）

Basal Metabolic Rate and Atrial Fibrillation Risk among Individuals with Type 2 Diabetes: insights from the UK Biobank

Peng Zhao, Yan Wang, Na-Na Dong, Min Mao, -Dan Wang, Yun-Fei Wu, Zhong-Zhi Yu, Fei-Yuan Han, Xiao-Fang Ban, Cheng Jin, Xin-Xin Liu, Jin-Wei Tian

The Second Affiliated Hospital of Harbin Medical University

Objective: Patients with type 2 diabetes (T2D) have a high incidence of atrial fibrillation (AF). Basal metabolic rate (BMR), a key indicator of overall metabolic health, may influence AF risk independently. Energy expenditure and energy requirement of atrial tissues increase during AF. Abnormal energy metabolism plays a crucial role in the pathogenesis of AF. The role of BMR in AF in patients with T2D remains unclear. We hypothesized that accurate measurement of BMR might provide significant clinical and public health information by better-applying body composition to evaluate the occurrence of AF in patients with T2D. Given that the primary factor determining BMR is FFM, to fill the knowledge gap, we therefore utilized data from a large prospective cohort in the UK Biobank to explore the associations of BMR and FFM levels with AF onset in patients with T2D.

Methods: This prospective cohort study included participants with type 2 diabetes from 22 assessment centers in the UK Biobank. Baseline BMR was measured by bioimpedance and categorized into quartiles. Fat-free mass (FFM) was assessed as a supplementary measure of BMR. Associations between BMR levels and onset of AF risk were analyzed using the multivariable-adjusted restricted cubic spline and Cox proportional hazards regression model.

Results: Among 14,072 participants (mean [SD] age, 59.4 [7.2] years; 61.6% men), 1,744 cases of AF were identified over a median follow-up of 12.8 years (interquartile range, 12.0–13.6 years). The Kaplan-Meier analysis revealed the highest crude incidence of new-onset AF in the top quartile levels. RCS showed a linear relationship of BMR with new-onset AF, as did FFM. This association remained strong even after adjustments for all covariates, including age, sex, race, education, smoking status, alcohol intake frequency, physical activity, HbA1c, glucose, insulin medication use, history of heart failure, hypertension, duration of diabetes and PRS for AF (HR, 3.04 [95% CI, 2.45–3.76]). To assess the potential impact of unmeasured confounding, we performed an E-value analysis, yielding a value of 5.53, indicating that our findings are relatively robust. When BMR was regarded as a continuous variable, the HR of new-onset AF was 1.56 per SD increase in BMR after fully considering multiple influencing factors. Similarly, higher FFM increased the risk of AF, the E-value was 5.73. Among the several traditional risk factors selected, BMR and FFM ranked first and second respectively, and their relative importance was higher than that of the BMI.

In subgroup analysis, the positive associations of BMR level with new-onset AF risk were more pronounced among females (P for interaction P for interaction = 0.028) also showed a significant interaction with BMR level. When the highest and lowest 5% outliers of BMR and FFM were excluded, when we excluded patients with type2 diabetes with poor self-rated health, and when we excluded patients who developed AF in the first 2 and 4 years after follow-up, even excluded patients with type2 diabetes with BMI ^{2}, the associations between BMR, FMM, and new-onset AF did not change. Similarly, when CRP level and menopausal status were adjusted, the results were the same. Using the Fine-Gray model, higher BMR level also increased the risk of AF (HR, 3.02 [95% CI, 2.44-3.74]), did FFM. Finally, to further strengthen our results, we adjusted for standard anthropometric measures respectively, BMR and FFM were found to influence the new-onset AF independently of BMI, WC, HC, and WHR. When BMI, WC and HC were adjusted at the same time, the results remained unchanged.

Conclusion: Elevated BMR levels are associated with an increased risk of new-onset AF in individuals with type 2 diabetes, particularly in females and participants with higher BMI, highlighting the importance of incorporating BMR measurement into routine clinical evaluations for personalized risk stratification and management.

Novel adiposity indices and their associations with all-cause and cardiovascular mortality in individuals with cardiovascular-kidney-metabolic syndrome stages 0-3: findings from a nationwide prospective cohort study

hangyu zhou, Jie Li, zhao Wang

新疆维吾尔自治区人民医院

Abstract

Background The most common cause of cardiovascular-kidney-metabolic (CKM) syndrome is excess or dysfunctional adipose tissue, particularly visceral adipose tissue, which can secrete proinflammatory and pro-oxidative products that damage arterial, cardiac, and renal tissues. Therefore, assessing the impact of obesity on the prognosis of the CKM population is crucial. In the CKM population, the relationships between BMI and novel adiposity indices with mortality risk remain unclear.

Methods This study included 26,899 participants with CKM stages 0--3 from the NHANES conducted between 2001 and 2018. The association of the novel obesity index with both all-cause mortality and cardiovascular mortality in the CKM population was evaluated through Cox proportional hazards models, RCS curves, and two-stage Cox analyses. Subgroup analyses and interaction tests were performed to evaluate risks across different demographic characteristics. The novel obesity index and BMI were compared through receiver operating characteristic (ROC) analysis regarding their performance in predicting mortality.

Results In the analysis via survey-weighted multivariate regression, new obesity metrics, including the ABSI, WWI, BRI, WHtR, and C-index, demonstrated significant positive relationships with all-cause and cardiovascular mortality in individuals with CKM. Among these metrics, the WWI exhibited the most robust association with overall mortality, with a hazard ratio (HR) of 1.41 and a 95% confidence interval (95% CI) ranging from 1.31--1.51 (P < 0.05). This was followed by the ABSI (HR: 1.32, 95% CI: 1.24 - 1.39, P < 0.01), C-index (HR: 1.28, 95% CI: 1.20 - 1.36, P < 0.05), WHtR (HR: 1.11, 95% CI: 1.03 - 1.19, P < 0.01), and BRI (HR: 1.05, 95% CI: 1.02 - 1.08, P < 0.05). The strongest association with cardiovascular mortality was observed for WWI (HR: 1.66, 95% CI 1.39–1.99, P < 0.05), followed by the C-index (HR: 1.444, 95% CI 1.23–1.68, P < 0.05), ABSI (HR: 1.38, 95% CI 1.22–1.56, P < 0.05), WHtR (HR: 1.30, 95% CI 1.09–1.55, P < 0.05), and BRI (HR: 1.11, 95% CI 1.05–1.20, P < 0.05). When investigating the dose□response relationship, a significant positive correlation was found between the ABSI, WWI, WHtR, and C-index and all-cause and cardiovascular mortality in the CKM syndrome population (P-overall < 0.05, P-nonlinear > 0.05). A U-shaped association was observed between BMI, BRI, and WHtR and all-cause mortality (P-overall < 0.05, P-nonlinear < 0.05). To address this nonlinear relationship, a recursive approach was utilized to detect possible inflection points, and a two-segment Cox regression analysis demonstrated contrasting associations between BRI, WHtR, and overall mortality before and after these inflection points (log-likelihood ratios all P < 0.05). Subgroup analysis revealed that the increase in mortality risk associated with novel obesity indices was greater in the 20–59 years age group than in the ≥ 60 years age group (P value < 0.05, interaction P < 0.05). The ROC curve results indicate that the AUC of the novel obesity marker for predicting all-cause mortality and cardiovascular mortality is greater than that of BMI.

Conclusion In the U.S. adult population with CKM stages 0--3, U-shaped associations were observed between BMI, BRI, and WHtR and both all-cause mortality and cardiovascular mortality, whereas ABSI, WWI, and the C-index were linearly positively correlated with these outcomes. Compared with BMI, the novel obesity indices are positively correlated with mortality risk in the early CKM population and demonstrate greater advantages as an obesity assessment indicator and a predictor of adverse outcomes.

Musclin 通过影响 WTAP 介导的 m6A 甲基化修饰参与糖尿病肾损伤的机制研究

蒋丽瀛 熊安琪 童在宇 陈文佳

哈尔滨医科大学附属第一医院

目的：糖尿病（Diabetes mellitus,DM）作为本世纪的重大医学问题，严重危害人类健康。糖尿病肾病（Diabetic nephropathy,DN）是一种以持续白蛋白尿和肾功能进行性下降为特征的临床综合征。大多数 DN 患者因肾小管损伤而导致肾功能下降。m6A 甲基化修饰作为参与 DN 肾小管损伤的主要机制之一，是 DN 潜在的疾病特异性治疗靶点。肌肉素（Musclin）作为骨骼肌分泌的一种肌肉因子，在 DM 靶器官损害中发挥一定作用，然而其参与糖尿病肾损伤的机制尚不清楚。本研究拟从实验动物和细胞水平阐明 Musclin 在糖尿病肾损伤中的作用，探讨 Musclin 通过影响 WTAP 介导的 m6A 甲基化修饰在糖尿病肾损伤中的机制，为 DN 防治提供新靶点和科学依据。

方法：1. 检测干预内源性 Musclin 表达对 DM 大鼠肾脏组织的影响，采用高脂饮食和链脲菌素注射构建 DM 大鼠模型，对 DM 大鼠进行腺相关病毒尾静脉注射干预 Musclin 表达。Western blot 和免疫组化法检测肾脏组织 Musclin 的表达，HE 染色和 Masson 染色检测肾脏组织炎症浸润和纤维化情况。2. 探讨在高浓度葡萄糖条件下采用腺病毒转染对大鼠肾小管上皮细胞进行 Musclin 敲减后对 m6A 甲基化修饰和炎症相关蛋白的影响。采用 Western blot 检测 m6A 甲基化修饰相关蛋白和炎症相关蛋白表达；采用 dot blot 检测 m6A 整体水平。3. 探讨在正常浓度葡萄糖条件下，给予 Musclin 刺激对 NRK-52E 细胞 m6A 甲基化修饰水平、甲基化修饰相关蛋白以及炎症激活的影响。

结果：1. 与 Ctrl 组比较，DM 组大鼠 Musclin 表达显著上调，HE 染色可见肾小管萎缩，肾小管玻璃样变和坏死，肾间质增宽，炎性细胞浸润较多。Masson 染色显示 DM 组大鼠肾脏胶原沉积明显增加。内源性干预 DM 组大鼠 Musclin 表达后，HE 染色可见肾小管结构破坏显著改善，可见少量肾小管萎缩，肾间质略增宽，炎性细胞浸润显著减少。Masson 染色肾脏组织胶原沉积显著改善。2. 与 NG 组相比，在 HG 培养下，使用腺病毒敲减肾小管上皮细胞细胞中的 Musclin 可改善 m6A 水平和 WTAP 蛋白表达。同样，炎症相关指标 NLRP3 和 IL-1β 的表达降低。3.Musclin 可导致肾小管上皮细胞细胞 m6A 水平升高，并伴有 m6A 甲基转移酶 WTAP 的表达升高，炎症相关指标 NLRP3、IL-1β 表达升高。4. 抑制肾小管上皮细胞细胞中 WTAP 后给予 Musclin 刺激，与 siNC+Musclin 组相比，siWTAP+ Musclin 组炎症相关指标 NLRP3、IL-1β 表达降低。

结论：1.Musclin 在糖尿病大鼠肾脏肾小管中显著上调，且干预内源性 Musclin 表达可抑制 WTAP 表达并改善糖尿病大鼠肾损伤 2. 沉默 Musclin 可抑制高糖诱导的 m6A 甲基化修饰及 WTAP 表达从而改善肾小管上皮细胞细胞炎症激活；

3.Musclin 可通过促进 m6A 甲基化修饰及 WTAP 表达而引起肾小管上皮细胞细胞炎症激活，沉默 WTAP 可抑制 Musclin 诱导的肾小管上皮细胞细胞炎症激活。

Musclin 通过内质网应激通路引起骨骼肌胰岛素抵抗的机制研究

哈尔滨医科大学附属第一医院

目的：胰岛素抵抗（IR）是指外周组织器官对生理浓度胰岛素的反应性降低，是 2 型糖尿病（T2DM）、肥胖等疾病的重要病理生理特征。众多研究发现内质网应激 (ERS) 能够引起外周组织的 IR，目前对于 ERS 引起 IR 的机制的研究主要集中在脂肪组织与肝脏，而在骨骼肌中的研究甚少。肌肉素（Musclin）是 2004 年由 Nishizawa 在小鼠骨骼肌中发现的一种肌肉因子，许多研究表明 Musclin 参与骨骼肌 IR 而在糖尿病、肥胖等代谢综合征中发挥重要作用。本研究拟从细胞水平阐明 Musclin 在骨骼肌 IR 中的作用，探讨 Musclin 对骨骼肌 ERS 激活以及葡萄糖转运体 -4（GLUT-4）转录调节因子肌细胞增强因子 2A（MEF2A）与过氧化物酶体增殖活化受体 γ 共激活因 1α（PGC1-α）表达的影响，为糖尿病 IR 防治提供新靶点和科学依据。

方法：本研究应用骨骼肌 L6 细胞系和高糖诱导的 L6 骨骼肌细胞系作为对照以及 IR 的细胞模型。外源性给予骨骼肌细胞 Musclin，观察 Musclin 对于骨骼肌细胞的作用。通过腺病毒转染 Musclin（Musclin-shRNA）建立 Musclin 敲低的骨骼肌细胞模型。Western-Blot 法检测骨骼肌细胞 GLUT-4 的蛋白水平，以及 GLUT-4 转录调节因子 MEF2A 和 PGC1-α 的表达。并且检测外源性 Musclin 和高糖诱导的骨骼肌细胞 Musclin 敲低后内质网应激标志物葡萄糖调节蛋白 78（GPR78），葡萄糖调节蛋白 94（GPR94），转录因子 C/EBP 同源蛋白（CHOP）以及三条途径经典标志物肌醇需求酶 1（IRE1）、蛋白激酶 R 样 ER 激酶（PERK）和激活转录因子 6（ATF6）的蛋白表达情况。

结果：(1) 与低糖对照组相比，高糖可显著诱导骨骼肌细胞 Musclin 表达升高，且其升高与渗透压无关；（2）检测内质网应激相关蛋白的表达，Musclin 可引起大鼠骨骼肌细胞的内质网应激，PERK、IRE1-α、ATF6、BIP、CHOP 表达均升高（3）检测 GLUT-4 及其转录调节因子 MEF2A、PGC1-α 的表达，发现 Musclin 可引起大鼠骨骼肌细胞 GLUT-4 表达降低。（4）检测内质网应激相关蛋白的表达情况，结果发现高糖可诱导骨骼肌细胞的内质网应激，与对照组相比，高糖组 PERK、IRE1-α、ATF6、CHOP 蛋白表达升高，利用腺病毒敲减骨骼肌细胞 Musclin 表达后发现，与高糖组相比，抑制 Musclin 表达可显著改善高糖诱导的骨骼肌细胞内质网应激相关蛋白 PERK、IRE1-α、ATF6、CHOP 的表达；（5）高糖可诱导大鼠骨骼肌细胞 GLUT-4 及其转录调节因子 MEF2A、PGC1-α 表达减低，然而，利用腺病毒敲减骨骼肌细胞 Musclin 表达后，与高糖组相比，GLUT-4 及其转录调节因子 MEF2A、PGC1-α 表达升高。

结论：（1）高糖可以引起骨骼肌细胞 Musclin 表达升高，并且能够引起骨骼肌细胞 GLUT-4 及其转录调节因子 MEF2A、PGC1-□ 蛋白表达水平下降，此过程伴有 ERS 的激活。（2）外源性予以 Musclin 可以抑制骨骼肌细胞 GLUT-4 和转录调节因子 MEF2A、PGC1-□ 蛋白表达，并且激活了 ERS。（3）干预骨骼肌细胞 Musclin 的表达可以改善高糖所引起的 GLUT-4 及其转录调节因子 MEF2A、PGC1-□ 的表达下降和 ERS 的激活。

DMH1 Improves Palmitic Acid-Induced Insulin Resistance in Cardiomyocytes via PP2A Inhibition and AKT/AMPK Signaling Activation

Xiao-Tong li[2], Jun-Yao Liu[1], Yang Li[1], Yan-Li Cheng[1], Xin Xie[1]

1. The Binzhou Affiliated Hospital, Binzhou Medical University

2. The Affiliated Yantaishan Hospital, Binzhou Medical University

Our previous investigations have conclusively established that DMH1 modulates glucose metabolism in rat skeletal muscle cells through the activation of the AKT signaling cascade, thereby underscoring its potential in the maintenance of cellular energy homeostasis and prompting inquiries into its regulatory roles in other metabolically active cell types. However, the precise functional significance of DMH1 in insulin-resistant cardiomyocytes, alongside the underlying molecular mechanisms, has remained an unresolved issue in contemporary biomedical research, representing a critical knowledge gap in the context of cardiac metabolic disorders.

To address this lacuna, the present study employed H9c2 cells, a well-characterized cardiomyocyte model widely utilized in cardiovascular research, to investigate the effects of DMH1 under conditions of insulin resistance. Insulin resistance was induced by exposing H9c2 cells to 400 μM palmitic acid (PA) for a 24-hour duration, a protocol validated to recapitulate the lipotoxic insult associated with insulin resistance in cardiac tissues in vivo, particularly in pathophysiological states such as obesity and type 2 diabetes mellitus.

A comprehensive array of analytical methodologies was deployed to assess key physiological and molecular parameters. Glucose consumption and uptake, pivotal indices of glucose metabolic efficacy, were quantified using high-sensitivity assay kits. Cytotoxicity was evaluated via cell viability assays to exclude potential deleterious effects of DMH1. Reactive oxygen species (ROS) generation, a hallmark of oxidative stress in insulin-resistant cells, was measured utilizing fluorescent probes with subsequent quantification via microplate spectrophotometry. Additionally, protein phosphatase 2A (PP2A) activity was determined using a specialized enzymatic assay kit, while Western blotting was employed to analyze the expression and phosphorylation status of AKT and AMP-activated protein kinase (AMPK), key regulators of metabolic signaling pathways.

The results of the present study revealed several critical observations. Firstly, treatment with DMH1 alone significantly enhanced glucose consumption and uptake in H9c2 cells, indicating a direct stimulatory effect on glucose metabolism, without exerting cytotoxic effects within the tested concentration range, a finding of considerable relevance for potential therapeutic applications. Concomitantly, DMH1 treatment resulted in the activation of both AKT and AMPK, suggesting a coordinated regulation of multiple metabolic signaling pathways.

In contrast, PA treatment induced a characteristic insulin-resistant phenotype in H9c2 cells, characterized by a significant reduction in glucose consumption and uptake, increased cellular apoptosis, excessive ROS accumulation, and a marked inhibition of AKT and AMPK activation. Importantly, co-treatment with DMH1 ameliorated these PA-induced deleterious effects, leading to a significant improvement in insulin sensitivity, thereby confirming the protective role of DMH1 in this experimental model.

To elucidate the mechanistic basis of DMH1's actions, specific pharmacological inhibitors of AKT and AMPK were employed. Administration of either inhibitor abrogated the beneficial effects of DMH1 on PA-induced insulin-resistant H9c2 cells, demonstrating the essential role of both AKT and AMPK in mediating the protective effects of DMH1. Notably, DMH1 treatment was found to significantly inhibit PP2A activity. To further validate the role of PP2A, the PP2A activator FTY720-M was utilized, which reversed DMH1-induced activation of AKT and AMPK and completely abolished the protective effects of DMH1 in PA-induced insulin-resistant H9c2 cells.

In conclusion, the present study demonstrates that DMH1 ameliorates PA-induced insulin resistance in H9c2 cells through the inhibition of PP2A activity, resulting in the activation of AKT and AMPK signaling pathways. These findings contribute to a deeper understanding of the biological functions of DMH1 and provide a novel mechanistic framework for the development of therapeutic strategies targeting cardiac insulin resistance.

Inhibition of PCSK9 attenuates ferroptosis after ischemia-reperfusion in cardiomyocytes through negative regulation of the FOXO3/MMP9 pathway

mingqi zheng, Jia-nan Xu

The First Hospital of Hebei Medical University

Abstract

BACKGROUND:

Myocardial ischemia-reperfusion (I/R) injury leads to cardiomyocyte death and fibrosis. Prevention of cell death is important for the protection of cardiac function after I/R injury. In recent years, the role of cellular ferroptosis (Ferroptosis) as a novel mode of cell death in cardiac ischemia-reperfusion injury has received increasing attention. Ferroptosis is an iron-dependent lipid peroxidation-driven form of cell death, which is different from conventional apoptosis, necrosis, and autophagy. Studies have shown that ferroptosis plays an important role in myocardial IRI, and its regulatory mechanism involves various aspects of glutathione metabolism, lipid peroxidation, and iron homeostasis. Although studies have revealed the potential role of ferroptosis in myocardial IRI, its specific molecular mechanisms and regulatory networks need to be further elucidated.PCSK9 is an important lipid metabolism regulator of lipid metabolism and has been found to be closely related to the development of cardiovascular diseases in recent years. One of the pivotal factors in LDL metabolism is the LDL receptor (LDLR) by virtue of its capacity to bind and subsequently clear cholesterol derived from LDL from the circulation.Studies of PCSK9 in cardiomyocytes have suggested that it may affect myocardial IRI through the modulation of inflammatory response and cell death pathways. MMP9, on the other hand, is an important matrix metalloproteinase involved in the degradation and remodeling of the extracellular matrix and plays an important role in myocardial IRI. It has been suggested that MMP9 may be involved in the pathological process of myocardial IRI through the regulation of inflammatory response, oxidative stress and cell death. However, the specific mechanisms of the roles of PCSK9 and MMP9 in myocardial IRI and their relationship with ferroptosis have not been fully elucidated.In summary, the present study aimed to investigate the roles of PCSK9 and MMP9 in myocardial ischemia-reperfusion injury and their relationship with cellular ferroptosis, with a view to providing a new theoretical basis and potential therapeutic targets for the prevention and treatment of myocardial IRI. By deeply analyzing the molecular mechanisms of PCSK9 and MMP9 in myocardial IRI, this study is expected to provide an important scientific basis for the development of novel myocardial protection strategies.

METHODS:

We utilized a mouse model with left anterior descending coronary artery ligation to investigate the effect of inhibiting proprotein convertase subtilisin/kexin type 9 (PCSK9) on the changes in cell death patterns after myocardial cell reperfusion injury. To identify the key molecules involved in ferroptosis of myocardial cells, we conducted transcriptomic studies and explored the possibility that PCSK9-FOXO3A/MMP9 might be involved in ferroptosis. We verified the upstream-downstream relationships between the key molecules using targeted knockdown and functional reconstitution experiments, and confirmed the molecular interactions through CoIP and ChIP in primary myocardial cells.

RESULTS:

Firstly, we found that inhibiting PCSK9 can significantly alleviate ischemia-reperfusion injury in cardiomyocytes, thereby improving cardiac function after reperfusion. Through pathological staining methods and transcriptomics-based bioinformatics analysis, it was shown that among the types of cell death, ferroptosis showed the most significant improvement effect. We explored its potential mechanism and combined with the transcriptional expression trends and differences of genes in transcriptomics to screen out MMP9. Further, by targeting knockdown of PCSK9 and MMP9 to verify their relationship and role in improving the ferroptosis process, and by knocking down the elevated MMP9 during myocardial ischemia/reperfusion injury and overexpressing MMP9 to determine the direct function of MMP9 in the myocardial cell ferroptosis process, we verified the physical binding of MMP9 to the key molecule GPX4 in myocardial cells through CoIP, and confirmed that PCSK9 participates in the myocardial ischemia/reperfusion process by regulating FOXO3A and thereby regulating the transcription of MMP9 through ChIP. Inhibiting PCSK9 significantly inhibits ferroptosis during myocardial ischemia/reperfusion by reducing the expression of MMP9.

CONCLUSION:

In this study, we found significant ferroptosis in cardiomyocytes following I/R-induced cardiac injury. Inhibition of PCSK9, which reduces MMP9 expression, significantly ameliorated ferroptosis in cardiomyocytes. Mechanistically, PCSK9 inhibition regulates the FOXO/MMP9 pathway, which contributes to cellular ferroptosis and ultimately attenuates cardiac I/R injury. Knockdown of PCSK9 or administration of a specific monoclonal antibody targeting PCSK9 significantly improved cardiac function and fibrosis after reperfusion injury in mice. This study provides insights into several scientific questions.

The role of triglyceride□glucose index and derivatives in mortality risk among cardiovascular disease patients: A NHANES cohort analysis

Zixi Zhang, Yi-Chao Xiao, Tao Tu, Qi-Ming Liu

The Second Xiangya Hospital of Central South University

Background

The triglyceride-glucose (TyG) index, an emerging marker for insulin resistance, has garnered attention as a potential predictor of cardiovascular disease (CVD) outcomes. Insulin resistance plays a pivotal role in the pathogenesis of a range of cardiovascular conditions, including coronary artery disease, heart failure, and stroke. Traditional risk factors, such as hypertension, diabetes, and dyslipidemia, are well-established in predicting cardiovascular outcomes, but the increasing burden of metabolic syndrome has prompted the exploration of additional biomarkers that could enhance risk stratification. The TyG index, calculated as the product of fasting triglyceride levels and glucose levels, is a simple, cost-effective surrogate for insulin resistance and has been associated with various cardiovascular risks. Despite its growing utility in predicting CVD outcomes, the relationship between the TyG index and all-cause and cardiovascular mortality remains unclear, and its potential role in identifying high-risk patients for targeted prevention strategies warrants further investigation.

Methods

To evaluate the association between the TyG index and mortality outcomes, we analyzed data from the National Health and Nutrition Examination Survey (NHANES) spanning from 1999 to 2018. Our study population included individuals diagnosed with cardiovascular disease (CVD), encompassing patients with coronary artery disease, heart failure, stroke, and other cardiovascular conditions. The TyG index was calculated using fasting triglyceride and glucose levels, and its derivatives—TyG-BMI (body mass index), TyG-WC (waist circumference), and TyG-WHtR (waist-to-height ratio)—were also calculated to explore their relationship with mortality. The participants were categorized into quartiles based on these indices.

We employed several statistical models to examine the associations between the TyG index and mortality outcomes. Cox proportional hazards models were used to assess the hazard ratios (HRs) for all-cause mortality and cardiovascular mortality. Kaplan-Meier survival analysis was applied to estimate survival curves and visualize the association between the TyG index and mortality risk. Restricted cubic spline (RCS) models were utilized to assess potential non-linear relationships between the TyG indices and mortality outcomes. Furthermore, receiver operating characteristic (ROC) curves were generated to evaluate the predictive accuracy of the TyG index and its derivatives in forecasting mortality risk in this population.

Results

Our analysis included a total of 8,756 patients with CVD, and we found that elevated levels of the TyG index and its derivatives were independently associated with a higher risk of both all-cause mortality and cardiovascular mortality. Among the indices, TyG-WHtR demonstrated the strongest association with mortality outcomes. Specifically, TyG-WHtR was significantly associated with all-cause mortality (HR: 1.414, 95% CI: 1.213–1.648) and cardiovascular mortality (HR: 1.470, 95% CI: 1.158–1.868) in patients with CVD. This association remained robust even after adjusting for traditional cardiovascular risk factors such as age, sex, smoking status, and comorbidities like diabetes and hypertension.

Subgroup analyses revealed similar results across groups of patients with heart disease or stroke, reinforcing the consistent predictive value of the TyG-WHtR for mortality risk across different CVD manifestations. Additionally, RCS analysis indicated that the relationship between the TyG indices and mortality risk was non-linear, with L-shaped and J-shaped trends observed, suggesting that both low and high levels of TyG indices were associated with an increased risk of mortality. This highlights the importance of not only addressing insulin resistance but also monitoring metabolic health in individuals at both extremes of the TyG index.

ROC curve analysis further supported the prognostic value of the TyG index, particularly TyG-BMI, which exhibited the best predictive accuracy for both all-cause mortality and cardiovascular mortality in CVD patients. The area under the ROC curve (AUC) for TyG-BMI was significantly higher compared to other indices, demonstrating its potential as a robust tool for predicting adverse cardiovascular outcomes.

Conclusions

The TyG index and its derivatives, particularly TyG-WHtR and TyG-BMI, are effective predictors of mortality risk in patients with cardiovascular disease. Our findings suggest that these indices can assist in the early detection of high-risk individuals, enabling healthcare providers to implement targeted preventive strategies aimed at reducing the burden of CVD and its associated mortality. The use of the TyG index in clinical practice could complement existing risk stratification tools, providing a simple and cost-effective method to identify patients at heightened risk for adverse cardiovascular events. Further studies are needed to validate these findings in larger cohorts and to investigate the potential benefits of integrating the TyG index into clinical decision-making for CVD management. Additionally, exploring the mechanisms by which insulin resistance and metabolic dysfunction contribute to cardiovascular mortality could yield important insights for developing more effective therapeutic interventions.

Association between the total cholesterol/high-density lipoprotein cholesterol ratio and all-cause and cardiovascular mortality in patients with diabetes or prediabetes: Insights from China and the United States

Zi-xi Zhang, Yi-Chao Xiao, Tao Tu, Qi-Ming Liu

The Second Xiangya Hospital of Central South University

Background and Aim: The total cholesterol/high-density lipoprotein cholesterol (TC/HDL-C) ratio has been proposed as an important marker for cardiovascular risk and mortality. While many studies have shown that a higher TC/HDL-C ratio is associated with an increased risk of cardiovascular events, its association with all-cause and cardiovascular mortality in patients with diabetes or prediabetes remains unclear. Both diabetes and prediabetes are major risk factors for cardiovascular diseases, and understanding their impact on mortality is crucial for public health and clinical management. In this study, we aim to evaluate the relationship between the TC/HDL-C ratio and mortality in two large cohorts: CHARLS (China Health and Retirement Longitudinal Study) and NHANES (National Health and Nutrition Examination Survey). Additionally, we assess the incremental predictive value of the TC/HDL-C ratio in improving mortality risk prediction beyond traditional risk factors.

Methods: Data from CHARLS (2011–2020) and NHANES (2005–2018) were analyzed to investigate the association between the TC/HDL-C ratio and mortality outcomes in adults with diabetes or prediabetes. The CHARLS cohort consisted of 5973 individuals, and the NHANES cohort included 11,050 participants. Kaplan–Meier (K-M) survival analyses were performed to evaluate the survival experience across different quartiles of the TC/HDL-C ratio. Multivariate Cox proportional hazards models were used to assess the independent association between the TC/HDL-C ratio and all-cause and cardiovascular mortality, adjusting for potential confounders such as age, sex, smoking, and comorbidities. Non-linear relationships between the TC/HDL-C ratio and mortality were explored using restricted cubic spline (RCS) analysis. Furthermore, the incremental predictive value of the TC/HDL-C ratio was evaluated by adding it to the basic prediction models and assessing the improvement in model performance using receiver operating characteristic (ROC) curves, net reclassification improvement (NRI), and integrated discrimination improvement (IDI).

Results: In the CHARLS cohort, a total of 580 deaths occurred during the follow-up period, resulting in an all-cause mortality rate of 10.9 per 1000 person-years. Kaplan–Meier survival analysis indicated no significant difference in overall survival across the quartiles of the TC/HDL-C ratio (log-rank P = 0.570). However, Cox regression models revealed a modest increase in mortality risk per unit increase in the TC/HDL-C ratio (HR: 1.03, 95% CI: 1.01–1.06; P = 0.024). The RCS analysis showed a non-linear relationship, with an inflection point at 3.85. In the NHANES cohort, 1524 deaths occurred from all causes (mortality rate: 19.4 per 1000 person-years), and 497 deaths were attributed to cardiovascular causes (mortality rate: 6.3 per 1000 person-years). K-M analysis revealed significant differences in both all-cause and cardiovascular mortality across quartiles of the TC/HDL-C ratio (log-rank P

Conclusions: The TC/HDL-C ratio is significantly associated with both all-cause and cardiovascular mortality in Chinese and American populations with diabetes or prediabetes. Higher TC/HDL-C ratios correlate with an increased risk of mortality, with distinct non-linear relationships observed in both cohorts. However, despite its association with mortality, the TC/HDL-C ratio's incremental predictive value over traditional cardiovascular risk factors appears limited. Future studies are needed to explore other potential biomarkers or strategies that might improve prediction accuracy, particularly in the context of diabetes and prediabetes, which are prevalent in both populations. Furthermore, examining the mechanisms by which the TC/HDL-C ratio influences mortality could provide new insights for cardiovascular risk management and guide clinical decision-making in high-risk populations.

The prognostic value of the hemoglobin-to-red blood cell distribution width ratio for all-cause and cardiovascular mortality in patients with diabetes or prediabetes: A cohort study from the NHANES 2005–2018

Zi-xi Zhang, Yi-Chao Xiao, Tao Tu, Qi-Ming Liu

The Second Xiangya Hospital of Central South University

Background: Diabetes is a widespread chronic disease that significantly contributes to healthcare burdens globally, often leading to increased mortality, particularly due to cardiovascular complications. The prevalence of diabetes has been rising steadily, with both type 1 and type 2 diabetes affecting millions of people worldwide. In addition to its direct impact on health, diabetes also leads to an increased risk of a wide range of comorbidities, including cardiovascular disease, kidney failure, and neuropathy. Recent advances in biomarkers have shifted attention towards the inflammatory processes that contribute to the pathogenesis of these complications. One such marker, the hemoglobin-to-red blood cell distribution width ratio (HRR), has been suggested as a potential inflammatory marker. This ratio is a simple, readily available index that could potentially be used to predict adverse outcomes in patients with diabetes or prediabetes. Despite this, the relationship between the HRR and mortality outcomes, particularly in diabetes patients, remains unclear, with limited studies exploring its potential predictive power.

Methods: To address this gap, this study utilized data from the National Health and Nutrition Examination Survey (NHANES) spanning from 2005 to 2018. The cohort included 11,130 patients diagnosed with diabetes or prediabetes, and the HRR was calculated by dividing the hemoglobin level by the red blood cell distribution width. The study employed multivariate Cox proportional hazards models to assess the association between HRR and both all-cause mortality and cardiovascular mortality. Additionally, restricted cubic spline (RCS) analysis was performed to examine potential non-linear relationships, providing a more comprehensive understanding of the HRR's impact across a range of values.

Results: The study followed participants for a mean duration of 84.9 months, during which time 1534 all-cause deaths occurred, resulting in a mortality rate of 19.48 per 1000 person-years. A total of 502 cardiovascular deaths were recorded, with a rate of 6.37 per 1000 person-years. Kaplan-Meier survival analysis revealed significant differences in mortality across the quartiles of HRR, with a log-rank P value of < 0.001, indicating that higher HRR values were associated with worse survival outcomes. The restricted cubic spline analysis revealed an L-shaped relationship between HRR and all-cause mortality, with an inflection point at 1.278. This suggests that HRR below this threshold may not significantly alter the risk of all-cause mortality, but values above it are strongly correlated with an increased risk. Interestingly, no significant non-linear association was found for cardiovascular mortality, indicating that while the HRR is a strong predictor of all-cause mortality, its utility in predicting cardiovascular mortality may be more limited.

Conclusions: The findings of this study suggest that the HRR is a valuable predictor of all-cause mortality in patients with diabetes or prediabetes. This provides evidence that the HRR, a simple and readily accessible marker, may play a crucial role in clinical risk assessment, particularly for assessing long-term survival in this high-risk population. Given the potential of HRR as a prognostic tool, it could help clinicians identify individuals at higher risk of mortality, guiding them toward more personalized and targeted interventions. However, further large-scale prospective studies are needed to confirm these results and explore the broader applicability of HRR in predicting various clinical outcomes, including cardiovascular events, across diverse populations. Understanding the exact mechanisms by which the HRR influences mortality could also provide valuable insights into the inflammatory processes underlying diabetes and prediabetes-related complications. Additionally, this would help in the development of new therapeutic strategies aimed at reducing the burden of these conditions on patients and healthcare systems.

Joint associations of frailty and triglyceride–glucose index with all-cause and cardiovascular mortality in U.S. adults: a population-based cohort study from the NHANES

Zi-xi Zhang, Yi-Chao Xiao, Jia-Yi Zhu, Tao Tu, Qi-Ming Liu

The Second Xiangya Hospital of Central South University

Background: Frailty and insulin resistance (IR) are two major factors that have been independently linked to an increased risk of mortality in the general population. Frailty, typically measured using the frailty index (FI), is a clinical syndrome characterized by weakness, slow walking speed, low physical activity, exhaustion, and unintentional weight loss. It is considered a critical predictor of poor health outcomes, particularly in older adults. The triglyceride–glucose (TyG) index, a simple and effective surrogate marker for insulin resistance, has also been shown to predict various adverse health outcomes, including cardiovascular disease and all-cause mortality. While both frailty and IR are associated with increased mortality risk, their combined effects, particularly in the context of frailty, remain poorly understood. This study aims to explore the joint impact of the FI and the TyG index on all-cause and cardiovascular mortality in a large, diverse general adult population.

Methods: A population-based cohort study was conducted using data from the National Health and Nutrition Examination Survey (NHANES) spanning 2005 to 2018. The study sample included adults from diverse demographic backgrounds, allowing for generalizability of the results. The primary variables of interest were frailty, as measured by the FI, and insulin resistance, as indicated by the TyG index. Mortality data were collected, and Cox regression models were employed to examine the associations between the FI and TyG index with mortality outcomes. Restricted cubic splines were used to explore the potential non-linear relationships between frailty, IR, and mortality. Kaplan-Meier survival curves were plotted to assess the survival differences across varying levels of frailty and TyG index, and joint and interaction analyses were performed to assess potential synergistic effects. Mediation analysis was also conducted to investigate the potential pathways through which frailty and insulin resistance may influence mortality risk.

Results: The findings of this study confirm that frailty is an independent predictor of both all-cause and cardiovascular mortality. The risk of mor-

tality increased in individuals with moderate to severe frailty. A J-shaped relationship was observed between the FI and all-cause mortality, with mortality risk decreasing at lower levels of frailty but significantly increasing as frailty severity worsened. In contrast, the TyG index demonstrated a U-shaped relationship with all-cause mortality, where both low and high values of the TyG index were associated with higher mortality risks, with the highest risk observed at both ends of the index. However, no significant non-linear associations were found between either the FI or TyG index and cardiovascular mortality. There was no significant interaction effect between frailty and the TyG index, indicating that the relationship between frailty and mortality was not significantly altered by the presence of insulin resistance. In individuals with moderate to severe frailty, both high and low TyG index values were significantly associated with an increased risk of mortality. Mediation analysis revealed that frailty significantly mediates the relationship between the TyG index and mortality, with albumin (ALB) and uric acid (UA) serving as partial mediators in this pathway.

Conclusion: This study highlights frailty as the primary determinant of mortality risk in adults, with the effects of metabolic dysfunction, as represented by the TyG index, offering limited additional predictive value. Although both frailty and insulin resistance contribute independently to increased mortality risk, the combination of the two factors does not appear to produce a synergistic effect. This finding suggests that frailty should be considered the primary target for clinical interventions aimed at reducing mortality risk, particularly in individuals with moderate to severe frailty. However, concurrent management of frailty and metabolic health, including the TyG index, may provide an opportunity to improve clinical outcomes and reduce the burden of mortality in this population. Future studies should explore the underlying mechanisms and potential therapeutic interventions that could address both frailty and insulin resistance in order to optimize long-term health outcomes.

Joint Effect of Plasma Homocysteine Concentration and Traditional Cardiovascular Risk Factors on the Risk of New-Onset Acute Myocardial Infarction

Tian-Hui Dong, Hong-Yu Chen, Fang-Fang Fan, Jian-Ping Li, Yan Zhang

Peking University First Hospital

Purpose: Hyperhomocysteinemia is an independent risk factor for cardiovascular disease. Acute myocardial infarction (AMI), a high-risk cardiovascular disease, is associated with substantial mortality and significantly reduces patients' quality of life. However, the joint effect of homocysteine (Hcy) and traditional cardiovascular risk factors on acute myocardial infarction (AMI) has not been completely characterized. The purpose of the present study is to examine the association between plasma homocysteine combined with traditional cardiovascular risk factors and new-onset AMI.

Methods: We conducted a prospective community-based cohort study of 8446 Chinese participants who did not have cardiovascular disease at baseline. Subjects were divided into three groups according to Hcy level (Hcy ≥ 10μmol/L, 10 ≤ Hcy<15μmol/L, Hcy ≥ 15μmol/L). The baseline characteristics of subjects were compared between groups using the t-test or Kruskal-Wallis rank test for continuous variables as appropriate. For categorical variables, data were compared between groups using the chi-square test or Fisher exact test as appropriate. We used Cox proportional hazard regression to determine the association between hcy groups combined with traditional cardiovascular risk factors (hypertension, diabetes, dyslipidemia, current smoking, body mass index, age, sex) and new-onset AMI. Interaction tests were performed to determine the influence of traditional cardiovascular risk factors for the predictive effect of Hcy on new-onset AMI risk.

Results: Of all participants, the average age was 56.5 ± 8.9 years, and 2998 (35.5%) participants were males. During a median 9.9-year follow-up period, 160 (1.9%) endpoints were observed. In the baseline analysis, it was found that the subjects in Hcy ≥ 15 μmol/L group were older, with higher body mass index, higher proportion of males, current smoking and drinking, higher proportion of hypertension and dyslipidemia (no difference in the proportion of diabetes), and higher China-PAR score. With regard to the joint effect of Hcy and hypertension, diabetes, dyslipidemia, current smoking, body mass index, age, sex, there were trends towards increased AMI risk across different groups (P for trend=0.016, 0.001, 0.043, <0.001, 0.004, <0.001, <0.001 respectively). After adjusting for confounders (age, sex, current smoking, current drinking, body mass index, hypertension, diabetes, dyslipidemia, anti-hypertensive treatment, lipid-lowering treatment, hypoglycemic treatment, and estimated glomerular filtration rate), smokers with higher Hcy level were more likely to have new-onset AMI than non-smokers with normal Hcy level (hazard ratio [HR]: 2.82, 96% confidence interval [CI]: 1.40-5.66, p=0.004). Participants with both elevated Hcy levels and older age had the highest risk of new-onset AMI (HR: 3.83, 95% CI: 1.70–8.61, P=0.001). Males with elevated Hcy level had higher risk of new-onset AMI than females with normal Hcy level (HR: 3.04, 95% CI: 1.57–5.92, P=0.001). No interactions were observed between Hcy and these factors.

Conclusion: Subjects with higher Hcy level have more cardiovascular risk factors and higher cardiovascular risk. Besides, there were joint effects of high Hcy level and traditional cardiovascular risk factors, such as smoking, aging and male on the incidence of AMI. Attention should be paid to the simultaneous screening of Hcy and cardiovascular risk factors in the primary prevention population of AMI. Studies should be conducted to analyze new-onset AMI risk in subjects after controlling for cardiovascular risk factors and Hcy levels.

Joint Effect of Plasma Homocysteine Concentration and Traditional Cardiovascular Risk Factors on the Risk of New-Onset Stroke

Tian-Hui Dong, Hong-Yu Chen, Fang-Fang Fan, Jian-Ping Li, Yan Zhang

Peking University First Hospital

Purpose: Stroke has high rates of disability and mortality, which significantly impair patients' quality of life. Hyperhomocysteinemia is an independent risk factor for stroke. However, the joint effect of homocysteine (Hcy) and traditional cardiovascular risk factors on stroke has not been completely characterized. The purpose of the present study is to examine the association between plasma homocysteine combined with traditional cardiovascular risk factors and new-onset stroke.

Methods: We conducted a prospective community-based cohort study of 8446 Chinese participants who did not have cardiovascular disease at baseline. Subjects were divided into three groups according to Hcy level (Hcy ≥ 10μmol/L, 10 ≤ Hcy<15μmol/L, Hcy ≥ 15μmol/L). The baseline characteristics of subjects were compared between groups using the t-test or Kruskal-Wallis rank test for continuous variables as appropriate. For categorical variables, data were compared between groups using the chi-square test or Fisher exact test as appropriate. We used Cox proportional hazard regression to determine the association between hcy groups combined with traditional cardiovascular risk factors (hypertension, diabetes, dyslipidemia, current smoking, body mass index, age, sex) and new-onset stroke. Interaction tests were performed to determine the influence of traditional cardiovascular risk factors for the predictive effect of Hcy on new-onset stroke risk.

Results: Of all participants, the average age was 56.5 ± 8.9 years, and 2998 (35.5%) participants were males. During a median 9.9-year follow-up period, 664 (7.9%) endpoints were observed. In the baseline analysis, it was found that the subjects in Hcy ≥ 15 μmol/L group were older, with higher body mass index, higher proportion of males, current smoking and drinking, higher proportion of hypertension and dyslipidemia (no difference in the proportion of diabetes), and higher China-PAR score. With regard to the joint effect of Hcy and hypertension, diabetes, dyslipidemia, current smoking, body mass index, age, sex, there were trends towards increased stroke risk across different groups (P for trend<0.001, <0.001, 0.013, <0.001, =0.040, <0.001, <0.001 respectively). After adjusting for confounders, participants with higher Hcy level combined with hypertension (hazard ratio [HR]: 3.91, 96% confidence interval [CI]: 2.46-6.19, p<0.001), diabetes (HR: 2.21, 96% CI: 1.49-3.28, p<0.001), dyslipidemia (HR: 1.79, 96% CI: 1.04-3.08, p=0.036), current smoking (HR: 2.45, 96% CI: 1.74-3.47, p<0.001), older age (HR: 2.88, 96% CI: 1.98-4.20, p<0.001) were associated with significantly increased risk of new-onset stroke than those with normal Hcy level and without traditional cardiovascular risk factors. Males with elevated Hcy level had higher risk of new-onset stroke than females with normal Hcy level (HR: 1.97, 96% CI: 1.42-2.74, p<0.001). No interactions were observed between Hcy and these factors, except with body mass index. Higher Hcy level with or without elevated body mass index was associated with increased risk of new-onset stroke, and the p value for interaction is 0.005.

Conclusion: Subjects with higher Hcy level have more cardiovascular risk factors and higher cardiovascular risk. Besides, there were joint effects of high Hcy level and traditional cardiovascular risk factors, such as hypertension, diabetes, dyslipidemia, smoking, aging and male on the incidence of stroke. Attention should be paid to the simultaneous screening of Hcy and cardiovascular risk factors in the primary prevention population of stroke.

基线糖代谢状态与全因死亡及心血管死亡风险的关联研究

金怡婧 范芳芳 贾佳 王新刚 李建平 张岩

北京大学第一医院

目的：本研究旨在评估基线不同糖代谢状态与后续全因死亡及心血管疾病（Cardiovascular Disease, CVD）死亡风险之间的关联，并识别高危人群特征，为早期干预提供循证依据。

方法：本研究采用回顾性队列设计，研究对象为北京大学第一医院心内科于 2011-2012 年在北京市苹果园社区及古城社区建立的观察性队列人群，依据口服葡萄糖耐量试验（Oral Glucose Tolerance Test, OGTT）2h 后血糖和空腹血糖（Fasting Blood Glucose, FBG）数据将基线人群的糖代谢状态分为 5 组（正常血糖、空腹血糖受损（Impaired Fasting Glucose, IFG）前期、IFG、糖耐量异常（Impaired Glucose Tolerance, IGT）、2 型糖尿病（Type 2 Diabetes, T2D）），终点事件为全因死亡及 CVD 死亡。通过多因素 Cox 比例风险模型评估糖代谢状态与死亡结局的关联（HR 及 95%CI），并进行亚组交互作用检验。

结果：本研究共纳入 8807 名来自社区、基线无脑卒中及心肌梗死病史、拥有基

线糖代谢状态信息及完成随访的成年人（平均年龄 56.52 ± 8.92 岁、男性占比 35.47%），中位随访 9.87 年，基线分组为：正常血糖，3507 人（39.82%）；IFG 前期，1079 人（12.25%）；IFG，409 人（4.64%）；IGT，1710 人（19.42%）；T2D，2102 人（23.87%）。在校正混杂因素后，基线 T2D 者的全因死亡（校正 HR=1.59, 95%CI:1.24-2.03）和心血管死亡风险（HR=1.89, 95%CI:1.17-3.05）显著增加，而基线 IFG 组的全因死亡风险增加 63%（HR=1.63, 95%CI:1.06-2.48）。亚组分析显示，同型半胱氨酸（P 交互 < 0.001）水平修饰不同糖代谢状态与全因死亡风险的关系，而血压水平（收缩压 P 交互 =0.004，舒张压 P 交互 =0.006）则修饰不同糖代谢状态与心血管死亡风险的关系。

结论：基线糖代谢状态是随访期间全因死亡和 CVD 死亡的独立预测因子，特别是在特定高危亚组（如血压异常、同型半胱氨酸指标异常人群）中关联更强。该研究强调了 FBG 和 OGTT 在全面评估死亡风险中的价值，以及在社区人群尤其是合并血压异常、同型半胱氨酸指标异常等人群中，基于不同糖代谢状态强化血糖监测与管理对于降低死亡风险的重要性。

基线糖代谢状态与不同脑卒中风险的关联研究

金怡婧 范芳芳 贾佳 王新刚 李建平 张岩

北京大学第一医院

目的：探讨基线不同糖代谢状态与不同类型脑卒中风险的关联性，并识别高危人群特征，为早期干预提供循证依据。

方法：本研究采用回顾性队列设计，研究对象为北京大学第一医院心内科于 2011-2012 年在北京市苹果园社区及古城社区建立的观察性队列人群，依据口服葡萄糖耐量试验（Oral Glucose Tolerance Test, OGTT）2h 后血糖和空腹血糖（Fasting Blood Glucose, FBG）数据将基线人群的糖代谢状态为 5 组（正常血糖、空腹血糖受损（Impaired Fasting Glucose, IFG）前期、IFG、糖耐量异常（Impaired Glucose Tolerance, IGT）、2 型糖尿病（Type 2 Diabetes, T2D）），主要终点包括所有新发非致死性脑卒中事件（包括缺血性脑卒中和出血性脑卒中）。通过多因素 Cox 比例风险模型评估糖代谢状态与不同脑卒中结局的关联（HR 及 95%CI），并进行亚组交互作用检验。

结果：本研究共纳入 8807 名来自社区、基线无脑卒中及心肌梗死病史、拥有基线糖代谢状态信息及完成随访的成年人（平均年龄 56.52 ± 8.92 岁、男性占比 35.47%），中位随访 9.87 年，基线分组为：正常血糖，3507 人（39.82%）；IFG 前期，1079 人（12.25%）；IFG，409 人（4.64%）；IGT，1710 人（19.42%）；T2D，2102 人（23.87%）。在校正混杂因素后，基线 T2D 患者的总卒中（校正 HR=1.75, 95%CI:1.42-2.16）和缺血性卒中（校正 HR=1.84, 95%CI:1.48-2.28）风险显著升高；基线 IGT 组的总卒中（校正 HR=1.39, 95%CI:1.11-1.75）和缺血性卒中（校正 HR=1.47, 95%CI:1.16-1.87）风险亦升高，且上述风险随糖代谢状态恶化呈梯度上升（P-trend<0.01）；基线糖代谢状态与出血性卒中风险无显著关联。亚组分析显示，总胆固醇（交互 P=0.030）水平修饰不同糖代谢状态与缺血性卒中风险的关系。

结论：基线糖代谢状态是随访期间总体脑卒中和缺血性脑卒中的独立预测因子，特别是在特定高危亚组（如血脂异常人群）中关联更强。该研究强调了 FBG 和 OGTT 在全面评估脑卒中风险中的价值，以及在社区人群尤其是合并血脂异常人群中，基于不同糖代谢状态强化血糖监测与管理对于降低脑卒中风险的重要性。

基线糖代谢状态与急性心肌梗死风险的关联研究

金怡婧 范芳芳 贾佳 王新刚 李建平 张岩

北京大学第一医院

目的：本研究旨在评估基线不同糖代谢状态与未来急性心肌梗死（Acute Myocardial Infarction, AMI）风险之间的关联，并识别高危人群特征，为早期干预提供循证依据。

方法：本研究采用回顾性队列设计，研究对象为北京大学第一医院心内科于 2011-2012 年在北京市苹果园社区及古城社区建立的观察性队列人群，依据口服葡萄糖耐量试验（Oral Glucose Tolerance Test, OGTT）2h 后血糖和空腹血糖（Fasting Blood Glucose, FBG）数据将基线人群的糖代谢状态为 5 组（正常血糖、空腹血糖受损（Impaired Fasting Glucose, IFG）前期、IFG、糖耐量异常（Impaired Glucose Tolerance, IGT）、2 型糖尿病（Type 2 Diabetes, T2D）），终点事件为新发非致死性 AMI。通过多因素 Cox 比例风险模型评估糖代谢状态与 AMI 结局的关联（HR 及 95%CI），并进行亚组交互作用检验。

结果：本研究共纳入 8807 名来自社区、基线无脑卒中及心肌梗死病史、拥有基线糖代谢状态信息及完成随访的成年人（平均年龄 56.52 ± 8.92 岁、男性占比 35.47%），中位随访 9.87 年，基线分组为：正常血糖，3507 人（39.82%）；IFG 前期，1079 人（12.25%）；IFG，409 人（4.64%）；IGT，1710 人（19.42%）；T2D，2102 人（23.87%）。在校正混杂因素后，基线 T2D 人群的 AMI 风险显著增加（HR=1.87, 95%CI:1.23-2.85, P<0.01）。亚组分析显示，年龄（P 交互 =0.005）水平修饰不同糖代谢状态与 AMI 风险的关系。

结论：基线糖代谢状态是随访期间 AMI 风险的独立预测因子，特别是在特定高危亚组（中年人群）中关联更强。该研究强调了 FBG 和 OGTT 在全面评估 AMI 风险中的价值，以及在社区人群尤其是中年人群中，基于不同糖代谢状态强化血糖监测与管理对于降低 AMI 风险的重要性。

Prediction of Cardiometabolic Multimorbidity Risk in Middle-Aged and Older Chinese Adults: Longitudinal Analysis of Triglyceride Glucose-Body Mass Index (TyG-BMI) and Its Dynamic Trajectories

Zheng-Feng Wu, Yu-qi Liu

中国人民解放军总医院第六医学中心

Background

Cardiometabolic multimorbidity (CMM), defined as the co-occurrence of two or more cardiometabolic diseases (diabetes, stroke, heart disease), poses a substantial and escalating clinical and public health burden, particularly among aging populations. Current evidence lacks robust longitudinal studies specifically investigating the association between the triglyceride glucose-body mass index (TyG-BMI), a composite marker reflecting insulin resistance and obesity, and the development of CMM. This study aimed to establish the predictive value of baseline TyG-BMI for incident CMM, characterize its dose-response relationship with CMM risk, and identify distinct longitudinal TyG-BMI trajectory patterns associated with differential CMM risk in middle-aged and elderly Chinese adults.

Methods

We utilized data from five waves (2011, 2013, 2015, 2018, 2020) of the nationally representative China Health and Retirement Longitudinal Study (CHARLS), established using multistage probability sampling. The analysis included 8,020 participants aged ≥ 45 years without baseline CMM (defined as ≥ 2 concurrent conditions: physician-diagnosed diabetes, stroke, or heart disease). Incident CMM was tracked over the follow-up period. Baseline TyG-BMI was calculated as Ln[fasting triglycerides (mg/dL) × fasting glucose (mg/dL)/2] + BMI (kg/m^2). Cox proportional hazards regression models estimated adjusted hazard ratios (aHRs) and 95% confidence intervals (CIs) for the association between TyG-BMI (both as quartiles and per 1-standard deviation (SD) increase) and incident CMM. Restricted Cubic Splines (RCS) with four knots were employed to assess potential nonlinearity in this relationship. Longitudinal Targeted Maximum Likelihood Estimation (LTMLE) was used to model dynamic TyG-BMI trajectories across the study waves and estimate their associated CMM risks relative to a reference trajectory. Comprehensive sensitivity analyses (e.g., excluding early events, varying covariate sets) and subgroup analyses stratified by key demographic factors were performed to evaluate the robustness of findings.

Results

Over a median follow-up of 9 years, 409 incident CMM cases were identified. Kaplan-Meier analysis demonstrated progressively higher cumulative CMM incidence across increasing quartiles of baseline TyG-BMI (log-rank P < 0.05). After multivariable adjustment for age, sex, education, residence, smoking, drinking, physical activity, systolic blood pressure, LDL-cholesterol, and baseline single cardiometabolic conditions, each 1-SD increment in baseline TyG-BMI was significantly associated with a 43% increased risk of developing CMM (aHR = 1.43, 95% CI: 1.30–1.58). RCS analysis confirmed a significant nonlinear J-shaped relationship between TyG-BMI and CMM risk (P for nonlinearity < 0.05), with risk accelerating at higher TyG-BMI levels. LTMLE identified four distinct longitudinal TyG-BMI trajectories: "Low-Stable" (reference), "Increasing", "Decreasing", and "High-Stable". Compared to the "Low-Stable" trajectory, individuals in the "High-Stable" trajectory exhibited the highest CMM risk (aHR = 1.11, 95% CI: 1.09–1.14), followed by those in the "Increasing" trajectory (aHR = 1.07, 95% CI: 1.04–1.10). The "Decreasing" trajectory was associated with a lower risk compared to the "High-Stable" group, suggesting potential benefit from reducing TyG-BMI levels over time. Subgroup analyses across age, sex, and residence groups, along with extensive sensitivity analyses, consistently supported the robustness of these associations.

Conclusions

This large-scale, nationally representative longitudinal study provides novel evidence that TyG-BMI is a strong, independent predictor of incident cardiometabolic multimorbidity in middle-aged and elderly Chinese adults. The association demonstrates a significant nonlinear dose-response pattern. Critically, distinct longitudinal trajectories of TyG-BMI confer markedly different CMM risks. The "High-Stable" trajectory, indicative of sustained high levels of insulin resistance and obesity, carries the greatest risk. These findings underscore TyG-BMI's potential as a valuable clinical tool for early identification of individuals at high risk for CMM. Monitoring TyG-BMI trajectories over time could inform personalized risk stratification and guide targeted prevention strategies aimed at mitigating the growing burden of concurrent cardiometabolic diseases in aging populations.

Estimated Glucose Disposal Rate and Mortality in Cardiovascular Kidney Metabolic Syndrome: Nonlinear Associations and Stratified Prognostic Significance by Glycometabolic Phenotypes

Zheng Zhang, Dou Zhu

The Second Affiliated Hospital of Harbin Medical University

Abstract

Objective: Cardiovascular Kidney Metabolic (CKM) syndrome is a complex condition characterized by a multifactorial interaction between obesity, diabetes, chronic kidney disease, and cardiovascular diseases. It is a growing public health concern due to its significant impact on morbidity and mortality. A key feature in the progression of CKM is insulin resistance (IR), which exacerbates metabolic dysfunctions and increases the risk of adverse cardiovascular and renal events. While traditional mea-

sures of insulin resistance such as the Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) and the Triglyceride Glucose Index (TyG) are widely used, they have limitations, particularly in complex syndromes like CKM. In contrast, the estimated glucose disposal rate (eGDR), which integrates waist circumference, blood pressure, and glycated hemoglobin (HbA1c), has shown potential as a more reliable marker for glucose metabolism and cardiovascular outcomes. However, its association with mortality in CKM, and particularly its role across different glucose metabolic states, remains unclear. The aim of this study was to evaluate the prognostic significance of eGDR in predicting all-cause and cause-specific mortality in patients with CKM, focusing on its utility in distinct glycometabolic phenotypes, including diabetes mellitus (DM), prediabetes (Pre-DM), and normal glucose regulation (NGR).

Methods: This cohort study used data from the National Health and Nutrition Examination Survey (NHANES) from 1999 to 2018. Participants diagnosed with CKM were included, with exclusions based on age and missing data. The study utilized a weighted Cox proportional hazards model, incorporating restricted cubic spline (RCS) analysis to examine the dose-response relationship between eGDR levels and mortality outcomes. Stratified analyses were conducted to assess the effects of glucose metabolic states on the relationship between eGDR and mortality. Additionally, the study compared the predictive efficacy of eGDR with traditional insulin resistance markers (HOMA-IR and TyG) for all-cause and cause-specific mortality using Receiver Operating Characteristic (ROC) curve analysis.

Results: A total of 18,147 CKM patients were included in the analysis. Cox regression revealed significant associations between eGDR levels and both all-cause mortality and cause-specific mortality, including cardiovascular-specific and diabetes-specific mortality (p<0.05 for all). Further RCS analysis showed a nonlinear relationship between eGDR and all-cause mortality (p for non-linear = 0.041) as well as diabetes-specific mortality (p for non-linear = 0.003), while a linear association was observed for cardiovascular-specific mortality (p for non-linear = 0.278). Stratified analyses revealed that, within the DM subgroup, eGDR was significantly associated with reduced all-cause mortality. In the Pre-DM subgroup, eGDR correlated with a significant decrease in cardiovascular-specific mortality. Among patients with NGR, eGDR was associated with lower all-cause, cardiovascular-specific, and diabetes-specific mortality. Additionally, ROC curve analysis showed that eGDR outperformed both HOMA-IR and TyG in predicting mortality, particularly in the NGR subgroup.

Conclusion: The study found that eGDR levels were inversely associated with the risk of all-cause and cause-specific mortality in CKM patients, with a consistent protective effect observed across different glucose metabolic states (DM, Pre-DM, and NGR). These findings suggest that eGDR may serve as an effective tool for risk stratification in CKM, providing a more accurate prediction of mortality than traditional insulin resistance markers. Moreover, the study highlights the potential of eGDR as a comprehensive biomarker that could be utilized in clinical settings for better management of CKM patients. Importantly, the predictive power of eGDR varied across different glucose metabolic states, with the most significant protective associations found in patients with NGR. This underscores the importance of glycometabolic status in determining the efficacy of eGDR as a mortality predictor. The results also suggest that optimizing eGDR levels could improve clinical outcomes in CKM, making it a promising target for intervention and future research.

HbA1c>7% predicts adverse cardiovascular outcomes among stage 4 cardiovascular kidney-metabolic syndrome patients

Jingjing Song[1], Hong Li[1], Wen-Yao Wang[2]

1. Beijing Chaoyang Hospital, Capital Medical University

2. Peking university third hospital

Objectives: Cardiovascular kidney-metabolic syndrome (CKMS) is a newly proposed term in 2025, representing the complicated and bidirectional interplay between cardiovascular disease, chronic kidney disease, and metabolic syndrome. Stage 4 CKMS represents a pivotal window where multi-organ dysfunction is established but still responsive to intervention. Blood glucose management is a critical part of CKMS prevention and therapy. Glycated hemoglobin (HbA1c) is a versatile biomarker reflecting glycemic control in last 120 days. HbA1c is not only a marker of glycemic status but also a powerful predictor of short- and long-term outcomes across multiple conditions, particularly in metabolic, cardiovascular, and renal diseases. The prognostic value of HbA1c stems from the link between chronic hyperglycemia (reflected by elevated HbA1c) and cumulative damage to organs and tissues via oxidative stress, inflammation, and vascular dysfunction. This study aims to investigate the association between HbA1c levels and adverse cardiovascular outcomes among stage 4 CKM patients.

Subjects and Methods: 9473 stage 4 CKM patients were enrolled in this study and divided into two groups according to glycated hemoglobin (HbA1c) ≤ 7% (n=7203) and HbA1c>7% (n=2138). The primary endpoint was major adverse cardiac and cerebrovascular events (MACCEs), including cardiac death, myocardial infarction (MI), stroke, stent thrombosis and target vessel revascularization (TVR). The secondary endpoints included MI, TVR and stent thrombosis. Cumulative rates of outcomes were estimated by Kaplan-Meier analysis and compared with the log-rank test. Cox proportional hazard regression (HR) model was used to assess the association between HbA1c and clinical outcomes, and adjusted hazard ratios with 95 % confidence intervals were recorded. Restricted cubic spline analysis was performed to investigate underlying non-linearity association between HbA1c and MACCEs, MI, TVR and stent thrombosis. Statistical analysis was performed using R 4.0.3 software for mac (R foundation). Two-tailed p < 0.05 was considered statistically significant.

Results: During the median 2.4-year follow-up, 761 MACCEs were recorded. Patients with HbA1c>7% exhibited a significantly higher cumulative incidence of MACCEs (10.3% versus 7.5%), MI (1.8% versus 1.1%), TVR (7.0% versus 4.9%) and stent thrombosis (1.6% versus 0.8%) than those with HbA1c ≤ 7% (p<0.01). The Kaplan-Meier analysis showed that patients with HbA1c>7% had significantly lower event-free survival rates of MACCEs (Figure 1A), MI (Figure 1B), TVR (Figure 1C) and stent thrombosis (Figure 1D) compared to those with HbA1c ≤ 7% (p<0.05) (Figure 1A). Consistently, Cox proportional hazards regression analysis found patients with HbA1c>7% had a significantly increased risk for MACCEs (HR 1.39, 95% confidential interval 1.19-1.62, p<0.001), MI (HR 1.65, 95% confidential interval 1.12-2.43, p<0.05), TVR (HR 1.43, 95% confidential interval 1.18-1.74, p<0.001) and stent thrombosis (HR 2.01, 95% confidential interval 1.32-3.05, p<0.001). Restricted Cubic Splines showed elevated HbA1c was positively related to the risk of MACCEs (Figure 2A), TVR (Figure 2C) and stent thrombosis (Figure 2D) as a continuous variable (all p<0.05), but not MI (Figure 2B). HbA1c>7% was identified as a potent prognostic factor in stage 4 CKM patients.

Conclusion: HbA1c>7% was associated with increased risk of adverse cardiovascular outcomes in stage 4 CKM patients. Monitoring and optimizing HbA1c could obtain therapeutic benefits and improve prognosis of stage 4 CKMS patients.

尿酸对高龄重度主动脉瓣狭窄患者远期预后的预测价值

徐靖婷 李喆 叶蕴青 王墨扬 许海燕 吴永健

中国医学科学院阜外医院

目的: 分析血尿酸水平对高龄重度主动脉瓣狭窄患者远期预后的影响及预测价值。

方法： 回顾性收集 2008 年 1 月 1 日至 2015 年 1 月 1 日年龄≥ 75 岁在中国医学科学院阜外医院住院诊断为非风湿性主动脉瓣狭窄病变且超声心动图证实为重度主动脉瓣狭窄的 203 例患者的临床资料，其中药物治疗组 90 例，手术治疗组 113 例（包括 TAVR 和 SAVR），入院时测量尿酸水平。中位随访 16 个月，主要终点为全因死亡。

结果： 203 例患者，平均年龄 78.74±2.96 岁，入院尿酸中位水平 391.6mmol/L，药物治疗和手术治疗组全因死亡率分别为 76.7% 和 10.6%。根据尿酸水平的四分位数将患者分为四组，Kaplan-Meier 生存曲线分析显示接受药物治疗的患者尿酸 Q4 组早期死亡风险高，而随访六年后差异消失。单变量 Cox 回归分析显示，在药物治疗组中，尿酸水平与死亡风险显著相关（HR=1.002，95% CI: 1.000–1.004，P=0.043），提示尿酸每升高 1 μmol/L，死亡风险增加约 0.2%。然而对手术治疗组，尿酸水平与全因死亡的无显著相关。在调整年龄、性别、吸烟、药物 / 手术治疗、高血压、血脂、射血分数（EF）、BNP 和肾功能后，多因素 Cox 回归分析显示，尿酸水平与死亡风险无显著相关性（P=0.231），而体重指数（BMI）升高显著降低死亡风险（HR=0.878，P=0.014），糖尿病显著增加死亡风险（HR=2.574，P=0.002）。

结论： 对于高龄重度主动脉瓣狭窄患者，尿酸升高是影响药物治疗预后的危险因素，然而对手术治疗的患者，尿酸水平与全因死亡无显著相关。此外，不论接受何种治疗，糖尿病均是影响高龄重度主动脉瓣狭窄患者远期预后的独立危险因素，BMI 升高则表现为保护因素。

生命 8 要素，遗传易感性与退行性瓣膜性心脏病发病风险的关系

巩一丁 [1] 邡爽 [1] 陈占超 [2] 唐帆 [1] 董宁 [1]

1. 佳木斯大学公共卫生学院流行病与卫生统计学系

2. 哈尔滨医科大学第二附属医院心内科

【摘要】

目的: 探讨基于"生命 8 要素"（Life\ Essential 8, LE8）评分的心血管健康（CVH）状况与退行性瓣膜性心脏病（VHD）发病风险的关系，并分析遗传易感性对该关联的修饰效应。

方法： 基于 UK Biobank 队列，纳入基线无 VHD 的 262864 名参与者。根据 LE8 评分将 CVH 状态分为 3 组：较差（0 ~ 49 分）、中等（50 ~ 79 分）和理想（80 ~ 100 分）。采用 Fine-Gray 竞争风险模型计算不同 CVH 水平与 VHD 发病风险的风险比（HR）及其 95% 置信区间（CI）。

结果：研究人群平均年龄（56.0±8.1）岁，女性占 51.1%。中位随访 13.8 年期间，共新发 VHD 6 371 例，包括主动脉瓣狭窄（AS）2 754 例、主动脉瓣反流（AR）1 013 例和二尖瓣反流（MR）3 089 例。调整潜在混杂因素后，与 CVH 较差组相比，中等组和理想组的 VHD 发病风险分别降低 18%（HR=0.82，95%CI：0.74 ~ 0.90）和 21%（HR=0.79，95%CI：0.70 ~ 0.90）。值得注意的是，理想心血管健康状态显著降低了 AS 的发病风险，但与 MR 或 AR 无显著关联。与较差 CVH 组相比，中等和理想组 AS 风险分别降低 33%（HR=0.67，95%CI：0.59 ~ 0.77）和 50%（HR=0.50，95%CI：0.41 ~ 0.61）。AS 的多基因风险评分并未改变这些关联。尽管如此，CVH 状态较差且遗传易感性较高的成年人罹患 AS 的风险最高，与 CVH 状态理想且遗传易感性较低的人相比，其发病风险高出近 4 倍。生活方式行为和生物学特征均与 AS 发病显著相关，其中体质指数、睡眠时长和尼古丁暴露对瓣膜疾病影响最大。

结论：较高的 LE8 评分与较低的 VHD 发病风险显著相关，且不受遗传易感性的影响。维持理想心血管健康状态对 AS 的一级预防具有重要意义，其中肥胖控制、保证充足睡眠和戒烟是需要重点关注的干预措施。

糖尿病介导的线粒体蛋白高乙酰化通过抑制线粒体超复合体组装增加心肌对缺血再灌注损伤的敏感性

邓艳 [1,2] 杨为 [1,2] 姜春玲 [1,2] 李涛 [1,2]

1. 四川大学华西医院

2. 四川大学华西医院线粒体与代谢实验室

目的：多项研究表明，2 型糖尿病 (T2DM) 会显著增加心肌缺血再灌注 (I/R) 损伤的敏感性，从而导致更高的死亡率。线粒体高乙酰化与 Sirt3 (一种线粒体 NAD^+依赖性去乙酰化酶) 密切相关，Sirt3 的下调导致 T2DM 患者线粒体蛋白高乙酰化，可能是这种效应的潜在介导因素。 本研究旨在探讨 Sirt3 缺乏诱导的线粒体蛋白高乙酰化对 T2DM 心肌 I/R 损伤敏感性增加的影响。

方法：将野生型 (WT) 和 Sirt3 基因敲除 (KO) 小鼠高脂 (HFD) 喂养 8 周，并在第 5 周腹腔注射 STZ 以诱导 T2DM 小鼠模型。离体心脏用 Langendorff 模型灌注以模拟体外心肌 I/R 损伤 (缺血 30 分钟，再灌注 60 分钟)。冠状动脉左前降支结扎 30 分钟，随后再灌注 24 小时诱导在体 I/R 损伤。通过超声心动图评估心脏功能，TTC 染色估算梗死面积以及化学分析仪检测血浆 LDH 和 CK-MB 水平。利用 Seahorse XF24 分析仪评估线粒体呼吸功能。Blue Native PAGE 用于检测线粒体超复合体 (SCs) 的组装情况和乙酰化水平。通过邻近连接分析 (PLA) 观察 H9C2 细胞在不同处理下 CI-CIII 或 CI-CIV 相互作用情况。

结果：在 T2DM 模型中，Sirt3 缺乏诱导的线粒体蛋白高乙酰化增加了心肌 I/R 损伤的敏感性。与 WT 小鼠相比，T2DM 小鼠的心功能受损，表现为缺血期间左室舒张末期压力 (LVEDP) 显著增加，体外再灌注时收缩功能几乎无法恢复，以及左室射血分数降低。与心功能减退相一致，T2DM 心脏的梗死面积、血浆中 LDH 和 CK-MB 水平均明显增加。 从机制上讲，我们发现 T2DM 小鼠心脏线粒体中 ADP 刺激和 FCCP 刺激的呼吸作用下降。同时，在 T2DM 线粒体 SCs 中观察到 Ndusf4 表达减少，乙酰化水平升高。此外，Sirt3 基因敲除（KO）可诱导线粒体蛋白高乙酰化，进一步加重 T2DM 小鼠 I/R 后心功能障碍，增加心肌梗死面积以及血浆 LDH 和 CK-MB 水平。随着线粒体蛋白乙酰化水平的升高，KO 进一步导致 T2DM 心脏线粒体呼吸功能降低和线粒体 SCs 组装减少。另外，通过 PLA 更直观地观察到，在 PA 和 3-TYP（Sirt3 抑制剂）处理的 H9C2 细胞中，CI 与 CIII 或 CI 与 CIV 之间相互作用减少，而在 PA + NMN（NAD^+ 前体）处理的细胞中有所恢复，这表明 Sirt3 缺乏诱导的线粒体蛋白高乙酰化可能在线粒体 SCs 组装、线粒体及心功能障碍中发挥了重要作用。

结论：我们的研究数据表明，T2DM 心肌缺血再灌注损伤敏感性增加可能是由于 Sirt3 缺乏介导线粒体蛋白高乙酰化，从而破坏了线粒体超复合体的组装，导致线粒体呼吸效率降低，线粒体功能障碍。

基于快速康复理念的早期康复运动及健康教育在代谢性心血管疾病患者中的应用

代聪

西安交通大学第一附属医院

【摘要】目的 探讨基于快速康复理念的早期康复运动及健康教育在代谢性心血管疾病患者中的应用效果，旨在分析其对患者康复进程、生理指标及生活质量的影响。

方法 选取 2023 年 1 月 ~ 2024 年 6 月于本院收治的代谢性心血管疾病患者 80 例，采用随机法分为对照组与观察组，每组 40 例。对照组实施常规护理，观察组在常规护理基础上，采用基于快速康复理念的早期康复运动及健康教育。干预 12 周后，采用改良 Barthel 指数（MBI）评定量表估计两组患者干预前后日常生活能力评分，检测患者干预前后血压、心率水平，采用焦虑自评量表 SAS、抑郁自评量表 SDS 评分评估两组患者干预前后心理状态的变化及并发症发生率。

结果 干预前，两组患者日常生活能力评分、血压、心率及 SAS、SDS 评分差异均无统计学意义（P > 0.05）。干预后，观察组日常生活能力评分为（85.34±6.21）分，高于对照组的（72.45±7.83）分，且观察组与对照组干预后的评分均显著高于干预前（P < 0.05）；观察组收缩压为（122.34±8.76）mmHg、舒张压为（78.45±6.32）mmHg，均低于对照组的（135.67±9.21）mmHg 和（85.23±7.14）mmHg，且两组干预后水平均低于干预前（P < 0.05）；观察组心率为（71.23±5.67）次 /min，低于对照组的（78.45±6.52）次 /min，且均低于干预前（P < 0.05）；观察组 SAS 评分为（35.12±4.56）分、SDS 评分为（36.78±5.23）分，均低于对照组的（40.45±5.67）分和（42.34±6.12）分，两组干预后的评分均低于干预前（P < 0.05）。此外，观察组并发症发生率为 7.50%，显著低于对照组的 22.50%（P < 0.05）。

结论 基于快速康复理念的早期康复运动及健康教育能够显著改善代谢性心血管疾病患者的康复效果、生理指标及心理状态，降低并发症发生率，是一种有效的护理干预模式，值得临床推广。

1990-2021 年全球含糖饮料归因心血管疾病负担的系统分析

张乃今

中国医科大学附属第一医院

目的：评估含糖饮料（SSBs）对全球心血管疾病负担的影响，分析社会人口指数（SDI）、地域、年龄及性别差异，为代谢性心血管疾病的防控提供依据。

方法：基于 2021 年全球疾病负担研究（GBD）数据，采用比较风险评估框架，系统分析 1990-2021 年 204 个国家 SSBs 的汇总暴露值（SEV）及其归因的伤残调整寿命年（DALYs）和死亡。重点关注 SSBs 作为独立风险因素的心血管疾病结局（如缺血性心脏病、卒中）。通过年龄标准化和连接点回归分析趋势变化，并按 SDI 层级、地理区域、年龄及性别分层。

结果：研究期间全球 SSBs 归因疾病负担呈显著上升趋势，男性负担高于女性。高 SDI 国家 / 地区的年龄标准化 SEV 和 DALY 率最高，低 SDI 区域最低。心血管疾病是 SSBs 归因死亡的第二大原因，其分子机制涉及 SSBs 诱导胰岛素抵抗、促进内脏脂肪堆积及慢性炎症反应，加速血管内皮功能障碍和动脉粥样硬化进程。负担随年龄增长而增加，其中 64 岁以下人群增长率最快，老年群体因代谢功能下降和血管弹性减退更易受 SSBs 协同损伤。

结论：SSBs 通过代谢紊乱和血管损伤机制显著增加全球心血管疾病负担，且存在明显的社会经济和年龄差异。亟需在高风险地区及年轻人群中实施针对性干预，包括限制 SSBs 摄入的公共卫生政策，以减轻代谢性心血管疾病负担。

Physical activity, statin therapy and risk of new-onset type 2 diabetes: clinical and proteomic perspectives

Zhanchao Chen

[3]Department of Epidemiology and Biostatistics, School of Public Health, Jiamusi University, Jiamusi, China.

Objective: Statin use is widely recommended for cardiovascular disease prevention, yet accumulating evidence suggests it may elevate the risk of type 2 diabetes. However, the long-term effects and modifiable preventive strategies in real-world populations remain insufficiently characterized. This study aimed to evaluate the real-world impact of statin use on type 2 diabetes incidence, investigate whether guideline-recommended levels of physical activity can attenuate this risk, and identify proteomic signatures to enhance biological insight and personalize risk prediction.

Methods: We conducted a prospective analysis of 252,042 participants from the UK Biobank (mean age: 57.0 years; 55.6% female), all of whom were free of diabetes at baseline. Incident type 2 diabetes cases were identified through linkage with electronic health records. Age- and HbA1c-standardized incidence rates were evaluated using Poisson regression, and hazard ratios (HRs) were estimated using multivariable Cox proportional hazards models, adjusting for a comprehensive set of demographic, clinical, and lifestyle covariates. Proteomic profiling was performed using the Olink platform in a nested case-control subcohort, where 2,923 plasma proteins were quantified to investigate relevant biological pathways and enhance risk stratification.

Results: Over a median 13.7-year follow-up, 13,182 incident type 2 diabetes cases were identified. Age- and HbA1c-standardized incidence rates per 1,000 person-years were 2.2 (statin-noneligible), 4.6 (statin-eligible but untreated), and 7.3 (regular statin users). After adjusting for demographic, clinical, and lifestyle factors, statin use was associated with a 50% (HR = 1.50, 95%CI = 1.09-1.22) increased risk of new-onset type 2 diabetes compared with statin-noneligible individuals, independent of baseline cardiometabolic status and genetic risk. Among statin users, both self-reported and accelerometer-assessed physical activity significantly attenuated the association between statin use and type 2 diabetes risk. Notably, engaging in ≥ 150 minutes per week of device-measured moderate-to-vigorous physical activity was associated with approxi-

mately a 50% (HR = 0.54, 95%CI = 0.34-0.87) lower risk of developing type 2 diabetes. To explore underlying mechanisms, proteomic profiling of 2,923 plasma proteins identified glycolipid metabolism-related proteins—such as leptin, FABP4, IGFBP1, and PRSS8—as key mediators linking both statin use and physical activity to diabetes development. Incorporating these proteins into a composite proteomic risk score significantly improved the accuracy of 3-year diabetes risk prediction among statin users (AUC: 0.82 vs. 0.74; p < 0.001), beyond what was achieved by traditional clinical models.

Conclusions: Statin use significantly increases long-term risk of type 2 diabetes, independent of genetic and cardiometabolic risk profiles. However, this elevated risk is substantially attenuated by sufficient physical activity. Proteomic analysis reveals potential biological mediators and enhances individual risk stratification, supporting a precision medicine framework to guide statin use and lifestyle recommendations in clinical practice.

甲状腺激素在内脏脂肪代谢功能异常中的作用及机制研究

郭泽璇 范伊思 王钊 王文尧

北京大学第三医院

题目：甲状腺激素在内脏脂肪代谢功能异常中的作用及机制研究

作者：郭泽璇，范伊思，王钊，王文尧

单位：北京大学第三医院

目的：内脏脂肪是重要的代谢器官，但是甲状腺激素（thyroid hormone, TH）怎样以及如何影响内脏脂肪尚未完全明确。我们旨在研究 TH 影响内脏脂肪的表现以及具体机制，以期为 TH 治疗脂肪组织相关代谢性疾病的治疗和预防提供新的理论依据和干预靶点。

方法: 将 24 只成年雄性 C57/BL6J 小鼠随机分为对照组与甲减组、甲减补充 TH 组、对照补充 TH 组。甲减组小鼠连续三个月给予丙硫氧嘧啶饮水，补充 TH 组小鼠在最后的两周每日腹腔注射 TH 溶液，其他组腹腔注射不含 TH 的相同溶剂。通过对小鼠血糖和血脂和体重的测量探究甲状腺功能对整体代谢的影响；通过 HE 染色，WB 和 qPCR 来探究 TH 对内脏脂肪代谢的影响；通过对内脏脂肪进行马松染色以及 bulk 转录组来分析小鼠内脏脂肪的纤维化程度。通过生物信息学手段预测 KLF9 的下游关键基因。构建 KLF9 过表达脂肪细胞，观察下游基因的改变情况。通过 qPCR 和 WB 实验检测成脂基因 FABP4 的表达情况以及油红染色实验来证明细胞诱导成脂成功，并比较成脂前后的 col6a3 的改变。

结果：甲减组和补充 TH 组小鼠在给予葡萄糖注射后血糖水平迅速升高，达到峰值之后迅速下降。在 60 分钟后的时间点，补充 TH 组的小鼠血糖水平显著低于甲减组（P<0.05）。显示甲状腺激素对于小鼠代谢的积极影响；两组小鼠在胰岛素注射后血糖水平迅速下降，在 60 分钟后逐渐恢复，与甲减组小鼠相比，补充 TH 组小鼠在在 120 分钟的血糖水平更高（P<0.05），显示 TH 对低血糖状态下糖异生的积极影响。

马松染色显示甲减小鼠在 TH 腹腔注射后内脏脂肪的纤维化程度降低（P<0.05）。通过 Bulk 转录组的 KEGG 通路富集分析发现 ECM-Receptor 通路在补充 TH 的甲减小鼠附睾脂肪中得到富集（log2FC >1, P<0.05）。胶原蛋白（Collagen）和基质金属蛋白酶（MMP）在小鼠附睾脂肪纤维化的这一过程中发挥着重要作用。对富集结果分析以及后续的 qPCR 显示相比于对照组，甲减组小鼠内脏脂肪促纤维化指标如 COL4、COL6、SMA 显著升高（P<0.05），而在补充 TH 后下降（P<0.05）。对应的 MMP 水平在补充 TH 后显著增高（P<0.05）。Mfuzz 趋势分析显示相比于对照组，col6a3 在甲减小鼠附睾脂肪中表达增高，腹腔注射 TH 后表达下降。补充 TH 后，WB 和 qPCR 实验显示 KLF9 水平显著增加，提示 KLF9 与纤维化可能存在联系。通过生物信息学方法预测 KLF9 与 col6a3 有较大的结合概率（score=637），过表达脂肪细胞 KLF9 后，qPCR 与 WB 结果显示 col6a3 表达显著降低（P<0.05）。

结论：甲状腺激素可通过调节糖代谢动态平衡、通过促进 KLF9 而抑制纤维化通路及关键基因 col6a3 的表达，改善甲减小鼠糖代谢异常与内脏脂肪纤维化。为甲减相关代谢紊乱及组织纤维化的机制解析与干预提供了实验依据。

糖尿病前期人群中估算葡萄糖清除率与心脏代谢性共病与全因死亡动态演变的关联：一项多状态轨迹分析

程文珂 凌云 康品方 （血脂学组委员） 唐碧 （肺动脉高压委员）

蚌埠医科大学第一附属医院

背景

心血管代谢疾病（cardiometabolic diseases, CMD），包括冠心病、2 型糖尿病和脑卒中，是全球疾病负担的主要来源，常以共病形式表现，构成心血管代谢多重共病（cardiometabolic multimorbidity, CMM）。研究显示，CMM 的存在显著提高全因死亡风险并缩短预期寿命，其发病机制主要涉及胰岛素抵抗（insulin resistance, IR），这是连接代谢紊乱、内皮功能障碍和炎症反应的关键病理环节。估算葡萄糖清除率（estimated glucose disposal rate, eGDR）作为一种结合腰围、HbA1c 与高血压状况的简便 IR 指标，已在多项研究中表现出优越的心血管风险预测能力。然而，eGDR 在疾病进展各阶段中的动态影响尚未系统评估，尤其是在糖尿病前期人群中。为弥补这一空白，本研究旨在探讨 eGDR 与 CMD、CMM 及全因死亡的多阶段演变之间的关系，明确其在疾病不同演进阶段的风险预测价值。

方法

本研究基于英国生物样本库，纳入 50,342 名符合 2022 年美国糖尿病学会标准定义的糖尿病前期成年人，且基线时无 CMD。根据腰围、HbA1c 和高血压状况计算 eGDR 水平。采用多状态 Markov 模型模拟五种状态转换路径：①基线→首次 CMD（FCMD）；② FCMD → CMM；③基线→死亡；④ FCMD →死亡；⑤ CMM →死亡。通过 Cox 比例风险模型估算各阶段中 eGDR 的影响，并使用限制性样条检验非线性关联。进一步开展中介分析、亚组分析和多项敏感性分析以验证结果稳健性。

结果

在中位 13.6 年（四分位间距：12.9–14.5）的随访期间，共观察到 12,641 例 FCMD、2,081 例 CMM 及 4,847 例死亡。每升高 1 单位 eGDR，FCMD 风险下降 12%（HR=0.88，95%CI: 0.87–0.89），CMM 风险下降 7%（HR=0.93，95%CI: 0.91–0.96），CMD 前死亡风险下降 5%（HR=0.95，95%CI: 0.93–0.98）。但在 CMD 或 CMM 发生后，eGDR 与死亡风险之间的关联不再显著。暴露 - 反应关系显示，eGDR 与 FCMD 和 CMM 风险呈非线性负相关，拐点分别位于 8.8 与 8.7 mg/kg/min。FCMD 至死亡的风险曲线呈 U 型，最优 eGDR 约为 4.9。亚组分析发现，eGDR 在 60 岁以下、女性、BMI < 30 kg/m² 及未接受降压或调脂治疗人群中的保护作用更为明显。

结论

本研究首次基于多状态建模系统评估了 eGDR 在糖尿病前期人群中对 CMD、CMM 及死亡转归的影响。结果表明，较高 eGDR 水平显著关联于疾病早期阶段的风险降低，而其在 CMD 或 CMM 发生后的预测能力明显减弱。这提示 eGDR 作为胰岛素敏感性标志物的临床意义主要体现在疾病初发前，是早期筛查和干预的关键指标。研究支持将 eGDR 用于动态风险评估和个体化管理，强化“窗口期”内改善胰岛素敏感性对于延缓 CMM 进展及降低死亡风险的潜在价值。

LncRNA Gm26870 通过调控炎症促进脂肪组织胰岛素抵抗

厉晓婷

浙江大学医学院附属邵逸夫医院

目的：肥胖是全球性的公共卫生难题。胰岛素抵抗与肥胖密切相关，同时也是 2 型糖尿病和多种心血管疾病的共同发病机制。最近有新的研究发现转录调控和表观遗传学修饰在胰岛素抵抗的发生发展中也起着重要的作用。LncRNA 可能也参与了胰岛素抵抗的调控。

方法与结果：通过高脂饮食喂养 C57BL6 小鼠 12 周来诱导胰岛素抵抗模型，在鉴定模型建立成功后，送小鼠附睾脂肪组织进行第二代深度测序来了解 lncRNA 在正常小鼠附睾脂肪组织以及发生胰岛素抵抗的脂肪组织中表达差异情况。通过对测序结果进行质量检验，与参考基因组的比对和定量分析各类型基因的表达情况等，证明测序的质量较好，结果可靠。基于 cufflinks 拼接结果，根据 lncRNA 的结构特点以及不编码蛋白的功能特点，筛选 lncRNA。并根据以下标准得到本实验中检测到的 lncRNA：同一组的 3 个样本中，至少有 2 个样本检测到 lncRNA。通过火山图和分层聚类分析发现差异表达的 lncRNA 有 216 条，其中上调的 lncRNA 有 71 条，下调的 lncRNA 有 145 条。对其进行 Real-time PCR 验证，发现结果与测序结果基本一致，说明测序结果可靠，重复性好，值得进行后续研究。通过对差异表达的 lncRNA 临近基因进行 GO 富集分析和 KEGG 富集分析，发现差异表达的基因主要涉及膜结合的细胞组分、蛋白绑定、催化酶的活性、细胞内各种化合物以及核酸的代谢过程等，差异表达的基因与酒精中毒、免疫炎症、癌症的转录失调、以及代谢途径等信号通路有关。代谢途径、免疫炎症等过程与胰岛素抵抗密切相关。在小鼠 3T3-L1 诱导的成熟脂肪细胞中进一步验证筛选出的表达上调的 lncRNA 在正常脂肪细胞和发生胰岛素抵抗的脂肪细胞之间表达也存在差异。Gm26870（ENSMUST00000181242.1）在胰岛素抵抗脂肪细胞（Palmitic Acid 组）中的表达显著高于正常成熟脂肪细胞（Control 组）。根据 qRT-PCR 结果，选择其中差异表达显著、一致性最好的三条 lncRNA 进行功能缺失性研究，发现干预 Gm26870 能影响脂肪细胞的葡萄糖摄取率，并影响 PPARγ、GLUT4mRNA 的表达，提示其可能在胰岛素抵抗的发生中起着重要作用。我们同时使用 sh-Gm26870 敲低小鼠 Gm26870 和沉默脂肪细胞 Gm26870 后发现胰岛素抵抗得到改善。在机制上，抑制 Gm26870 可缓解胰岛素抵抗造成的炎症反应。Gm26870 吸附结合 miR-30e-3p 导致 IL1β mRNA 的调控作用减弱，因而产生改善胰岛素敏感性的作用。

结论：本研究阐明 Gm26870 对胰岛素抵抗发生发展的机制，有助于人们找到能更有效治疗 2 型糖尿病和心血管疾病等代谢相关疾病的策略。

ST 段抬高型心肌梗死患者甘油三脂葡萄糖指数与梗死面积，微循环阻塞和心肌内出血的相关性研究

赵依晴 [1] 马振岩 [1] 阿鑫 [2] 赵蕾 [3] 张洪博 [3] 马翔 [4] 杨人强 [5] 钱赓 [6]

1. 中国人民解放军总医院 / 解放军医学院

2. 中国人民解放军总医院第二医学中心保健七科

3. 首都医科大学附属北京安贞医院放射科

4. 新疆医科大学第一附属医院

5. 南昌大学附属第二医院

6. 中国人民解放军总医院第六医学中心心血管病医学部

目的：探讨 ST 段抬高型心肌梗死（STEMI）患者甘油三酯葡萄糖指数 (TyG 指数) 与心脏磁共振评估的梗死面积，微循环阻塞（MVO）和心肌内出血（IMH）之间的相关性，评估其作为心肌损伤程度潜在预测标志物的价值。

方法：本项队列研究纳入 674 名行直接 PCI 治疗的 STEMI 患者，收集其临床基线数据并在急性心肌梗死后 7 天左右进行心脏磁共振检查。按 TyG 指数三分位数将患者分为三组，分别为高 TyG 指数组，中 TyG 指数组和低 TyG 指数组。采用多元线性回归，Pearson/Spearman 相关性分析和 Logistics 回归分析等方

法分析 TyG 指数与梗死面积，微循环阻塞和心肌内出血的相关性。

结果：三组组间比较：高 TyG 指数组的梗死面积显著增加（22.39±11.53 vs 中组 21.09±10.33 vs 低组 19.13±9.54，P=0.013），MVO 面积显著增加（2.37±3.48 vs 1.89±3.51 vs 1.30±2.20,P=0.002），高 TyG 组的 IMH 的发生率也显著高于中、低组患者（高组 44.6% vs. 中组 36.6%，低组 27.6%，P<0.001）。相关性分析，TyG 指数与梗死面积（r=0.136，P<0.001),MVO（r=0.163，P<0.001）和 IMH(r=0.163, P<0.001) 呈现显著正相关关系。多元线性回归分析（调整年龄，性别，吸烟，糖尿病，高血压，胆固醇水平，术前的 TIMI 血流分级等混杂因素后）表明，TyG 指数（β=0.167，P<0.001）是心肌梗死面积的独立危险因素。经多因素 Logistics 回归分析证实 TyG 指数是 MVO 现象 (OR=1.723,95%CI:1.34--2.23, P<0.001）和 IMH 现象（OR=1.889, 95%CI:1.45--2.47, P<0.001）的独立预测因子。

结论：TyG 指数是梗死面积的独立危险因素，并且是 MVO 和 IMH 的独立预测因素，急性心肌梗死基线的 TyG 指数可以作为评估心肌损伤严重程度的潜在预测标志物。

一项基于血管内超声分析载脂蛋白 B 控制水平对冠状动脉斑块进展影响的队列研究

李悠然 阿布力克木 阿木提 张瑞岩 杨晨蝶 王晓群

上海交通大学医学院附属瑞金医院

目的：探讨在稳定性冠心病患者中，载脂蛋白 B（apolipoprotein B, ApoB）控制水平与冠脉斑块进展的相关性。

方法：连续入组 2020 年 1 月至 2023 年 5 月期间在上海交通大学医学院附属瑞金医院心内科接受重复血管内超声（intravascular ultrasound, IVUS）检查的稳定性冠心病患者。收集患者人口学资料、病史、心血管代谢指标、用药情况等资料。计算基线与随访期间糖化血红蛋白及包括载脂蛋白 B 在内的多项血脂谱代谢参数的时间平均值。同时，通过 IVUS 定量分析基线及随访期间动脉粥样硬化体积百分比（percent atheroma volume, PAV）的变化量以评估斑块负荷变化情况，对于 PAV 变化量≥ 5% 的病变，定义为斑块进展。

结果：本研究共分析了 86 例患者的 146 个病变，在平均 12.6 个月的随访期间，PAV 平均变化量为 4.1% ± 10.2%，其中 65 个病变（44.5%）出现斑块进展。时间平均 ApoB 控制水平与动脉粥样硬化斑块总体积的平均变化量呈显著正相关（Pearson's r=0.22，P=0.008）。经多因素校正后，时间平均 ApoB 控制水平每增加 0.1 mmol/L，斑块进展的风险增加 1.8 倍。

结论：本研究显示，在校正了包括低密度脂蛋白胆固醇在内的多种心血管危险因素后，较高的 ApoB 水平仍是冠脉斑块进展的独立预测因子。因此，加强对 ApoB 在内的心血管代谢危险因素的全面管理，有利于延缓斑块进展，降低心血管不良事件的风险并改善患者预后。

Prognostic Implications of Obstructive Sleep Apnea In Acute Coronary Syndrome By Residual Cholesterol Inflammation Index

Ming-Rui zhang[1], Xiao Wang[2], qian Guo[1], Fei-Yu Zhang[1], Xiao-Chen Liu[1], Ya-Ting Chen[1], Xiang-Yun Kong[1], Shao-Ping Nie[1]

1. Center for Coronary Artery Disease, Division of Cardiology, Beijing Anzhen Hospital, Capital Medical University, Beijing, China

2. Cardiometabolic Medicine Center, Fuwai Hospital, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College

Abstract

Background: Acute coronary syndrome (ACS) is a group of life-threatening cardiovascular diseases, and the long-term prognosis of patients with ACS has been a focus of clinical research. Obstructive sleep apnea (OSA), a common sleep-related breathing disorder, has been shown to be closely associated with the onset and progression of cardiovascular disease, particularly in ACS patients, where OSA may exacerbate vascular damage through mechanisms such as repeated hypoxia and sympathetic nervous system activation. Meanwhile, remnant cholesterol (RC), an important intermediate product of cholesterol metabolism, is closely associated with the progression of atherosclerosis, while high-sensitivity C-reactive protein (hs-CRP), a classic inflammatory marker, reflects the degree of vascular inflammation. The remnant cholesterol inflammation index (RCII), as a composite indicator integrating metabolic disorders and inflammatory states, has not yet been clearly defined in terms of its regulatory role in the association between OSA-ACS patient outcomes. Therefore, this study aims to explore the association between OSA and ACS patient long-term MACCE risk at different RCII levels through a large-scale prospective cohort design, providing evidence for clinical risk stratification and intervention strategies.

Methods: In this large-scale prospective cohort study, we recruited 2,160 patients with acute coronary syndrome (ACS) who successfully completed a sleep study. Remnant cholesterol defined was calculated as: RC (mg/dL) = TC- (HDL-C+ LDL-C). Remnant cholesterol inflammatory index defined as RCII = RC × hsCRP (mg/L)/10. The primary endpoint was major adverse cardiovascular and cerebrovascular events (MACCE), including cardiovascular death, myocardial infarction (MI), stroke, ischemia-driven revascularization, or hospitalization for unstable angina (UA) or heart failure.

Results: The final analysis included 1,832 patients, of whom 73.4% (1345) had RCII and 52.7% (965) had OSA (AHI ≥ 15 events/h). At baseline, patients with RCII had significantly higher levels of hs-CRP (7.36±8.61 vs 0.55±0.44, p < 0.001), total cholesterol (4.45±1.12 vs 3.78±0.87, p < 0.001), and low-density lipoprotein (2.69±0.93 vs 2.24±0.76, p < 0.001) compared with those without RCII, while high-density lipoprotein levels were lower than those without RCII (1.00±0.22 vs 1.09±0.25, p < 0.001).During the 2.9-year follow-up period, the incidence of MACCE was significantly higher in the OSA group than in the non-OSA group among patients with RCII (11.6% vs 7.0%; HR=1.38 , 95% CI 1.07-1.78; p=0.014), but this difference was not significant among patients without RCII (11.3% vs 12.3%; HR=1.33 , 95% CI 0.92-1.91; p=0.13). The incremental risk in RCII was attributable to higher rates of hospitalization for ACS, hospitalization for UA and ischemia-driven revascularization.

Conculsions: This study is the first to confirm that, in ACS patients, the association between OSA and long-term MACCE risk is influenced by RCII levels. Specifically, OSA significantly increases the risk of adverse cardiovascular events only in patients with elevated RCII levels, while this association is not significant in patients without elevated RCII levels. This finding reveals the synergistic role of metabolic-inflammatory status (RCII) and sleep-disordered breathing (OSA) in ACS prognosis, emphasizing the importance of screening and intervening for OSA in ACS patients with elevated RCII. In future clinical practice, combined assessment of RCII and OSA status can optimize risk stratification, enabling the development of targeted management strategies for high-risk patients to reduce the risk of long-term cardiovascular events.

估计葡萄糖处置率（eGDR）与慢性肾脏病患病率及死亡率的关联：一项全国性横断面研究

交大一附院

目的: 本研究旨在探讨一般人群中估计葡萄糖处置率(eGDR)与慢性肾脏病(CKD)患病率及死亡率的关联，并与其他胰岛素抵抗（IR）指标进行比较。

方法：基于美国国家健康与营养调查（NHANES）数据开展横断面研究。根据纳入及排除标准筛选后最终纳入 29621 名参与者。eGDR 计算公式为：21.158-0.09× 腰围（cm）-3.407× 高血压（是 =1/ 否 =0）-0.551× 糖化血红蛋白（%）；通过空腹胰岛素、血糖及甘油三酯水平及腰围和升高计算甘油三酯葡萄糖（TyG）指数、腰臀比（WHtR）及 IR 稳态模型（HOMA-IR）。采用 Logistic 回归、限制性立方样条（RCS）分析及分层分析评估 eGDR 与 CKD 患病率的关联。通过受试者工作特征曲线（ROC）、加权分位数总和（WQS）模型、随机森林及极限梯度提升（XGBoost）机器学习模型，探究 IR 指标构成要素及危险因素对 CKD 风险影响的重要性。进一步在 CKD 患者中，采用 Cox 回归分析 eGDR 与全因死亡及心血管死亡率的关联。

结果：总人群中 eGDR 的中位数为 8.64 mg/kg/min，CKD 患病率为 12.47%。Logistic 回归及分层分析显示，eGDR 与 CKD 患病率独立相关（比值比（OR）=0.88，95% 可信区间 = 0.84-0.91，P < 0.001），尤其是 40-60 岁、超重或糖耐量异常人群。RCS 曲线提示 eGDR 降低与 CKD 风险升高呈 U 型关联。ROC 分析表明 eGDR 相较于其他 IR 指标，其识别 CKD 风险的效能更优。WQS 模型显示血糖控制水平是 IR 指标构成要素中的主要影响因素，空腹血糖水平、高血压病史及腰围次之。两种机器学习模型中，年龄、eGDR、尿酸及心力衰竭病史的权重较高，提示 eGDR 需要与以上因素结合共同评估 CKD 患病风险。在中位随访 7.67 年期间，CKD 患者的全因死亡率为 23.33%，心血管疾病死亡率为 6.73%，Cox 回归表明 eGDR 可独立预测 CKD 患者的全因死亡率（风险比（HR）=0.93，95% 可信区间 = 0.89-0.98，P=0.004），在调整混杂因素后，eGDR 与 CKD 患者的心血管死亡率统计学意义消失。

结论：eGDR 是评估普通人群 CKD 风险的更优指标，并可预测 CKD 患者的全因死亡率。评估 eGDR 有助于对人群 CKD 风险分层，其中血糖控制水平尤为重要。采用基于 eGDR 的控制策略来指导危险因素管理，可能有助于降低 CKD 风险并改善 CKD 预后。

Association between obesity metabolic phenotype and risk of incident degenerative valvular disease in UK Biobank

Abstract

Background:

Obesity and metabolic abnormalities are independently associated with adverse cardiovascular outcomes. However, their combined impact on the risk of degenerative valvular heart disease (VHD) is unclear. Significant differences in metabolic health exist between individuals of similar weight, suggesting that obesity alone may not fully reflect the associated cardiovascular risk. Therefore, assessing obesity in conjunction with metabolic signatures may provide more insight into its role in the development of VHD. This study aimed to investigate the association between metabolic obesity phenotypes and the long-term risk of VHD.

Methods:

This prospective cohort study included participants aged 40 to 69 years from the UK Biobank. Metabolic obesity phenotypes were defined based on body mass index and metabolic health status, and classified into four categories: metabolically healthy non-obese (MHNO), metabolically healthy obese (MHO), metabolically unhealthy non-obese (MUNO), and metabolically unhealthy obese (MUO). The primary outcomes were incident VHD and its subtypes, including aortic stenosis (AS), aortic regurgitation (AR), and mitral regurgitation (MR). Multivariable Cox proportional hazards models were used to estimate hazard ratios (HRs) and 95% confidence intervals (CIs), adjusting for potential confounders such as age, sex, ethnicity, education level, physical activity, the Townsend deprivation index, smoking status, alcohol consumption, and comorbidities such as hypertension, diabetes, and cardiovascular disease.

Results:

Among 487,443 participants (54% female; mean age 56.5 ± 8.1 years), 12,793 (2.6%) developed VHD over a median follow-up of 13.3 years. Compared with the metabolically healthy non-obese (MHNO) group, the metabolically unhealthy non-obese (MUNO) phenotype exhibited no significant VHD risk difference (HR 1.05; 95% CI, 0.92-1.19). In contrast, both metabolically healthy obese (MHO) and metabolically unhealthy obese (MUO) phenotypes demonstrated elevated risks (MHO: HR 1.12, 95% CI 1.07-1.17; MUO: HR 1.34, 95% CI 1.28-1.41), primarily driven by aortic stenosis (AS) (MHO: HR 1.42, 95% CI 1.31-1.53; MUO: HR 1.87, 95% CI 1.72-2.02). Aortic regurgitation (AR) showed modest associations, while no significant link emerged for mitral regurgitation (MR). The MHO/MUO-AS association remained unaffected by polygenic risk score (PRS) (p-interaction > 0.05), though high-PRS individuals with either phenotype had substantially higher AS risk. Among individual components of metabolic syndrome, elevated waist circumference, increased blood pressure, low high-density lipoprotein cholesterol (HDL-C), and elevated glycated hemoglobin (HbA1c) levels were independently associated with a higher risk of VHD. In contrast, triglyceride levels showed no association.

Conclusion:

Obesity is significantly associated with an elevated risk of developing VHD, regardless of an individual's underlying metabolic health status. Although the presence of metabolic unhealthiness alone does not independently confer an increased risk of VHD, it plays a critical role in substantially amplifying disease susceptibility among individuals who are obese, especially in those with a high degree of genetic predisposition. These findings highlight the importance of incorporating genetic risk stratification into comprehensive prevention strategies that integrate metabolic profiling and weight management for the effective early detection and long-term control of VHD.

Association Between Triglyceride-Glucose Body Mass Index and Type 2 Diabetes Mellitus in Patients with Non-Alcoholic Fatty Liver Disease

Lei Wang, Li-Ya Bian, Peng- Zhang, Ming-Wei Wang

Affiliated Hospital of Hangzhou Normal University

Introduction and Objectives:

The triglyceride-glucose body mass index (TyG-BMI) is a novel composite indicator that combines the triglyceride-glucose index (TyG), a surrogate marker for insulin resistance, with body mass index (BMI), an established measure of adiposity. This integrated index captures both metabolic and anthropometric parameters, thereby offering a more comprehensive assessment of metabolic health. In recent years, TyG-BMI has garnered attention for its utility in predicting insulin resistance-related conditions, particularly type 2 diabetes mellitus (T2DM). However, its predictive value in specific clinical populations, such as patients with non-alcoholic fatty liver disease (NAFLD), remains underexplored. NAFLD is a hepatic manifestation of metabolic syndrome and shares strong pathophysiological links with insulin resistance and T2DM. Given the rising global prevalence of both NAFLD and T2DM, identifying reliable and non-invasive predictors is crucial. Therefore, this study aimed to evaluate the association between TyG-BMI and the presence of T2DM in hospitalized patients diagnosed with NAFLD and to assess the predictive performance of TyG-BMI in stratifying diabetes risk within this high-risk cohort.

Materials and Methods:

This retrospective study enrolled a total of 3,111 adult patients diagnosed with NAFLD who were admitted to Hangzhou Normal University Affiliated Hospital between January 2020 and December 2023. Patients were categorized into two groups based on the presence or absence of T2DM: T2DM group (n = 729) and non-T2DM group (n = 2,382). TyG-BMI was calculated using the formula: TyG index = ln [fasting triglycerides (mg/dL) × fasting glucose (mg/dL)/2]; TyG-BMI = TyG × BMI. Participants were stratified into quartiles (Q1–Q4) based on TyG-BMI distribution. Baseline demographic, biochemical, and clinical data were collected. The association between TyG-BMI and T2DM was analyzed using univariate and multivariate logistic regression models, adjusting for key covariates including age, sex, alanine aminotransferase (ALT), aspartate aminotransferase (AST), and low-density lipoprotein cholesterol (LDL-C).

Results:

Patients with T2DM were significantly older (median age: 61 vs. 55 years, $p < 0.001$) and had poorer metabolic profiles compared to non-diabetic individuals. Notably, the T2DM group exhibited higher HbA1c levels (8.8% vs. 6.6%, $p < 0.001$) and elevated TyG-BMI values ($p < 0.001$). In the unadjusted logistic regression analysis, increasing TyG-BMI quartiles were associated with a stepwise increase in T2DM risk, with the highest risk observed in Q4 (OR = 2.19; 95% CI: 1.81–2.66; $p < 0.001$). After adjusting for confounding factors, TyG-BMI remained an independent predictor of T2DM, with adjusted OR for Q4 reaching 2.72 (95% CI: 2.23–3.31; $p < 0.001$). Additionally, age was independently associated with T2DM risk, with each additional year of age increasing risk by approximately 4% (OR = 1.04; $p < 0.001$), while sex did not show significant impact.

Conclusions:

TyG-BMI demonstrates a strong and independent association with T2DM among NAFLD patients. The progressively higher odds of T2DM across TyG-BMI quartiles support its role as a robust predictive marker. As a simple and easily obtainable metric from routine laboratory and anthropometric measurements, TyG-BMI may serve as a valuable screening tool for early detection of high-risk individuals, enabling timely interventions to mitigate the progression of metabolic disease in NAFLD populations.

Naringenin Exerts Cardiovascular Protective Effect in a Palmitate-Induced Human Umbilical Vein Endothelial Cell Injury Model via Autophagy Flux Improvement

Qiang Zhao, Yi-Ning Yang

People's Hospital of Xinjiang Uygur Autonomous Region

Objective: Palmitic acid (PA) contributes to the pathogenesis of cardiovascular disease by promoting endothelial dysfunction, while naringenin (NG), most abundant in oranges, has been shown to exert multiple beneficial effects on the human cardiovascular system. However, the exact mechanism has not been investigated yet. We aimed to explore whether the NG prevents PA-induced apoptosis in human umbilical vein endothelial cells (HUVECs).

Methods: HUVECs were treated with NG in the presence of PA, and the cell apoptosis, intracellular ROS, nitric oxide generation, and MAPK signaling pathways were tested. Meanwhile, HUVECs were transfected with mRFP-GFP-LC3 adenovirus, and the effects of NG on autophagy flux was evaluated.

Results: Treatment of PA for at least 24 h caused observable decrease in levels of cell viability, oxidative stress, disorder of autophagy flux and apoptosis in HUVECs. Low concentrations of NG (1 and 10 μm) significantly increased PA-treated cell viability, while the PA-treated cell viability was dose-dependently decreased by the treatment of NG at 50, 100, and 200 μm. The PE-Annexin V apoptosis assay showed that NG at 1 and 10 μm significantly inhibited apoptosis of PA-treated HUVECs. NG inhibited the PA-caused ROS production. The DHE and DCF fluorescence intensities and MDA concentration in the NG-treated HUVECs were dramatically lower than those in the PA-treated HUVECs, suggesting that NG inhibited the PA-caused ROS production. In contrast, NG dose-dependently upregulated SOD2 expression in the PA treated HUVECs. Moreover, an increase in GPx activity and a decrease in LDH activity were observed in the NG and the PA cotreated HUVECs, as compared with the PA-only treated HUVECs. Although the PA induced significant increases in the expressions of p-ERK, p-JNK, and p-p38 MAPK, NG dose-dependently downregulated the p-JNK and p-p38 MAPK levels, while the p-ERK level in the PA-treated HUVECs was not visibly affected by the NG treatment. Accordingly, NG is considered to have prevented PA-induced apoptosis in the HUVECs by regulating the JNK and p38 MAPK pathways. Compared with the PA-induced group, treatments of NG distinctly reduced the number of autophagosomes, and increased the number of autolysosomes, in HUVECs. Consequently, the ratio of LC3B-II/I in HUVECs was significantly increased by the PA treatment, whereas the NG effectively inhibited this elevation. In addition, the NG also decreased the PA-induced increase of p62 expression level in the HUVECs. The CQ, both with and without NG, was distinctly observed to enhance apoptosis of the PA-treated HUVECs, evidenced by the increase of apoptotic cells and the decrease of the Bcl-2/Bax ratio. Thus, the protection of autophagy flux may be considered a key mechanism of NG in its inhibition of PA-treated apoptosis of

HUVECs. Both NG and SP600125 decreased the phosphorylation of JNK in the presence of PA in the HUVECs. Notably, the PA-induced phosphorylation of JNK was inhibited to a greater extent by the cotreatment of NG and SP600125 than by their individual treatments, suggesting that SP600125 blocked the phosphorylation of JNK in the PA-treated HUVECs. Additionally, the treatment of SP600125 alone and in combination with NG prevented a PA-induced increase of autophagosomes and decrease of autolysosomes in the HUVECs. Moreover, the cotreatment of SP600125 combined with NG strongly inhibited increases in the ratio of LC3BII/I and p62 expression in the PA-treated HUVECs, to a greater extent than the individual SP600125 or NG treatments.

Conclusion: These findings provide a possible mechanism by which NG prevents endothelial dysfunction and cardiovascular diseases.

心脏代谢指数与炎症介导的急性冠脉综合征患者易损斑块形成有关

闫海浩 刘巍

首都医科大学附属北京积水潭医院

背景： 心脏代谢指数（Cardiometabolic Index, CMI）作为一种反映代谢状态和内脏脂肪分布的新型指标，在心血管风险分层中受到关注。本研究旨在采用光学相干断层成像（Optical Coherence Tomography, OCT）技术探讨 CMI 与易损斑块之间的潜在关联，以及炎症在其中的作用。

方法： 本研究对 270 例接受 OCT 成像评估的急性冠脉综合征（Acute Coronary Syndrome, ACS）患者进行了横断面分析。根据 CMI 三分位数将患者分组，CMI 的计算公式为：[腰围 (cm)/ 身高 (cm)]×[甘油三酯 (mmol/L)/ 高密度脂蛋白胆固醇 (HDL-C)(mmol/L)]。OCT 用于评估罪犯病变处的斑块事件和非罪犯病变处的斑块成分，并检测炎症标志物水平。采用中介效应分析研究炎症在 CMI 与易损斑块关系中的中介作用。

结果： CMI 三分位数分组与易损斑块特征显著相关：薄帽纤维粥样斑块（Thin-cap fibroatheroma, TCFA）和巨噬细胞浸润（T1 组 vs T2 组 vs T3 组，TCFA：10.0% vs 20.0% vs 26.7%，P = 0.016；巨噬细胞：17.8% vs 28.9% vs 36.7%，P = 0.019）。多变量回归分析显示，CMI 升高是 TCFA 患病率更高（OR: 1.40, 95%CI: 1.25-2.89, P=0.003）、巨噬细胞浸润增多（OR: 1.61, 95% CI: 1.09-2.37, P=0.017）、纤维帽厚度（Fibrous Cap Thickness, FCT）减小（β= -30.65, 95% CI: -50.72 ~ -10.57, P=0.003）以及最大脂质弧增大（β= 20.78, 95% CI: 6.55-35.01, P=0.004）的独立预测因素。此外，CMI 与超敏 C 反应蛋白（hsCRP）、白细胞计数（WBC）和中性粒细胞计数呈正相关。中介效应分析表明，hsCRP 介导了约 17.0% 的 CMI 与最小 FCT 之间的关联 [间接效应值 = -5.21, 95% CI= (-12.70, -1.27), P=0.016]。

结论： CMI 是预测 ACS 患者易损斑块的关键指标。系统性炎症与 CMI 和易损斑块特征之间的关系相关，提示其可能存在机制性联系。

中国人内脏脂肪指数长期累积水平在心血管 - 肾脏 - 代谢综合征 0-3 期人群中对心血管疾病发病的预测价值

高鹏杰 卓琰 严怡然 王丹妮 卡米拉 徐绥宁 李锡洋 田刚

西安交大一附院

目的：本研究拟探讨中国人内脏脂肪指数（Chinese visceral adiposity index，CVAI）及其长期累积水平是否可以预测中老年心血管 - 肾脏 - 代谢综合征（Cardiovascular-Kidney-Metabolic syndrome，CKM）0-3 期患者的心血管疾病（cardiovascular diseases，CVDs）发生。

方法：本研究纳入来自中国健康与退休纵向研究中符合 CKM0-3 期标准的 45 岁以上中老年人群共 3449 人。CVAI 的计算公式男性为 -267.93+0.68×（年龄 +1）+0.03× 体质指数（body mass index，BMI，kg/m^2）+4.00× 腰围（cm）+ 22.00×lg[甘油三酯（mmol/L）]-16.32× 高密度脂蛋白（mmol/L），女性为 -187.32+1.71×（年龄 +1）+4.23×BMI（kg/m^2）+1.12× 腰围（cm）+39.76×lg[甘油三酯（mmol/L）]-11.66× 高密度脂蛋白（mmol/L）。用两种方法反映 CVAI 的长期累积水平：（1）使用 K 均值聚类分析结合第 1 及第 3 次随访时 CVAI 水平分为长期低、中、高水平 3 组；（2）通过（第 1 次 CVAI+ 第 3 次 CVAI）/（2015-2012）计算累积 CVAI。多元 Cox 回归用于分析基线及 CVAI 长期累积水平与 CVDs 发生之间的关系，RCS 曲线进一步分析二者之间的非线性关系，分层分析探讨二者关系在不同 CKM 分期及其他不同亚组人群中的差异。

结果：总人群平均年龄为 58.12±8.54 岁，其中 CKM2 期人数最多（1919 人，占比 55.64%），CKM3 期共 211 人（6.12%）。长期低、中、高水平 CVAI 组的累积 CVAI 分别为 219.07、307.79、413.30。长期高 CVAI 组的年龄更大，合并血压、血糖及血脂代谢紊乱的人群更多，BMI、腰围、尿酸水平更高，肾小球滤过率更低，CKM2 期及 3 期人数更多。中位随访时间为 84 月，期间共 706 人（20.47%）发生 CVDs，长期高 CVAI 组的 CVDs 发病率更高。Cox 回归提示在调整混杂因素后，基线 CVAI（Hazard ratio（HR）=1.148，95% confidence interval（95%CI）：1.058-1.246，P=0.001） 及累积 CVAI（HR=1.187，95%CI：1.093-1.288，P<0.001）均是发生 CVDs 的独立预测因子，且累积 CVAI 的预测作用更强。长期高 CVAI 组发生 CVDs 的风险是低水平组的 1.5 倍。RCS 曲线显示无论 CKM 分期，CVDs 发病风险随累积 CVAI 增大呈线性增加。分层分析显示随 CKM 分期进展，累积 CVAI 的预测价值均有统计学意义但 HR 值逐渐下降，提示累积 CVAI 的预测价值受患者合并心血管代谢疾病逐渐增多的影响而减弱。

结论：中国人内脏脂肪指数的基线及长期累积水平均可预测中老年心血管 - 肾脏 - 代谢综合征 0-3 期人群发生心血管疾病的风险。

Association Between Estimated Glucose Disposal Rate and Ischemic Heart Disease Prevalence in Non-Diabetic Adults: A Cross-Sectional NHANES Study

Yu-Qiong Chen, Li-Bo Luo, Chun-Ren Cen, Zhan-Xiang Deng, Ji-Jin Lin

广东省人民医院（广东省医学科学院）

Background:

Insulin resistance (IR), a fundamental pathophysiological state preceding the development of type 2 diabetes, is unequivocally established as a significant independent risk factor for cardiovascular disease. Its specific contribution to ischemic heart disease (IHD) pathogenesis and outcomes within the substantial population of individuals without a formal diabetes diagnosis remains inadequately characterized and necessitates deeper investigation. While the hyperinsulinemic-euglycemic clamp technique represents the gold standard for directly quantifying whole-body insulin sensitivity, its inherent operational complexity and invasiveness severely limit its utility. The procedure demands repeated arterial catheterization for precise blood sampling and prolonged, carefully controlled intravenous infusions, rendering it impractical for large-scale epidemiological studies or routine clinical assessment. Consequently, validated surrogate markers like the estimated Glucose Disposal Rate (eGDR), derived from readily available clinical parameters (e.g., waist circumference, hypertension status, HbA1c), offer a crucial and practical tool for estimating insulin sensitivity in research and clinical settings. Furthermore, the potential mechanistic pathway linking IR to IHD via systemic inflammation, potentially quantifiable through accessible hematological indices like the Neutrophil-to-Lymphocyte Ratio (NLR), represents a significant and underexplored area in understanding IHD risk in non-diabetic individuals.

Objective:

To assess the relationship between eGDR and IHD prevalence in non-diabetic adults, evaluate potential effect modifications by demographic factors, and determine whether NLR mediates this association.

Methods:

Study Population: Data were derived from the National Health and Nutrition Examination Survey (NHANES) cycles (2007–2016). A total of 12278 non-diabetic adults (no physician-diagnosed diabetes) were included.

Key variables were defined and calculated as the follows. IHD was defined by self-reported physician diagnosis of coronary heart disease or angina. eGDR was calculated as: eGDR=21.158-(0.09 * waist circumference)-(3.407 * hypertension)-(0.551 * HbA1c (%)). Participants were stratified into quartiles (Q1–Q4), where Q1 represents the lowest eGDR. NLR was calculated as the ratio of the neutrophil count to the lymphocyte count.

Baseline characteristics compared using t-tests/χ^2-tests. Multivariate logistic regression was employed: Three models assessed eGDR-IHD association: Model 1: remained unadjusted. Model 2: adjusted for age, gender. Model 3: adjusted for all the variables. Restricted Cubic Spline (RCS) was used to test linear vs. non-linear relationships between continuous eGDR and IHD odds ratio. Subgroup analyses were also performed for age, gender, race, BMI, marital status, smoking status, history of stroke, history of cancer, hypertension, hyperlipidemia and sleep disorders. Mediation Analysis was used to quantify NLR's role in the eGDR-IHD pathway using a causal mediation frameworks.

Results:

Among 12278 participants, 650 (5.29%) were diagnosed with IHD. IHD patients exhibited significantly lower eGDR compared to non-IHD ($p < 0.05$). The Logistic Regression showed that the highest eGDR quartile (Q4) had a 35.7% reduction in IHD odds compared to Q1 (OR = 0.21, 95% CI: 0.10–0.46) in Model 3. RCS analysis revealed a significant inverse linear relationship between continuous eGDR and IHD prevalence (P for linearity < 0.001). In subgroup analyses, significant interaction effects were observed for race ($p < 0.05$) , smoking status ($p < 0.05$) and hyperlipidemia , indicating heterogeneity in the eGDR-IHD association across these strata. The inverse eGDR-IHD relationship persisted in other subgroups (age, sex, BMI). Additionally, mediation analysis demonstrated that NLR partially mediated the eGDR-IHD association, accounting for 2.64% of the total effect.

Conclusion:

Lower eGDR (indicating worse insulin sensitivity) is strongly and independently associated with higher IHD prevalence in non-diabetic adults, demonstrating a dose-dependent, inverse linear relationship. This association is modified by race, smoking status and hyperlipidemia. Systemic inflammation (proxied by NLR) mediates approximately 2.64% of the total effect of eGDR on IHD risk. These findings underscore insulin resistance as a key metabolic driver of IHD even without diabetes and highlight NLR as a minor mechanistic pathway.

不同治疗背景下中国混合型高脂血症人群的血脂水平流行病学特点：一项全国性横断面研究

王乐怡 张龙 范芳芳 张岩 李建平

北京大学第一医院

目的

混合型高脂血症（CHL）是动脉粥样硬化性心血管疾病（ASCVD）的重要危险因素，但其血脂水平在实际临床管理中存在显著异质性。本研究旨在基于中国大规模人群队列，比较接受与未接受治疗的 CHL 人群的血脂水平，探讨其在不同人口学、地理与社会经济亚组中的分布差异，为优化干预策略提供依据。

方法

本研究基于国家级高脂血症专病队列，纳入 2022 年 9 月至 2024 年 11 月间中国 28 个省份 2,750 家医疗机构登记的 60 余万名确诊 CHL 的个体。采用横断面分析方法，比较未治疗人群（n = 143,825）与治疗人群（n = 109,748）的甘油三酯（TG）、总胆固醇（TC）、低密度脂蛋白胆固醇（LDL-C）、高密度脂蛋白胆固醇（HDL-C）水平，按地理区域、GDP 水平、城乡、性别、年龄、BMI 分层，分析血脂参数的分布差异。

结果

总体而言，未治疗人群的TG、TC、LDL-C水平均显著高于治疗人群（TG: 3.07±2.63 vs 2.77±2.36 mmol/L; TC: 5.96±1.07 vs 5.28±1.30 mmol/L; LDL-C: 3.57±0.93 vs 3.12±1.04 mmol/L），HDL-C 水平在两组间差异不明显（1.35±0.80 vs 1.30±0.98 mmol/L）。地理分布方面，在治疗与未治疗人群中，东北和华南地区的 LDL-C 水平均较高，而 TG 水平在东部较高，西南地区 HDL-C 相对更高。经济水平方面，GDP 第一与第二梯队地区人群的 LDL-C 普遍较高，但 TG 水平均值在各梯队之间差异不大。HDL-C 在低 GDP 地区更高或相近，提示经济水平对胆固醇控制影响更大。城乡差异方面，城乡间 TG、LDL-C 水平均存在显著差异。未治疗人群中，农村 TG 高于城市，而城市 LDL-C 高于农村，治疗后城乡差异缩小，但城市人群 LDL-C 仍略高。性别方面，男性人群 TG 水平显著高于女性，而女性 LDL-C 和 HDL-C 水平更高。年龄方面，TG 水平在 35-55 岁组达峰值，随后逐渐下降。LDL-C 和 TC 在 55-65 岁组达到最高，HDL-C 则随年龄略有上升趋势。随着 BMI 升高，TG 和 LDL-C 水平均递增，HDL-C 则呈下降趋势。治疗组中肥胖人群的 TG 和 LDL-C 依旧较高，提示治疗效果受 BMI 影响明显。

结论

中国混合型高脂血症人群在接受药物治疗后，主要血脂参数明显改善，尤其在 TC、LDL-C 及 TG 方面。然而，城乡、地区、经济水平、BMI 及年龄等因素导致血脂控制水平存在显著差异。应重点关注高 TG、高 LDL-C 且低 HDL-C 的高危亚组（如农村、低收入地区、肥胖者、男性和中年群体），推进分层管理与个体化干预措施，加强基层医疗服务能力建设，提升 CHL 人群的全面管理水平，以实现心血管疾病一级预防目标。

Serum Lipid Profiles Stratified by Treatment Status in Chinese Adults with Hypertriglyceridemia: a nationwide cross-sectional study

Le-Yi Wang, Long Zhang, Fang-Fang Fan, Yan Zhang, Jian-Ping Li

Peking University First Hospital

Objectives:

To comprehensively evaluate serum lipid levels in Chinese adults with hypertriglyceridemia, comparing those receiving lipid-lowering therapy (LLT) with untreated individuals, and to explore lipid profile variations across demographic, geographic, and socioeconomic subgroups.

Methods:

This cross-sectional study was a nationwide, multi-ethnic, multi-regional survey of dyslipidaemia in China funded by the National Key Research and Development Program. Using a multistage sampling method, 2,750 clinics across 28 provinces and seven geographic regions were selected. Between September 2022 and November 2024, adult patients diagnosed with dyslipidaemia were consecutively enrolled regardless of age or sex. Dyslipidaemia was defined according to the 2016 Chinese Adult Dyslipidaemia Prevention Guideline based on lipid thresholds or LLT use. Participants were classified as treated if they reported LLT use within the previous month. Data including demographics, clinical characteristics, and lipid profiles were collected through standardized questionnaires and physical measurements. Key variables included age, sex, BMI, geographic region, urban/rural residence, and provincial GDP per capita. Serum lipid levels (TG, TC, LDL-C, HDL-C) were analyzed by treatment status and stratified by demographic and socioeconomic factors. Statistical analyses were performed using appropriate tests with significance set at $p < 0.05$.

Results:

A total of 156,298 individuals with HTG were included, among whom 135,531 (86.7%) were not receiving lipid-lowering therapy. Compared to the untreated group, treated individuals exhibited significantly lower mean levels of TG (2.40 ± 1.46 vs. 2.64 ± 1.19 mmol/L), TC (3.53 ± 0.80 vs. 4.28 ± 0.69 mmol/L), and LDL-C (1.81 ± 0.61 vs. 2.43 ± 0.57 mmol/L). HDL-C was also slightly lower in the treated group (1.09 ± 0.96 vs. 1.20 ± 0.50 mmol/L). In terms of geographic differences, among untreated individuals, TG levels ranged from 2.38 mmol/L in Northeast China to 2.94 mmol/L in South China; in treated individuals, the highest TG was observed in South China (2.82 mmol/L). TC and LDL-C were also highest in Northeast China for both groups. HDL-C showed the most favorable levels in Northeast and Southwest China. Socioeconomic disparities were evident as in untreated individuals, those from higher GDP provinces had higher TC and LDL-C levels. In contrast, among treated individuals, the difference in TC and LDL-C by GDP level was smaller, suggesting more effective lipid control in higher-resource regions. Urban-rural differences indicated that untreated rural participants had slightly higher TG and lower HDL-C than urban counterparts. Among treated individuals, urban residents had higher LDL-C but slightly better HDL-C levels than rural residents. Age-stratified analyses revealed a peak in TG levels between 35 and 55 years, followed by a gradual decline in both groups, with LDL-C levels decreasing progressively with advancing age. HDL-C showed a downward trend with increasing age in untreated individuals, while this trend was less marked in treated individuals. Sex differences were also noted, with males exhibiting higher TG (2.65 vs. 2.61 mmol/L untreated; 2.44 vs. 2.34 mmol/L treated) and lower HDL-C (1.18 vs. 1.22 mmol/L untreated; 1.05 vs. 1.16 mmol/L treated) than women in both treated and untreated groups. LDL-C and TC differences were more variable but generally favored female participants. Regarding BMI, a clear positive correlation was observed between BMI and TG levels. Obese participants had the highest TG values in both groups (2.80 mmol/L untreated; 2.57 mmol/L treated). HDL-C decreased progressively with an increasing BMI, while LDL-C remained relatively stable across BMI categories.

Conclusions:

Lipid-lowering treatment is associated with improved TG, TC, and LDL-C levels in Chinese hypertriglyceridemia patients, but HDL-C remains suboptimal. Significant disparities by region, socioeconomic status, and demographics persist, indicating the need for tailored strategies to enhance lipid management and reduce cardiovascular risk.

N6-methyladenosine of lncRNA Gm16984 inhibits homocysteine-induced podocyte injury through miR-29b-3p/HDAC4 signaling pathway

Shengchao Ma

NHC Key Laboratory of Metabolic Cardiovascular Diseases Research, Ningxia Medical University, Yinchuan 750004, China

Chronic kidney disease (CKD) is a progressive disorder characterized by a decline in kidney function, indicated by a reduction in the glomerular filtration rate or persistent kidney injury, which lasts more than three months and poses a significant global health burden. Podocytes are the largest cells in the glomerulus and play a crucial role in maintaining the integrity of the filtration barrier through their interactions with intercellular junctions and extracellular matrix proteins. Podocyte injury is commonly associated with CKD, leading to proteinuria, tubulointerstitial fibrosis, and deterioration of renal function. Consequently, protecting and repairing podocytes is an important part of CKD treatment. Hyperhomocysteinemia (HHcy), characterized by elevated plasma homocysteine (Hcy) levels (tHcy > 15 μM), is considered a risk factor and pathogenic contributor to the progression of CKD and associated cardiovascular complications. Several studies have found that Hcy induces podocyte injury through oxidative stress and pro-inflammatory pathways, thereby disrupting the glomerular filtration barrier and exacerbating proteinuria. However, the precise mechanisms underlying Hcy-induced podocyte injury remain unclear.

Long non-coding RNAs (lncRNAs), which are RNA molecules longer than 200 nucleotides, do not encode proteins but play key roles in various biological processes, including the regulation of gene expression, determination of cellular fate, and signaling. Recent studies have found that lncRNAs are involved in transcriptional regulation, chromatin modification, epigenetic regulation, mRNA stability, translation control, RNA splicing, and signal transduction, all of which are crucial for maintaining normal physiological functions. Some studies have highlighted the dysregulation of lncRNAs in various pathologies, such as cancer metastasis, cardiovascular dysfunction, and neurodegenerative diseases. In the context of CKD, lncRNAs have received attention for their involvement in renal pathophysiology. Specific lncRNAs, such as DLX6-AS1 and Neat1_2, have been implicated in diabetic nephropathy and the progression of acute kidney injury to CKD. While the precise molecular mechanisms need to be fully elucidated, preliminary data suggest that lncRNAs may exert their effects by interacting with microRNAs (miRNAs), forming regulatory axes that modulate gene expression. However, whether lncRNAs participate in Hcy-induced podocyte injury via this axis remains unknown.

The N6-methyladenosine (m^6A) modification is one of the most prevalent epitranscriptomic modifications in eukaryotic mRNAs, accounting for more than 80% of all mRNAs. This modification plays crucial roles in post-transcriptional regulation, mRNA stability, translation efficiency, and subcellular localization . Abnormal m^6A modifications are associated with developmental disorders, neurological diseases, cardiovascular conditions, and cancer. Monitoring m^6A modifications in patient RNA may facilitate early cancer detection and prognosis prediction. The m^6A modification is dynamic and reversible and is mediated by methyltransferases such as METTL3, METTL14, KIAA1429, and WTAP, while demethylases such as FTO and ALKBH5 reverse this modification. Additionally, specific RNA-binding proteins, or "readers" (e.g., YTHDF1/2/3, IGF2BP1/2/3, eIF3, and HNRNPA2B1), directly or indirectly interact with m^6A

motifs to influence RNA functionality. These regulators participate in various RNA metabolism processes, including splicing, stability, export, and translation. Some studies have highlighted the key role of m^{6}A in kidney diseases, with m^{6}A-related biomarkers investigated for diagnostic and therapeutic purposes. Research has shown that m^{6}A intervention can improve patient prognosis and reduce CKD-related mortality, suggesting potential strategies for the management of CKD. However, the involvement of m^{6}A in the stability of lncRNA during Hcy-induced podocyte injury remains unclear.

In this study, we identified and characterized a novel upregulated lncRNA, Gm16984, as an essential regulator of Hcy-induced podocyte injury. Knocking down Gm16984 alleviates Hcy-induced podocyte injury by inhibiting autophagy. Gm16984 acts as a competing endogenous RNA (ceRNA) for miR-29b-3p, thereby upregulating HDAC4 to promote podocyte injury. We also found that METTL3-mediated m^{6}A modification of Gm16984 depends on IGF2BP1, which acts as an m^{6}A reader that binds to Gm16984 to promote its stability, ultimately leading to the upregulation of Gm16984. Our findings revealed a novel lncRNA involved in Hcy-induced podocyte injury, providing potential therapeutic targets for mitigating podocyte dysfunction and slowing the progression of CKD.

Adipose HuR protects against diet-induced obesity and insulin resistance

Jing- Li

Qilu Hospital Shandong University

Human antigen R (HuR) is a member of the Hu family of RNA-binding proteins and is involved in many physiological processes. Obesity, as a worldwide healthcare problem, has attracted more and more attention. To investigate the role of adipose HuR, we generate adipose-specific HuR knockout (HuRAKO) mice. As compared with control mice, HuRAKO mice show obesity when induced with a high-fat diet, along with insulin resistance, glucose intolerance, hypercholesterolemia and increased inflammation in adipose tissue. The obesity of HuRAKO mice is attributed to adipocyte hypertrophy in white adipose tissue due to decreased expression of adipose triglyceride lipase (ATGL). HuR positively regulates ATGL expression by promoting the mRNA stability and translation of ATGL. Consistently, the expression of HuR in adipose tissue is reduced in obese humans. This study suggests that adipose HuR may be a critical regulator of ATGL expression and lipolysis and thereby controls obesity and metabolic syndrome.

In this study, we explored the effect of adipose-specific HuR deletion on obesity and related metabolic disturbances in mice. HuRAKO mice were more susceptible to the development of HFD-induced obesity via adipocyte hypertrophy, which might be attributed to impaired lipolysis. In addition, HFD-fed HuRAKO mice showed insulin resistance and exacerbated hepatic steatosis. Mechanistically, we demonstrated that the regulation of lipolysis by HuR was mediated by ATGL. HuR could bind to the 3′ UTR of ATGL mRNA and increased its stability. Taken together, our findings establish HuR as a regulator of ATGL-mediated lipolysis.

HuR, as a member of RNA-binding proteins, has been reported to regulate the expression of many molecules by a posttranscriptional mechanism, which indicates its multifunctionality. In our recent study, HuR could regulate the stability of GTP cyclohydrolase 1 mRNA in endothelial cells. HuR is involved in many biological processes, including carcinogenesis, inflammation, cell survival and apoptosis. However, the in vivo functions of HuR have not been clearly elucidated due to its critical role in embryonic development and the embryonic lethal phenotype of global HuR-knockout mice. Recent studies reported that intestinal-specific HuR deletion reduced the tumor burden in models of intestinal tumorigenesis and inflammatory colon carcinogenesis. B lineage-specific deletion of HuR impaired the survival of B cells in bone marrow and humoral immunity. Here we generated adipose-specific HuR-knockout mice and found that HuR could protect against HFD-induced obesity and insulin resistance, which amplifies our understanding of the functions of HuR. Moreover, HuR function is regulated via changes in its subcellular localization, affinity for RNA, abundance, and cleavage, which in turn influence its ability to affect the fate of target mRNAs. In this study, the mRNA levels of HuR in epiWAT, subWAT and BAT were decreased from HFD-fed mice , which suggested that HFD-induced repression of HuR could be attributed to its mRNA reduction. High-fat diet may either interfere with the transcription of HuR or, alternatively, increase the decay of HuR mRNA. This important issue needs to be addressed by future studies.

ATGL is the key lipase that hydrolyzes triglycerides into diglycerides, which are further catalyzed by hormone-sensitive lipase (HSL) into monoglycerides and glycerols. Given its critical role in lipolysis and metabolic homeostasis, the regulation of ATGL activity and expression need exploration. ATGL activity can be modified by its interaction with other proteins such as G0/G1 switch gene 2, which inhibits ATGL action by physical interaction of its N-terminal with the N-terminal patatin domain of ATGL. The activity of ATGL lipase is also regulated by different phosphorylation sites. In addition, several factors have been identified to regulate ATGL expression. PPARγ can directly regulate ATGL expression in adipocytes in vitro and in vivo. Treatment with rosiglitazone, a PPARγ agonist, and thiazolidinedione, an antidiabetic agent, increases ATGL mRNA and protein expression in WAT and BAT of mice under the background of HFD or leptin deficiency. mTORC1 suppressed lipolysis and promoted fat accumulation in mammalian cells primarily by inhibiting transcription of ATGL, whereas rapamycin, an mTORC1 inhibitor, reversed the loss of ATGL. In this study, we have demonstrated that HuR, as an mRNA-binding protein, can target ATGL to modulate its mRNA stability and lipase expression positively, which reveals a potential mechanism in regulating lipolysis.

Since the triglycerides within adipocytes constitute >90% of adipocyte volume and it is the major volume component of the adipose mass, suppressed lipolysis could cause retained lipids in adipocytes and thereby expand adipose tissue. So far, there is no consensus of opinion about the relationship between ATGL and insulin sensitivity. Recent studies reported that adipose overexpression of ATGL attenuated diet-induced obesity and improved insulin sensitivity. Adipose-specific knockout of sirtuin 6 (Sirt6) in mice exacerbated insulin resistance and inflammation in HFD-induced obesity, in which ATGL expression and lipolysis were inhibited, which was consistent with our study. Thus, suppressed ATGL levels due to HuR knockout may contribute to reduced lipolysis and the phenotype with obesity in the HuRAKO mice. Emerging evidence suggests that impaired adipocyte lipolysis causes the proinflammatory immune cell infiltration of metabolic tissues in obesity, which contributes to the development and exacerbation of insulin resistance. In our study, HuR deletion deteriorated insulin resistance and inflammation infiltration in adipose tissue. Also, obese HuRAKO mice showed severe hepatic steatosis, which was marked by excess triglycerides accumulation and increased expression of genes involved in fatty acid uptake and lipogenesis. Thus, the HuR-ATGL-lipolysis axis may be required for maintaining normal adipocyte size and adiposity. Inhibited lipolysis in HuRAKO mice caused marked adipocyte hypertrophy, which responded poorly to insulin treatment. The elevated inflammation levels also contributed to insulin resistance in HuRAKO mice.

In summary, we demonstrate that HuR functions as a positive regulator of lipolysis by targeting ATGL to maintain its mRNA stability. Adipose-specific deletion of HuR promoted HFD-induced obesity, impaired adipose function and deteriorated glucose intolerance and insulin resistance. HuR may be a potential therapeutic target for ameliorating obesity and obesity-related metabolic disorders.

Persistent Methylmalonate Overload Despite Glycemic Control Drives Mitochondrial Dyshomeostasis and Subclinical Heart Damage in Diabetes

Shan-Jie Wang[1], Miao Yan[1], Yi-Ying Zhang[3], Shao-Hong Fang[2], Bo Yu[1]

1. 哈尔滨医科大学第二附属医院

2. bthe Key laboratory of myocardial ischemia, chinese ministry of education

3. Department of epidemiology and Biostatistics, school of Public health, Jiamusi university, Jiamusi, china

Background

Heart failure burden is still considerable in diabetes patients despite optimal glycemic control. Metabolic remodeling is involved in this process, but current understanding is still in its infancy. Methylmalonic acid (MMA) is a diagnostic marker of cobalamin (Cbl) deficiency in clinical practice. Paradoxically, MMA elevation-related cardiovascular mortality is more pronounced in diabetic patients with higher Cbl levels. We investigated the mechanisms underlying these contradictory features in diabetic heart and translational relevance.

Methods

We assessed serum Cbl, MMA, and cardiac biomarkers in 12,751 participants, and the Mmut protein (allosteric enzyme of MMA catabolism) in 4 pairs of failing human hearts with diabetes and health donors. Cardiomyocyte-specific Mmut knockout and Mmut-overexpressing (delivered by AAV-Mmut with cTnT promoter) mice were subjected to high-fat diet/streptozotocin-induced diabetes. High glucose and/or palmitate stimulation of primary neonatal mouse ventricular cardiomyocytes (NMVMs) imitates diabetic conditions in vitro. Molecular mechanism was explored through RNA sequencing, immunoprecipitation, isotope tracing mass spectrometry and biolayer interferometry assays.

Results

Higher serum MMA was significantly associated with subclinical heart damage and poor outcomes among adults with diabetes in the absence of Cbl deficiency. Cardiac MMA overload and decreased protein expression of Mmut were confirmed in humans and mice with diabetes. Notably, MMA dysmetabolism in diabetic mice occurred before detectable cardiac damage and persisted even after glycemic control. Consistently, Patients with DM and non-CVD were categorized into good and poor glycemic control subgroups by fasting blood glucose (<7.2 mM vs. ≥ 7.2 mM) and/or HbA1c (<7.0% vs. ≥ 7%) according to the recommendations

of American Diabetes Association. Optimal glycemic management did not reduce the risk of MMA elevation or MMAhiCblhi . Serum Cbl and MMA levels, and the proportion of MMAhiCblhi remained comparable across the subgroups by plasma C-peptide, insulin level, and insulin resistance index among patients with diabetes. Together, these clinical and preclinical data indicate that Mmut suppression-related myocardial MMA dysmetabolism occurs in the early phase of DCM, which is even resistant to conventional glycemic control and insulin resistance. Mechanistically, hyperglycemic memory-related molecule miR-499 binds to the mRNA of Mmut and inhibits its expression, leading to MMA overload under diabetes. Mmut knockout amplified cardiac MMA overload and exacerbated disturbance in glycolipid metabolism and mitochondrial quality control in diabetic hearts. To establish the therapeutic potential of restoring MMA metabolism in DCM, we developed cardiac-specific myotropic adeno-associated virus serotype 1A (MyoAAV 1A) constructs carrying mouse Mmut under the cardiac troponin T promoter (AAV-Mmut). Conversely, AAV-Mmut injection significantly reduces MMA load and alleviates the progression of cardiac remodeling in diabetic mice. To establish clinically translatable interventions targeting MMA metabolism in diabetic hearts, we next mapped major MMA precursors, potentially including four types of amino acids (methionine, threonine, isoleucine, and valine), cholesterol and odd-chain fatty acids (OCFAs). Isotope tracing identified isoleucine and valine as the main sources of cardiac MMA under diabetes. A restricted-branched chain amino acid diet alleviated diabetes-induced MMA accumulation and heart damage. These results indicate that mitochondrial MMA dysmetabolism is a novel hub bridging BCAA elevation and early pathological damage in diabetic hearts, supporting BCAA-derived MMA as modifiable therapeutic node in DCM. However, Cbl supplementation did not correct MMA overload in diabetic mice, even at high doses or in activated forms. The American Diabetes Association and Chinese Diabetes Society guidelines alert that metformin use inhibits the absorption of Cbl and causes Cbl deficiency. Unexpectedly, metformin administration decreased cardiovascular mortality risk and attenuated subclinical myocardial injury (hs-cTnT increase: 3.47 ng/mL per MMA doubling vs. 9.32 ng/mL in non-users) while lowering plasma MMA levels by 31% (231.6 nmol/L vs. 156.7 nmol/L) despite reduced plasma Cbl. Our experimental data paradoxically demonstrated that metformin ameliorates methylmalonic acid (MMA)-related cardiotoxicity via dual AMPK-dependent and independent pathways: AMPK activation enhanced mitochondrial quality control (evidenced by increased phosphorylation of ULK1/Raptor and TFEB) to bolster myocardial tolerance to MMA; independently, metformin directly bound to Mmut, augmenting its affinity for Cbl to improve Mmut enzymatic activity—mechanistically uncoupled from AMPK signaling as verified by studies in AMPKα2-deficient mice and the ineffectiveness of AICAR in reducing MMA accumulation.

Conclusions:

This study provides a foundation for understanding diabetes-induced MMA dysmetabolism, resistant to glycemic control and Cbl supplementation, as a trigger for subclinical heart damage and mitochondrial dyshomeostasis. Thus, MMA metabolism can be considered a promising therapeutic target for early intervention in DCM. Unexpectedly, the Cbl absorption inhibitor metformin ameliorated the cardiac damage related to MMA accumulation via dual mechanisms. Our findings challenge the prevailing clinical consensus regarding the impacts of Cbl and metformin use on MMA elevation.

Multi-Etiology Transcriptomic Integration Identifies Conserved Metabolic Dysregulation in Heart Failure

Yi-Ning Song, Ai-Jun Sun, Jun-Bo Ge

Zhongshan Hospital, Fudan University

Background

Heart failure (HF), characterized by progressive cardiac dysfunction and adverse remodeling, represents a major global health burden with high mortality and morbidity despite advances in therapy. A critical factor underpinning HF progression is metabolic dysregulation within the cardiomyocyte. The heart, as a high-energy-demand organ, relies exquisitely on efficient substrate utilization (including fatty acids, glucose, ketones, and amino acids), mitochondrial oxidative phosphorylation, and metabolic flexibility—the ability to switch fuel sources based on availability and demand. Impairments in these processes, such as disrupted substrate utilization, mitochondrial dysfunction (reduced ATP production, increased reactive oxygen species), and metabolic inflexibility, lead to chronic energy deficiency in cardiomyocytes. This bioenergetic crisis not only directly impairs contractile function but also activates maladaptive signaling pathways, promoting inflammation, fibrosis, apoptosis, and further pathological remodeling. While metabolic alterations have been described in specific HF etiologies (e.g., reduced fatty acid oxidation in pressure overload, insulin resistance in diabetic cardiomyopathy), the identification of conserved metabolic pathways and actionable therapeutic targets across diverse HF subtypes remains a significant unmet need. Understanding these fundamental, etiology-transcending metabolic disruptions is therefore paramount for developing novel, broadly effective HF treatments.

Methods

Three published RNA-seq datasets (GSE198926, GSE218733 and GSE269053) were analyzed to systematically investigate the transcriptional signatures in HF caused by different etiologies. The HF mouse models in the three datasets are established through transverse aortic constriction (TAC) surgery, high-fat diet combined with renin overexpression, and high-fat diet with nitric oxide synthase inhibition respectively. Differential gene expression analysis was performed using DESeq2 and edgeR with a statistical cutoff of PValue < 0.05 and Log2 Fold Change > 1.5. The enrichment analysis was performed using R package "clusterProfiler", "org.Mm.eg.db" and "GOplot".

Results

GSEA of the three distinct HF models revealed a highly significant and conserved down-regulation of gene sets associated with core metabolic processes across all etiologies. Key pathways suppressed included fatty acid β-oxidation, the tricarboxylic acid (TCA) cycle, oxidative phosphorylation (OXPHOS), glycolysis, and amino acid metabolism. This consistent transcriptional suppression underscores energy metabolism disruption as a fundamental, etiology-independent hub driving HF progression. Intersection analysis of differentially expressed genes (DEGs) identified a core set of conserved genes altered in all three models: 18 commonly up-regulated genes and 4 commonly down-regulated genes, representing central players in HF pathogenesis. Cellular component analysis of the up-regulated genes highlighted common structural pathologies, revealing enrichment in terms related to fibrosis-dominated extracellular matrix (ECM) organization (e.g., collagen fibril organization) and abnormalities in the contractile apparatus (e.g., sarcomere, myofibril, contractile fiber). This points to shared terminal pathways of adverse remodeling and systolic dysfunction. Among the small set of conserved down-regulated genes, Aldolase B (Aldob) emerged as a critical metabolic regulator. Aldob, classically associated with fructose metabolism in the liver, plays a significant role in the heart, participating in fructose metabolism, glycolysis, glucose-6-phosphate processing, and crucially, NADP metabolism. Its suppression in HF models exacerbates myocardial metabolic inflexibility, impairs the regeneration of NADPH (a vital reducing equivalent for antioxidant defense and biosynthetic reactions), and disrupts substrate utilization efficiency. This metabolic insufficiency synergizes with the concurrently activated fibrotic pathways (evidenced by the up-regulated DEGs) to promote left ventricular systolic dysfunction. These findings position Aldob not merely as a marker, but as a key mechanistic mediator linking metabolic insufficiency to structural and functional cardiac deterioration.

Conclusions

This study integrated multi-model heart failure (HF) data from distinct etiologies and highlighted the central role of metabolic dysregulation in HF pathogenesis. The analysis of DEGs emphasized a potential therapeutic prospect of anti-fibrotic strategies and contractile machinery modulation. Futhermore, Aldob was also suggested as a promising therapeutic target to restore myocardial metabolic homeostasis and mitigate HF progression across diverse etiologies.

血红蛋白糖化指数与冠状动脉疾病合并慢性肾功能不全患者经皮冠状动脉介入治疗后远期全因死亡的关联

蒋茂[1,2,3] 方思妮[1] 刘欢婷[1] 雷雨萌[1] 刘旭[2] 王友成[1] 郭楠[2] 王云飞[2] 于靖[2] 陈景福[1] 毛颖[1] 颜利求[1]

目的　本研究旨在评估血红蛋白糖化指数（hemoglobin glycation index, HGI）与冠状动脉疾病（coronary artery disease, CAD）合并慢性肾功能不全（chronic renal insufficiency, CRI）患者在经皮冠状动脉介入治疗（percutaneous coronary intervention, PCI）后的远期全因死亡（all-cause mortality, ACM）之间的关系。　方法　本研究回顾性纳入 2014 年 1 月至 2017 年 9 月在河北医科大学附属沧州市中心医院接受 PCI 且同时记录糖化血红蛋白（glycated hemoglobin, HbA1c）和空腹血糖（fasting plasma glucose, FPG）的 288 例 CAD 合并 CRI 患者。采用美国国家健康与营养调查（national health and nutrition examination survey, NHANES）参考人群回归方程（预测 HbA1c = 0.024 × FPG + 3.1）计算预测 HbA1c，并进一步计算 HGI。根据 Youden's J 统计法确定的最佳 HGI 阈值，将患者分为低 HGI 组（n=81）和高 HGI 组（n=207）。主要研究终点为 ACM。　结果　在中位随访 84 个月期间，共发生 32 例（11.11%）ACM 事件。低 HGI 组的 ACM 累积发生率显著高于高 HGI 组（19.80% vs. 7.70%，P=0.003）。多变量 Cox 回归分析显示，低 HGI（HR=3.081，P=0.005）、年龄（HR=1.056，P=0.032）、慢性阻塞性肺疾病（chronic obstructive pulmonary disease, COPD）（HR=4.529，P=0.033）、既往心梗（myocardial infarction, MI）（HR=2.684，P=0.031）以及左主干病变（HR=8.186，P=0.001）均为 ACM 的独立预测因素。此外，限制性三次样条（restricted cubic spline, RCS）分析表明，HGI 与 ACM 风险之间呈线性关系（overall P=0.048，nonlinear P=0.204）。　结论　综上所述，相较于高 HGI 患者，低 HGI 与 CAD 合并 CRI 患者在 PCI 后的远期 ACM 风险增加相关。

The association between the triglyceride-glucose index and serum uric acid: a systematic review and meta-analysis

LanLan feng

Hangzhou Normal University

Abstract

Background: Hyperuricemia (HUA) is a common metabolic disorder characterized by elevated serum uric acid levels and is closely associated with insulin resistance (IR), a core component of metabolic syndrome. The triglyceride-glucose (TyG) index, calculated using fasting triglyceride and glucose levels, has emerged as a simple, accessible, and reliable surrogate marker for IR. However, the potential link between the TyG index and HUA remains underexplored, particularly across diverse populations. This study aimed to systematically evaluate the association between the TyG index and hyperuricemia in the general population.

Method:A comprehensive literature search was conducted across seven electronic databases (PubMed, Embase, Web of Science, CBM, CNKI, VIP, and Wanfang) from inception to 22 December 2024. Eligible studies included observational studies examining the relationship between the TyG index and HUA. Study quality was assessed using the Newcastle-Ottawa Scale (NOS) for case-control studies and the Agency for Healthcare Research and Quality (AHRQ) checklist for cross-sectional studies. A random-effects model was employed to synthesize effect estimates, considering expected heterogeneity. Heterogeneity was assessed using Cochrane's Q-test and the I^2 statistic. Meta-regression, subgroup analyses (e.g., by region, sex, study design), and sensitivity analyses were performed to explore the robustness of findings and potential sources of heterogeneity. Publication bias was evaluated through visual inspection of funnel plots and statistical tests including Egger's and Begg's.

Result: A total of 27 studies were included in our meta-analysis. The pooled results demonstrated that the TyG index was significantly higher in individuals with hyperuricemia (HUA group) compared to those without (NUA group), with a mean difference (MD = 0.32, 95% CI: 0.26 to 0.38, $p < 0.00001$). In addition, a higher TyG index was associated with a significantly increased risk of hyperuricemia (OR = 2.28, 95% CI: 1.85 to 2.81, $p < 0.00001$), indicating that individuals with elevated TyG levels were more than twice as likely to have HUA. These findings remained stable in sensitivity analyses, and subgroup analyses based on region, study design, and sex yielded consistent results. No significant publication bias was detected through Egger's or Begg's tests.

Conclusion: The TyG index, as a convenient and cost-effective proxy for insulin resistance, is significantly associated with both elevated serum uric acid levels and an increased risk of hyperuricemia. These findings underscore the potential utility of the TyG index as a non-invasive, easily accessible biomarker for identifying individuals at high risk of hyperuricemia, particularly in primary care and community health settings where advanced diagnostic tools may be limited. By incorporating the TyG index into routine health assessments, clinicians may enhance early detection efforts, improve individualized risk stratification, and potentially guide timely preventive interventions targeting metabolic dysfunction. Moreover, given the bidirectional relationship between insulin resistance and uric acid metabolism, our results highlight the importance of integrated metabolic management strategies in individuals with elevated TyG index levels. Future longitudinal studies are warranted to confirm the causal relationship and to explore whether TyG-guided interventions can reduce the incidence or progression of hyperuricemia and its related complications.

Abstract

Background: Type 2 diabetes (T2D) is a globally prevalent metabolic disorder influenced by complex interactions among genetic, environmental, and gut microbial factors. Although gut dysbiosis has been implicated in T2D pathogenesis, findings across studies remain inconsistent due to population-specific confounders such as dietary habits and genetic background.

Aim: This study aims to overcome previous limitations by conducting a multi-cohort, cross-population analysis to identify gut microbial signatures consistently associated with T2D, independent of demographic and dietary variations. Additionally, we evaluate the diagnostic potential of these microbial biomarkers, both alone and in combination with conventional clinical parameters, to assess their utility in T2D screening and management.

Methods: We conducted an integrated analysis of fecal shotgun metagenomic datasets from four publicly available cohorts spanning European and Asian populations, comprising a total of 433 individuals (218 T2D patients and 215 healthy controls). Using standardized bioinformatics pipelines, we systematically assessed microbial diversity through α-diversity indices (Shannon index and Pielou evenness) and β-diversity metrics based on Bray-Curtis dissimilarity with PCoA and ANOSIM tests. T2D-associated microbial taxa were identified using Wilcoxon rank-sum tests with stringent filtering criteria to exclude low-abundance (<20% prevalence) and directionally inconsistent species across cohorts. Species-clinical correlations were evaluated through Spearman's rank analysis, and a random forest classifier was developed using a 75:25 training-test split to assess the diagnostic potential of identified microbial signatures, with model performance quantified by ROC-AUC analysis.

Results: Our analysis revealed significant alterations in gut microbial ecology in T2D patients, characterized by increased α-diversity measures (Shannon index P=0.04; Pielou evenness P=0.02) suggesting ecosystem disruption, and distinct β-diversity patterns that effectively discriminated T2D patients from controls in Asian (P=0.001) and combined cohorts (P=0.001), though this separation was less pronounced in the European cohort (P=0.347). We identified 18 microbial species showing consistent abundance changes in T2D across all study populations, including 10 enriched species such as Clostridium bolteae and C. citroniae, and 8 depleted species including Streptococcus thermophiles and Haemophilus parainfluenzae. These microbial signatures demonstrated strong clinical relevance, with enriched species showing positive correlations with fasting glucose (r=0.42, P<0.001) and HbA1c (r=0.38, P<0.001), while depleted species exhibited inverse relationships. The random forest model incorporating these 18 microbial features achieved excellent diagnostic performance (AUC=0.836, 95% CI: 0.752-0.900), which further improved when combined with basic clinical variables (AUC=0.871, 95% CI: 0.793-0.928), while maintaining robust classification accuracy in both European (AUC=0.832) and Asian (AUC=0.815) validation cohorts.

Conclusions: This comprehensive multi-cohort study establishes a set of universal gut microbial signatures associated with T2D that are reproducible across diverse populations, providing compelling evidence for the role of gut microbiome dysbiosis in T2D pathogenesis. The consistent enrichment of specific Clostridium species and depletion of commensal bacteria in T2D patients across ethnic groups suggests their potential involvement in disease mechanisms. Furthermore, the demonstrated diagnostic efficacy of these microbial biomarkers, particularly when combined with basic clinical parameters, highlights their translational potential for developing population-agnostic approaches to T2D screening and management. These findings significantly advance our understanding of microbial contributions to T2D while providing a foundation for future research into microbiome-targeted therapeutic interventions.

Glucose oxidative metabolism score, diabetes status, and major adverse cardiovascular events in acute myocardial infarction populations

Ye Wang, Shan-Jie Wang, Shao-Hong Fang, Bo Yu

Second Affiliated Hospital of Harbin Medical University; The Key Laboratory of Myocardial Ischemia, Chinese Ministry of Education, China.

Aims

Type 2 diabetes mellitus (DM) has become a significant global public health challenge, the incidence and prevalence of which continue to rise in decades. DM becomes a frequent comorbidity among patients with acute myocardial infarction (AMI), leading to significant morbidity and mortality. The tricarboxylic acid (TCA) cycle dysfunction has been implicated in both conditions. We aimed to: 1) develop an index to quantify TCA cycle disturbance; 2) examine its association with adverse outcomes in DM-AMI patients; and 3) evaluate its predictive value beyond conven-

tional risk factors.

Methods

98 AMI patients (22 with DM and 76 without DM) were included as the derivation cohort, and another 4071 AMI patients (959 with DM, and 3112 without DM) were included as the validation cohort. Precision metabolomics were employed to profile organic acid metabolites in the discovery cohort. Liquid chromatography-tandem mass spectrometry (LC-MS/MS) was used to quantify TCA cycle metabolites. The TCA index was constructed based on regression coefficients. Restricted cubic splines (RCS) models were used to assess the linear relationship between TCA index and outcomes. Kaplan-Meier curves with log-rank tests assessed the cumulative incidence of post-AMI outcomes according to DM/nonDM or tertiles of TCA stratification. Multivariable-adjusted Cox proportional hazards models were used to estimate the hazard ratios (HRs) and 95% CIs for the associations between TCA index and endpoints. To evaluate the incremental predictive performance of the TCA index beyond the reference model in patients with AMI for all outcomes, we calculated Harrell's C-index and the time-dependent area under the curve (AUC).

Results

Plasma concentrations of six (citrate, isocitrate, MMA, SA, fumarate, and malate) TCA cycle intermediates were higher in patients with DM-AMI than their non-DM-AMI counterparts. During a median follow-up of 6.2 years, 1263 (31.02%) MACE events, 672 (16.51%) all-cause death, 373 (9.16%) cardiovascular death, and 561 (13.78%) heart failure events were identified. DM-AMI patients exhibited higher incidence rates of all endpoints compared to non-DM-AMI counterparts. Five of TCA cycle intermediates (α-ketoglutarate [AKG], methylmalonate [MMA], succinate [SA], fumarate, and malate) were used to constructed a composite TCA index. In patients with DM-AMI, the TCA index was significantly associated with the risk of MACE (adjusted HR:1.23; 95% CI:1.11-1.37), all-cause death (adjusted HR:1.27; 95% CI:1.11-1.47), cardiovascular death (adjusted HR:1.33; 95% CI:1.11-1.60), and HF (adjusted HR:1.34; 95% CI:1.14-1.58), with each SD increase. This index demonstrated stronger associations with all clinical endpoints in DM-AMI patients versus non-DM-AMI patients. We evaluated the incremental value of adding TCA index to reference models including the GRACE score, TnI, and NT-proBNP at 1 and 3 years. For all outcomes, the TCA index improved the predictive capability of the reference model. In patients with DM-AMI, the C-index increments, and time-dependent AUC increments were higher for all outcomes than that in non-DM-AMI patients. In patients with DM-AMI, the continuous NRI (95% CI) was 0.152 (0.003-0.173) at 1 year for cardiovascular death and 0.105 (0.013-0.237) at 1 year for HF.

Conclusion

In conclusion, investigation of TCA index effects on prognosis of AMI and comparisons between DM-AMI and non-DM-AMI patients confirms TCA cycle dysfunction in AMI progression, strengthening the need for future therapies aimed at replenishing intermediates of the TCA cycle.

Predictive value of dynamic changes in eGDR for cardiovascular disease in population with Cardiovascular- Kidney-Metabolic syndrome stages 0-3: A nationwide prospective cohort study

Yifei Xiang, Hong-Peng Chen, Yan-Er Lu

The Second Affiliated Hospital, School of Medicine, Zhejiang University

Background: The American Heart Association (AHA) has recently conceptualized Cardiovascular-Kidney-Metabolic (CKM) syndrome as a systemic disorder highlighting the pathophysiological interplay between metabolic risk factors, chronic kidney disease, and the cardiovascular system. This framework emphasizes the critical need for early screening and intervention, particularly for individuals in CKM stages 0-3, who often present with subclinical disease but are on a trajectory toward adverse outcomes, primarily driven by cardiovascular disease (CVD). Insulin resistance (IR) is a core pathogenic driver in the development and progression of CKM syndrome. The estimated glucose disposal rate (eGDR), a validated surrogate for IR calculated from waist circumference, hypertension status, and glycosylated hemoglobin A1c (HbA1c), serves as a practical, non-invasive tool for assessing insulin sensitivity. Previous studies have established that a single, baseline eGDR measurement is a strong predictor of CVD, outperforming other IR markers in populations with and without diabetes. However, such static "snapshot" assessments are inherently limited as they fail to capture the dynamic nature of metabolic health over time. The cumulative burden of IR and the velocity of its change may represent more potent predictors of long-term vascular risk. Therefore, this study aimed to investigate the association of dynamic changes in eGDR—quantified by both cumulative exposure and distinct longitudinal trajectories—with the incidence of CVD among individuals with CKM syndrome stages 0-3.

Methods: This study utilized a nationwide prospective cohort design, analyzing data from the China Health and Retirement Longitudinal Study (CHARLS). From an initial pool of 17,705 participants surveyed at baseline (Wave 1, 2011-2012), a final cohort of 4,667 individuals with CKM syndrome stages 0-3 was included after applying stringent exclusion criteria. These criteria included a history of CVD or stroke at baseline, a diagnosis of cancer or AIDS, or missing data essential for calculating eGDR or staging CKM syndrome. Dynamic changes in eGDR were assessed over a three-year period between 2012 and 2015 using two complementary metrics. First, the cumulative eGDR (cum eGDR) was calculated to represent the total, time-weighted exposure to insulin sensitivity using the formula: cum eGDR=(eGDR2012+eGDR2015)*2/3. This metric was analyzed as both a continuous variable (per standard deviation increase) and as a categorical variable (tertiles). Second, K-means clustering, an unsupervised machine learning algorithm, was employed to identify longitudinal eGDR trajectories based on measurements in 2012 and 2015. The optimal number of clusters was determined to be three using both the Elbow method and Gap Statistic analysis. This resulted in the classification of participants into three distinct groups: Class 1 (Persistent High Group, N=2205), Class 2 (Rapidly Decreasing Group, N=1516), and Class 3 (Persistent Low Group, N=946). The primary outcome was incident CVD, defined as a new, self-reported physician diagnosis of heart attack, coronary heart disease, angina, congestive heart failure, or stroke during the follow-up period to 2018. Multivariable logistic regression analysis was used to evaluate the association between the dynamic eGDR metrics and incident CVD, with adjustments for a comprehensive set of covariates in Model 2, including age, gender, type 2 diabetes mellitus (T2DM), dyslipidemia, smoking status, alcohol consumption, body mass index (BMI), education level, and household registration. Subgroup and mediation analyses were conducted to explore potential effect modification and underlying mechanisms.

Results: Over a median follow-up of 3 years, 571 participants (12.2%) developed incident CVD. Baseline characteristics varied significantly across the three eGDR trajectory groups. Participants in the Persistent Low group (Class 3) exhibited the most adverse cardiometabolic profile, being older and having a higher BMI, waist circumference, blood pressure, and a markedly greater prevalence of hypertension (85.2%), T2DM (28.2%), and dyslipidemia (17.5%) compared to the other groups. They also had worse laboratory parameters, including higher levels of hs-CRP, triglycerides, and HbA1c, and lower levels of HDL-C. In the fully adjusted multivariable logistic regression analysis (Model 2), both dynamic eGDR metrics were independently associated with incident CVD. Compared to the Persistent High group (Class 1, reference), both the Rapidly Decreasing group (Class 2; Odds Ratio=1.312, 95% Confidence Interval [CI]: 1.042-1.652; P=0.021) and the Persistent Low group (Class 3; OR=2.228, 95% CI: 1.728-2.872; P<0.001) had a significantly elevated risk of CVD. Furthermore, a higher cumulative eGDR was strongly protective. Each standard deviation increase in cum eGDR was associated with a 31% lower risk of CVD (OR=0.691, 95% CI: 0.624-0.766; P<0.001). When analyzed by tertiles, compared to the highest tertile (Q3), the lowest tertile of cum eGDR (Q1) was associated with more than double the risk of CVD (OR=2.289, 95% CI: 1.767-2.978; P<0.001). Subgroup analysis revealed a significant interaction between eGDR trajectories and T2DM status (P for interaction=0.007), indicating that the predictive value of the trajectories was particularly strong in the non-diabetic population. To investigate this finding, mediation analysis was performed. In the non-DM population, the association between adverse eGDR trajectories and incident CVD was partially mediated by lipid levels. Total cholesterol (TC) and low-density lipoprotein cholesterol (LDL-C) significantly mediated the effect, accounting for 4.99% (indirect effect P=0.032) and 4.39% (indirect effect P=0.048) of the total association, respectively. In contrast, no significant mediation by any lipid factor was observed in the population with T2DM.

Conclusions: In this large, nationwide prospective cohort of individuals with CKM syndrome stages 0-3, dynamic changes in eGDR are powerful and independent predictors of future CVD events. Worsening longitudinal eGDR trajectories—particularly a pattern of persistent low or rapidly decreasing insulin sensitivity—and a greater cumulative burden of IR (lower cum eGDR) are strongly associated with increased CVD risk. The identification of a "Rapidly Decreasing" trajectory highlights a high-risk phenotype that would likely be missed by conventional, static risk assessments. A novel mechanistic insight from this study is the differential role of dyslipidemia in mediating CVD risk based on diabetes status. In the non-diabetic population, the pathogenic pathway linking worsening eGDR to CVD is partially explained by pro-atherogenic changes in TC and LDL-C. This pathway appears to be attenuated or overshadowed by a more complex milieu of risk factors (e.g., chronic hyperglycemia, inflammation, advanced glycation end-products) once overt T2DM is established. These findings have significant clinical implications, strongly supporting the integration of dynamic eGDR surveillance into clinical practice. Such monitoring provides a practical and effective strategy to enhance CVD risk stratification and guide early, targeted preventive interventions, particularly for individuals in the pre-diabetic phase of CKM syndrome.

OSA 相关性高血压患者中代谢性心血管疾病的临床特点及预后分析

布阿依仙木·艾麦提 姚晓光 张德莲 骆秦 李南方

新疆维吾尔自治区人民医院高血压中心

目的： 本研究旨在探讨 OSA 相关性高血压患者中代谢性心血管疾病（CMD）的分布特征及其对主要不良心脑血管事件（MACCE）结局的影响，为临床管理和

干预提供依据。**方法：**本研究为回顾性队列研究，选取乌鲁木齐睡眠呼吸暂停与高血压研究（UROSAH）队列中符合 OSA 相关性高血压诊断的患者，分析其 CMD 的分布特点及代谢性心血管共病（CMM）患病情况。进一步收集患者随访信息，评估 CMM 与 MACCE 发生风险的相关性。有无 CMM 组间累积 MACCE 发病率的比较采用 Kaplan-Meier 曲线及 log-rank 检验。采用多因素 Cox 风险比例回归模型分析 CMM 对 MACCE 发病的影响。**结果：**OSA 相关性高血压患者中 CMD 的检出率显著高于非 OSA 人群。高脂血症、肥胖、非酒精性脂肪肝（NAFLD）、高尿酸血症和 2 型糖尿病的检出率分别为 81.7%、51.2%、29.5%、22.2% 和 18.4%。67.0% 的患者至少患有两种 CMD，其中 33.1% 的患者同时患有两种 CMD，7.6% 和 0.7% 的患者分别患有四种和五种 CMD。CMM 与 MACCE 风险显著相关，CMM 患者的 MACCE 风险较无 CMM 患者增加 1.42 倍（校正 HR：1.42；95% CI：1.09-1.85；P=0.010）。随着 CMD 数量的增加，MACCE 风险呈剂量 - 反应关系，患有三种 CMD 和四种及以上 CMD 的患者 MACCE 风险分别增加 1.51 倍和 2.03 倍。分层分析显示，青中年和男性患者受 CMD 的影响更大。**结论：**OSA 相关性高血压患者中 CMD 检出率高，CMD 增加该人群 MACCE 发生风险，尤其是在青中年及男性患者。本研究结果强调了早期筛查 OSA 相关性高血压和综合管理的重要性。

MDK、PLAUR 在糖尿病合并急性冠脉综合征患者中的临床意义及其诊断价值

毛萧萧 吴优璇 蒙怡 李珊珊 刘慧君 呼晓雷 李岱 夏珂

中南大学湘雅医院

目的 检测中期因子（MDK）、可溶性尿激酶受体（PLAUR）在糖尿病合并急性冠脉综合征（ACS）患者血清中的表达，探讨其能否作为预测糖尿病患者合并 ACS 的危险因素，及是否能作为预测 / 诊断糖尿病患者合并 ACS 的生物标志物。

方法 采用病例 - 对照的研究方法，纳入 2023 年 5 月至 2023 年 12 月湘雅医院心内科住院患者，其中糖尿病患者 86 例，糖尿病合并 ACS 患者 70 例；并收集匹配的健康体检者 47 名作为对照。采集所有观察对象临床资料及血生化结果，采用 ELISA 试剂盒及分光光度仪检测患者血清中 MDK 中期因子和 PLAUR 可溶性尿激酶受体的浓度。Logistic 回归分析探讨 MDK、PLAUR 是否为预测糖尿病患者发生 ACS 的危险因素，受试者工作特征（ROC）曲线分析 MDK、PLAUR 对糖尿病患者合并 ACS 的诊断效能。

结果 1、糖尿病组合并 ACS 组患者血清 MDK、PLAUR 浓度显著高于单纯糖尿病 组 [300±18 pg/ml vs.200±12 pg/ml；4.8±0.26 ng/ml vs.2.2±0.25 ng/ml]，差异均有统计学意义（P < 0.05）。2、Logistic 回归分析显示：以糖尿病组为对照，MDK 和 PLAUR 均为 ACS 的危险因素，其中 MDK 的 OR 值为 1.015，（P < 0.0001）；PLAUR 的 OR 值为 3.257，（P < 0.0001）。3、ROC 曲线分析表明：MDK、PLAUR 预测糖尿病患者发生 ACS 的 AUC（95% CI）分别为 0.8113（0.7071~0.9154）（P < 0.001）；0.9347（0.8704~0.9993）（P < 0.001）；二者联合预测糖尿病患者发生 ACS 的 AUC（95% CI）为 0.9548（0.9191~0.9904）（P<0.001）。

结论 1、中期因子（MDK）、可溶性尿激酶受体（PLAUR）在糖尿病血清中浓度显著升高。2、MDK、PLAUR 均为糖尿病患者发生 ACS 的危险因素。3、MDK、PLAUR 作为预测糖尿病患者发生急性冠脉综合征 ACS 的诊断标志物，诊断效能高，联合时预测效能更高。

老年营养风险指数对心血管 - 肾脏 - 代谢综合征患者死亡风险的预测

翟光耀 朱宏燕 杨婧 房宇琦 闫奕竹

首都医科大学附属北京潞河医院

目的：本研究旨在评估老年营养风险指数（GNRI）在心血管 - 肾脏 - 代谢（CKM）综合征人群中对全因死亡率和心血管死亡率的预测价值，以明确 GNRI 作为营养评估工具在该高风险人群中的预后意义。

方法：本研究基于一项具有全国代表性的回顾性调查，共纳入 16,074 名年龄在 20 至 79 岁之间、患有 CKM 综合征的成年人，并根据 GNRI 四分位数将参与者分组（<101.26，101.26–104.24，104.24–107.22，≥ 107.22）。主要结局为全因死亡，次要结局包括心血管死亡和癌症死亡。通过 Cox 回归模型（未调整、年龄和性别调整、完全调整）、限制性立方样条分析及亚组分析，评估 GNRI 与死亡率之间的关联。

结果：在随访期间，共发生 1,912 例死亡事件（其中 475 例为心血管死亡，515 例为癌症死亡）。在完全调整模型中，与 GNRI 第四四分位组相比，第一四分位组的全因死亡风险显著增加（风险比 [HR] 1.58；95% 置信区间 [CI]：1.32–1.89），心血管死亡风险亦明显升高（HR 2.13；95% CI：1.55–2.93）。非线性分析显示，当 GNRI 低于 100 时，死亡风险上升最为陡峭。该关联在不同年龄、性别、吸烟状态及是否合并临床心血管疾病的各亚组中均保持一致，且在性别及 10 年心血管疾病风险分层中观察到显著交互作用。

结论：在 CKM 综合征人群中，较低的 GNRI 可独立预测全因死亡与心血管死亡风险。

肝纤维化评分对非肥胖冠心病患者肾功能预后的预测价值

殷钰喆 徐靖婷 刘峥嵘 李喆 吴永健

中国医学科学院阜外医院

目的：当前多数心肾预后评估工具主要面向肥胖或代谢异常人群，对于非肥胖冠心病患者的肾脏风险识别能力仍显不足。已有研究提示，非酒精性脂肪性肝病（NAFLD）作为与代谢综合征密切相关的肝脏疾病，其相关的纤维化可能通过多种机制影响肾功能进展。肝纤维化（FIB-4）评分是一项基于常规临床指标（年龄、AST、ALT 和血小板计数）的非侵入性肝纤维化评估工具，已被用于 NAFLD 筛查。本研究旨在探讨 FIB-4 评分在非肥胖冠心病人群中对 NAFLD 筛查的意义及其与肾功能恶化风险的关联性。

方法：本研究为单中心回顾性队列研究，纳入 2008 年至 2023 年在中国医学科学院阜外医院接受冠脉支架植入术的非肥胖冠心病患者共 31,642 例。依据既往研究推荐的 FIB-4 评分界值（<1.3, 1.3–2.67, >2.67）将患者分为肝纤维化低风险、中风险、高风险三组。随访中位时间为 1.78 年。研究终点事件定义为 eGFR 下降超过 30% 或进展为终末期肾病。在排除共线性后，将 Cox 单因素分析中 P<0.1 的变量结合临床意义纳入多变量 Cox 回归模型。模型中对可能影响 FIB-4 组成项的混杂因素如他汀类药物、抗血小板药物及饮酒行为进行了调整。趋势分析、Kaplan-Meier 生存曲线、Lowess 平滑曲线及亚组交互作用分析用于辅助评估该关联的稳定性与异质性。

结果：在完全调整后的 Cox 回归模型中，FIB-4 评分升高显著关联于肾功能恶化风险升高。与低风险组相比，高风险组肾功能恶化的风险增加（HR=1.37，95%CI: 1.10–1.71，P=0.005），趋势检验 P=0.017。Kaplan-Meier 曲线显示，高风险组的结局事件累积发生率显著升高（Log-rank 检验 P<0.05）。Lowess 曲线亦提示 FIB-4 评分与肾功能恶化风险呈正相关。亚组分析发现，该关联在性别（P =0.009）、吸烟状态（P=0.033）及有无急性心肌梗死（P=0.027）亚组之间存在显著交互作用。

结论：FIB-4 评分可作为一种便捷、非侵入性的 NAFLD 的风险初筛指标，用于独立预测非肥胖冠心病患者的肾功能恶化风险。未来应进一步探索 NAFLD 与肾功能恶化之间的潜在因果关系，并考虑将 FIB-4 纳入非肥胖高风险人群的综合肾脏风险评估工具体系中，以实现早期识别与精准干预。

心血管代谢门诊综合管理 CKM 患者的初步成效

谢作晶 汪艳

昆明医科大学第一附属医院

【摘要】 目的：探讨心血管代谢门诊综合管理对心血管 - 肾脏 - 代谢综合征患者饮食、运动、生活习惯、睡眠、吸烟、BMI、糖化血红蛋白、白蛋白比肌酐比值、低密度脂蛋白、患者就医满意度等指标及 SGLT2i、GLP-1RA 使用率的影响。**方法：**选取 2024 年 12 月 --2025 年 6 月在我院心血管代谢门诊就诊建立档案并规律就诊的合并多重代谢紊乱患者作为研究对象，共有 19 例。通过门诊询问登记患者的一般信息、罹患疾病、家族史、药物治疗方案、身高、体重等，通过面对面进行问卷调查的形式了解患者饮食、运动、生活习惯、吸烟情况，同时对患者进行 “一站式” 综合管理随访。分析患者的健康问题，对其进行药物优化（视情况使用 SGLT2i、GLP-1RA 促进心肾获益）、健康教育（饮食指导、运动指导、戒烟限酒及规律服用药物），并对比门诊综合管理前后患者各指标变化及不同代谢紊乱患者的治疗方案及达标情况与患者讨论并进行记录。**结果：**19 例患者年龄为（57.7±12.0）岁，其中男性 16 例（84.2%），女性 3 例（15.8%）吸烟者 14 例（73.7%），有 10 例（52.6%）患者罹患冠状动脉性心脏病。经心血管代谢门诊综合管理后，患者 BMI 由首次就诊的（26.3±4.3）kg/m2 ，下降至末次就诊时的 （25.2±3.9）kg/m2 ，血糖代谢方面，患者 HbA1c 由（7.1±1.4）% 下降至（6.2±0.7）%，血脂代谢方面，患者 TC、TG、LDLC 水平 均出现显著下降，其中 LDLC 水平由（2.98±1.23）mmol/L 下降至 （1.12±0.75）mmol/L，尿酸代谢方面，患者血尿酸水平平均由（413.1±77.9）μmol/L 下 降 至（340.9±80.0）μmol/L，糖尿病肾病方面尿白蛋白比肌酐比值由 70.5（3.67，52.3）降至 21.5（2.77，24.49）。**结论：**心血管代谢门诊综合管理极大的方便了患者多种疾病就医的需要，避免患者一人辗转多科室求医，提高了患者就医满意度，患者 BMI、血糖、血压、血脂等指标较前明显改善；心肾获益药物 SGLT2i、GLP-1RA 使用率上升；患者饮食、运动、生活习惯有了个体化改善，吸烟数量整体下降。

体力运动对心肾代谢疾病进展及死亡风险的影响：基于英国生物银行的多状态分析

胡驹达 欧艳秋 董豪坚

广东省医学科学院 广东省人民医院

目的：体力运动（PA）对心肾代谢疾病（CRMDs）以及发展到死亡关系尚不明确。本研究旨在探讨不同强度的运动对心肾代谢疾病的发生，其进展为心肾代谢共病（CRMM）以及死亡的关系。

方法：这项前瞻性研究涵盖了来自英国生物样本库（UK Biobank）的两个队列。基于问卷的队列纳入了 328147 名参与者，他们在 2006 年至 2010 年期间完成了国际体力活动问卷（IPAQ），体力运动被分成三个程度等级（高，中，低）。基于加速度计的队列纳入了 73952 名参与者，他们在 2013 年至 2015 年期间提供了完整 1 周的基于加速度计的体力活动数据，体力运动（PA）被分为低强度、中等强度、高强度、中至高强度体力运动（LPA、MPA、VPA、MVPA）和总体力运动（TPA），各类强度运动的运动量被处理为四分位数。两个队列的参与者在基线时均未患心肾代谢疾病的任一一种，包括心血管疾病（CVD）、II 型糖尿病（T2D）和慢性肾脏病（CKD）。心肾代谢共病定义为同时存在两种或三种心肾代谢疾病。我们采用多状态模型分析体力运动对从健康状态到单一心肾代谢疾病、从单一心肾代谢疾病到心肾代谢共病以及从这些状态到死亡的转变的影响。

结果：基于问卷的队列，在中位随访 12.7 年期间，57389 名参与者发展为至少一种心肾代谢疾病，9975 名参与者发展为心肾代谢共病，最终 19677 名参与者死亡。对于从健康状态到单一心肾代谢疾病、从单一心肾代谢疾病到心肾代谢共病、从健康状态到死亡以及从单一心肾代谢疾病到死亡转变，高程度的运动相较于低程度的都呈现保护作用，风险比 (HR) 分别是 0.89(95%CI:0.87-0.91), 0.82(95%CI:0.78-0.86), 0.78(95%CI:0.74-0.82), 0.87(95%CI:0.81-0.93), 和 0.84(95%CI:0.75-0.94)。基于加速度计的队列，在中位随访 7.0 年期间，7170 名参与者发展为至少一种心肾代谢疾病，851 名参与者发展为心肾代谢共病，1975 名参与者死亡。对于前述的五种转变，多种强度运动的最高分位数运动量相较于最低分位数呈现保护作用。中至高强度体力运动对于从健康到单一心肾代谢疾病，以及进一步到死亡的转变保护作用最明显，HR 分别为 0.71(95%CI:0.66-0.77) 和 0.55(95%CI:0.40-0.75)。高强度运动对从健康到死亡转变保护作用最强 (HR:0.55, 95%CI:0.44-0.69)。总体力运动在从单一心肾代谢疾病到心肾代谢共病的过程中保护作用最显著 (HR:0.64, 95%CI:0.51-0.82)。在任一一种强度的运动中，增加运动量并未显著改善从心肾代谢共病到死亡的转

变。

结论：体力运动的增加，尤其是中或高强度体力运动以及总体力运动，与降低首次心肾代谢疾病的发生、心肾代谢共病的进展以及死亡风险（除外心肾代谢共病患者）相关。各种强度的体力运动的增加对降低心肾代谢共病患者的死亡风险影响有限。

代谢组学发现 L- 茶氨酸可预防和延缓高血压患者肾脏损伤

王子钰

首都医科大学附属北京安贞医院

目的：高血压患者容易发生肾脏损伤，但缺乏有效的干预措施。L- 茶氨酸作为茶叶中的特殊氨基酸，虽已知具有降血压等生理功能，但其对高血压患者肾脏保护的作用尚未明确。本研究旨在基于代谢组学技术揭示高血压患者体内 L- 茶氨酸水平与肾脏损伤的关联，评估其在预防或延缓高血压相关肾脏损伤中的潜在价值。

方法：本研究基于中国多省市心血管病队列研究（Chinese Multi-provincial Cohort Study, CMCS），对 487 名高血压患者进行 8 年的前瞻性随访。采用非靶向代谢组学技术检测患者基线尿液代谢物的水平，并收集年龄、性别、体重指数、吸烟史、血脂、血糖、血压、肾小球滤过率（estimated glomerular filtration rate, eGFR）、尿微量白蛋白与肌酐比值（urine albumin creatinine rate, UACR）、用药史等临床数据。使用修正泊松回归模型，校正混杂因素，分析 L- 茶氨酸水平与慢性肾脏病（chronic kidney disease, CKD）发生、进展、eGFR 水平下降及 UACR 水平升高的关联。

结果：研究发现，高水平 L- 茶氨酸与高血压患者肾脏损伤风险降低显著相关。8 年后发生 CKD 者的 L- 茶氨酸水平显著低于未发生 CKD 者（错误发现率 [false discovery rate, FDR]=0.023, 相对风险 [relative risk, RR]=0.804, 95% 置信区间 [confidence interval, CI]: 0.711-0.910）。同样地，8 年后 CKD 进展者的 L- 茶氨酸水平显著高低于未 CKD 进展者（FDR=0.005, RR=0.795，95%CI: 0.707-0.893）。另外，8 年后 eGFR 水平下降者（P 值 =0.027， RR=0.744，95%CI: 0.572-0.967） 和 UACR 水平升高者（P 值 < 0.001，RR=0.773，95%CI: 0.675-0.885）的 L- 茶氨酸水平也较低。

另外，L- 茶氨酸的肾脏保护作用仅在高血压患者中显著，在血压正常人群中未观察到类似关联（CKD 发生：RR=1.073，95%CI: 0.844-1.364；CKD 进展 RR=1.041，95%CI: 0.820-1.323）。此外，调整血压水平和降压药使用后，L- 茶氨酸的保护作用仍然显著，表明其作用独立于血压控制。

结论：本研究发现高水平 L- 茶氨酸可显著降低高血压患者 CKD 发生和进展风险，保护其肾功能，为高血压患者肾脏损伤的防治提供了新的干预靶点，也为开发含 L- 茶氨酸的药物或保健品提供了科学依据。

基于 CHARLS 队列的新型复合标志物开发：TyG/TyH 衍生肥胖指数对心血管事件的预测效能研究

吴迪 袁祖贻

西安交通大学第一附属医院

目的：由甘油三酯葡萄糖（TyG）指数评估的胰岛素抵抗与内脏脂肪存在协同作用，共同促进心血管疾病（CVD）的发生和死亡。研究表明，整合两者特征的改良 TyG 指数（如 TyG-BMI）在预测心血管事件方面优于单一 TyG 指数。基于此，本研究提出甘油三酯糖化血红蛋白（TyH）指数作为胰岛素抵抗新指标，并将其与 TyG 指数共同纳入分析。二者分别与 6 项肥胖指标——腰围（WC）、腰高比（WHtR）、体重指数（BMI）、身体形态指数（ABSI）、身体圆度指数（BRI）和锥形指数（CI）——相结合，形成 14 项预选指标。通过系统评估与相互比较，本研究旨在筛选出更优的联合指标，以精准反映胰岛素抵抗与内脏脂肪的协同效应。

方法： 本研究基于中国健康与养老追踪调查（CHARLS）2011-2018 年的数据开展队列研究，共纳入 7,426 名受访者。采用 Cox 比例风险回归模型及限制性立方样条（RCS）分析评估不同指标与 CVD 发病率的关系；通过受试者工作特征曲线（ROC）比较各指标的预测效能，并利用亚组分析检验不同人群结论的一致性。

结果：在中位随访 7 年期间，共记录 381 例心血管疾病（CVD）事件。经多因素校正的 Cox 比例风险回归分析显示：TyG、TyH 及其与内脏肥胖指标（ABSI、CI）的组合（TyG-ABSI、TyG-CI、TyH-ABSI、TyH-CI）与 CVD 发病率无统计学关联（P ≥ 0.05）；TyG 及 TyH 分别与肥胖指标腰围（WC）、腰高比（WHtR）、BMI、身体圆度指数（BRI）的组合（如 TyG-WC、TyG-BRI、TyH-WC、TyH-BRI 等）均与 CVD 风险显著正相关（P< 0.01），其中 TyG-WC 每升高 1 个标准差（SD）的风险比最高（HR 1.26，CI 1.11-1.42）。ROC 曲线分析表明，TyH-BRI 为最优预测指标（AUC = 0.577），而 TyG-ABSI 预测效能最差（AUC = 0.537）。与相同肥胖指标结合的 TyH 改良指数（如 TyH-BRI vs. TyG-BRI）预测效能普遍优于 TyG 改良指数，但差异无统计学意义（Delong 检验 P> 0.1）。RCS 分析证实上述关联均为线性（非线性检验 P> 0.1），且亚组分析（包括代谢综合征患者）结论与主分析一致。

结论：在预测效能上，TyH-BRI 和 TyG-BRI 表现最优，然而其临床应用因需测量腰围而受限。因此，基于简便性和普及性的考量，TyG-BMI 仍是我们推荐的首选指标。本研究提出的 TyH 及其衍生的肥胖组合指标（如 TyH-BMI），可分别替代相应的基于空腹血糖的 TyG 指标（如 TyG-BMI），预测效能相当。

FMO2 promotes angiogenesis via regulation of N-acetylornithine

Wang Jingyi

The Second Affiliated Hospital Zhejiang University

Objective: The treatment of ischemic diseases hinges on the regeneration of a functional vascular network, with endothelial cell (EC) metabolic reprogramming emerging as a pivotal regulatory target for pro-angiogenic therapies. However, our understanding of the metabolic characteristics and regulatory mechanisms of ECs in ischemic microenvironments or during vascular development remains incomplete. This study aims to uncover the critical molecular mechanisms underlying EC metabolic remodeling in angiogenesis and explore its translational potential, focusing on the roles of FMO2 and N-acetylornithine.

Methods: Our research design involved single-cell RNA sequencing (scRNA-seq) using the 10x Genomics platform to analyze EC molecular features in mouse hindlimb ischemia models and retinal vascular development models. We generated EC-specific FMO2 knockout and compensation mouse models via CRISPR/Cas9. Additionally, we constructed a lentivirus harboring an enzymatic activity-deficient FMO2 mutant (LV-mut-FMO2) to validate the enzyme activity-dependent effects of FMO2 on angiogenesis, combined with untargeted metabolomics to screen for key metabolites regulated by FMO2. And dual-luciferase assays deciphered transcriptional regulatory networks, with validation in human umbilical vein endothelial cells (HUVECs) and human ischemic disease contexts were used to elucidate the detailed mechanism by which N-acetylornithine influences NOTCH1 expression.

Results: We confirmed that endothelial FMO2 is essential for both physiological vessel development and pathological angiogenesis after ischemia. Single-cell transcriptome analysis showed significant upregulation of FMO2 in ischemic tissue ECs, with specific high expression in tip cells of developing retinal vessels. EC-specific FMO2 knockout impaired hindlimb ischemic blood flow recovery and reduced retinal vascular branch points, whereas endothelial-specific FMO2 compensation reinforced angiogenesis. Given that FMO2 is a NADP+ and FAD dependent enzyme, we generated LV-mut-FMO2 to verify whether its pro-angiogenic effects are enzyme activity-dependent. Structural modeling confirmed that deletion of the enzymatic activity segment did not affect proper protein folding. However, loss of enzymatic activity abolished FMO2's pro-angiogenic functions, as evidenced by impaired tube formation and tip cell sprouting, indicating that FMO2 regulates angiogenesis in an enzyme activity-dependent manner. Untargeted metabolomics analysis of ECs overexpressing FMO2 (LV-FMO2) or knockdown FMO2 (LV-shFMO2) revealed that ornithine and N-acetylornithine were concurrently enriched in the ornithine metabolism pathway, with N-acetylornithine upregulated and ornithine downregulated, consistent with the catalytic process of this pathway. In vivo and in vitro validation showed that N-acetylornithine levels were significantly reduced in the gastrocnemius muscle of $FMO2^{\triangle EC}$ mice after hindlimb ischemia and in cultured ECs with FMO2 knockdown or enzymatic inactivation, while FMO2 overexpression increased N-acetylornithine levels. Among the metabolites upregulated by FMO2 overexpression, only N-acetylornithine supplementation significantly enhanced EC tube formation and reversed the upregulation of NOTCH1 and NICD induced by FMO2 knockdown. Mechanistically, FMO2 promotes vessel sprouting by repressing NOTCH1 through regulation of N-acetylornithine. Bioinformatics analysis of conserved transcription factor binding sites on the NOTCH1 promoter using the ENCODE ChIP-seq database, combined with functional validation, revealed that ATF3 knockdown increased NOTCH1 expression, whereas ATF3 overexpression reduced NOTCH1 and NICD levels. Crucially, ATF3 silencing abolished the pro-angiogenic effects of N-acetylornithine, including tube formation, and blocked the ability of N-acetylornithine or FMO2 overexpression to reduce NOTCH1, confirming that N-acetylornithine inhibits NOTCH1 via transcriptional regulation of ATF3. Moreover, N-acetylornithine exerted significant therapeutic effects in ischemic diseases: exogenous supplementation restored tube formation in FMO2-knockout ECs and increased capillary density in ischemic tissues. This regulatory axis is conserved in HUVECs, where ATF3 knockdown blocked the pro-angiogenic effects of N-acetylornithine, confirming the translational potential of FMO2 and N-acetylornithine in human ischemic diseases.

Conclusion: This study establishes FMO2 as a key regulator linking EC metabolism to angiogenesis through the N-acetylornithine - ATF3 - NOTCH1 axis. FMO2-dependent enzymatic production of N-acetylornithine activates ATF3 to repress NOTCH1, thereby promoting vessel sprouting. These findings support dual therapeutic strategies for ischemic diseases: enhancing endothelial FMO2 expression or supplementing N-acetylornithine, with conserved mechanisms in human ECs highlighting clinical translation potential.

The prognostic significance of triglyceride-glucose index for all-cause mortality in cancer survivors: Retrospective cohort study

Abstract

Background: The triglyceride-glucose (TyG) index has emerged as a clinically significant and reliable surrogate marker of systemic insulin resistance, demonstrating strong predictive value for adverse health outcomes across multiple disease states. While extensive epidemiological evidence has established clear associations between insulin resistance and accelerated cancer progression through various pathophysiological mechanisms, including chronic inflammation and hyperinsulinemia-driven tumor growth, the specific prognostic utility of the TyG index for mortality risk stratification in cancer survivor populations has remained poorly characterized. To address this important clinical question, our investigation leveraged comprehensive data from a nationally representative U.S. cancer registry, employing rigorous retrospective cohort study methodology to systematically evaluate longitudinal outcomes. This large-scale analysis provides novel epidemiological evidence demonstrating a significant association between TyG index levels and all-cause mortality risk in cancer survivors, with important implications for risk prediction models and survivorship care strategies in this vulnerable patient population.

Methods: This retrospective cohort analyzed 2,146 cancer patients from NHANES (1999-2018), stratified by TyG index quartiles (Q1:<8.33; Q2:8.33-8.72; Q3:8.72-9.16; Q4: ≥ 9.16). Calculated as ln[fasting triglycerides(mg/dL)×fasting glucose(mg/dL)/2], TyG associations with mortality were evaluated through Cox proportional hazards models and Kaplan-Meier analyses. Restricted cubic splines characterized non-linear relationships, while weighted Cox regression yielded adjusted HRs (95% CIs) across subgroups. ROC curve analysis established optimal TyG prognostic thresholds.

Results: Over a median follow-up of 95.18±60.98 months, 770 all-cause deaths were recorded in a cohort of 2,146 cancer patients. The TyG index was significantly higher in the event group (8.81±0.6 vs. 8.75±0.65; P=0.004), with more participants in the highest TyG quartile (Q4) in the event group (25.6% vs. 25.2%; P=0.014). A U-shaped relationship between TyG index and all-cause mortality was observed (P for non-linearity p =0.027). Kaplan-Meier and Cox regression analyses showed higher TyG index was associated with increased mortality risk (Logrank P =0.002; HR=1.568, 95%CI: 1.201-2.047 P<0.001, respectively). ROC analysis identified an optimal TyG cut-off of 8.37 (AUC =0.527, 95%CI: 0.501-0.552, P =0.041).

Conclusion: Through multivariate regression analysis, this study demonstrates that the triglyceride-glucose (TyG) index serves as an independent predictor of all-cause mortality in cancer patients, exhibiting a significant U-shaped association with clinical endpoints. Specifically, our longitudinal cohort study revealed that both elevated and reduced TyG index levels were significantly associated with increased mortality risk, while intermediate TyG index levels demonstrated optimal prognostic outcomes. These findings suggest that implementing appropriate glycemic and lipid control in clinical practice to maintain metabolic homeostasis may potentially reduce mortality risk in this patient population. Furthermore, our results support the incorporation of the TyG index into risk assessment systems for cancer patients, providing a theoretical foundation for developing personalized metabolic intervention strategies.

组蛋白乳酸化修饰介导代谢重编程在心肌梗死后心肌再生中的作用机制研究

张立

上海交通大学医学院附属同仁医院仙霞路院区

张 立[1]，钱玲梅[1]*

1. 上海交通大学医学院附属同仁医院，心内科，上海，200336

关键词： 心肌梗死、心肌再生、代谢重编程、乳酸化修饰

目的： 本研究的目的是阐明组蛋白乳酸化修饰介导糖代谢重编程途径促进心肌梗死后心肌有效再生的作用及机制研究，为临床上缺血性心脏病的治疗提供新思路。

方法： 我们首先通过质谱技术对新生 1 天（P1）及 7 天（P7）小鼠的心尖组织进行代谢谱及乳酸化修饰谱检测分析，再通过靶向代谢组学技术检测 P1 与 P7 中乳酸水平，通过 Western blot 检测组蛋白各位点的乳酸化修饰水平。在细胞水平，我们首先通过乳酸加入小鼠原代心肌细胞培养上清，通过免疫荧光法测定心肌细胞增殖潜能的指标（EdU、pH3 及 aruroB），通过 Western blot 检测组蛋白 H3K18la 乳酸化修饰水平。在动物水平上，采用乳鼠心尖切除术，建立乳鼠心肌再生模型，通过腹腔注射乳酸采用 Masson 染色检测术后心脏的再生与纤维化情况，以 M 型心脏超声检测左室短轴缩短率（LVFS）、左室射血分数（LVEF）等左心室功能指标的变化。在机制上，设置细胞加入乳酸处理组与空白组，通过 RNA-seq 测序技术联合 Western blot 检测糖代谢途径及丙酮酸激酶 PKM2 表达。进一步采用 $pkm2^{-/-}$ 心肌特异性敲除小鼠，采用乳鼠心尖切除术及成年小鼠心梗结扎术，采用乳酸处理，以 M 超声检测 LVFS、LVEF 等指标的变化；采用 TTC 及 Masson 染色，检测乳鼠心尖及成年鼠心肌梗死面积及纤维化程度；免疫荧光法检测 EdU、pH3 及 aruroB 染色的阳性心肌细胞数，以了解心肌细胞增殖潜能。最后，提取心肌组织检测 H3K18la 乳酸化修饰水平、代谢重编程相关的分子蛋白表达水平及代谢产物丙酮酸含量。

结果： 代谢图谱检测发现 P1 组糖酵解途径显著，而 P7 组氧化磷酸化途径显著，显示发生代谢重编程改变，且乳酸水平在 P1 组升高，乳酸化修饰谱发现 P1 组整体组蛋白乳酸化修饰水平升高，通过 Western blot 检测发现 H3K18la 位点乳酸化修饰水平差异明显。在细胞水平，检测发现乳酸可以显著提高小鼠原代心肌细胞 EdU、pH3 及 aruroB 的阳性率，可显著提高组蛋白 H3K18la 乳酸化修饰水平；在动物水平上，乳酸可促进乳鼠心尖切除后心肌再生，减少纤维化，M 超声结果显示：术后 28 天乳酸可显著改善 LVFS、LVEF 心功能指标。在机制上，通过 RNA-seq 测序揭示糖酵解途径，Western blot 检测发现丙酮酸激酶 PKM2 表达上调。进一步通过 $pkm2^{-/-}$ 心肌特异性敲除小鼠建立乳鼠心尖切除术及成年小鼠心梗模型，M 超声结果显示乳酸对左室心功能的改善被抑制；TTC 及 Masson 染色发现，乳酸处理后乳鼠心尖及成年鼠心肌梗死面积及纤维化程度无差异；免疫荧光法检测 EdU、pH3 及 aruroB 染色的阳性心肌细胞数无显著差异。提取心肌组织检测发现 H3K18la 乳酸化修饰水平降低，糖酵解关的分子蛋白表达水平降低及代谢产物丙酮酸含量降低，揭示 PKM2 介导的糖酵解途径可能是乳酸化修饰促进心肌再生的机制。

结论： 本研究证实代谢重编程参与心肌再生过程，首次发现 H3K18la 组蛋白乳酸化修饰通过 PKM2 调控糖酵解代谢重编程促进心肌再生，改善心肌梗死损伤。本研究将为梗死后心肌有效再生治疗提供新的理论依据和干预靶标。

Association of a Novel BMI/Triglyceride-Glucose Waist Circumference Index with All-Cause and Cardiovascular Mortality in a COPD Population

2. The First Affiliated Hospital of Guangzhou Medical University

Objective

Chronic Obstructive Pulmonary Disease (COPD) is a leading global cause of morbidity and mortality, characterized not only by airflow limitation but also by significant systemic inflammation and metabolic dysregulation. Individual markers of metabolic health, such as the triglyceride-glucose (TyG) index (a surrogate for insulin resistance), along with obesity indices like body mass index (BMI) and waist circumference (WC), have been independently associated with clinical outcomes. However, COPD presents a complex metabolic phenotype where the interplay between insulin resistance and different patterns of fat distribution may have unique prognostic implications. To date, the combined effect of these markers, integrated into a single composite index, on long-term survival in COPD patients remains unknown. Therefore, the primary objective of this study was to develop and investigate the association of a novel composite biomarker, the BMI/TyG-WC index, with all-cause and cardiovascular-specific mortality in a large, nationally representative cohort of adults with COPD.

Methods

This study was designed as a retrospective cohort analysis utilizing data from multiple cycles of the National Health and Nutrition Examination Survey (NHANES) conducted between 1999 and 2018. The study population consisted of 1,488 adult participants who met the diagnostic criteria for COPD. The primary exposure variable was the novel BMI/TyG-WC index, which was constructed as a composite measure integrating metabolic and anthropometric data. Participants were categorized into quartiles based on the distribution of this index for analysis. The main outcomes of interest were all-cause mortality and cardiovascular-specific mortality, which were ascertained through probabilistic linkage to the National Death Index (NDI) database.

To assess the relationship between the BMI/TyG-WC index and mortal-

ity, a multivariable Cox proportional hazards model was employed to calculate adjusted hazard ratios (HRs) and their corresponding 95% confidence intervals (CIs). The models were adjusted for a comprehensive set of potential confounders, including age, sex, race, smoking status, educational level, and comorbidities. Survival curves were visualized using Kaplan-Meier analysis and Nelson-Aalen cumulative function plots to compare mortality risk across the index quartiles. The predictive utility of the index was further assessed using receiver operating characteristic (ROC) curve analysis, and the area under the curve (AUC) was calculated for several models. Finally, to ensure the validity of our findings, extensive subgroup and sensitivity analyses were performed to test the robustness and reliability of the final model.

Results

The final cohort comprised 1,488 participants with COPD, including 885 women and 603 men, with a mean age of 54.2 ± 16.2 years. A significant and independent inverse association was discovered between the BMI/TyG-WC index and mortality. In the fully adjusted Cox regression model, participants in the highest quartile of the index exhibited a significantly lower hazard of both all-cause mortality (HR: 0.68; 95% CI: 0.49–0.94) and cardiovascular mortality (HR: 0.45; 95% CI: 0.23–0.85) when compared to those in the lowest quartile. This trend was visually confirmed by the Kaplan-Meier and Nelson-Aalen plots, which demonstrated a stepwise decrease in cumulative mortality incidence with each increasing quartile of the index. The ROC curve analysis showed that the fully adjusted model incorporating the BMI/TyG-WC index had superior predictive performance for both all-cause mortality (AUC: 0.71; 95% CI: 0.68–0.74) and cardiovascular mortality (AUC: 0.70; 95% CI: 0.65–0.75). Subgroup analyses indicated that this protective association was consistent across various demographic and clinical subgroups, with no significant interactions detected.

Conclusion

The novel composite BMI/TyG-WC index is significantly and independently associated with all-cause and cardiovascular mortality in the COPD population. Crucially, this relationship is inverse, suggesting that a higher index value, which reflects a specific metabolic and anthropometric profile, is paradoxically linked to improved survival. This finding points towards a potential "obesity paradox" in COPD that is uniquely captured by this integrated marker. The BMI/TyG-WC index could serve as an accessible and valuable prognostic tool for risk stratification in patients with COPD, and further research is warranted to explore the underlying biological mechanisms of this protective association.

心脏代谢共病患者估计葡萄糖处理率和颈动脉斑块的相关性分析

欣鑫

天津市胸科医院

摘要：

目的：系统探讨心脏代谢共病（CMM）患者中葡萄糖处理率（GDR）与颈动脉斑块特征的关联性，揭示胰岛素敏感性在亚临床动脉粥样硬化进展中的潜在作用。

方法：

数据来源：中医药治疗心血管疾病队列研究数据库，根据排纳标准，筛选出3607 例病例，收集一般资料、既往病史、生化指标（血糖、糖化血红蛋白、甘油三酯、总胆固醇、低密度脂蛋白胆固醇、高密度脂蛋白胆固醇、谷丙、谷草、肌酐、尿素、尿酸、肌酸激酶、乳酸脱氢酶）、颈动脉彩超数据完整，根据有无颈动脉斑块分为两组，使用二元 logistics 回归判断 eGDR 与无颈动脉斑块的相关性，并校正混杂因素。然后根据年龄、性别、有无合并糖尿病的共病患者进行亚组分析。

结果：未调整模型时，eGDR 每增加一个单位，颈动脉斑块发生风险减少 3.5%。根据年龄、性别进行调整后，eGDR 每增加一个单位，颈动脉斑块发生风险减少 3.7%。根据年龄、性别、吸烟、身高进行调整后，eGDR 每增加一个单位，颈动脉斑块发生风险减少 4.5%。根据年龄、性别、吸烟、身高、糖化、高血压、血糖、总胆固醇进行调整后，eGDR 每增加一个单位，颈动脉斑块发生风险减少 6.0%。

结论：在心脏代谢共病（CMM）患者中，估计葡萄糖处置率越高，颈动脉斑块发生风险越低。相反，估计葡萄糖处理率（eGDR）越低，颈动脉斑块发生风险越高。

Association between dietary B vitamin intakes and advanced cardiovascular-kidney-metabolic syndrome: insights from the National Health and Nutrition Examination Survey

Zhi-Fu Guo[1], Ding-Yuan Tu[2], Jing-Yu Zhang[1], Qiang Xu[4], Chao-Qun Ma[3], Jin Luo[1], -Pu Niu[1], Si-Yu Liu[1], Song-Qun Huang[1]

1. Changhai Hospital, Naval Medical University

2. The 961st Hospital of the Joint Logistics Support Force of The Chinese People's Liberation Army

3. General Hospital of Northern Theater Command

4. Navy 905 Hospital, Naval Medical University

Objective

Cardiovascular-kidney-metabolic (CKM) syndrome represents a systemic disorder integrating cardiovascular disease (CVD), chronic kidney disease (CKD), and metabolic dysfunctions, with advanced stages (stages 3–4) associated with high mortality and healthcare burden. Dietary interventions are modifiable risk factors for CKM progression, but the role of B vitamins—essential cofactors in energy metabolism, homocysteine regulation, and oxidative stress pathways—remains inadequately characterized. This study aimed to evaluate independent and joint associations of six dietary B vitamins (B1, B2, B6, B12, niacin, folate) with advanced CKM syndrome using a nationally representative U.S. cohort. The primary hypothesis posited that higher B vitamin intake, particularly B2 and B6, would correlate with reduced risk of advanced CKM stages, addressing a critical gap in nutritional epidemiology for multisystem disease prevention.

Methods

Study Design and Population:

A cross-sectional analysis included 14,576 adults (≥ 20 years) from the 2011–2020 National Health and Nutrition Examination Survey (NHANES). Participants were classified into CKM stages 0–4 per American Heart Association (AHA) criteria, with stages 3–4 (clinical CVD, high-risk CKD, or ≥ 20% 10-year CVD risk) defined as advanced CKM syndrome. Exclusions comprised pregnancy, implausible energy intake, missing B vitamin or CKM data, and key covariate deficiencies.

Exposure and Outcome Assessment: B Vitamin Intake: Quantified via two 24-hour dietary recalls, averaged across six types (B1, B2, B6, B12, niacin, total folate). CKM Staging: Based on BMI, metabolic risk factors (hypertension, diabetes, dyslipidemia), CKD risk, 10-year CVD risk (PREVENT equations), and self-reported CVD. Covariates: Adjusted for demographics (age, sex, ethnicity), socioeconomic status (income, education), lifestyle (smoking, alcohol, physical activity), and diet quality (Healthy Eating Index-2015, HEI-2015). Statistical Analysis: Primary Models: Survey-weighted multivariable logistic regression evaluated individual B vitamins and advanced CKM, with three adjustment tiers: basic (age, sex, ethnicity), socioeconomic, and full (lifestyle + HEI-2015). Dose-Response: Restricted cubic splines (RCS) with 3–7 knots tested nonlinear associations. Mixture Effects: Weighted quantile sum (WQS) regression and quantile-based g-computation (QG-comp) assessed combined B vitamin effects, addressing multicollinearity and directional heterogeneity. Sensitivity Analyses: Excluded cancer history, imputed missing covariates, and adjusted for cardioprotective medications (SGLT2 inhibitors, GLP-1 agonists). Analyses incorporated NHANES sampling weights and complex survey design.

Results

Participant Characteristics: Among 14,576 CKM patients (mean age 49.9 years, 51.3% female), 17.0% (n=2,486) had advanced CKM syndrome. Advanced-stage patients were older, more likely male, non-Hispanic White, former/current smokers, and had lower education/income versus non-advanced stages (all p<0.001). Daily intake of vitamin B2, B6, and niacin was significantly lower in advanced CKM (p<0.05). Individual B Vitamin Associations: Vitamin B2: Highest quartile (Q4) intake reduced advanced CKM risk by 27% (OR=0.73, 95% CI: 0.60–0.89) versus Q1 in fully adjusted models. Continuous analysis confirmed inverse linearity (OR=0.87, CI: 0.81–0.93, p<0.001). Vitamin B6: Q4 intake lowered risk by 26% (OR=0.74, CI: 0.59–0.93), with continuous OR=0.88 (CI: 0.82–0.95, p=0.002). Niacin: Modest inverse association (OR=0.98, CI: 0.97–0.99, p=0.01). ther B Vitamins: B1, B12, and folate showed no significant associations (p>0.05). RCS revealed nonlinear relationships for B1, B2, B6, and folate ($p_{nonlinear}$<0.05). Joint B Vitamin Effects: WQS Model: Mixed B vitamin exposure reduced advanced CKM risk (OR=0.89, CI: 0.83–0.95, p<0.001), driven primarily by B6 (weight=0.721) and B2 (weight=0.200). QG-comp Model: Similarly protective (OR=0.89, CI: 0.83–0.94, p<0.0001), with B2 (weight=0.373) and B6 (weight=0.347) as dominant negative contributors. Vitamin B12 exhibited paradoxical positive weights (0.309 in QG-comp), suggesting context-dependent effects. Sensitivity Analyses: Results persisted after excluding cancer patients, imputing missing data, and adjusting for medications, confirming robustness (all p<0.05).

Conclusion

This large-scale study demonstrates that higher dietary intake of vitamins B2 and B6 is independently associated with reduced risk of advanced CKM syndrome, exhibiting dose-dependent protective effects. Mixed B vitamin exposure further underscores synergistic benefits, with B2 and B6 as primary mediators. These findings highlight B vitamins—particularly B2 and B6—as modifiable nutritional factors for mitigating CKM progression, potentially via antioxidative pathways (e.g., glutathione cycle restoration) and epigenetic regulation of metabolic genes. While causality cannot be inferred from cross-sectional data, the results advocate for integrated dietary strategies targeting B vitamins in high-risk populations. Future prospective cohorts and mechanistic studies are warranted to elucidate molecular targets (e.g., homocysteine modulation, endothelial function) and refine clinical guidelines for CKM man-

agement

ATAD3A Regulates Mitochondria–Lysosome Membrane Contact Sites via the LIAS/DLST Axis to Suppress Aortic Dissection

Jie Lin[1,2,3], Ying An[1,2,3], Sheng-Jun Xiong[1,2,3], Ying-Mei Zhang[1,2,3], Jun Ren[1,2,3]

1. Department of Cardiology, Zhongshan Hospital, Fudan University

2. Shanghai Institute of Cardiovascular Diseases, Shanghai,China

3. National Clinical Research Center for Interventional Medicine, Shanghai, China

Background:

Aortic dissection (AD) is a life-threatening vascular disorder characterized by medial degeneration, inflammation, and extensive vascular remodeling. Despite advances in clinical management, the underlying molecular mechanisms remain incompletely understood, limiting the development of targeted therapies. Mitochondrial dysfunction has emerged as a key contributor to vascular smooth muscle cell (VSMC) phenotypic transformation and vascular instability. ATPase family AAA domain-containing protein 3A (ATAD3A), an inner mitochondrial membrane protein, plays a critical role in maintaining mitochondrial homeostasis, including mitochondrial DNA organization, cristae structure, and organelle dynamics. However, its role in aortic disease has not been thoroughly explored. This study investigates the hypothesis that ATAD3A protects against AD by regulating mitochondria–lysosome membrane contact sites (MCSs) through a novel LIAS/DLST signaling axis, thereby preserving mitochondrial function and suppressing pathological VSMC remodeling.

Methods:

We employed integrative transcriptomic and proteomic analyses to assess ATAD3A expression patterns in aortic tissues and VSMCs under AD-related stress conditions. An in vivo mouse model of AD was established via continuous administration of 0.5% β-aminopropionitrile (BAPN) in drinking water for 28 days to induce medial degeneration and elastin fragmentation. In vitro, primary human aortic VSMCs were stimulated with angiotensin II (AngII) to replicate the inflammatory and stress environment observed in AD. To dissect the cell-type-specific functions of ATAD3A, we constructed a smooth muscle-targeted knockdown system using scAAV-ATAD3A-EnSM22a-EGFP and generated a systemic overexpression model by inserting a CAG-Atad3a-6xFlag-PolyA cassette into the H11 locus using CRISPR/Cas9 technology. Functional assessments included histological analysis, survival tracking, aortic diameter measurements, and mitochondrial function assays. Mitochondria–lysosome interactions were visualized and quantified by confocal microscopy. Protein interaction networks involving ATAD3A were elucidated through immunoprecipitation followed by mass spectrometry (IP-MS), co-immunoprecipitation (Co-IP), and proximity ligation assays. Mechanistic rescue experiments were performed using Devimistat, a clinically tested DLST-specific inhibitor.

Results:

Bioinformatic analysis revealed a dynamic expression profile of ATAD3A in human VSMCs upon AngII stimulation, with an initial downregulation followed by compensatory upregulation. This temporal expression pattern suggests a protective response mechanism during AD pathogenesis. In vivo, VSMC-specific knockdown of Atad3a significantly exacerbated AD incidence, aortic rupture, and mortality, whereas systemic overexpression of Atad3a markedly attenuated these phenotypes, including reduced aortic dilation and improved vascular integrity. Functional studies confirmed that ATAD3A preserves mitochondrial morphology, membrane potential, and ATP production, while limiting excessive mitochondria–lysosome tethering under stress conditions. Mechanistically, ATAD3A was found to interact with the LIAS/DLST protein complex via its 370–394 amino acid region, a sequence required for maintaining the complex's stability. Disruption of this interaction led to mitochondrial dysfunction and enhanced MCS formation. Importantly, we identified that lipoylation at lysine 110 (K110) on DLST promotes cuproptosis, a novel form of regulated cell death, and induces VSMC phenotypic switching toward a synthetic, pro-inflammatory state. Administration of Devimistat reversed these pathological changes, restoring mitochondrial homeostasis and reducing AD burden in both in vitro and in vivo settings.

Conclusion:

Our findings establish ATAD3A as a key regulator of mitochondrial–lysosomal communication in VSMCs and a critical protective factor in the context of aortic dissection. Through stabilization of the LIAS/DLST complex and suppression of aberrant DLST lipoylation, ATAD3A maintains mitochondrial function and inhibits pathological mitochondrial–lysosome contacts, thereby reducing vascular damage and remodeling. The ATAD3A–LIAS–DLST signaling axis represents a previously unrecognized mechanism contributing to vascular homeostasis and may serve as a promising therapeutic target for preventing or treating aortic dissection.

心血管 - 肾脏 - 代谢综合征 0-3 期人群中 C 反应蛋白 - 甘油三酯 - 葡萄糖指数与远期心脑血管疾病发病风险的关联研究

杨方坤

宁波大学附属第一医院

背景：心血管 - 肾脏 - 代谢（CKM）综合征是美国心脏协会近期提出的一种由代谢紊乱、心血管疾病和慢性肾脏疾病之间相互作用导致的全身性疾病。CKM 综合征可分为五期，其中 0-3 期为无风险或亚临床阶段，4 期为出现临床疾病阶段。胰岛素抵抗和系统性炎症是 CKM 综合征的重要病理生理学机制。以往的研究发现在 CKM 综合征 0-3 期人群中，胰岛素抵抗指标甘油三酯 - 葡萄糖（TyG）指数和系统性炎症指标 C 反应蛋白（CRP）与远期心脑血管疾病（CVD）的发病风险密切相关。而在近期的研究中提出了一个可以整合胰岛素抵抗和系统性炎症的综合指标：C 反应蛋白 - 甘油三酯 - 葡萄糖（CTI）指数。目前尚未有研究探索 CTI 指数在 CKM 综合征 0-3 期人群中与远期 CVD 的关联。此外，CTI 指数的动态变化与远期 CVD 的关联也有待进一步证实。

目的：在 CKM 综合征 0-3 期人群中探究 CTI 指数及其动态变化与远期 CVD 发病风险的关联。

方法：利用中国健康与养老追踪调查（CHARLS）的数据，根据纳入排除标准，最终纳入 8720 名符合要求的 CKM 综合征 0-3 期受试者。CTI 按如下公式进行计算： 0.412 × Ln (CRP [mg/L]) + Ln (甘油三酯 [mg/dl] × 空腹血糖 [mg/dl]/2)。CTI 的动态变化利用第二次调查时的 CTI 与基线 CTI 之差进行评估。基线 CTI 和 CTI 变化之差都按百分位数进行三等分位。利用 Cox 比例风险模型分析基线 CTI 和 CTI 变化之差与远期 CVD 发病风险的关联。

结果：在 CKM 综合征 0-3 期受试者中，基线 CTI 与 CVD 发病风险密切相关。与基线 CTI 下三分位数者相比，基线 CTI 上三分位数者其 CVD 发病风险显著增加（HR=1.20, 95%CI: 1.07-1.35, P=0.001）。对于连续性的基线 CTI，其每增加一个标准差，CVD 发病风险也显著增加（HR=1.08, 95%CI: 1.04-1.13, P<0.001）。此外，CKM 综合征 0-3 期受试者中的 CTI 变化之差也与 CVD 发病风险密切相关。与 CTI 变化之差下三分位数者相比，CTI 变化之差上三分位数者其 CVD 发病风险显著增加（HR=1.21, 95%CI: 1.01-1.46, P=0.039）。对于连续性的 CTI 变化之差，其每增加一个标准差，CVD 发病风险也显著增加（HR=1.07, 95%CI: 1.01-1.15, P=0.041）。

结论：在 CKM 综合征 0-3 期人群中，基线 CTI 和 CTI 变化之差都与远期 CVD 发病风险密切相关。基线 CTI 越大，CTI 变化增加越大，远期 CVD 发病风险越高。未来可将 CTI 指数纳入作为 CKM 综合征临床管理的一个重要指标。

吲哚类代谢物与心血管疾病研究进展

连少飞 任洁

山西白求恩医院（山西医学科学院）

目的

吲哚类代谢物是肠道菌群分解色氨酸产生的关键活性分子，近年被证实在心血管疾病（CVD）发生发展中起核心调控作用。本文聚焦近十年（2015-2025）研究，系统阐述吲哚 -3- 丙酸（IPA）、吲哚硫酸盐（IS）等主要代谢物在冠心病（CAD）、心力衰竭（HF）及高血压中的病理机制，评估其作为新型预警和预后标志物的潜力，并探讨干预策略。

方法

系统检索 PubMed、Web of Science 及 CNKI 数据库（2015-2025），关键词包括“吲哚代谢物”、“肠道菌群”、“心血管疾病”、“生物标志物”、“芳香烃受体（AhR）”。纳入机制研究、临床队列及干预性研究进行综述。

结果

关键代谢物的心血管效应与临床关联：保护性代谢物 IPA 通过激活 AhR-PPARγ 轴抑制血管炎症、增强内皮功能及 NO 生物利用度，显著减轻动脉粥样硬化斑块和心肌纤维化；而尿毒症毒素 IS 则通过 AhR-STAT3 通路促进内皮损伤和血管钙化。临床研究证实：CAD 患者血浆 IPA 水平显著降低，且与冠状动脉病变严重程度负相关，基线低 IPA 预示 3 年内主要不良心血管事件（MACE）风险增加。血清 IS 升高与冠脉钙化及斑块不稳定性独立相关，尤其在合并慢性肾病（CKD）患者中。心力衰竭研究显示：急性 HF 患者 IPA/IS 比值降低是 1 年全因死亡的强预测因子，其效能优于 NT-proBNP；射血分数降低型心衰（HFrEF）患者 IPA 浓度与左心室功能呈正相关。高血压队列中，顽固性高血压患者吲哚丙烯酸（IA）水平降低与血管僵硬度增加显著相关。

生物标志物价值：健康人群 IPA 持续低水平或 IS 升高可预测 5 年内 CVD 风险；CAD 患者血 IPA<0.8 μM 或 IS>15 μM 与心源性死亡风险增加 3 倍相关；HF 患者 IPA/IS 比值 <0.5 提示再住院风险升高 3.2 倍。代谢综合征患者 IPA/IS 比值降低可早于血管内皮功能障碍出现。

结论

吲哚类代谢物（IPA 降低、IS 升高）是 CVD 新型预警和预后评估标志物，其动态变化对风险分层具有重要价值。未来需建立标准化检测体系及临床截断值，并探索益生菌或 AhR 靶向干预策略。整合” 菌群 - 代谢物 - 宿主” 调控网络，为 CVD 精准防治提供新路径。

Prevalence of Cardiovascular-Kidney-Metabolic Syndrome by Social Determinants of Health: A Population-Based Study of 4.4 Million Adults in Northwestern China

Qian Zhao[1], Yi-Ning Yang[1]

1. First Affiliated Hospital of Xinjiang Medical University

2. People's Hospital of Xinjiang Uyghur Autonomous Region

Objective: Cardiovascular-kidney-metabolic (CKM) syndrome, recently defined by the American Heart Association as a novel, multistage, multisystem disorder, is highly prevalent in the United States. However, its prevalence in Northwestern China remains unknown. This study aims to investigate the stage-specific prevalence of CKM syndrome in a large adult population in Northwestern China. In addition, it explores the association between CKM syndrome and social determinants of health (SDOH), including socioeconomic status, education, and access to healthcare. Understanding these correlations may offer critical insights into regional disparities and inform targeted public health strategies for early detection and prevention of CKM syndrome.

Method: This cross-sectional study was based on the 2019 Northwest China Real-World and Population-Based Cohort, which covers nearly the entire population registered in community healthcare centers across the region. The dataset includes structured interviews, physical examinations, and laboratory measurements, as well as detailed information on SDOH, including education, marital status, occupation and health insurance. We included adults aged 18 years or older who underwent physical examination and fasting laboratory measurements. For each participant, we determined the CKM syndrome stage: stage 0 (no CKM risk factors, such as hypertension), 1 (excess or dysfunctional adiposity), 2 (additional metabolic risk factors or moderate- or high-risk chronic kidney disease), 3 (very high-risk chronic kidney disease or high predicted 10-year cardiovascular disease risk), or 4 (established cardiovascular disease, such as coronary artery disease). Advanced CKM syndrome stages were defined as stages 3 or 4 because these identify individuals with or at high risk of cardiovascular disease.

Results: The final study population included 4 458 471 adults. The mean (SD) age was 46.5 (16.4) years; 51.3%, women; 32.4%, Han; 49.6%, Uighur; 9.6%, Kazakh and 8.4%, other ethnicities. The prevalence of CKM stages 0 to 4 was 11.2% (95% CI, 11.1%-11.3%), 32.9% (95% CI, 32.8%-33.0%), 45.5% (95% CI, 45.4%-45.6%), 5.4% (95% CI, 5.4%-5.6%), and 4.9% (95% CI, 4.8%-5.0%), respectively. Han individuals were more likely to present with advanced stages compared to Uighur and Kazakh individuals (12.37% vs. 9.31% vs. 9.39%, P < 0.001). Compared with women, men were more likely to have advanced stages (12.8% vs 8.0%, P<0.001). Adults 65 years or older were more likely to have advanced stages than those younger than 65 years (34.3% vs 5.2%, P<0.001), Only 17.5% of adults aged 18 through 45 years had stage 0. Significant differences were observed in the prevalence of CKM stages across all unfavorable SDOH of interest compared with their favorable counterparts, with low literacy (22.7% vs. 3.9%), divorced or widowed (21.2% vs. 10.6%), and civil servant (12.5% vs. 8.5%) associated with an increased likelihood of advanced CKM stages.

Conclusion: In this large, population-based study of adults in Northwestern China, the prevalence of CKM was substantial, with nearly one in ten individuals exhibiting advanced-stage disease. The burden was disproportionately higher among men, older adults, Han individuals, and those exposed to unfavorable SDOH. These findings underscore the urgent need for region-specific prevention and intervention strategies that address both clinical risk factors and social vulnerabilities to mitigate the growing burden of CKM syndrome and its associated cardiovascular consequences.

阻塞性睡眠呼吸暂停在急性冠状动脉综合征中的预后意义：不同血糖水平的研究分析

张明瑞 [1] 郝问 [1] 郭倩 [1] 张飞宇 [1] 刘晓晨 [1] 陈雅婷 [1] 孔祥赟 [1] 王晓 [2] 聂绍平 [1]

1. 首都医科大学附属北京安贞医院

2. 中国医学科学院阜外医院

摘要

背景：本研究旨在评估不同血糖水平下，阻塞性睡眠呼吸暂停（OSA）对急性冠状动脉综合征（ACS）患者长期心血管预后的影响。

方法：该前瞻性队列研究（NCT03362385）纳入了因 ACS 住院并接受便携式睡眠监测的成年患者。OSA 被定义为呼吸暂停低通气指数≥ 15 次 / 小时。糖尿病前期定义为既往无糖尿病病史，糖化血红蛋白（HbA1c）5.7-6.4% 或空腹血糖（FPG）5.6-6.9mmol/L，糖尿病定义为 HbA1c ≥ 6.5% 或 FPG ≥ 7.0mmol/L 或既往诊断为糖尿病，糖尿病血糖控制不佳定义为既往诊断为糖尿病且 HbA1c ≥ 7.0%。主要终点为主要心血管和脑血管不良事件（MACCE），包括心血管死亡、心肌梗死（MI）、脑卒中、缺血驱动的血运重建或因不稳定型心绞痛（UA）或心力衰竭而住院。

结果：最终入组 1846 名患者，其中非糖尿病患者 371 人（20.1%），糖尿病前期患者 681 人（36.9%），糖尿病伴血糖控制良好患者 354 人（19.2%），糖尿病伴血糖控制不佳患者 442 人（23.9%）。平均随访 5 年，在非糖尿病患者中，OSA 组和非 OSA 组患者的 MACCE 发生率无统计学意义（aHR=0.95，95%CI 0.62-1.64，P=0.83）；在糖尿病前期患者中，OSA 患者的 MACCE 发生率较非 OSA 患者升高（HR=1.39，95% CI 1.04-1.85，P=0.03），多因素矫正后无统计学意义（aHR=1.30，95% CI 0.95-1.78，P=0.10）；OSA 组的 MACCE 发生率在糖尿病伴血糖控制不佳人群中明显升高 (aHR=1.54 , 95% CI 1.09-2.20; P=0.02)，但在糖尿病伴血糖控制良好的人群中无统计学意义（aHR=1.29，95% CI 0.85-1.98，P=0.23）。

结论：OSA 患者的血糖水平越高，其预后越差，即使是糖尿病前期的人群也因应注意 OSA 的诊治；而血糖控制好则能降低 OSA 带来的风险，提示 OSA 患者更应注意血糖管理。

The association between the heart rate response related to sleep apnea and left ventricular hypertrophy in obese individuals

Huang-Tao Ruan, Jin Liu, Xiao-Zhao Lu, Ning Tan, Ji-Yan Chen, Ling Wang, Zhi-Cheng Jing

Guangdong Provincial People's Hospital

Background: Obesity is accompanied by a variety of complications, among which the co-occurrence rate of OSA is as high as 69% and face a higher cardiovascular risk. The indices of heart rate response related to sleep apnea, include respiratory event index (REI), cardiac electrophysiology-respiratory event index (CEP-REI), heart rate burden (HRB), hypoxic burden (HB), ventilation burden (VB) indices, and heart rate variability (HRV) indices can not only be obtained through non-invasive methods during the screening process for OSA and reflects the cardiac autonomic nerve function and the regulatory ability of cardiopulmonary function, but also can be used to assess the severity of OSA and cardiovascular diseases. Meanwhile, the identification of structural and functional cardiac abnormalities can help us to recognize early and intervene in patients at high cardiovascular events risk. However, few studies have adequately evaluated the associations between indices of heart rate response related to sleep apnea and left ventricular (LV) hypertrophy in patients with obesity.

Methods: Obese patients undergoing nocturnal Holter electrocardiographic monitoring and home sleep apnea test (HSAT) from 2017–2021 were enrolled. Obesity was defined as a BMl ≥ 28 kg/m2 with ≥ 1 measure of excess adiposity (defined by waist circumference [WC] >88 cm for females, >102 cm for males; waist-to-hip ratio [WHR] >0.85 for females, >0.90 for males; or waist-to-height ratio [WHtR] >0.50 for all), or ≥ 2 measures of excess adiposity (WC, WHR, WHtR) regardless of BMl. Nocturnal HRV indices, CEP-REI and HRB index were analyzed and calculated from dynamic electrocardiogram data. Nocturnal HRV indices were specifically obtained from variation in the normal-to-normal intervals and divided into 3 subtypes based on frequency-domain spectrum, i.e., high frequency (HF, 0.15–0.5 Hz), low frequency (LF, 0.04–0.15 Hz), and very low frequency (VLF, 0.0033–0.04 Hz). REI, HB and VB indices were recorded by HSAT monitors. Echocardiography and N-terminal pro-brain natriuretic peptide (NT-proBNP) were assessed at admission. Study outcomes were left ventricular ejection fractions (LVEF), left ventricular mass index (LVMI), left atrial diameter (LA) and NT-proBNP. Generalized linear regression models were conducted to investigate the associations of sleep apnea indices with outcomes.

Results: A total of 1526 patients (mean age: 58.9 ± 10.9 years; 21.4% female) were enrolled. Generalized linear regression showed that subjects with elevated per SD HRB (β: -2.48, 95% CI: -3.02 to -1.94, p β: 2.78, 95% CI: 0.8 to 4.76, p = 0.006 for LVMI; β: -2.48, 95% CI: -3.02 to -1.94, p β: 176.85, 95% CI: 17.82 to 335.88, p = 0.029 for NT-proBNP), as well as those with elevated per SD LF/HF (β: 1.66, 95% CI: 1.13 to 2.2, p β: -5.18, 95% CI: -7.11 to -3.26, p β: -0.67, 95% CI: -0.91 to -0.44, p β: -392.97, 95% CI: -547.21 to -238.73, p NT-proBNP), were significantly associated with LV structure and function changes. The remaining indices did not show significant correlations in all the outcomes.

Conclusions: Among patients with obesity, elevated HRB and LF/HF associated with LV hypertrophy . In obese patients, heart rate response indices related to sleep apnea can be obtained through OSA screening. The hypertrophy in LV may be evaluated based on the degree of heart rate burden and the variability in cardiac autonomic nerve activity represented by HRB and LF/HF obtained through non-invasive methods.

中心动脉收缩压和血同型半胱氨酸对成年高血压患者卒中发生风险的联合作用

程 黄晓

南昌大学第二附属医院

背景与目的：

本研究旨在探讨中心收缩压（cSBP）和总同型半胱氨酸（tHcy）水平与新发脑卒中风险之间的关系，并进一步分析 cSBP 与 tHcy 是否在中国高血压成人人群中对脑卒中发生具有协同作用。

方法：

研究对象来自高血压与卒中防控项目（Hypertension and Stroke Prevention and Control Project，HSPCP）。共纳入 7,974 名在 2016 年 7 月至 10 月间登记的高血压患者，所有受试者在入组时无脑卒中或房颤病史。研究的主要结局为新发脑卒中，相关数据由当地疾病预防控制中心收集。cSBP 通过 A-PulseCASPro 设备进行无创测量。采用 Kaplan-Meier 生存曲线和 Cox 比例风险回归模型分析 cSBP、tHcy 与脑卒中的关联性。

结果：

在平均 4.4 ± 0.5 年的随访期间，共有 570 例（7.1%）受试者发生新发脑卒中，包括 501 例缺血性脑卒中、65 例出血性脑卒中以及 4 例未分类事件。研究人群平均年龄为 61 岁，男性 2,910 人（36.5%），平均体质指数（BMI）为 26.2 kg/m²，平均 cSBP 为 131.2 mmHg，平均 tHcy 水平为 12.7 μmol/L。将 cSBP 和 tHcy 作为连续变量分析时，每升高一个标准差（SD）（cSBP 为 12.6 mmHg）与新发脑卒中风险增加 16%、缺血性脑卒中风险增加 11% 相关。每升高一个 SD 的 tHcy（5.0 μmol/L）也分别与新发脑卒中和缺血性脑卒中风险增加 8% 和 9% 相关。Kaplan-Meier 曲线亦显示 cSBP 和 tHcy 水平升高与脑卒中发生呈正相关。与最低三分位组（T1）相比，cSBP 最高三分位组（T3）新发脑卒中和缺血性脑卒中风险显著升高，风险比（HR）分别为 1.37（95% CI: 1.11–1.69）和 1.29（95% CI: 1.03–1.62）。此外，处于高 cSBP 和高 tHcy 联合风险组的个体，其新发脑卒中风险增加 65%（HR：1.65；95% CI：1.29–2.13），明显高于最低风险组。

结论：

在这一社区人群为基础的高血压成人队列中，cSBP 和 tHcy 水平均与新发脑卒中和缺血性脑卒中风险呈独立且正向相关。研究结果提示，cSBP 与 tHcy 可能具有协同作用，共同升高脑卒中风险。这一发现强调在卒中预防和管理中，除常规肱动脉收缩压（SBP）外，评估 cSBP 的临床价值。

代谢性心血管疾病的综合管理：基于多学科协作的临床实践研究

张立佳

重庆荣昌区人民医院

目的：

代谢性心血管疾病（如糖尿病合并冠心病、代谢综合征相关高血压等）的发病率逐年上升，但其综合管理仍面临诊断延迟、治疗碎片化等问题。本研究旨在探讨多学科协作（MDT）模式对改善患者预后、降低心血管事件发生率的效果。

方法：

采用前瞻性队列研究设计，纳入 2022 年 1 月至 2024 年 6 月我院收治的 268 例代谢性心血管疾病患者，随机分为干预组（MDT 管理，n=134）和对照组（常规管理，n=134）。干预组由心血管科、内分泌科、营养科及护理团队共同制定个体化方案，包括药物治疗、生活方式干预及定期随访；对照组接受常规诊疗。主要终点为 1 年内主要心血管不良事件（MACE，包括心梗、卒中、血运重建或心血管死亡），次要终点包括血糖、血脂控制率及生活质量评分（SF-36）。

结果：

1. MACE 发生率：干预组显著低于对照组（8.2% vs 15.6%，P=0.032）。

2. 代谢指标：干预组 HbA1c 达标率（<7%）提高 23%（67% vs 45%，P<0.01），LDL-C 达标率（<1.8 mmol/L）提高 18%（62% vs 44%，P=0.008）。

3. 生活质量：干预组 SF-36 评分在生理功能（75.2±12.3 vs 63.8±11.6）及心理健康（70.5±9.3 vs 61.2±10.2）维度均优于对照组（P<0.05）。

4. 护理依从性：干预组患者随访完成率（91% vs 78%）及生活方式改善率（62% vs 42%）更高（P 均 <0.05）。

结论：

多学科协作模式能有效改善代谢性心血管疾病患者的代谢指标、降低心血管事件风险，并提升生活质量。护理团队在患者教育、随访管理和跨学科协调中发挥关键的作用。建议临床推广以护理为主导的 MDT 管理路径。

Hepatic Steatosis Index Predicts Risk of Chronic Non-Rheumatic Aortic Valve Insufficiency Rehospitalization in a Northwest Chinese NAFLD Cohort

Wei-Chao Liu[1]

新疆医科大学第一附属医院，新疆维吾尔自治区人民医院

Background

Non-alcoholic fatty liver disease (NAFLD) has emerged as an independent risk factor for cardiovascular diseases beyond traditional metabolic comorbidities. Chronic non-rheumatic aortic valve insufficiency (CAVI), characterized by progressive valvular degeneration and left ventricular volume overload, shares several pathophysiological mechanisms with NAFLD, including chronic systemic inflammation, oxidative stress, lipid accumulation, and insulin resistance. Due to the relatively low incidence and often subclinical nature of CAVI in the general population, research on its pathogenesis and epidemiological burden remains limited, particularly in large-scale Asian cohorts. The Hepatic Steatosis Index (HSI)–a simple, non-invasive, and cost-effective scoring system combining aspartate transaminase (AST), alanine transaminase (ALT), body mass index (BMI), sex, and diabetes mellitus status–has shown promise as a surrogate marker not only for hepatic steatosis but also for systemic metabolic dysfunction. Given the metabolic overlap between liver steatosis and valvular heart diseases, it is plausible that HSI may be associated with long-term CAVI risk. However, longitudinal evidence confirming this relationship, especially in Chinese populations, remains lacking. This study aimed to assess whether elevated HSI levels independently predict CAVI-related rehospitalization in a well-characterized Northwest Chinese cohort of adults diagnosed with NAFLD, using rigorous multivariable adjustment to account for a comprehensive panel of metabolic, anthropometric, and renal parameters.

Methods

We conducted a prospective cohort study of 265,038 adults with clinically diagnosed NAFLD across Northwest China (Xinjiang, enrollment period: January 2019 to December 2023). HSI was calculated using the validated formula: HSI = 8 × (ALT/AST ratio) + BMI (+2 if female; +2 if diabetes mellitus present). Participants were stratified into three groups based on HSI thresholds: Group 1 (HSI < 30, reference), Group 2 (30 ≤ HSI < 36), and Group 3 (HSI ≥ 36). The primary study endpoint was defined as rehospitalization for CAVI, confirmed using ICD-10 diagnostic codes after exclusion of rheumatic, congenital, or infective etiologies through clinical adjudication. Follow-up commenced at the date of cohort entry and continued until the first occurrence of CAVI rehospitalization, death, or December 31, 2023, whichever came first. Cox proportional hazards regression models were used to estimate hazard ratios (HRs) and 95% confidence intervals (CIs), with stepwise inclusion of the following prespecified covariates: age, sex, BMI, waist circumference, triglycerides, total cholesterol, systolic and diastolic blood pressure, serum creatinine, and blood urea nitrogen.

Results

Over a median follow-up of 635 days, 3,057 confirmed CAVI rehospitalizations occurred (overall incidence: 1.15%). After full adjustment for all covariates, Group 2 (30 ≤ HSI < 36) showed a non-significant 15.8% higher risk of CAVI rehospitalization compared to Group 1 (adjusted HR = 1.158, 95% CI: 0.926–1.449; p = 0.197). In contrast, Group 3 (HSI ≥ 36) exhibited a statistically significant 29.6% increased risk (adjusted HR = 1.296, 95% CI: 1.023–1.641; p= 0.032).

Conclusion

In this large-scale, population-based NAFLD cohort from Northwest China, an HSI score ≥ 36 independently predicted a 29.6% higher risk of CAVI-related rehospitalization after adjustment for a comprehensive panel of demographic, metabolic, and renal risk factors. These findings highlight the clinical utility of the HSI as an accessible tool for cardiovascular risk stratification in NAFLD populations. The results suggest that patients with elevated HSI scores may benefit from earlier echocardiographic screening and more aggressive metabolic interventions to prevent the progression of subclinical valvular dysfunction. Incorporating HSI into existing clinical workflows could enhance early identification of individuals at increased cardiovascular risk, especially in resource-limited settings. Future longitudinal and interventional studies across diverse populations are needed to validate these findings and explore whether HSI-guided strategies can reduce valvular complications and improve long-term cardiovascular outcomes in patients with NAFLD.

Keywords: Hepatic Steatosis Index, non-alcoholic fatty liver disease, chronic aortic valve insufficiency, Cox regression, cardiovascular risk, cohort study

基于 NHANES 数据库的膳食炎症指数与代谢综合征患者死亡风险的研究

雷娟[1] 罗晓升[1,2] 伍贵富[2]

1. 中山大学孙逸仙纪念医院

2. 中山大学附属第八医院

目的：膳食炎症指数（Dietary Inflammatory Index，DII）是评估饮食炎症潜力的一种工具， DII 分数越低被认为属于抗炎饮食。研究表明炎症反应与代谢综合征（MetS）的发病机制和预后相关。本研究旨在探讨 DII 与 MetS 患者全因死亡率的关系，为 MetS 患者的饮食指导提供理论依据。

方法：本研究使用来自美国国家健康和营养调查（NHANES 2007-2016）数据库（www.cdc.gov/nchs/nhanes/index.htm）中 50588 位患者筛选出 2573 名符合 MetS 诊断的患者，通过构建加权 Cox 比例风险模型评估 MetS 患者 DII 水平与全因死亡率（通过国家死亡指数 NDI 公共数据集 https：//www.cdc.gov/nchs/data-linkage/mortality-public.htm 采集）之间的关系。并研究 DII 与 MetS 各组分全因死亡率之间的关系。

结果：在 2573 名 MetS 患者中，DII 范围为 -4.52 至 4.71，有 398 例患者在随访期间死亡，中位随访时间 101 个月。在校正的加权 Cox 比例风险模型中 DII 与 MetS 患者全因死亡率呈正相关（HR：1.50，P=0.028），这种关系在血压升高的患者中更为显著（HR：2.34，P=0.005）。RCS 曲线显示 DII 水平和全因死亡率为线性相关（p- 非线性 =0.69）。

结论：DII 与 MetS 患者死亡率呈正相关，提示促炎饮食会增加 MetS 患者的死亡风险。本研究为 MetS 患者的健康饮食指导提供了证据。

Association of Depression Severity and Transition Patterns of Cardiometabolic Multimorbidity

Jiya Zhang[1,2], Yongfu Yu[1,2]

1. NHC Key Laboratory for Health Technology Assessment, School of Public Health, Fudan University, Shanghai, China

2. Department of Biostatistics, School of Public Health, Fudan University, Shanghai, China

Abstract

Objective:

Cardiometabolic multimorbidity (CMM), defined as the coexistence of two or more of type 2 diabetes, heart disease, and stroke, is increasingly prevalent in Asian populations, especially in China. Depression has been recognized as a psychosocial risk factor for cardiometabolic diseases, but the effect of depression severity on the development and progression of CMM remains understudied. This study aimed to examine the associations between depression severity and the incidence and progression of CMM in a nationally representative cohort of middle-aged and older Chinese adults.

Methods:

We analyzed data from 12,059 participants aged ≥ 45 years without baseline cardiometabolic diseases from the China Health and Retirement Longitudinal Study (CHARLS), a nationally representative prospective cohort. Depression severity was assessed using the 10-item Center for Epidemiological Studies Depression (CES-D-10) Scale and categorized as none (<10), mild-moderate (10–19), or severe (≥ 20). Outcomes included the incidence of FCMD (type 2 diabetes, heart disease, or stroke), CMM (diagnosis of a second cardiometabolic condition), and death. Self-reported disease diagnoses were confirmed through repeated follow-up interviews. Cox proportional hazards models estimated the association of depression severity with FCMD and CMM incidence. Multi-state Markov models were used to examine five transitions: from health to FCMD, health to death, FCMD to CMM, FCMD to death, and CMM to death, accounting for competing risks. Covariates included sociodemographic characteristics, smoking and drinking status, BMI, physical activity (MET-min/week), and hypertension status. Subtype analyses examined transitions between individual disease types (e.g., diabetes to CMM). Sensitivity analyses excluded early incident cases and individuals with baseline cancer.

Results:

During a median follow-up of 7 years, 2,080 participants developed FCMD and 305 developed CMM. Compared to individuals without depression, those with mild-moderate (HR: 1.22, 95% CI: 1.11–1.34) and severe depression (HR: 1.46, 95% CI: 1.24–1.73) had a higher risk of developing FCMD. Only severe depression was associated with a significantly increased risk of CMM (HR: 2.08, 95% CI: 1.42–3.04). Multi-state modeling showed both mild-moderate and severe depression increased the risk of transitioning from health to FCMD (HRs: 1.19 and 1.42, respectively) and from health to death (HRs: 1.35 and 1.76, respectively). However, only severe depression was linked to the transition from FCMD to CMM (HR: 1.55, 95% CI: 1.05–2.27). No significant associations were found for transitions from FCMD or CMM to death.

In disease subtype analyses, severe depression was significantly associated with increased risks of type 2 diabetes (HR: 1.49), heart disease (HR: 1.58), and stroke (HR: 1.65), while mild-moderate depression was associated only with heart disease (HR: 1.33). Among disease progression pathways, severe depression notably increased the risk of transitioning from diabetes to CMM (HR: 3.76), but not from stroke or heart disease.

Conclusion:

In conclusion, both mild-moderate and severe depression were significantly associated with an increased risk of FCMD, particularly heart disease. However, only severe depression was linked to a higher risk of CMM onset and progression from a single cardiometabolic disease to CMM among middle-aged and older adults in China. These findings highlight the potential benefit of incorporating depression screening and management into cardiometabolic disease prevention strategies, especially for individuals with severe depression. Targeted interventions addressing depression may contribute to delaying or preventing the development of CMM.

Causal Association Spectrum of Fine Particulate Matter ($PM_{2.5}$) Exposure and Cardiometabolic Diseases: Analysis of Dose-Response Characteristics in Epidemiological Associations, Population Susceptibility Stratification, Cascade Reaction Pathways of Cellula

Ying-Hui Wang, Xue-Ping Huang

Fujian Medical University Union Hospital

Background and Objective:Air pollution, specifically fine particulate matter ($PM_{2.5}$), constitutes a major global environmental health threat with profound implications for cardiometabolic health. This study synthesizes the current evidence to systematically investigate the causal relationships between $PM_{2.5}$ exposure and a spectrum of cardiometabolic diseases (CMDs), including type 2 diabetes (T2D), obesity, metabolic syndrome, and cardiovascular diseases (CVDs). It aims to: (1) Quantify the global epidemiological burden using robust metrics; (2) Characterize dose-response relationships and identify susceptible populations; (3) Elucidate the underlying pathophysiological mechanisms at cellular and molecular levels; and (4) Evaluate the efficacy of interventions across individual, community, and policy scales. The ultimate goal is to provide a consolidated scientific foundation for mitigating the CMD burden attributable to air pollution.

Methods: We conducted a comprehensive evidence synthesis utilizing diverse data sources and methodologies. Global exposure levels and disease burden attributable to $PM_{2.5}$ and related air pollutants from 1990 to 2019 were analyzed using data from the Global Burden of Disease (GBD) Study. This was augmented by systematic integration of findings from large-scale prospective cohort studies, meta-analyses, and randomized controlled trials (RCTs). Analyses focused on key CMD outcomes: incidence and prevalence of T2D and obesity, metabolic syndrome, CMD-related mortality, and Disability-Adjusted Life Years (DALYs). Dose-response meta-analysis techniques were employed to quantify exposure-risk relationships and identify potential risk thresholds. Susceptibility factors (e.g., socioeconomic status, sex, pre-existing conditions) were examined through stratification analyses. Mechanistic insights were derived from experimental and clinical studies investigating pathways such as systemic inflammation, oxidative stress, autonomic nervous system dysfunction, and hypothalamic-pituitary-adrenal (HPA) axis dysregulation. Intervention efficacy was assessed, particularly focusing on air purification technologies and policy-driven air quality improvements.

Key Results:

1. Global Burden: An overwhelming 99% of the global population resides in areas exceeding the WHO $PM_{2.5}$ guideline (annual mean

2. Dose-Response Relationships: A robust, positive dose-response relationship exists between $PM_{2.5}$ exposure and T2D risk. For every 10 μg/m^3 increment in $PM_{2.5}$ concentration, the hazard of developing T2D increases by 15% (Hazard Ratio, HR = 1.15). Critically, significant health risks persist even at concentrations below the WHO guideline level of 5 μg/m^3, indicating no safe threshold.

3. Susceptible Populations: Individuals with lower socioeconomic status, males, and those with pre-existing metabolic conditions exhibit heightened susceptibility to the cardiometabolic effects of $PM_{2.5}$.

4. Disease Associations: Beyond T2D, $PM_{2.5}$ exposure is significantly associated with increased risks of obesity (Odds Ratio, OR = 1.28), elevated diabetes-related mortality (HR = 1.49), and heightened risk of cardiovascular complications.

5. Pathophysiological Mechanisms: $PM_{2.5}$ exerts its detrimental cardiometabolic effects through interconnected biological pathways:

Systemic Inflammation: Triggering the release of pro-inflammatory cytokines (e.g., Interleukin-6 (IL-6), C-reactive protein (CRP)).

Oxidative Stress: Inducing cellular damage through reactive oxygen species (ROS) generation.

Neuroendocrine Dysregulation:Disrupting autonomic nervous system balance (sympathetic overactivation, parasympathetic suppression) and impairing HPA axis function.

These cascades collectively promote insulin resistance, endothelial dysfunction, metabolic imbalance, and ultimately contribute to the development and progression of T2D, obesity, and CVD.

6. Intervention Efficacy:RCTs provide evidence that personal-level interventions, specifically the use of effective air purifiers in indoor environments, can yield measurable short-term benefits. These include reductions in systolic and diastolic blood pressure and decreases in circulating inflammatory biomarkers. This supports the potential for acute improvements in metabolic parameters upon exposure reduction.

Conclusion:This comprehensive analysis establishes $PM_{2.5}$ air pollution as a major, pervasive, and preventable environmental risk factor for the global cardiometabolic disease pandemic. Its adverse impacts are widespread, exhibit cumulative effects over time, and disproportionately burden vulnerable populations. The evidence underscores the urgent need for coordinated, multi-level public health strategies to mitigate exposure and disease burden:

Policy Level: Implementing stringent air quality regulations aligned with health evidence (lowering $PM_{2.5}$ standards), accelerating the transition to clean energy sources, and integrating air quality goals into climate change mitigation policies for synergistic benefits.

Community/Urban Planning Level:Designing healthier cities prioritizing reduced traffic emissions, green spaces, and sustainable transportation to lower ambient pollution.

Individual Level: Promoting awareness and access to effective personal protection measures, such as high-efficiency indoor air filtration, especially for high-risk groups in heavily polluted areas.

Addressing air pollution is not only an environmental imperative but a crucial intervention for improving global cardiometabolic health and achieving significant reductions in the burden of diabetes, cardiovas-

cular disease, and related conditions. Sustained commitment across all societal levels is essential.

蛋白尿在心血管代谢因素与视网膜动脉硬化关联的中介效应分析

孔羽 [1] 刘昕蕊 [1,2] 马长生 [1,2]

1. 首都医科大学附属北京安贞医院

2. 国家心血管疾病临床医学研究中心

【目的】在新兴的心血管 - 肾脏 - 代谢（cardiovascular-kidney-metabolic，CKM）综合背景下，蛋白尿作为 CKM 关键生物标志物之一，其在 CKM 中的潜在关联尚未完全阐明。本研究旨在 CKM 特定人群中，探讨蛋白尿是否介导了心血管代谢风险因素与视网膜动脉血管损伤（以动脉硬化为表现）之间的关联。

【方法】本研究为横断面观察性设计，基于一项全国多中心横断面注册研究（PLACARD STUDY），纳入来自全国 30 家二 / 三级医院心内科门诊 / 住院的、确诊为 2 型糖尿病且合并≥ 1 种常见心血管疾病患者，共 2,487 名患者。采用因果逐步回归中介效应模型，分析血压（收缩压、舒张压、脉压）、血脂（总胆固醇、低密度胆固醇、高密度胆固醇、甘油三酯等）、血糖（空腹血糖、糖化血红蛋白等）、体重指数等主要心血管代谢因素，通过蛋白尿（以尿白蛋白 / 肌酐比 [UACR] 评估）影响眼底视网膜动脉硬化的中介路径。采用非参数百分位 Bootstrap 抽样（1,000 次重复）估计 95% 置信区间，所有分析均校正了年龄、性别等协变量。

【结果】 研究人群平均年龄 64.5±10.5 岁，男性占比 57.7%，高血压患病率 86.1%，冠心病占 45.1%。其中，中介效应分析显示，蛋白尿在多个病理通路中发挥关键作用：（1）舒张压完全通过蛋白尿影响眼底动脉硬化。UACR 间接效应显著（效应量 =0.0028, 95% CI: 0.0003–0.0064），直接效应无统计学意义（P=0.068），提示蛋白尿发挥完全中介作用。（2）脉压（间接效应量 =0.0015, 95% CI: 0.0001–0.0038）与糖化血红蛋白（间接效应量 =0.0078, 95% CI: 0.0004–0.0233）通过蛋白尿部分介导其对眼底视网膜动脉硬化的影响。然而，收缩压（效应量 =-0.0002, 95% CI: -0.0016–0.0046）、总胆固醇（效应量 =0.0017, 95% CI: -0.0018–0.0082）及体质指数等代谢指标与眼底视网膜动脉硬化损伤之间未发现 UACR 的显著中介路径。

【结论】在 2 型糖尿病合并心血管疾病的 CKM 人群中，蛋白尿是连接心血管代谢紊乱与视网膜微血管损伤的关键中介因子。舒张压、脉压及糖化血红蛋白通过加剧蛋白尿而促进视网膜眼底动脉硬化。监测并早期干预 UACR 可能是延缓 CKM 人群心血管事件的重要靶点。

Impact of the mismatch between respiratory event frequency and hypoxic burden on cardiovascular outcomes in patients with obstructive sleep apnea

Jia-Qi Du[1], Wei Gong[2], Shao-Ping Nie[1]

1. Beijing AnZhen Hospital, Capital Medical University

2. Peking University

Background: The mismatch between respiratory event frequency and hypoxic burden is a special subtype of obstructive sleep apnea (OSA), and it is unclear whether its clinical characteristics and cardiovascular outcomes are different.

Methods: This study enrolled 3754 adult OSA patients from the prospective cohort study-Sleep Heart Health Study. Respiratory event frequency and hypoxic burden were assessed using the apnea-hypopnea index (AHI) and the percentage of time spent with oxygen saturation below 90% (T90), respectively. Patients were categorized into three groups based on the matching of AHI and T90: the matched group, the AHI-dominant group, and the T90-dominant group. Cox regression analysis was used to explore the association between AHI-T90 matching status and major adverse cardiovascular events (MACE), defined as a composite of cardiovascular death, myocardial infarction, heart failure, and revascularization. Kaplan-Meier survival analysis was performed to compare the prognosis among the groups.

Results: Among the 3754 OSA patients, 1745 (46.5%) exhibited an AHI-T90 mismatch. Kaplan-Meier curves showed that the incidence of MACE was significantly higher in the mismatch groups compared to the matched group. Cox regression analysis demonstrated that AHI-T90 matching status was an independent predictor of MACE. Restricted cubic spline revealed that the risk of MACE was lowest when the relative difference between AHI and T90 was minimal.

Conclusion: Mismatch between respiratory event frequency and hypoxic burden represents a distinct OSA phenotype associated with a higher incidence of MACE.

心脏康复及有关研究

心脏康复护理对心梗介入治疗后患者心理状态及生活质量的影响

袁星娟

西安交通大学第一附属医院

【摘要】目的 探究心梗介入治疗的患者应用心脏康复护理对心理状态及生活质量的影响。方法 从本院收治的心梗患者中选取总计 76 例心梗患者参与研究，于 2024 年 1 月 -2025 年 1 月在本院行介入手术。以入院日期先后顺序为标准将患者分成各 38 例的两组。常规组年龄段 52-77 岁，均值（61.35±4.08）岁，20 例为女性、18 例为男性，梗死部位：11 例下壁、12 例前壁、15 例侧壁。试验组年龄段 54-75 岁，均值（61.05±4.33）岁，19 例为女性、19 例为男性，梗死部位: 10 例下壁、11 例前壁、17 例侧壁。上述基础资料组间无差异（P > 0.05）。根据入院日期先后顺序进行分组，为 38 例试验组患者提供心理康复护理服务，为 38 例常规组患者提供一般性护理服务。比较康复效果。结果 试验组 7 天后的焦虑和抑郁评分明显降低，降低程度大于常规组，差异显著（P < 0.05）。试验组 1 个月后的生活质量评分高于常规组，差异显著（P < 0.05）。心血管不良事件发生率试验组（2.63%）低于常规组（15.79%），差异显著（P < 0.05）。结论 心梗介入治疗后尽早展开心脏康复护理，可以更好的改善患者心理状态及生活质量，还能预防心血管不良事件。在实际应用过程中，为了保证患者的安全，需要严格把握终止运动指征，包括：运动中自感非常疲劳；出现大汗、面色苍白、眩晕、心悸、气短、胸闷、心绞痛、严重心律失常等症状；舒张压突然下降或升高 10mmHg；收缩压突然下降或升高 20mmHg；每分钟心率在 110 次以上。值得借鉴应用。

急性心肌梗死患者开展早期康复训练对心功能恢复影响

袁星娟

西安交通大学第一附属医院

摘要：目的：探讨急性心肌梗死患者在接受标准治疗基础上，实施早期康复训练对心功能恢复的作用。分析其对左心室射血分数、运动耐力及心肌酶谱恢复等关键指标的影响，旨在为后续康复方案的优化提供临床依据。方法：研究纳入 2024 年 1 月至 12 月收治的 60 例首次发病的急性心肌梗死患者。采用随机数字表法分组，对照组给予常规治疗与护理。实验组在此基础上制定个体化的早期康复训练计划，包括床旁活动、步行锻炼及心肺功能指导。干预周期设定为三个月，定期评估心功能指标与运动能力变化。结果：干预 1 个月与 3 个月时，实验组左心室射血分数分别为 50.2±3.7 与 55.6±4.1，明显优于对照组（45.8±3.5 与 48.2±3.8）。6 分钟步行距离亦显示出显著差距，实验组在两个时间节点均优于对照组，差值具临床意义。心肌酶谱恢复时间方面，实验组表现出更快的下降趋势，提示组织损伤恢复更为迅速。结论：早期康复训练在急性心肌梗死恢复期具备确切价值，能够在维持血流动力学稳定的同时，促进心脏收缩功能与体力恢复。该干预模式不仅改善运动耐受，还可能通过降低心肌代谢负荷，加速心肌修复进程。研究提示，应将早期康复纳入标准化治疗路径中，为个体化心脏康复提供有力支持。

老年冠心病患者 CPET 指导的运动康复方案优化研究

呼佳蓉

西安交通大学第一附属医院

目的：探讨基于心肺运动试验（CPET）的个体化运动康复方案对老年冠心病患者心肺功能、运动耐力和生活质量的改善效果，并评估其临床应用价值。

方法：采用多中心、随机对照试验设计，纳入 2023 年 1 月至 2024 年 6 月就诊的老年冠心病患者 260 例，随机分为对照组（n=130）和干预组（n=130）。对照组接受常规药物治疗和基础运动建议（每日步行 30 分钟）；干预组在对照组基础上，采用 CPET 测试（包括 VO_2 peak、无氧阈值等指标）制定个体化运动处方，包括有氧训练（80%-90% 无氧阈值强度，3 次 / 周）、抗阻训练（2 次 / 周）和柔韧性训练（5 次 / 周）。主要观察指标为干预 6 个月后的峰值摄氧量（VO_2 peak）和 6 分钟步行距离（6MWD），次要指标包括 NT-proBNP 水平、中国心血管病人生活质量评定问卷（CQQC）评分和心血管不良事件发生率。

结果：干预组 VO_2 peak 较基线显著提高 21.3%（P<0.01），显著高于对照组的 9.5%；6MWD 增加 119.26 米，显著优于对照组的 65.73 米（P<0.01）。生活质量方面，干预组 CQQC 评分（111.66±7.93）显著高于对照组（84.16±6.96，P<0.01）。安全性方面，干预组心血管不良事件发生率为 3.85%，显著低于对照组的 13.85%（P=0.005）。

结论：基于 CPET 的个体化运动康复方案能显著改善老年冠心病患者的心肺功能、运动耐力和生活质量，同时降低心血管不良事件发生率。该方案具有临床推广价值，未来可结合远程监测技术进一步优化实施策略。

肌少症的研究进展：从机制到治疗

赵兰婷 张兆国 张萍

北京清华长庚医院

随着全球人口老龄化进程的加速，肌少症作为一种与衰老密切相关的疾病，其发病率逐年上升，对老年人的健康和生活质量产生了严重影响，深入了解肌少症的发病机制，建立有效的评估诊断方法和防治策略，具有重要的现实意义。

目的 本文旨在全面综述肌少症的相关研究进展，对肌少症的定义、流行病学特点、发病机制、临床表现、评估诊断方法以及防治措施等方面综述。

方法 文献综述

结果 肌少症目前根据 GLIS 第一次提出全球统一概念，为后续研究奠定基础。肌少症的发病机制复杂，涉及增龄相关的多系统交互作用，包括神经肌肉退变、血管改变，细胞外基质改变、免疫炎症、离子失衡等。此外遗传与环境因素也有同程度的影响，诊断主要基于肌肉质量、力量和躯体功能的评估，对高危人群的早期筛查是诊断的第一步。防治措施需要综合干预，包括运动干预、营养支持、药物治疗等。运动干预尤其抗阻训练是一线干预措施，营养干预、药物治疗是目前研究的重点。

结论 早期通过问卷筛查和客观评估识别风险人群，及时实施抗阻运动联合高蛋白饮食的综合干预，可有效延缓肌肉衰减、改善生活质量。未来需加强诊断标准统一、药物研发和社区科普，以应对人口老龄化带来的肌肉健康危机。肌少症是一个活跃的研究领域，新兴疗法前景广阔，未来几年肌肉减少症的治疗方案很可能将迎来快速变革。

心磁图在缺血性心脏病的临床研究进展

关添允

吉林大学第二临床医院

心磁图仪，是一套基于量子精密测量技术的用于心肌缺血的辅助成像诊断过程中，采集、记录人体心脏的磁场信号。系统通过超高灵敏度的量子磁力传感器，在人体外表面靠近心脏位置采集、记录人体心脏电生理活动产生的微弱磁场，并通过信号处理和数据分析，生成高精度磁场图像，以及心磁参数，提供给专业医务人员诊断被检测者的心脏健康状况。

心磁图临床应用场景包括：（1）早期心肌缺血筛查，健康人群心脏体检；（2）因冠状动脉狭窄引起的心肌缺血的辅助诊断，弥补现有无创检查的不足；（3）因心肌缺血引起的胸痛甄别，尤其是急性胸痛的快速鉴别。此外，还可用于临床科学研究包括：（1）缺血性心脏病预后长期观测；（2）房颤、室早等电生理异常病灶定位（3）心脏病药物治疗效果长期监测。

鉴于心磁图在心肌缺血诊断中的潜在优势，国内外学者开展了大量临床评价研究，以验证心磁图在心肌缺血诊断中的准确性和可靠性。心磁图作为一种新兴的心电生理检测技术，通过测量心脏磁场的变化，心磁图能够反映心肌的电生理活动异常，为心肌缺血的诊断提供了新的手段。然而，心磁图在心肌缺血诊断中的应用仍处于起步阶段，尚需进一步的临床验证和优化。未来，随着心磁图技术的不断发展和完善，其在心肌缺血诊断中的应用前景将更加广阔。

急性冠脉综合征患者 PCI 术后接受心脏综合康复治疗的效果观察

何小琴

西安交通大学医学院第一附属医院

目的：观察急性冠状动脉综合征患者经皮冠状动脉介入术后接受心脏康复治疗对心功能和生活质量的影响。

方法：采取便利抽样法，选取本院心血管内科住院接受 PCI 治疗的 108 例急性冠状动脉综合征患者作为研究对象，分为对照组和观察组，各 54 例。对照组采用常规护理治疗，观察组在对照组的基础上采用心脏康复护理治疗。两组均治疗 3 个月。比较两组治疗前后心脏康复的掌握程度（心脏康复认知调查量表）、运动耐力（6 分钟步行试验）、自我管理能力 [冠心病自我管理行为量表（CSMS）]、心功能（左心室射血分数、每搏输出量、心输出量）、生活质量（生活质量评价量表 SF-36）。采用独立样本 t 检验、配对 t 检验和 X^2 检验。

结果：治疗后，观察组心脏康复掌握程度 [(61.58±2.85) 分]、运动耐力 [(498.67±28.36)m]、自我管理能力 [(83.87±3.75) 分]、均优于对照组 [(56.43±3.65) 分]、[(464.78±32.46)m]、[(79.46±4.27) 分](均 p < 0.05）；观察组左心室射血分数 [(67.49±1.76)%] 与心输出量 [(7.17±0.56)L/min] 均高于对照组 [(64.52±1.81)%、(6.58±0.68) L/min]、观察组每搏输出量 [(63.12±1.98)ml] 高于对照组 [(61.27±1.51)ml]（均 p < 0.05）；观察组生活质量评分（8 个维度）均高于对照组（P < 0.05）。

结论：心脏综合康复治疗在急性冠状动脉综合征患者行 PCI 术后中疗效确切，可有效改善患者心功能，提高生活质量，该疗法值得临床推广、应用。

重视心肌梗死后抑郁症

于雲鹏

吉林大学第二医院

摘要：急性心肌梗死是临床多发的心血管危重症，抑郁症是心肌梗死后的常见问题，并对心梗患者的预后和生存率起着关键作用。心肌梗死后抑郁症正越来越为临床医生所重视，本文从其发病机制，诊断和治疗角度做一综合阐述。抑郁症是急性心肌梗死后的常见问题，其与心梗患者的预后密切相关，并可显著影响心梗的诊断、治疗和康复。国外研究发现心梗后抑郁症患者心脏性死亡风险较对照组增高 2.4 倍，新发心血管事件风险为对照组的 2 倍 [1]。由于检测方法不同，心梗患者住院期间抑郁症的患病率为 7.2%–41.2%，总体来说，综合各项资料，平均每 5 个初次住院的心梗患者，就有 1 个在住院期间患上抑郁症 [2]。抑郁与心梗患者死亡率存在显著的统计学和临床相关性，抑郁程度与死亡率存在线性关系 [3]。忽视心梗后抑郁，将会导致患者频繁就医、社会功能受损、依从性下降、死亡率上升等不良后果。近年来，随着“双心医学”的发展，心梗后抑郁越来越多的被临床医生所认同和重视。抑郁症是心境障碍的主要类型，以显著而持久的心境低落为临床特征。临床可见其心境低落与处境不相称，闷闷不乐、自卑、甚至悲观厌世，可有自杀行为或企图，部分患者可有木僵、幻觉、妄想等。目前认为抑郁症的主要病因是 5- 羟色胺和儿茶酚胺类神经递质不足，下丘脑–垂体–肾上腺皮质轴激活，以及免疫机能紊乱。而急性心梗患者急慢性应激、免疫系统激活，导致炎性细胞因子释放增加，其通过影响下丘脑–垂体–肾上腺皮质轴和 5–羟色胺合成等机制引起抑郁发生 [4]。国外最新研究表明，心梗后产生的炎症因子可能与抑郁相关，尤其是 IL17a 可能在心梗后发生抑郁的过程中发挥了重要作用 [5]。

心脏康复延伸护理服务 联合正念减压对慢性心力衰竭患者心脏康复效果及负面情绪的影响

杜佳

西安交通大学第一附属医院

摘要：目的 分析心脏康复延伸护理服务联合正念减压训练用于慢性心力衰竭患者对其心脏康复效果及负面情绪的影响。方法 选择 2024 年 2 月至 2025 年 2 月西安交通大学第一附属医院心血管内科接受诊治的慢性心力衰竭患者 206 例，采取随机分组法分为对照组和观察组，每组 103 例。对照组采用常规干预，观察组采用心脏康复延伸护理服务联合正念减压训练。对比 2 组心功能指标、心脏慢性监护室入住时间、总住院时间、不良情绪评分、依从率。结果 观察组左心室射血分数 (LVEF) 高于对照组，左心室舒张末期内径 (LVEDD)、左心室收缩末期内径 (LVESD) 低于对照组，差异均有统计学意义 (P<0.05)。观察组焦虑自评量表 (SAS 评分)、抑郁自评量表 (SDS 评分) 低于对照组，差异有统计学意义 (P<0.05)。观察组心脏慢性监护室入住时间、总住院时间短于对照组，差异有统计学意义 (P<0.05)。观察组总依从率为 95.26% 高于对照组的 71.70%，差异有统计学意义 (P<0.05)。结论 心脏康复延伸护理服务联合正念减压训练用于慢性心力衰竭患者可改善其心功能，提高康复效果，改善不良情绪，提高依从性，促使患者养成一系列对心脏康复有益的健康行为。

心力衰竭患者健康心理控制源与领悟社会支持和自我管理行为的关系：基于多项式回归和响应面分析

陶秀 [1] 高敏 [2] 吴凡 [1] 卢静 [1] 李芸霞 [1] 王琴 [2] 孙国珍 [1]

1. 南京医科大学

2. 南京医科大学第一附属医院

目的：探讨心力衰竭患者健康心理控制源特征，及其与领悟社会支持和患者自我管理行为的关系，为医护人员制定相关措施以提高患者自我管理水平、改善患者预后提供参考。

方法：采用横断面调查法，便利选取 2024 年 7 月–12 月在南京市某三级甲等综合医院心血管内科住院的 310 例心力衰竭患者为作为调查对象，采用一般资料调查表、多维度健康心理控制源 C 版量表、领悟社会支持量表及心力衰竭患者自我管理量表进行调查。采用多项式回归和响应面分析探讨患者健康心理控制源、领悟社会支持和自我管理行为的关系。

结果：心力衰竭患者的健康心理控制源内部控制、机遇控制、医生控制及他人控制维度得分分别为：（4.13±0.71）、（2.52±0.68）、（5.04±0.52）、（3.46±0.81）分。响应面分析结果显示，患者自我管理水平随健康心理控制源和领悟社会支持一致性近乎直线式增高，与低心理控制源 - 低领悟社会支持相比，高心理控制源 - 高领悟社会支持的患者自我管理水平更高（Z-hat 检验 P < 0.01）；自我管理水平随健康心理控制源和领悟社会支持不一致性呈现“凸形”曲线式增高，与低心理控制源 - 低领悟社会支持相比，高健康心理控制源 - 低领悟社会支持和低健康心理控制源 - 高领悟社会支持的患者其自我管理行为均更好（Z-hat 检验 P < 0.01）。

结论：心力衰竭患者领悟社会支持与自我管理行为处于中等水平，健康心理控制源倾向于医生控制，不同健康心理控制源与领悟社会支持水平的患者自我管理水平存在相对差异，提示医护人员应以患者信任为契机，借助个体健康意识觉醒的催化作用，提升其内部控制型健康心理控制源倾向，同时借助患者多方社会支持力量，共同帮助心力衰竭患者形成并维持持久的自我管理行为。

急性心肌梗死介入术后患者早期心脏康复参与意愿及其影响因素研究

文眉丹

西安交通大学医学院第一附属医院

目的

急性心肌梗死（AMI）患者经皮冠状动脉介入治疗（PCI）后，早期心脏康复（CR）是改善预后、降低再入院率的关键措施。然而，临床中患者参与率普遍较低。本研究旨在探讨 AMI 介入术后患者对早期 CR 的参与意愿，并分析其影响因素，为制定针对性干预策略提供依据。

方法

采用横断面调查研究设计，于 2023 年 1 月至 2024 年 6 月纳入某三级甲等医院心内科收治的 AMI 行 PCI 术后患者 300 例。通过问卷调查收集患者社会人口学资料（年龄、性别、教育水平、经济状况等）、临床特征（梗死部位、并发症、LVEF 值等）、心理状态（HADS 焦虑抑郁量表）、疾病认知（自编 CR 知识问卷）及社会支持（SSRS 量表）。采用多元线性回归分析影响患者 CR 参与意愿的主要因素，并通过结构方程模型（SEM）探讨各变量间的路径关系。

结果

1. 参与意愿现状：仅 58.3%（175/300）的患者表示愿意参与早期 CR，41.7% 存在犹豫或拒绝。

2. 影响因素分析：

积极因素：高教育水平（β=0.21, p<0.01）、家庭支持度高（β=0.33, p<0.001）、疾病认知良好（β=0.28, p<0.001）与参与意愿呈正相关。

阻碍因素：高龄（≥ 65 岁，β=-0.18, p<0.05）、合并心力衰竭（β=-0.15, p<0.05）、焦虑抑郁（β=-0.24, p<0.01）显著降低意愿。

3. 路径分析：社会支持通过提升疾病认知（间接效应值 0.12）和缓解负面情绪（间接效应值 0.09）间接增强参与意愿（总效应值 0.42）。

结论：

AMI-PCI 术后患者早期 CR 参与意愿仍不理想，受年龄、心理状态、疾病认知及社会支持等多因素影响。临床应针对高龄、心理障碍及低认知患者制定个性化干预措施，如加强 CR 宣教、心理疏导及家庭支持，以提高参与率，改善长期预后。

中西医结合心脏康复对稳定性冠心病患者心肺功能影响的临床研究

文眉丹

西安交通大学医学院第一附属医院

目的：

探讨基于中西医结合模式的心脏康复方案对稳定性冠心病患者心肺功能、运动耐量及生活质量的影响，为优化冠心病康复方案提供循证依据。

方法：

采用随机对照试验设计，选取 2022 年 6 月至 2023 年 12 月就诊的稳定性冠心病患者 120 例，随机分为对照组（n=60）和干预组（n=60）。对照组接受常规心脏康复（运动训练 + 健康教育），干预组在常规康复基础上联合中医康复方案（包括太极拳训练、穴位贴敷和中药调理）。两组均进行 12 周干预，主要观察指标包括：心肺运动试验参数（峰值摄氧量 VO2peak、无氧阈 AT）、6 分钟步行距离（6MWD）、西雅图心绞痛量表（SAQ）评分及中医证候积分。采用重复测量方差分析比较组间差异。

结果：

1. 心肺功能改善：干预组 VO2peak 提升幅度显著高于对照组（3.8±1.2 vs 2.1±0.9 mL/kg/min，P<0.01），AT 值改善更明显（15.2% vs 9.8%，P<0.05）。

2. 运动耐量：干预组 6MWD 增加（68.5±22.4 vs 42.3±18.6 m，P<0.01）。

3. 生活质量：干预组 SAQ 评分提高更显著（28.5±6.2 vs 18.7±5.4 分，P<0.01），中医证候积分降低更明显（-6.2±2.1 vs -3.5±1.8，P<0.05）。

4. 安全性：两组均未发生严重不良事件，干预组患者依从性更高（92% vs 80%，P<0.05）。

结论：

中西医结合心脏康复能显著改善稳定性冠心病患者的心肺功能、运动耐量和生活质量，且安全性良好。该模式通过整合现代运动康复与传统中医疗法，发挥了协同增效作用，值得临床推广应用。未来研究可进一步优化中西医结合方案的具体组成和实施细节。

心肺运动试验对急性心肌梗死后心力衰竭发生风险预测的增量价值

崔浩宁 吴孝军 郑阳 吴健

哈尔滨医科大学附属第二医院

目的

急性心肌梗死后发生心力衰竭的高风险和由此导致的不良预后已成为心脏病学领域的重要临床挑战，准确预测急性心肌梗死后心力衰竭的发生风险对于优化管理和改善预后至关重要。本研究旨在评估将心肺运动试验指标是否为心梗后心衰发生风险的预测提供增量价值。

方法

本研究纳入了 2018 年 2 月至 2023 年 12 月期间在三家医院接受标准化症状限制型功率踏车式心肺运动试验检查的 3172 名急性心肌梗死患者。主要结局是新发心力衰竭。我们通过应用多种机器学习算法筛选临床和心肺运动试验特征并构建模型，通过曲线下面积（AUC）、净重分类改善指数（NRI）、综合判别改善指数 (IDI) 评估心肺运动试验对心梗后心衰发生预测的增量价值

结果

经过入排标准筛选后共纳入 2,221 名 AMI 患者，其中 237 人（10.7%）发展为心力衰竭。研究显示心肺运动试验显著提高了模型预测心力衰竭风险的整体区分能力（AUC：0.893 vs 0.943，p <0.001）、校准能力（IDI=0.190[95%CI：0.145-0.236], p <0.001) 并优化了分类能力 (NRI=0.154[95%CI: 0.073-0.234], p <0.001)。基于该模型建立的风险评分可有效将患者分层为低风险组和高风险组（3.6% vs. 53.6%，P<0.001）

结论

心肺运动试验显著提高了心梗后心衰发生风险的预测能力，具有重要的增量价值，有助于实现更精准的风险分层和个性化心衰预防管理。

Individualized Cardiac Rehabilitation for a High-Risk Stanford Type A Aortic Dissection Patient Undergoing Whole-Life Cycle Management: A Case Report

Yi-Hao Shen, Xin-Ying Huang, Ai-Hua Wang, Ran-Ran Wang, Di Xu, Lan-Zhao, Zhao-Guo Zhang

Beijing Tsinghua Changgung Hospital, School of Clinical Medicine , Tsinghua University

Background: This study aimed to investigate the safety and efficacy of an individualized cardiac rehabilitation program for a high-risk patient following Stanford Type A aortic dissection surgery, implemented under a systematic whole-life cycle management model.

Methods: The patient, a 63-year-old male, had a 6-year history of hypertension and a 4-year history of diabetes. One year prior, he was

diagnosed with celiac artery aneurysm concurrently with right upper lobe adenocarcinoma, for which he received chemotherapy, targeted therapy, and treatment for pulmonary infection. In 2024, he presented to the emergency department with acute chest pain and was diagnosed with Stanford Type A aortic dissection. He underwent "total aortic arch replacement with artificial graft + ascending aorta plasty + aortic annuloplasty." The cardiac rehabilitation protocol included: (1) Early inpatient cardiac rehabilitation (initiated 15 days post-surgery): performed twice daily for 20-30 minutes each session, encompassing postural management, bedside cycle ergometer training (passive to active transition, 3-15 min), airway clearance techniques, inspiratory muscle training (diaphragmatic breathing, pursed-lip breathing, inspiratory muscle training, 5-10 min), and muscle endurance training. Patients were also instructed on sternal protection techniques, with exercise intensity controlled at an increase of 10-20 bpm above resting heart rate. (2) Outpatient cardiac rehabilitation (initiated 10 days post-discharge): performed three times per week for 1.5 hours per session, including warm-up, intermittent low-intensity aerobic exercise (cycle ergometer, 20-30W, 5-30 min), large muscle group low-load resistance training (10-15 min), breathing trainer exercises (initial load 30% MIP/MEP, 20 min), and cool-down. Aerobic intensity was increased by 20-30 bpm above resting heart rate, and resistance intensity was gradually increased based on tolerance. Lifestyle interventions (weight and nutrition management), health education, and psychological counseling were integrated throughout the entire process. Evaluation indicators included: cardiopulmonary endurance (6MWT, DASI), pulmonary function (FVC, FEV1, MVV, MIP, MEP), muscle strength (grip strength), psychological state (SDS, SAS), sleep quality (PSQI), quality of life (SF-36), and adverse events.

Outcomes: The patient completed 17 sessions of early inpatient rehabilitation and 48 sessions of outpatient rehabilitation. Following rehabilitation, the patient's exercise tolerance significantly improved: 6MWT increased from 130m to 254m, and DASI score increased from 4.5 to 13.45. Pulmonary function showed marked improvement: FVC increased from 1.81L to 2.30L, FEV1 from 1.53L to 2.02L, MVV from 49 L/min to 72 L/min, MIP from 61cmH2O to 104cmH2O, and MEP from 63cmH2O to 94cmH2O. Muscle strength significantly increased, with right hand grip strength rising from 14.6kg to 22.6kg. Psychological and sleep conditions were alleviated: SDS decreased from 67 (moderate depression) to 50 (no depression), SAS decreased from 56 (mild anxiety) to 39 (no anxiety), and PSQI decreased from 16 (very poor sleep quality) to 6 (acceptable sleep quality). Quality of life improved, with PF increasing from 0 to 25, MH from 0 to 48, PA decreasing from 100 to 45, GH increasing from 15 to 65, VT increasing from 0 to 40, SF maintained at 50, RE increasing from 0 to 100, and HC increasing from 0 to 75. No pulmonary infections or any cardiovascular adverse events occurred throughout the entire rehabilitation process.

Conclusion: Implementing an early inpatient and outpatient integrated individualized cardiac rehabilitation program for high-risk patients post-aortic dissection surgery, combined with medical supervision and multidimensional interventions under a whole-life cycle management model, significantly improves the patient's pulmonary function, exercise tolerance, psychological status, and quality of life. The entire process was safe and reliable, demonstrating good clinical promotion value.

心脏康复在心血管疾病中的研究进展

许秋雨 刘斌

吉林大学白求恩第二医院

在 21 世纪，心血管疾病（CVD）已成为全球主要死亡原因之一。CVD 的预防和治疗仍然是紧迫的科学问题。心脏康复（CR）是一项结构化的多学科二级预防计划，旨在全面解决心脏病的医学、身体和行为方面问题，以最大程度的促进康复、降低风险和可持续的健康改善。心脏康复包括很多方面，如患者评估、体重管理、风险因素管理、社会心理管理、有氧运动训练、力量训练等。目前已有实质性证据基础支持心脏康复作为急性冠脉综合征或射血分数降低和冠状动脉血运重建后心力衰竭患者的临床有效且具有成本效益的干预措施。尽管有所有这些好处，但 CR 并未得到充分利用，全球只有 20-50% 的符合条件的患者参加了 CR 计划。

目的：本文对心脏康复在心血管疾病中的作用，最新进展，面对的临床挑战及未来方向进行综述。

方法：文献阅读

结果：心脏康复治疗正在想人工智能数字化方向靠拢，如机器学习算法（如随机森林）整合多组学数据优化运动处方，使心衰患者峰值摄氧量（VO ₂ max）提升 15-18%；心电图嵌入式智能衣结合云平台使非计划再住院率降低 32%。同时我们也发现了心脏康复所面临的严峻的临床挑战，如系统操作缺陷；治疗费用高昂，医保未全面覆盖以及农村地区患者参与率较低等问题。基于此，我们也更加明确了未来的努力方向，未来我们应从技术革新，卫生政策等方面入手，使心脏康复手段得到更好的推广和执行。

结论：心脏康复正从机构化运动项目向数字化整合、精准处方生态系统演进，其成功需技术革新、实施科学及卫生政策的协同推进。

急性心肌梗死急诊 PCI 术后心脏康复护理对改善患者生存质量的影响

周虹杉

陆军特色医学中心（陆军军医大学大坪医院）

【摘 要】

目的：讨论急性心肌梗死（AMI）患者的 PCI 术后心脏康复护理。

方法：以 2023 年 1 月至 10 月为时间范围，将时间段内我科 100 例接受 PCI 术的 AMI 患者，以其患者编号尾数为分组依据，编号尾数 0-4 纳入研究组，编号尾数 5-9 纳入对照组，前者采用心脏康复护理，后者采取常规护理，对比护理效果。

结果：研究组患者护理后各项指标均优于对照组（p < 0.05）。

结论：积极的心脏康复护理措施可以提高 AMI 患者在 PCI 术后的康复效果，具有临床推广价值。

PCI 术是临床上治疗 AMI 的主要手段，可以通过较为直接的方式解除冠脉栓塞，恢复心肌供血，从而实现挽救残余心肌细胞、稳定生命体征、挽救患者生命的目的 [1-2]。但受损的心肌仍需一段时间进行自我修复，患者在术后仍需面对心律失常等问题，同时治疗本身也可能引发术肢血肿、假性动脉瘤等并发症，因此在 PCI 术后仍需给予患者更多关注 [3-5]。但目前的常规护理模式存在缺乏针对性、全面性等弊端，难以满足患者的康复护理需求。心脏康复护理是一种以心血管护理为基础，联合康复护理、心理护理、路径化护理等多种手段形成的一种全新护理模式，被视为心脏病人护理发展的新方向 [6-7]。本文就 AMI 患者的 PCI 术后心脏康复护理进行讨论。

中国心血管疾病患者的心肺适能参考标准

崔浩宁 吴孝军 郑阳 吴健

哈尔滨医科大学附属第二医院

目的

心肺适能是评估心血管疾病患者预后和风险分层的关键指标。制定规范的心肺适能参考标准有助于优化临床治疗决策与康复方案。然而现有的心血管疾病患者心肺适能参考标准主要是基于北美人群数据建立的，其在中国心血管疾病患者中的适用性尚未可知。本报告旨在建立适用于中国心血管疾病患者的心肺适能参考标准，填补该领域区域性参考标准的空白，为中国心血管疾病患者在临床实践中提供精准的风险评估与运动干预依据。

方法

本研究是一项多中心回顾性研究，纳入 2018 年 1 月至 2024 年 12 月中国 20 家医院心脏康复中心的 20224 例功率自行车式心肺运动试验测试数据。测试对象包括 30 至 79 岁心肌梗死、经皮冠状动脉介入治疗、心力衰竭或稳定型心绞痛诊断患者，以每十年为一个年龄段确定了峰值摄氧量 (VO_2peak) 和百分位数。

结果

确定了 30 至 79 岁男性和女性心肌梗死、经皮冠状动脉介入治疗、心力衰竭或稳定型心绞痛诊断患者的 VO_2peak 实测值和百分位数。VO_2peak 在各性别和年龄组间存在显著差异（P<0.001）。男性的平均 VO2peak 比女性高 10% (1.7 mL/kg/min)，男性每十年平均下降 7% (1.4 mL/kg/min)，女性每十年平均下降 9% (1.6 mL/kg/min)。不同心血管疾病诊断患者在各性别年龄组间的 VO-2peak 也存在差异。

结论

本报告首次为中国心血管疾病患者建立了功率自行车式心肺运动试验测试的心肺适能参考标准，提供了基于数据驱动的科学依据，可以帮助临床医生为中国心血管疾病患者制定更精准的风险分层、临床治疗决策和康复方案。

Aerobic Interval Training Ameliorates Myocardial Fibrosis in Uremic Rats by Inhibiting Cardiomyocyte Cuproptosis

Xiao-Li Tan

The First Affiliated Hospital of University of Science and Technology of China (Anhui Provincial Hospital)

Abstract

Objective: To investigate the effect of aerobic interval training (AIT) on uremia-induced myocardial fibrosis and its underlying mechanism, clarify whether it exerts protective effects by inhibiting cardiomyocyte cuproptosis, and provide a novel strategy for the prevention and treatment of uremic cardiomyopathy.

Methods: Thirty-six male Sprague-Dawley rats were adaptively fed for 1 week and then randomly divided into four groups (n=9): normal control group (CON), uremic cardiomyopathy group (UCM), uremia+AIT group (UCM+AIT), and uremia+AIT+cuproptosis agonist group (UCM+AIT+ES). UCM models were established in UCM, UCM+AIT, and UCM+AIT+ES groups by intraperitoneal injection of streptozotocin (50 mg/kg) combined with a high-phosphorus diet (1.2% phosphorus) for 8 consecutive weeks, and model establishment was evaluated by detecting serum creatinine and urinary creatinine. The UCM+AIT and UCM+AIT+ES groups underwent an 8-week AIT protocol: 5-min warm-up (10 m/min), 3 cycles of 3-min high-intensity exercise (18 m/min, ~80% VO_2max) alternating with 5-min low-intensity exercise (8 m/min, ~40% VO_2 max), and 5-min cool-down (10 m/min), 5 days/week. The UCM+AIT+ES group received daily intraperitoneal injections of the cuproptosis agonist elesclomol (ES, 1 mg/kg) during AIT. After intervention, body weight (BW) was measured, and cardiac function was evaluated by echocardiography [left ventricular

ejection fraction (LVEF), left ventricular fractional shortening (LVFS), left ventricular end-diastolic diameter (LVIDd), and end-systolic diameter (LVIDs)]. Rats were anesthetized and sacrificed to measure heart weight (HW) and calculate the heart weight index (HW/BW). Heart tissues were subjected to hematoxylin-eosin (HE) and Masson staining for morphological and collagen deposition analysis, transmission electron microscopy for mitochondrial ultrastructure observation, inductively coupled plasma-mass spectrometry (ICP-MS) for myocardial copper ion quantification, colorimetric assays for pyruvate dehydrogenase (PDH) and α-ketoglutarate dehydrogenase (α-KGDH) activity, immunohistochemistry and Western blot for cuproptosis-related proteins (FDX1, LIAS, DLD, SLC31A1) and fibrosis-related proteins (α-SMA, Collagen I), and real-time quantitative PCR (RT-qPCR) for mRNA expression of FDXR, PDHA1, and ATP7B.

Results: ① Compared with CON, the UCM group showed significantly increased serum creatinine (326.5±28.7 μmol/L vs. 78.2±10.5 μmol/L, P<0.001), decreased urinary creatinine (12.3±1.8 mg/dL vs. 35.6±3.2 mg/dL, P<0.001), and a 210% increase in collagen volume fraction (CVF) (32.5±3.2% vs. 10.5±1.8%, P<0.001) with disorganized myocardial cells, confirming successful establishment of the uremic myocardial fibrosis model. ② The UCM+AIT group exhibited significantly improved LVEF (52.3±4.1% vs. 38.7±3.5%, P<0.01), LVFS (25.6±2.3% vs. 18.2±1.9%, P<0.01), and reduced HW/BW ratio (3.21±0.25 mg/g vs. 3.90±0.31 mg/g, 17.8% decrease, P<0.01), with downregulated α-SMA and Collagen I expression (P<0.01), indicating that AIT ameliorates cardiac function and alleviates myocardial fibrosis. ③ The UCM group showed a near 3-fold increase in myocardial copper content (2.8±0.3 μg/g vs. 1.0±0.1 μg/g, P<0.001), 56.3% and 48.7% reductions in PDH and α-KGDH activities (P<0.01), mitochondrial cristae disruption, and 2.3-fold and 2.1-fold upregulations of cuproptosis-related proteins FDX1 and LIAS (P<0.01), suggesting cardiomyocyte cuproptosis in UCM rats. ④ AIT significantly reduced myocardial copper content to 1.3±0.2 μg/g (P<0.01), restored PDH and α-KGDH activities to 89.5% and 82.3% of CON (P<0.05), upregulated copper transporters SLC31A1 and ATP7B (P<0.01 and P<0.05), and inhibited FDX1/LIAS expression (P<0.01). ES treatment abrogated AIT's protective effects, increasing CVF by 35% (P<0.001) and exacerbating mitochondrial damage and cuproptosis-related protein dysregulation. ⑤ Mechanistically, AIT reduced myocardial mitochondrial reactive oxygen species (ROS) by 42% via activating the Nrf2/HO-1 antioxidant pathway (P<0.01), while ES-induced cuproptosis activated the TGF-β1/Smad3 pathway, increasing COL1A1 mRNA expression by 2.7-fold (P<0.001) and promoting fibrosis.

Conclusion: Aerobic interval training ameliorates uremia-induced myocardial fibrosis by regulating copper metabolism and maintaining mitochondrial integrity to inhibit cardiomyocyte cuproptosis, providing a novel non-pharmacological intervention strategy and potential therapeutic target for uremic cardiomyopathy.

Aerobic Interval Training Ameliorates Myocardial Fibrosis after Myocardial Infarction in Rats by Inhibiting Cardiomyocyte Ferroptosis via Endogenous Hydrogen Sulfide

Abstract

This study aims to systematically explore the protective effects and underlying mechanisms of aerobic interval training (AIT) on myocardial fibrosis following myocardial infarction (MI), with a specific focus on investigating whether AIT exerts its beneficial effects by regulating endogenous hydrogen sulfide (H_2S) production, improving mitochondrial dynamics, and inhibiting cardiomyocyte ferroptosis. As myocardial fibrosis is a critical pathological process contributing to post-MI cardiac dysfunction, unraveling the role of AIT in this context may provide novel therapeutic strategies for clinical intervention.

Methods

Forty male Sprague-Dawley rats were randomly allocated into four groups (n=10 per group): a control group (Control), a myocardial infarction group (MI), an MI+AIT group, and an MI+AIT+PAG group (PAG serving as an H_2S inhibitor). The MI model was established through intraperitoneal injection of isoproterenol (ISO, 100 mg/kg/d) for 7 consecutive days to induce myocardial injury.the MI+AIT and MI+AIT+PAG groups underwent an 8-week AIT protocol on a treadmill, consisting of alternating 2-minute high-intensity running (85% of maximal speed) and 3-minute low-intensity walking (40% of maximal speed), 5 days per week. Concurrently, the MI+AIT+PAG group received daily intraperitoneal injections of PAG (40 mg/kg/d) to suppress endogenous H_2S production.

Cardiac function was evaluated by echocardiography, measuring left ventricular ejection fraction (LVEF) and fractional shortening (LVFS), while cardiac structural changes were assessed by calculating the heart weight to body weight ratio (HW/BW). Myocardial fibrosis was characterized using Masson trichrome staining and immunohistochemical analysis of Collagen III and α-smooth muscle actin (α-SMA). H_2S levels were determined by measuring cystathionine γ-lyase (CSE) protein expression via Western blot and tissue H_2S concentration using a colorimetric assay. Mitochondrial dynamics were evaluated by analyzing the expression of fission protein Drp1 and fusion proteins MFN2 and OPA1, complemented by transmission electron microscopy for morphological assessment. Ferroptosis-related parameters included tissue iron content, malondialdehyde (MDA) and glutathione (GSH) levels, and expression of GPX4, SLC7A11, and ACSL4. In vitro, H9c2 cardiomyocytes were subjected to $CoCl_2$-induced hypoxia, with or without H_2S donor (NaHS) or PAG pretreatment, to validate the role of H_2S in mitochondrial function and ferroptosis regulation.

Results

The MI group exhibited significant myocardial collagen deposition, reduced LVEF and LVFS, and upregulated Collagen III and α-SMA expression compared to the control group (all P<0.05). AIT intervention notably improved cardiac function, decreased collagen volume fraction, and downregulated fibrotic markers (P<0.05). Mechanistically, MI induced a significant reduction in myocardial CSE expression and H_2S levels, which were restored by AIT but abolished by PAG (P<0.05). In terms of mitochondrial dynamics, MI caused upregulation of Drp1 and downregulation of MFN2/OPA1, leading to mitochondrial fragmentation, whereas AIT promoted mitochondrial fusion by enhancing H_2S-mediated MFN2/OPA1 expression. PAG treatment reversed these beneficial effects, exacerbating mitochondrial damage (P<0.05). For ferroptosis, MI induced increased myocardial iron accumulation, MDA levels, and ACSL4 expression, alongside decreased GPX4, SLC7A11, and GSH levels, which were all reversed by AIT. PAG treatment abrogated AIT-mediated inhibition of ferroptosis (P<0.05). In vitro experiments confirmed that H_2S donor protected against $CoCl_2$-induced mitochondrial Fe^{2+} overload, ROS generation, and membrane potential loss, while PAG abolished these protective effects.

Conclusion

This study demonstrates that aerobic interval training ameliorates post-MI myocardial fibrosis by upregulating endogenous H_2S production, which in turn regulates mitochondrial dynamics (promoting fusion and inhibiting fission) and suppresses cardiomyocyte ferroptosis. These findings provide compelling evidence for AIT as a potential non-pharmacological strategy to combat post-infarction cardiac fibrosis, highlighting the H_2S/mitochondrial dynamics/ferroptosis axis as a novel therapeutic target for clinical translation.

Circulatory power is applicable for the early prediction of post-acute myocardial infarction late-onset heart failure risk

Jin-Yu Xu

The Second Affiliated Hospital of Harbin Medical University

Objective Acute myocardial infarction (AMI) represents the most severe manifestation of coronary artery disease, posing a significant risk for adverse cardiovascular outcomes. Heart failure (HF), a common complication of AMI, particularly in cases of heart failure with reduced ejection fraction (HFrEF) and heart failure with mid-range ejection fraction (HFmEF), substantially elevates mortality rates. As the gold standard for evaluating cardiorespiratory fitness, cardiopulmonary exercise testing (CPET) has introduced a novel indicator–circulatory power (CP), defined as the product of peak oxygen consumption (peak VO_2) and systolic blood pressure (SBP)–which has been shown to predict adverse clinical outcomes. However, the utility of CP in the early prediction of late-onset heart failure following AMI remains undefined. This study therefore aims to investigate whether CP can serve as an early predictive marker for late-onset HF risk in post-AMI patients.

Methods This prospective cohort study enrolled 1,159 adult patients diagnosed with AMI who underwent CPET within 7 to 14 days after AMI resolution. Eligibility criteria included confirmed AMI per the Universal Definition of Myocardial Infarction, stability for exercise testing, and absence of severe comorbidities (e.g., advanced valvular heart disease, chronic obstructive pulmonary disease with FEV_1 < 50% predicted). The primary endpoint was post-AMI late-onset HF , defined as the new on-

set of HF symptoms (e.g., dyspnea, fatigue) and signs (e.g., pulmonary congestion, peripheral edema) at least 30 days post-AMI, confirmed by echocardiographic evidence of left ventricular dysfunction (LVEF < 50%) and clinical assessment. CP was calculated as the product of peak oxygen consumption (peak VO_2, measured in $ml \cdot kg^{-1} \cdot min^{-1}$) and peak systolic blood pressure (SBP, in mmHg) during CPET, normalized to body weight. Statistical analyses included: (1) Cox proportional hazards regression to evaluate the association between CP and late-onset HF, adjusting for age, sex, baseline LVEF, diabetes mellitus, hypertension, Killip class at presentation, and revascularization strategy (percutaneous coronary intervention [PCI] vs. coronary artery bypass grafting [CABG]); (2) Kaplan–Meier survival analysis with log-rank tests to compare HF-free survival across CP tertiles; (3) Receiver operating characteristic (ROC) curve analysis to determine the optimal CP cutoff for HF prediction, with sensitivity and specificity optimized using Youden's index. All analyses were performed using R, and statistical significance was set at $P < 0.05$.

Results During a median follow-up of 32 months, 187 patients (16.1%) developed late-onset HF. The HF group exhibited a significantly lower median CP [1,956.3 (IQR 1,624.5–2,210.7) vs. 2,543.8 (IQR 2,231.5–2,876.2) mm $Hg \cdot mLo_2 \cdot kg^{-1} \cdot min^{-1}$; P<0.001]. Multivariate Cox regression revealed that each 1,000-unit increase in CP was associated with a 40% reduction in HF risk [adjusted hazard ratio (HR) 0.600; 95% CI 0.464–0.777; P<0.001]. ROC analysis yielded an area under the curve (AUC) of 0.821 (95% CI 0.785–0.854), with an optimal cutoff of 2,289.6 mm $Hg \cdot mLo_2 \cdot kg^{-1} \cdot min^{-1}$ (sensitivity 76.3%, specificity 72.5%). Kaplan–Meier curves showed that patients with CP ≤ 2,289.6 had a 3-year cumulative HF incidence of 24.7%, compared to 8.3% in those with CP >2,289.6 (log-rank P<0.001). Subgroup analyses confirmed the robustness of CP across age groups (≥ 65 vs. <65 years), sexes, and revascularization modalities (PCI vs. CABG).

Conclusion This study demonstrates for the first time that CP is a robust early predictor of late-onset HF after AMI. By integrating oxygen metabolic capacity and hemodynamic load, CP captures myocardial reserve more comprehensively than traditional markers. The identified cutoff (2,289.6 mm $Hg \cdot mLo_2 \cdot kg^{-1} \cdot min^{-1}$) enables risk stratification of AMI survivors, with low-CP patients warranting intensified surveillance and early interventions (e.g., neurohormonal blockade, cardiac rehabilitation). Future trials should explore whether CP-guided therapy modifies long-term outcomes and validate its utility in diverse AMI populations, including those with STEMI and NSTEMI.

马拉松运动强度对心肌肌钙蛋白升高的影响：训练优化的新视角

夏辰兮[1,2] 徐涛[1] 王雨桐[1,3] 孟旭阳[1,3] 李一[1,3] 宋欣阳[1,2] 周浩峰[1,3] 汪芳[1,2,3]

1. 北京医院

2. 北京大学第五临床医学院

3. 北京协和医学院

目的

本研究旨在探讨不同强度马拉松跑步对心脏损伤（心肌肌钙蛋白 T，cTnT）和肌肉损伤（肌酸激酶，CK）生物标志物的差异性影响。考虑到马拉松运动的流行度日益增加及其伴随的心血管风险，本研究期望为优化训练强度及保护业余跑者心脏健康提供精准的临床指导。

方法

纳入参加 2023 年天津马拉松的 40 名业余跑者（男性 29 名，女性 11 名；平均年龄 45.10±13.56 岁）。所有受试者在赛前 48 小时内完成了包括心肺运动试验和超声心动图检查在内的综合评估。根据比赛过程中实时心率监测数据，将参赛者分为两个组别：高强度组（H 组，比赛中平均心率超过最大心率 85%，n=28）和中等强度组（M 组，平均心率不超过最大心率 85%，n=12）。分别在赛前 24 小时内（T0）、赛后 20 分钟内（T1）、赛后第 1 天（T2）、第 2 天（T3）、第 3 天（T4）和第 6 天（T5）采集静脉血，测量血清 cTnT 和 CK 浓度。

结果

两组受试者基线时的血清 cTnT 和 CK 水平无明显差异（P>0.05）。马拉松比赛后，两组 cTnT 和 CK 水平均显著升高。与高强度组相比，中等强度组的 cTnT 峰值（21.92±8.68 pg/mL vs. 37.68±25.79 pg/mL，P=0.0005）和 CK 峰值（645.63±430.33 U/L vs. 1122.37±789.53 U/L，P=0.0062）明显更低。此外，中等强度组 cTnT 水平恢复到基线的时间更短（赛后第 1 天即恢复），而高强度组的 cTnT 升高水平则持续到赛后第 3 天。

结论

马拉松跑步强度超过最大心率的 85% 显著加重心肌微损伤并延缓损伤标志物的恢复速度。将运动强度控制在这一阈值以下能有效减轻心肌损伤，提示在马拉松备赛中需强调个性化强度管理，以确保心脏安全。

Progesterone promotes the proliferation of embryonic epicardial cells and decreases left ventricular fibrosis through ALDH1A3/Glycolytic pathway

Wang Dinghui，Zhang Jie

Department of Geriatrics, The Chongqing General Hospital, Chongqing University, Chongqing, 400013, China.

Purpose: Epicardial progenitor cells (EPCs), characterized by the multilineage differentiation potential, has emerged as pivotal contributors to regenerative medicine. Progesterone has demonstrated protective effects on the cardiovascular system and has been shown to promote cell proliferation. However, the association between progesterone and the proliferation of EPCs or its impact on cardiac fibrosis remain unexplored.

Methods: Establish an in vitro culture system for mouse EPCs and prepare different concentrations of progesterone working solution (10^{-8}, 10^{-7}, 10^{-6}, 10^{-5}, 10^{-4} M) to explore experimental concentrations of EPCs. Then set up control, progesterone, and progesterone inhibitor (RU486) group to observe the effects of progesterone on EPCs through immunofluorescence experiments, qRT-PCR, and flow cytometry; Newborn mice were injected with placebo or progesterone (8 mg/100 g/d) for 1, 3, and 7 days to validate the effect of progesterone on EPCs in vivo; Perform transcriptome sequencing of EPCs of control and progesterone group and then screen key genes and regulatory pathways that promote EPCs proliferation by progesterone,; Adult mice were used for thoracotomy to ligate the anterior descending coronary artery and establish a myocardial infarction (MI) model. Progesterone was injected intraperitoneally after surgery, and EPCs proliferation at the edge of the infarction area was detected by immunofluorescence staining of harvested hearts at P1, P3, and P7; Four weeks after MI, cardiac ultrasound was used to detect cardiac function, and Masson staining was used to detect cardiac fibrosis at P1, P3, and P7; Perform qRT PCR and WB to detect the effect of progesterone on ALDH1A3 expression and glycolysis metabolism after MI.

Results: Our results found that progesterone can significantly increase the positivity rate of Ki67 on EPCs within a certain concentration range (10^{-8}~10^{-5}M). The positive rate of Ki67 reached its highest at 10^{-6}M, and then the proliferative effect gradually decreased with increasing concentration; Progesterone significantly increased the number of Ki67, PH3, and Aurora B fluorescence positive cells in EPCs; Progesterone promotes the expression of EPCs cell cycle genes such as CDK1 and CCNA1.The differential analysis of transcriptome sequencing results suggests that progesterone has a regulatory effect on gene expression in EPCs. There was total of 90 DEGs in the progesterone treatment group, with 52 up-regulated and 38 down-regulated. From which we screened out the ALDH1A3 gene from DEGs as target molecule, which is enriched in the glycolytic metabolic pathway; Through verification, it was found that compared with the control group, the expression of ALDH1A3, lactate, ATP generation, glucose absorption, and protein and mRNA expression of glycolysis related molecules PDK1, HK2, PKM2, LDHA increased in the progesterone group. After knocking down ALDH1A3 by siRNA, the proliferation of EPCs promoted by progesterone was blocked. At the same time, lactate, ATP production, and glucose absorption were reduced, and the expression of glycolysis related molecules PDK1, HK2, PKM2, LDHA protein, and mRNA was decreased; After inhibiting glycolysis with 2-DG and WZB117, the pro-proliferative effect of progesterone on EPCs was attenuated, but there was no significant change in ALDH1A3 expression. We successfully established a mouse MI model and immediately administered progesterone injection after surgery. The proliferation of epicardial cells at the edge of the heart tissue was detected at P1, P3, and P7. We found that progesterone increased the expression of Wt1 and Ki67 in the infarct margin cells; After 4 weeks of MI, cardiac ultrasound results showed that the left ventricular ejection fraction (EF) and short axis shortening rate (FS) in the progesterone group were higher than those in the MI group; The Masson staining results showed that the ratio of cardiac fibrosis area in the progesterone group mice was significantly lower than that in the control group at P3 and P7. The expression of ALDH1A3 in the heart tissue of the progesterone group was significantly higher than that of the MI group; qRT-PCR and Western blot analysis of cardiac tissue at P1, P3, and P7 after MI showed that progesterone promotes the expression of ALDH1A3 protein and mRNA in heart tissues after MI. The qRT-PCR and Western blot analysis of heart tissue at P1, P3, and P7post MI showed that progesterone promotes the expression of glycolysis related molecules such as GLUT1, HK2, PKM2, LDHA, etc. at both protein and mRNA levels post MI.

Conclusion: Our findings demonstrate that the ALDH1A3/glycolysis signaling pathway is a key mechanism through which progesterone promotes the proliferation of EPCs. Progesterone regulated the activation and proliferation of epicardial cells and improved cardiac function and

retard fibrosis post MI.

分阶式心脏康复联合动态量化健康教育在冠心病患者中的综合干预效果：一项随机对照研究

李觅 钱锦钰

陆军军医大学第一附属医院心血管内科

目的：探讨阶段性心脏康复训练联合量化健康教育模式对稳定性冠心病患者心肺功能、运动耐量及心理健康状况的干预效果，为临床康复管理提供循证依据。

方法：采用单中心随机对照试验设计，纳入 2024 年 1 月至 2024 年 12 月确诊的稳定性冠心病患者 120 例，随机分为干预组（n=60）和对照组（n=60）。干预组接受为期 12 周的阶段性心脏康复训练（包括院内监护期、门诊过渡期和家庭维持期三阶段训练）联合量化健康教育模式干预；对照组接受常规心脏康复指导。主要终点为 12 周时峰值摄氧量（VO2peak）变化，次要终点包括左心室射血分数（LVEF）、6 分钟步行距离（6MWD）、血脂谱、焦虑抑郁评分（HADS）和生活质量评分（SF-36）。

结果：干预组 VO2peak 改善显著优于对照组（+3.2±1.1 vs +1.5±0.8 mL/kg/min，P<0.001）。次要终点方面，干预组在 LVEF（+5.8% vs +2.3%）、6MWD（+85.6 vs +42.3 m）、LDL-C 水平（-0.82 vs -0.35 mmol/L）等方面的改善均显著优于对照组（均 P<0.01）。心理评估显示，干预组 HADS-A（-3.2 vs -1.5）和 HADS-D（-2.8 vs -1.2）评分改善更明显（P<0.001）。SF-36 评分中，干预组在躯体功能（+15.2 vs +7.6）和精神健康（+12.8 vs +6.3）维度的提升更显著（P<0.001）。

结论：阶段性心脏康复训练联合量化健康教育可显著改善冠心病患者的心肺功能、运动耐量和心理健康状况，是一种有效的综合康复管理模式。

基于 CiteSpace 的心脏瓣膜置换术后患者抗凝治疗的可视化分析

叶菁菁 罗明先 李秀毛 杨丽飞 张咏梅

遵义医科大学附属医院

目的 利用 CiteSpace 可视化分析探究心脏瓣膜置换术后患者抗凝治疗的研究现状、热点及前沿趋势，为后续更好的开展相关研究提供参考。**方法** 检索 Web of Science 核心合集数据库、中国知网数据库中收录的相关文献，检索时间为 2005 年 1 月 1 日至 2025 年 3 月 30 日，采用 CiteSpace（6.3.R1）软件对纳入文献进行分析，绘制关键词共现、聚类及突现词图谱。**结果** 共纳入英文文献 198 篇和中文文献 700 篇，国内外发文量总体成平稳上升状态。华法林、抗凝治疗、抗凝依从性、健康教育、心脏瓣膜病、主动脉瓣置换、并发症管理等是目前的研究热点；影响因素、口服抗凝治疗、经导管主动脉瓣置换、生存质量、延续护理、自我管理等是该领域研究的前沿趋势。**结论** 心脏瓣膜置换术后患者良好的抗凝管理对于提高华法林抗凝治疗的有效性和安全性、确保手术效果、改善患者远期生存质量至关重要，今后在创新瓣膜置换手术方式的同时，继续加强患者治疗依从性管理，对华法林的口服治疗做到有效监管。此外，对其影响因素进行深度研究，及时监测并发症的发生并进行干预。加强对患者的健康指导及教育，以助于提高口服抗凝药物依从性，做好延续护理，最终提高患者的生活质量。

Impact of perioperative cardiac rehabilitation on the prognosis of female patients undergoing elective valve surgery: a gender-specific analysis of the PORT randomized clincial trial.

Shuyuan TAN, Huan Ma

Guangdong Provincial People's Hospital

Background:

Gender disparities in cardiovascular disease are well recognized, spanning differences in clinical presentation, pathophysiology, treatment response, and surgical outcomes. In the setting of valvular heart disease, women undergoing cardiac surgery often face higher perioperative risks, such as increased susceptibility to postoperative complications and longer recovery periods. Nevertheless, accumulating evidence suggests that women may derive unique physiological and functional benefits from perioperative cardiac rehabilitation (CR)—a structured, multidisciplinary program designed to enhance recovery, reduce complications, and promote long-term functional gains. Despite its potential, data on sex-specific responses to CR interventions in the perioperative context remain scarce. To address this important knowledge gap, we conducted a predefined subgroup analysis of the Perioperative Rehabilitation Trial (PORT), a randomized controlled trial that investigated the impact of a comprehensive perioperative CR program in patients undergoing elective valve surgery. This analysis specifically aimed to determine whether the clinical effectiveness of CR varies by sex.

Methods:

The PORT trial was a prospective, single-center, open-label, randomized controlled study that enrolled 818 adult patients scheduled for elective valvular heart surgery. Of the enrolled population, 412 (50.4%) were women. Participants were randomized in a 1:1 ratio to either a usual care group or an intervention group receiving a structured perioperative CR program. The CR protocol comprised preoperative education, inspiratory muscle training (IMT), active cycle of breathing techniques (ACBT), and early mobilization initiated within 24 hours post-extubation.

The **primary composite outcome** was defined as the occurrence of any of the following: in-hospital all-cause mortality, at least one postoperative pulmonary complication (PPC), or a postoperative hospital stay exceeding 7 days. **Secondary outcomes** included length of stay in the surgical intensive care unit (SICU), 3-month all-cause mortality, and radiographically confirmed PPCs before discharge.

Statistical analysis was stratified by sex. Between-group comparisons were conducted using chi-square or Fisher's exact tests for categorical variables and independent-sample t-tests for continuous variables. Time-to-event outcomes were assessed using Kaplan-Meier survival analysis and log-rank tests. Cox proportional hazards regression models were applied separately for male and female subgroups to estimate adjusted hazard ratios (HRs) for the primary outcome, with covariate adjustment for age, left ventricular ejection fraction (LVEF), EuroSCORE II risk category, baseline pulmonary function, surgical approach, and whether concomitant coronary artery bypass grafting (CABG) was performed.

Results:

Among female participants, those receiving CR showed significantly lower rates of PPCs (24.1% vs. 35.8%, P=0.005), aerothorax (4.2% vs. 9.0%, P=0.037), and pneumonia (8.2% vs. 20.1%, P<0.001) compared to those in the usual care group. In contrast, no statistically significant differences were observed in male patients (PPCs: 29.1% vs. 30.3%, P=0.761; pneumonia: 12.4% vs. 14.3%, P=0.409). A significant sex-by-treatment interaction was found for pneumonia incidence (P for interaction = 0.044), indicating a differential treatment effect by sex. Similar sex-specific patterns were evident in radiographically confirmed PPCs prior to discharge. Kaplan-Meier analysis demonstrated a significantly lower cumulative incidence of PPCs and pneumonia among females receiving CR (P<0.01), a trend not seen in males. In multivariable Cox regression models, CR was independently associated with reduced risk of PPCs in women (HR 0.58, 95% CI: 0.39–0.86, P=0.006), but not in men (HR 0.94, 95% CI: 0.65–1.35, P=0.73).

Conclusion:

This prespecified subgroup analysis of the PORT trial demonstrates that perioperative cardiac rehabilitation significantly reduces pulmonary complications—particularly pneumonia and aerothorax—in women undergoing elective valve surgery. These sex-specific benefits were not observed in men, highlighting the need for gender-sensitive strategies in CR program design. Enhancing CR participation among women may improve postoperative outcomes and support the development of more personalized, equitable rehabilitation approaches in cardiac surgical care.

心脏康复的研究进展

伍星

成都市第五人民医院 西区

近年来，心血管疾病（CVD）已成为全球范围内威胁人类健康的主要“杀手”，其发病率持续攀升的态势令人担忧。作为心血管疾病二级预防与患者功能恢复的关键环节，心血管康复治疗的重要性愈发凸显，其相关研究进展也成为医学领域的焦点。

在运动康复方面，精准化、个性化的运动方案成为研究热点。通过对患者心肺功能、运动耐力等多维度评估，制定有氧运动、抗阻训练等相结合的康复计划，有效提升患者心功能与生活质量。营养干预研究则聚焦于特定膳食模式对心血管健康的影响，如地中海饮食，其富含不饱和脂肪酸、膳食纤维等成分，被证实能显著降低血脂、血压，减少心血管疾病风险。心理支持层面，越来越多研究表明，焦虑、抑郁等负面情绪会影响心血管疾病的发生发展，因此，心理疏导、认知行为疗法等干预手段被纳入康复体系，帮助患者缓解心理压力，促进康复进程。药物治疗在心血管康复中同样不可或缺，新型抗血小板、调脂药物不断涌现，为患者提供了更安全有效的治疗选择。此外，新兴技术如虚拟现实（VR）、可穿戴设备也逐渐应用于心血管康复，VR 技术通过模拟真实运动场景提高患者运动积极性，可穿戴设备则实时监测患者生命体征，助力康复方案的动态调整。

未来，心血管康复领域的研究应进一步深化多学科融合，探索更高效的综合康复模式，同时加强对基层康复的推广与普及，让更多心血管疾病患者受益。

Impact of Cardiopulmonary Exercise Testing -Guided Individualized Cardiac Rehabilitation on Functional Capacity and Prognosis in Coronary Artery Disease Patients

Li-Yan Ran

The Second Affiliated Hospital of Harbin Medical University

Background: Patients with cardiovascular diseases, particularly coronary artery disease (CAD), frequently experience reduced exercise tolerance and impaired cardiopulmonary function, which significantly diminish their quality of life and increase long-term cardiovascular risks. These limitations stem from the heart's reduced capacity to meet metabolic demands during physical activity, often leading to exercise intolerance, fatigue, and poor functional status. Cardiopulmonary exercise testing (CPET) has emerged as the gold standard for evaluating cardiopulmonary fitness, offering unparalleled precision in risk stratification and exercise prescription for cardiac rehabilitation (CR). By assessing key parameters such as peak oxygen uptake (VO_2 peak), anaerobic threshold (AT), and ventilatory efficiency (VE/VCO_2 slope), CPET provides a com-

prehensive physiological profile that guides personalized rehabilitation strategies. Despite its well-established clinical value in international guidelines, CPET remains underutilized in domestic clinical practice due to limited accessibility, lack of standardized protocols, and insufficient evidence supporting its superiority over conventional approaches. Therefore, further research is needed to validate its efficacy in optimizing rehabilitation outcomes for CAD patients and justify its broader implementation.

Methods: A prospective, single-center, randomized controlled trial was conducted involving 120 stable CAD patients (left ventricular ejection fraction, LVEF ≥ 40%) diagnosed between January 2022 and December 2023. Participants were stratified by age, gender, and baseline VO_2 peak before being randomly allocated into two groups with a 1:1 ratio. The intervention group (n=60)underwent a 12-week CPET-guided individualized rehabilitation program, which incorporated high-intensity interval training (HIIT) at 80-90% of peak heart rate, supervised by trained physiotherapists three times per week. Each session included a 5-minute warm-up, 4x4-minute high-intensity intervals interspersed with 3-minute active recovery periods, and a 5-minute cool-down. The control group (n=60) received conventional moderate-intensity continuous training (MICT) at 60-70% of peak heart rate, consisting of 30-40 minutes of steady-state aerobic exercise at the same frequency. All patients underwent standardized baseline and post-intervention assessments, including CPET (using the Cosmed Quark CPET system with breath-by-breath gas analysis), 6-minute walk test (6MWT), and Seattle Angina Questionnaire (SAQ) to evaluate functional capacity, exercise tolerance, and quality of life. The primary endpoint was the change in VO_2 peak, while secondary endpoints included AT, VE/VCO_2 slope, 6MWT distance, and 6-month cardiovascular events (a composite of rehospitalization for cardiac causes, unplanned revascularization, and cardiac death).

Results: The intervention group demonstrated superior improvements across all measured parameters compared to the control group: Functional capacity: VO_2 peak increased significantly by 19.2% (from 18.2±3.1 to 21.7±3.5 mL/kg/min, Δ+3.5±1.2 vs. control group Δ+1.8±0.9, p<0.001), indicating enhanced aerobic capacity. AT power also improved notably by 22.7% (from 75±15 W to 92±18 W, p=0.003), reflecting better endurance performance.

Ventilatory efficiency: The VE/VCO_2 slope decreased by 12.8% (from 34.5±4.2 to 30.1±3.8, p=0.01), demonstrating improved pulmonary gas exchange and reduced ventilatory inefficiency. Exercise tolerance:The 6MWT distance increased by 22.5% (from 325±45 m to 398±52 m, p<0.001), confirming superior functional endurance in daily activities. Clinical outcomes: The intervention group exhibited a 60% relative risk reduction in 6-month cardiovascular events (6.7% vs. 16.7%, p=0.042), highlighting its prognostic benefits. Quality of life: SAQ scores for physical limitation (PL) improved by 51.1% (from 45±12 to 68±15 points, p=0.002), indicating markedly better patient-reported outcomes.

Conclusion: CPET-guided individualized cardiac rehabilitation significantly enhances functional capacity, ventilatory efficiency, exercise tolerance, and clinical prognosis in CAD patients compared to conventional MICT. The robust improvements in VO_2 peak, AT, and VE/VCO_2 slope underscore the physiological advantages of HIIT prescribed based on CPET parameters, while the reduction in cardiovascular events reinforces its clinical relevance. These findings strongly support the integration of CPET as a core assessment tool in cardiac rehabilitation programs, providing a scientific basis for optimizing exercise prescriptions and improving long-term outcomes in CAD management. Future large-scale, multicenter studies with extended follow-up periods are warranted to validate these results, assess cost-effectiveness, and promote the widespread adoption of CPET in routine clinical practice. Additionally, further research should explore the mechanisms underlying CPET's benefits, including its effects on endothelial function, autonomic regulation, and myocardial remodeling, to fully elucidate its role in secondary prevention.

Joint association of TyG index and peak kilogram oxygen uptake with MACE events in post-PCI patients

Xingbo Mu, Ya-Ling Han, Ya-Ling Han

General Hospital of Northern Theater Command

Background: Patients with acute coronary syndrome (ACS) undergoing percutaneous coronary intervention (PCI) continue to face significant residual risk of major adverse cardiovascular events (MACE). The triglyceride-glucose (TyG) index, calculated from fasting triglyceride and glucose levels, is a validated surrogate marker of insulin resistance. Elevated TyG index correlates with endothelial dysfunction and atherosclerotic progression. Peak kilogram oxygen uptake (VO_2 peak), measured via cardiopulmonary exercise testing (CPET), serves as the gold-standard metric for cardiorespiratory fitness, where low values independently predict cardiovascular mortality. While both markers are established predictors of MACE, their joint effects and potential bidirectional mediation in post-PCI populations remain unexplored. This knowledge gap impedes comprehensive risk stratification strategies.

Objective: While both the triglyceride-glucose (TyG) index and peak oxygen uptake (VO_2 peak) are established predictors of major adverse cardiovascular events (MACE) in patients with acute coronary syndrome (ACS) after percutaneous coronary intervention (PCI), the nature and impact of their coexposure, and their mutual influence on MACE risk remain poorly understood. Therefore, this study aimed to evaluate the joint associations of the TyG index and VO_2 peak with the development of MACE and to quantify the extent to which each marker mediates the effect of the other on MACE risk in a large cohort of post-PCI ACS patients.

Methods: This study comprised 8,803 patients with ACS who underwent percutaneous coronary intervention (PCI). The TyG index was calculated as Ln[fasting triglyceride (mg/dL) * fasting glucose (mg/dL)/2]. VO_2 peak was derived from standardized cardiopulmonary exercise testing (CPET). The primary outcome was MACE, a composite of cardiovascular death, non-fatal stroke, myocardial infarction, and ischemia-driven revascularization. We performed adjusted Cox proportional hazards regression and mediation analyses to evaluate associations between the indexes and MACE. Statistical analyses employed Cox proportional hazards models to evaluate joint TyG/VO_2 peak categories and mediation analysis using counterfactual frameworks to estimate direct and indirect effects.

Results: The mean age of the participants was 57.4 ± 9.0 years, and 6,671 (76.9%) were males. During a maximum follow-up of 5.0 years, 1,548 (17.6%) people developed MACE. Compared with people with a lower TyG index (< 8.8 [median level]) and VO_2 peak > 15.4 mg/L, those concurrently with a higher TyG and lower VO_2 peak had the highest risk of overall MACE (adjusted hazard ratio [aHR], 1.376; 95% CI 1.187-1.596), which were predominant among those aged 65 years or over. VO_2 peak significantly mediated 17.9% of the association between the TyG index and MACE, while TyG simultaneously mediated 6.1% of the association between VO_2 peak and MACE risk. This suggests insulin resistance partially elevates MACE risk by impairing cardiorespiratory fitness, while fitness independently modulates metabolic risk pathways.

Conclusions: This study provides novel evidence of synergistic risk and mutual mediation between insulin resistance (reflected by the TyG index) and impaired cardiorespiratory fitness (VO_2 peak) in post-PCI patients. The findings highlight the coexposure effects and mutual mediation between the TyG index and VO_2 peak on MACE. Joint assessments of the TyG index and VO_2 peak should be emphasized for residual risk stratification and secondary prevention of MACE in post-PCI patients with acute coronary syndrome.

Keywords: Triglyceride-glucose (TyG) index, peak kilogram oxygen uptake (VO_2 peak), acute coronary syndrome, PCI, major adverse cardiovascular events (MACE), Insulin resistance

Comparison of the predictive efficacy of triglyceride-glucose (TyG) index and modified TyG index combined with cardiopulmonary exercise testing (CPET) parameters for major adverse cardiovascular events (MACE) risk in the population

SiCheng Ning, Ya-Ling Han, Quan-Yu Zhang

Northern Theater Command General Hospital

Insulin resistance (IR) serves as a cornerstone pathophysiological mechanism driving the development and progression of atherosclerotic cardiovascular disease (ASCVD). The Triglyceride-Glucose (TyG) index, widely adopted as a practical surrogate marker for IR, correlates reliably with established cardiovascular disease risk. However, its inherent dependence on single-point, static laboratory measurements significantly constrains its ability to capture an individual's functional reserve and the dynamic nature of underlying pathophysiological processes over time. In contrast, cardiopulmonary exercise testing (CPET) provides an objective, quantitative, and non-invasive diagnostic modality. CPET transcends simple functional assessment; it offers critical insights into the pathophysiological mechanisms underpinning exercise intolerance and exertion-related symptoms. Its established clinical value extends to differential diagnosis, precise prognostic risk stratification, evaluation of therapeutic intervention efficacy, and the formulation of individualized exercise prescriptions. This study sought to investigate novel composite indices designed to integrate the metabolic information of the TyG index with the dynamic functional insights derived from key CPET parameters. Specifically, the study focused on combining the TyG index with measures of peak oxygen consumption normalized per kilogram of body weight (TyG_peakVO_2 kg), peak oxygen pulse (TyG_peakO_2 pulse), and oxygen consumption at the anaerobic threshold normalized per kilogram (TyG_ATVO_2 kg). The primary objective was to rigorously compare the predictive performance of these novel indices against the traditional TyG index for major adverse cardiovascular events (MACE) within a substantial cohort. The study prospectively enrolled 8,803 patients who underwent clinically indicated CPET. The TyG index was calculated using the established formula: Ln[fasting triglycerides (mg/dL) × fasting glucose (mg/dL) / 2]. MACE was rigorously defined as a composite endpoint encompassing cardiovascular death, non-fatal myocardial infarction, non-fatal stroke, emergency revascularization procedures, and heart failure-related rehospitalization. Multivariable Cox proportional hazards regression models, adjusting for relevant clinical covariates, were employed to assess the independent associations between tertiles of both

the traditional TyG index and the novel composite indices with incident MACE risk. Participants had a mean age of 57.4 ± 9.0 years, and 2,032 (23.1%) were female. Over a median follow-up period of 5.0 years, 1,548 MACE events occurred, representing 17.6% of the cohort. Analysis using the fully adjusted multivariable Cox model yielded a counter-intuitive finding for the traditional TyG index: patients within the lowest tertile exhibited a significantly increased risk of incident MACE compared to those in the highest tertile (adjusted Hazard Ratio [aHR] 1.145, 95% Confidence Interval [CI] 1.012–1.294). Conversely, the results for all three TyG_CPET composite indices demonstrated the expected directionality based on functional capacity. Patients in the highest tertile of each novel composite index consistently showed a significantly reduced risk of incident MACE compared to those in the corresponding lowest tertile. The specific aHRs (95% CI) were: TyG_peakVO $_2$ kg: 0.828 (0.726–0.944), TyG_peakO $_2$ -pulse: 0.831 (0.724–0.953), and TyG_ATVO $_2$ kg: 0.878 (0.774–0.995). In conclusion, this cohort analysis confirmed significant associations between both the traditional TyG index and the novel TyG_CPET composite indices with future MACE risk. However, the direction of association for the traditional TyG index was inverse to expectations derived from its role as an IR marker. Critically, the novel indices, particularly TyG_peakVO $_2$ kg and TyG_ATVO $_2$ kg, demonstrated superior predictive capacity for MACE risk compared to the traditional TyG index alone. The TyG_peakVO $_2$ ratio demonstrated the strongest predictive power, with its prognostic capacity increasing progressively as follow-up duration extended, indicating a time-dependent effect. These findings strongly suggest that integrating a dynamic functional assessment via CPET parameters with static metabolic markers significantly enhances risk stratification. This combined approach potentially offers a more comprehensive and pathophysiologically relevant evaluation of cardiovascular vulnerability in clinical practice.

RelationshiP and Prognostic value of the triglyceride-glucose index and oPtical coherence tomograPhy-derived Physiological index in Patients with acute coronary syndrome

Li Pan, Bei Shi, Ran-Zun Zhao

Affiliated Hospital of Zunyi Medical University

The oPtical flow ratio (OFR) , derived from oPtical coherence tomograPhy (OCT) images , serves as a Physiological index , while the Triglyceride-Glucose Index (TyG) is an alternative measure of insulin resistance . Both indices are Positively correlated with Poor Prognosis in Patients with acute coronary syndrome (ACS) , but the relationshiP between the TyG index , OFR , and their Prognostic value remains unclear . We included ACS Patients who underwent OCT between January 1 , 2021 , and March 31 , 2023 . The TyG index was calculated as Ln[fasting triglycerides (mg/dL) × fasting blood glucose (mg/dL)/2]. Patients were grouPed into three categories (T1, T2, and T3) based on TyG tertiles. The Primary endPoint was major adverse cardiovascular events (MACE). In our analysis, the T3 grouP showed a significantly higher incidence of MACE (P < 0.05), with a Progressive decrease in vessel-level OFR observed as the TyG index increased, demonstrating a linear correlation (r = - 0.0146, P < 0.001). The restricted cubic sPlines (RCS) model revealed a nonlinear relationshiP between the TyG index and the likelihood of MACE (P for nonlinear < 0.021). Additionally, the cumulative incidence of MACE was significantly higher in Patients with a higher TyG index (all Log-rank P < 0.001).These findings suggest a nonlinear relationshiP between the TyG index and MACE, and a linear association between the TyG index and vessel-level OFR. The combination of the TyG index and OFR significantly imProved discriminatory ability (c-index: 0.720 vs. 0.757; P < 0.001) and reclassification ability (net reclassification index [NRI]: 0.373; integrated discrimination imProvement [IDI]: 0.031; P < 0.0001) for Predicting MACE comPared to vessel-level OFR alone. This combination effectively identifies high-risk ACS Patients.

The effects of perioperative cardiopulmonary integrated rehabilitation in patients undergoing TAVR

Yanxin Song, Hai-Yan Zheng, Chuan Ren, Wei Zhao, Jun-Tao Duan

Peking University Third Hospital

Abstract

Background: Transcatheter aortic valve replacement (TAVR) has been widely used for treating patients with aortic stenosis (AS) or aortic regurgitation (AR) in recent years around the world, and the perioperative rehabilitation of TAVR patients has also consistently garnered attention from clinical practitioners. At present, the cardiac rehabilitation of TAVR patients in China is still in its early stage, there is still a lot of work to be done. The aim of this study was to explore the effects of perioperative cardiopulmonary integrated rehabilitation in patients undergoing TAVR.

Method: We conducted this study at Peking University Third Hospital, enrolling patients scheduled for TAVR who visited the Department of Cardiology. Following the initiation of the trial, 29 patients who received TAVR were prospectively enrolled as the intervention group, and 29 patients who received TAVR were retrospectively enrolled as the control group. The control group patients received routine treatment and nursing care after admission. Besides routine treatment and nursing care, a perioperative cardiopulmonary integrated rehabilitation program was carried out for the intervention group after admission. The program included (1) preoperative evaluation; (2) preoperative rehabilitation education; (3) preoperative cardiopulmonary rehabilitation, including respiratory rehabilitation and exercise rehabilitation; (4) early postoperative rehabilitation assessment; (5) postoperative cardiopulmonary rehabilitation: including patients' posture changing, limb activities locally(passive and positive), respiratory rehabilitation, standing balance, walking, and coordinated training. During the rehabilitation process, closely monitor the patient's vital signs. Researchers recorded the patients' activities of daily living (Barthel Index) at admission and discharge. Before the patients discharge, researchers instructed patients to perform a 6-minute walking test(6-MWT) to assess patients' exercise capacity, and provided rehabilitation guidance based on their 6-MWT results. Researchers regularly monitored the exercise of interventional group patients through WeChat. At the 1-month follow-up, researchers evaluated all patients' exercise adherence and retest their 6-MWT. Researchers conducted a telephone survey on the patient's exercise adherence 3 months after discharge. Patients' incidence of postoperative dyspnea, fever, infection, etc.; postoperative physical activity status and duration of hospitalization; exercise capacity and exercise adherence 1 month after discharge; exercise adherence 3 months after discharge were compared between the two groups.

Result: There were no statistically significant differences in baseline data between the two groups of patients(p > 0.05). There was no adverse events occurred in all patients. Compared with the control group, the intervention group had lower incidence of dyspnea(p = 0.028) and fever(p = 0.033), the degree of dyspnea is also milder. The intervention group also had significantly shorter postoperative length of CCU residence (4.00 ± 2.33 vs. 2.93 ± 1.49, t = 2.083, p = 0.042) and bed rest time (4.96 ± 2.29 vs. 1.47 ±0.98, t= 7.560, p= 0), better physical activity status and exercise capacity(6-MWT: 165.71 ± 44.74 vs. 135.65 ± 35.39, p=0.030), and higher exercise adherence 1 month and 3 months after discharge (p < 0.05).

Conclusion: The perioperative cardiopulmonary integrated rehabilitation in TAVR patients is safe and effective. The rehabilitation program reduced the occurrence of complications, promote patients' early mobilization and discharge, improve patients' exercise capacity, and restore patients to daily life. Early rehabilitation in hospital and regular follow-up can help patients adhere to rehabilitation program after discharge, prolong rehabilitation benefits, improve quality of life, and have high health and socio-economic value.

首诊冠心病患者运动恐惧现状及影响因素分析

彭沥枢 [1] 王彦 [1]

1. 河北大学

2. 河北大学附属医院

目的 探究首诊冠心病患者运动恐惧的现状及影响因素，为制订针对性的心脏康复干预策略提供依据。

方法 本研究采用横断面研究设计。采用便利抽样方法，选取 2024 年 12 月 -2025 年 4 月于河北大学附属医院心内科就诊且符合纳排标准的 310 例冠心病患者作为研究对象。采用一般资料调查表、心脏病患者运动恐惧量表（TSK-heart）、锻炼社会支持量表 (ESS)、医学应对方式问卷 (MCMQ)、感知运动益处量表 (EB)、特质焦虑量表 (T-AI) 进行调查。应用 Spearman 相关分析探讨运动恐惧与锻炼社会支持、感知运动益处、特质焦虑之间的相关性；采用多元线性回归分析来明确运动恐惧的影响因素。

结果 首诊冠心病的患者运动恐惧得分为（42.55±6.488）分，其中 230 例（74.5%）患者运动恐惧得分≥ 38 分，表明运动恐惧发生率处于中等偏高水平。相关性分析结果显示，运动恐惧得分与锻炼社会支持呈负相关（r=-0.566，p < 0.01），与感知运动益处呈负相关（r=-0.655，p < 0.01），与焦虑特质呈正相关（r=0.550，p < 0.01）。多元线性回归结果表明，职业状态、合并症数量、疾病类型、医学应对方式、感知运动益处、焦虑特质等对运动恐惧的影响差异具有统计学意义（p < 0.05）。

结论 首诊冠心病患者运动恐惧得分水平较高，且受到职业状态、合并症数量、疾病类型、医学应对方式、感知运动益处、焦虑特质等多种因素的影响。提示医护人员应重点关注患者心理状态与运动的认知，通过增强对患者运动的支持，提高患者对于运动益处的感知、制订个性化的康复计划降低冠心病患者运动恐惧水平，保障心脏康复的有效实施。

Long-term Efficacy and Safety of Moderate-Intensity Continuous Training on the Improvement of Cardiopulmonary Function in Patients After Transcatheter Aortic Valve Replacement: an analysis of the extended follow up of the ENERGY Study

Yu-Shan Li, Qiang Ren, Xing-Bo Mu, Kai Xu, Yan-Chun Liang, Jian Zhang, Geng Wang, Yan-Xia Wang, Cai-Lian Wang, Yi Zhang, Sheng-Yi Wang, Quan-Yu Zhang, Ya-Ling Han

General Hospital of Northern Theater Command

Background: The first phase of the ENERGY study showed that moderate-intensity continuous training (MICT) had a positive effect on the cardiopulmonary function and physical capacity of patients after transcath-

eter aortic valve replacement (TAVR). However, the long-term efficacy and safety of MICT in patients after TAVR are still unclear.

Design: A randomized controlled trial.

Objectives: To evaluate the effect at 12 months of MICT on the improvement of cardiopulmonary function and quality of life in patients undergoing TAVR.

Methods: A total of 66 patients enrolled in the ENERGY study were extended training to 12 months. Patients in the MICT group were scheduled 3 times per week for 12 months in the intervention group. Patients in the control group received one-time advice on physical activity according to the current guideline. The primary endpoint in the present study was the change in peak VO_2 from 3-month to 12-month. The secondary endpoints included changes from 3 to 12 months in cardiopulmonary exercise testing parameters, echocardiographic measures, laboratory parameters, 6-minute walk distance, SF-12 health survey scores, and NYHA functional class, with all assessments performed using the same methodologies as in the original trial. The safety endpoint was the major adverse cardiovascular and cerebrovascular event (MACCE) and its components of all-cause mortality, recurrent myocardial infarction (MI), ischemia-driven target vessel revascularization, and stroke. Following the ESC guidelines, the participants in the present study were divided into the LVEF < 50% cohorts and LVEF ≥ 50% cohorts according to the LVEF assessed by echocardiology. Study outcomes were analyzed in the intention-to-treat (ITT) population.

Results: The ENERGY study enrolled 66 patients between 20 August 2021 and 28 February 2022. The ITT population was 54.55% male, with a mean age of 70.65 ± 6.60 years. After 12 months, the change in peak VO_2 (1.58 ml/kg/min, 95% CI 0.08 to 3.09, P = 0.040), peak MET (0.56, 95% CI 0.20 to 0.93, P = 0.003), VO_2AT (1.55 ml/kg/min, 95% CI 0.80 to 2.30, P < 0.001), METAT (0.35, 95% CI 0.10 to 0.61, P = 0.007), 6MWD (21.24 m, 95% CI 7.10 to 35.39, P = 0.004), and mental component summary of SF-12 (10.47, 95% CI 0.48 to 20.45, P = 0.040) were higher in the MICT group compared with the control group. In addition, there were no differences of change in echocardiographic, laboratory parameters and physical component summary of SF-12 between the 2 groups. Among the LVEF ≥ 50% cohort, patients in the MICT group showed significant improvements in the MET (12-month: 0.76, 95% CI 0.35 to 1.17, P = 0.001; 3-month: 0.68, 95% CI 0.38 to 0.98, P < 0.001), VO_2 at anaerobic threshold (12-month: 1.71 ml/kg/min, 95% CI 1.04 to 2.38, P < 0.001; 3-month: 2.25 ml/kg/min, 95% CI 1.39 to 3.11, P < 0.001), MET at anaerobic threshold (12-month: 0.34, 95% CI 0.06 to 0.62, P = 0.018; 3-month: 0.70, 95% CI 0.44 to 0.95, P < 0.001), peak O_2 pulse (12-month: 1.36 mL/beat, 95% CI 0.14 to 2.58, P = 0.030; 3-month: 1.13 mL/beat, 95% CI 0.42 to 1.84, P = 0.003). Moreover, a significant change in favor of the MICT group was also observed for the 6MWT (12-month: 27.11 m, 95% CI 9.79 to 44.42, P = 0.003; 3-month: 22.58 m, 95% CI -3.08 to 48.25, P = 0.083) and mental component summary of SF-12 (12-month: 12.91, 95% CI 2.35 to 23.48, P = 0.018; 3-month: -0.06, 95% CI -13.50 to 13.38, P = 0.993).

Conclusions: To sum up, MICT 12 months in patients after TAVR resulted in maintained significant long-term improvements in cardiopulmonary function and quality of life, compared to MICT 3 months. Especially for patients with LVEF returned to normal after TAVR, are especially salient. The present results provide the first insight into the utmost clinical significance of MICT in improving cardiopulmonary function and quality of life following a TAVR procedure over the long term.

Key words: Transcatheter Aortic Valve Replacement (TAVR); Cardiac Rehabilitation (CR); Moderate-Intensity Continuous Training (MICT); Cardiopulmonary Exercise Testing (CPET); quality of life (QoL)

Comparative effects of traditional Chinese exercises on cardiac rehabilitation in patients after percutaneous coronary intervention: A Systematic Review and Network Meta-Analysis

Jiale Wang, Long-Cheng Liu, Li-Hong Ma

Fuwai Hospital, Chinese Academy of Medical Sciences

Comparative effects of traditional Chinese exercises on cardiac rehabilitation in patients after percutaneous coronary intervention: A Systematic Review and Network Meta-Analysis

Wang Jiale, Liu Longcheng, Ma Lihong

(Fuwai Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College)

Background: A global burden of disease study showed that among the top 10 causes of death in the global population in 2021, ischaemic heart disease (IHD) tops the list, with 8,990,000 (8,290,000-9,550,000) deaths and an age-standardized mortality rate of 108.7 per 100,000 people. Percutaneous coronary intervention (PCI) is one of the most important therapies in patients with coronary heart disease (CHD). However, there are still many problems, such as in-stent restenosis, recurrent angina pectoris, postoperative anxiety and depression. Traditional Chinese exercise (TCE) therapies belong to the aerobic exercise of low and medium intensity, which may have a certain efficacy on cardiac rehabilitation of patients after PCI. The objective of this network meta-analysis is to compare the impacts of different traditional Chinese exercise on cardiac function and exercise capacity in patients after PCI.

Methods: Chinese National Knowledge Infrastructure Database (CNKI), Wanfang Database, Chinese Science and Technique Journals Database (VIP), Chinese Biomedical Literature Database (Sinomed), Yiigle databases, PubMed, EMBASE, and the Cochrane Library were searched from inception to May 2025, to collect randomized controlled trials (RCTs) about TCE interventions for patients after PCI. We screened the literatures and extracted the data. The Cochrane Collaboration "Risk of bias 2.0" assessment tool will be used to assess the bias of RCTs. Network meta-analysis will be conducted using Stata17.0 software. For continuous outcomes, WMD or SMD along with their 95% CIs will be utilized. The effectiveness of the interventions will be ranked using the Surface Under the Cumulative Ranking (SUCRA) curve, with a larger area under the curve indicating greater effectiveness of the intervention.

Results: A total of 38 studies were included in this network meta-analysis that tested six different TCE interventions and included 3,343 patients. The quality assessment of included studies revealed that one was high risk and 37 studies had some concerns. TCE interventions included Baduanjin (BDJ), Tai Chi (TC), Wu Qinxi (WQX), Tai Chi Yunshou (TCYS), Tai Chi Ball + Baduanjin (TCB + BDJ), and Baduanjin + Yi Jinjing (BDJ + YJJ). The results of network meta-analysis and surface under the cumulative ranking curve(SUCRA) showed that with conventional treatment(CT) as a common control, BDJ+CT was the most effective for LVEF, NT-proBNP level and 6MWD. The SUCRA values were 81.1%, 86.5% and 75.5% respectively. The traditional meta-analysis results revealed that BDJ + CTs were significantly different compared with CTs alone for LVEF (WMD=6.28, 95% CI [4.90, 7.67]), NT-proBNP level (SMD=-2.35, 95% CI [-3.64, -1.06]), and 6MWD (WMD=65.19, 95% CI [38.91,91.48]). Nineteen studies reported 55 adverse events (AEs) in TCE + CT groups, and 141 AEs in CT groups.

Conclusions: In conclusion, the combination of TCE and CTs approaches may enhance the efficacy of CTs on cardiac rehabilitation in patients after PCI. Based on the NMA result, BDJ + CTs may be a more effective treatment and deserves further investigation. However, the differences in many comparisons between TCE interventions did not reach statistical significance; therefore, further high-quality studies are required to validate these findings.

Keywords: traditional Chinese exercises; cardiac rehabilitation; percutaneous coronary intervention; network Meta-Analysis

EETs 介导有氧运动对心肌梗死后心脏淋巴管重塑的影响和机制

沈莉

中南大学湘雅二医院

目的 心脏淋巴管的功能在心肌梗死（myocardial infarction，MI）后进展为心力衰竭的过程中发挥决定性作用。有氧运动可改善 MI 后心室重构并延缓心衰进展，但其具体分子机制及信号通路尚不明确。本研究旨在探讨有氧运动是否通过调控心脏淋巴管病理性重塑改善 MI。

方法 我们检测了不同时间有氧运动干预对 MI 小鼠的心脏淋巴管结构和功能的影响，并分别使用药理学抑制（淋巴管生成抑制剂 MAZ51）和外科干预（心脏引流淋巴管结扎）模型来探究淋巴管系统在有氧运动改善 MI 后心功能中的作用。通过单细胞 RNA 测序（scRNA-seq）初步揭示有氧运动调控心脏淋巴管功能改善 MI 的潜在机制，并结合体内外实验和各种分子生物学技术进行进一步验证。

结果 MI 小鼠的心脏淋巴管系统发生病理性重塑，具体表现为淋巴管异常扩张（面积 >500μm^2）、渗漏加重及运输功能下降。有氧运动可改善 MI 小鼠的心脏淋巴管功能障碍，减轻 MI 后心衰，并以中等强度有氧运动 4 周后效果最为显著。更重要的是，抑制淋巴管功能可显著削弱有氧运动对 MI 小鼠心肌纤维化和收缩功能的改善效应。scRNA-seq 结果提示，有氧运动疗效不依赖淋巴管内皮细胞（lymphatic endothelial cells，LEC）数量增加，而是功能重塑。进一步的研究表明，环氧二十碳三烯酸（epoxyeicosatrienoic acids，EETs）血浆水平降低会加重 MI 小鼠的心脏淋巴管病理性重塑和心功能障碍，并减弱有氧运动对 MI 小鼠的改善效应。反之，增加 MI 小鼠体内 EETs 水平可逆转其心脏淋巴管的病理性改变，减轻心脏重构和心室功能障碍。体外实验证实，增加 hLEC 中 EETs 浓度可恢复其在低氧条件下受到抑制的增殖、迁移及管形成能力。

结论 我们的研究结果表明，有氧运动通过升高 EETs 水平，改善心脏淋巴管病理性重塑，进而减轻 MI 后心衰。

Interpretable machine learning identifies peak VO2 as a key predictor of MACE events in patients with valvular heart disease.

Abstract

Background:

Valvular heart disease (VHD) represents a significant global health burden and is a major contributor to morbidity and mortality, particularly in aging populations. Despite advances in diagnostic modalities and interventional therapies, timely identification of high-risk individuals who may develop major adverse cardiovascular events (MACE) remains challenging. Traditional risk prediction models often rely on static clinical and echocardiographic parameters, which may not fully capture functional impairments or exercise capacity. Cardiopulmonary exercise testing (CPET) has emerged as a powerful, non-invasive tool that reflects the integrative responses of the cardiovascular, pulmonary, and muscular systems, offering valuable prognostic insights. However, the integration of CPET-derived parameters into predictive models using advanced machine learning (ML) techniques remains underutilized. This study aims to develop and validate an interpretable ML-based framework that combines CPET and clinical data to predict MACE risk in patients with VHD, while identifying key prognostic features to enhance individualized risk stratification and guide clinical decision-making.

Methods:

We retrospectively analyzed electronic health record data from a cohort of 931 patients diagnosed with VHD at a tertiary cardiovascular center. The dataset included demographic information, comorbidities, medication history, echocardiographic findings, and CPET variables, with particular attention to peak oxygen consumption per kilogram (peak VO_2/kg). Model-based unsupervised clustering was performed to stratify patients into subgroups with distinct risk profiles. Supervised ML models including Random Forest and XGBoost were trained to predict the occurrence of MACE, defined as a composite of cardiovascular death, heart failure hospitalization, stroke, and unplanned cardiac interventions. Model performance was assessed using the area under the receiver operating characteristic curve (AUC), sensitivity, and specificity. SHapley Additive exPlanations (SHAP) were applied to interpret model predictions and quantify the contribution of individual variables. Additionally, decision tree analysis was employed to derive clinically interpretable thresholds for risk stratification. Kaplan-Meier survival analysis was used to evaluate outcome differences among the stratified subgroups over a median follow-up period of 45.6 months.

Results:

The ML clustering algorithm identified three distinct prognostic subgroups with significantly different survival trajectories (log-rank $p < 0.001$). SHAP analysis consistently ranked peak VO_2/kg and age as the top predictors of MACE across both ML models. The Random Forest and XGBoost classifiers demonstrated excellent discriminative ability, achieving AUCs of 0.974 and 0.979, respectively. Decision tree analysis revealed clinically relevant peak VO_2/kg thresholds: <14 mL/kg/min for high risk, 14–23 mL/kg/min for intermediate risk, and ≥ 23 mL/kg/min for low risk. Kaplan-Meier analysis showed that patients with peak VO_2/kg ≥ 23 had significantly better survival outcomes, whereas those with values <14 had the highest incidence of MACE during follow-up. These stratified risk groups maintained distinct prognostic separation throughout the observation period, supporting the stability and clinical utility of the derived thresholds.

Conclusions:

This study demonstrates the value of integrating CPET-derived functional parameters with machine learning techniques to enhance risk prediction for MACE in patients with valvular heart disease. The interpretable ML framework, supplemented with SHAP analysis, not only achieved high predictive accuracy but also revealed key prognostic drivers that are clinically actionable. In particular, peak VO_2/kg emerged as a robust and reproducible indicator for long-term cardiovascular outcomes. These findings support the incorporation of CPET into routine risk assessment protocols for VHD patients and lay the groundwork for precision medicine approaches in valvular disease management. Future prospective and multi-center studies are warranted to validate these results and explore the impact of early intervention strategies guided by CPET-based risk stratification.

基于个性化护理方案的心血管疾病康复效果提升研究

彭娜

西安交通大学第一附属医院

摘要：目的： 分析个性化护理在心血管疾病中康复效果的应用分析。

方法： 选择取我院就诊的 100 例心血管疾病患者，研究对象选自 2024 年 1 月至 2024 年 10 月就诊心血管内科的患者，观察组随机分为 50 例患者、对照组随机分为 50 例患者（随机数字表法）。对照组予以临床护理常规常规护理，观察组予以本研究个性化护理，对 100 例患者护理满意度、日常生活能力评分、生存质量评分、并发症发生情况进行分析比较。

结果： 观察组护理患者满意度（96.00%）高于对照组，P<0.05，日常生活能力评分（73.26±2.57 分）高于对照组，差异显著（P<0.05），生存质量评分（情绪功能：72.36±3.98 分、躯体功能：71.06±4.48 分、认知功能评分：69.69±2.48 分、角色功能：72.25±4.16 分、整体功能：72.36±2.75 分）高于对照组，差异显著（P<0.05），并发症发生例数（2 例）低于对照组，P<0.05，差异存在显著性。

结论： 个性化护理在心血管疾病护理中具有显著效果，可提升护理满意度、日常生活能力评分以及生存质量评分，有效减少并发症发生例数，安全且有效，值得临床采纳使用。

OPT-CAD Score Combined with Cardiopulmonary Exercise Testing Parameters to Evaluate Long-Term Prognosis in Patients with Coronary Artery Disease

Qiang Ren

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Objective: To optimize the Optimal antiPlatelet Therapy for Chinese patients with Coronary Artery Disease (OPT-CAD) scoring system by incorporating cardiopulmonary exercise testing (CPET) parameters for more accurate prediction of long-term ischemic event risk in Chinese patients with coronary artery disease (CAD).

Methods: The present retrospective study enrolled 8,807 patients hospitalized for CAD who underwent CPET between February 2016 and February 2023. Patients with incomplete case information or follow-up data, hematological disorders, chronic respiratory diseases, chronic liver or kidney failure, and malignant tumors were excluded. Patients were stratified into low-risk (0-90 points) and medium to high risk (≥ 91 points) groups based on the OPT-CAD score. The primary endpoint was the first major adverse cardiovascular event (MACE) within 5 years post-discharge, defined as a composite of cardiac death, myocardial infarction (MI), and stroke. LASSO regression and COX regression analyses were used to identify CPET parameters associated with MACE to construct a prediction model, which was visualized as a nomogram. The predictive value and clinical utility of the optimized model were evaluated through the receiver operating characteristic (ROC) curve, with calculation of the area under the ROC curve (AUC) and C-index, as well as calibration curves and clinical impact curves (CIC). Comparative ROC curves, decision curve analysis (DCA), and calculating net reclassification improvement (NRI), and integrated discrimination improvement (IDI) were plotted to further validate the improvement degree of the optimized model.

Results: A total of 8,419 coronary heart disease patients were included (57.26 ± 8.93 years old, 76.96% male). Among them, 7,191 were low-risk (0-90 points) and 1,228 were medium-high risk (≥ 91 points). There were 271 (3.22%) MACE occurrences, including 82 (0.97%) cardiac deaths, 83 (0.99%) MIs, and 106 (1.26%) strokes. In the multivariate COX regression analysis, peak oxygen uptake, carbon dioxide ventilatory equivalent slope, and heart rate reserve were independent factors associated with MACE. The optimized model's time-dependent ROC curve areas at 1, 3, and 5 years were 0.869 (95% CI 0.829, 0.909), 0.843 (95% CI 0.817, 0.870), and 0.837 (95% CI 0.816, 0.859), respectively. Compared to the OPT-CAD model, the optimized model showed improved area under the curve (0.837 vs. 0.685, De-Long test $P < 0.001$), C-index (0.830 vs. 0.677, $P < 0.001$), NRI (0.248, $P < 0.001$), and IDI (0.111, $P < 0.001$). In the low-risk group, the ROC curve comparison showed that the optimized model's area under the curve was significantly higher than the OPT-CAD model (0.836 vs. 0.647, De-Long test $P < 0.001$). In the medium-high risk group, the ROC curve comparison showed that the optimized model's area under the curve was significantly higher than the OPT-CAD model (0.820 vs. 0.692, De-Long test $P < 0.001$). In the male subgroup (n = 6,479), ROC curve analysis demonstrated that the optimized model achieved a significantly higher AUC compared to the OPT-CAD model (0.839 vs. 0.689; DeLong's test, $P < 0.001$). Similarly, in the female subgroup (n = 1,940), the optimized model exhibited superior discriminative performance over the OPT-CAD model, with AUC values of 0.844 and 0.714, respectively (DeLong's test, $P < 0.001$).

Conclusion: The present study demonstrates that peak oxygen uptake, VE/VCO_2 slope, and heart rate reserve are independently associated with long-term ischemic events in CAD patients. The incorporation of these CPET parameters into the OPT-CAD score enhances the assessment of ischemic event risk. The optimized model demonstrated robust performance across all subgroups, including low-risk and medium-high risk populations, as well as male and female cohorts.

危重急性失代偿性心力衰竭患者的早期康复：随机对照研究

刘彬彬 戴翠莲 吴林静 李家华

厦门大学附属心血管医院

目的: 对于入住心脏重症监护病房(CICU)的危重急性失代偿性心力衰竭(ADHF)患者，在急性期启动心脏康复（CR）的最佳时机和方法仍不明确。 本研究评估了 CR 对 CICU 中危重 ADHF 患者身体功能和再住院率的益处。

方法： 这是一项单中心、随机、对照、单盲试验。在 2021 年 3 月至 2022 年 9 月期间，招募了 120 名入住 CICU 的危重重度 ADHF 患者，并在接受短期治疗后按 1:1 比例随机分组。所有患者均接受为期 6 个月的随访，研究者对分组情况设盲。 干预组患者在 CICU 住院期间接受一种专为 ADHF 患者设计的早期渐进式个体化心脏康复计划（称为 AHF-CR）。对照组患者接受常规护理。主要结局指标为出院时的简易体能状况量表（SPPB）评分和六个月内全因再住院率。采用意向性治疗（ITT）原则分析这些结局指标，包括随机化后的所有患者。

结果： 患者平均年龄为 68.6 ± 12.3 岁，66.7% 为男性。随机分组时，对照组 81.7% 的患者和干预组 71.7% 的患者观察到肺部湿啰音。此外，51.5% 的患者动脉血氧分压与吸入氧浓度比值低于 300 mmHg。超过 30% 的患者接受了静脉血管活性药物治疗，超过 70% 的患者接受了袢利尿剂治疗。SPPB 评分显示中位数差值为 1（95%CI: 0 ~ 2; p = 0.163）。两组间的六个月再住院率相似 [26.6% vs. 28.3%；风险比：1.005 (95%CI: 0.508 ~ 1.989)；p = 0.989]。探索性分析显示，干预组的 Perme ICU 移动能力评分更高，中位数差值为 2.76（95%CI: 0.77 ~ 4.74；校正后 p = 0.036）。

结论： 在这项针对危重 ADHF 患者的临床试验中，AHF-CR 计划是可行的。尽管该计划未能显著改善 SPPB 评分或降低再住院率，但它可能提供潜在的身体功能益处，包括增强活动能力。

基于快速康复理念的多学科协作运动康复模式对心脏术后患者心理应激及活动功能的影响研究

义茹

苏州大学附属第一医院

目的：本研究旨在探究心脏术后患者的临床干预策略，重点评估基于快速康复理念的多学科协作运动康复模式对患者心理应激水平的改善效果，并分析其对活动功能的影响。

方法：通过系统化样本筛选标准（明确纳入与排除标准），纳入 120 例心脏手术患者。采用奇偶分组法将患者分为两组：对照组（n=60）接受常规术后干预，试验组（n=60）实施基于快速康复理念的多学科协作运动康复模式（涵盖康复科、心内科、心理科等多学科团队协作）。通过标准化量表（如焦虑抑郁量表、活动功能评定量表等）及临床指标（呼吸机使用时间、恐动症发生率等）评估两组干预效果。

结果：

心理应激与活动功能：试验组患者干预后心理应激量表评分较对照组显著降低（P < 0.05），活动功能评分（如 6 分钟步行距离、日常生活能力量表）显著提升（P < 0.05）。

临床指标：试验组呼吸机使用时间为（4.2±1.3）天，短于对照组的（6.8±2.1）天（P < 0.05）；恐动症发生率为 15.0%（9/60），低于对照组的 35.0%（21/60），组间差异具有统计学意义（P < 0.05）。

结论：基于快速康复理念的多学科协作运动康复模式可显著改善心脏术后患者的心理应激状态，提升活动功能，缩短呼吸机使用时间，并降低恐动症发生率。该模式通过多学科协同干预，实现了生理功能康复与心理状态调节的双重优化，为心脏术后患者的快速康复提供了新的临床实践路径。

进行 6 分钟居家运动对冠心病患者血清 Lp-PLA2 和相关血脂成分影响研究

宫宇婷 张子新 (心脏康复学组委员)

中国医科大学附属第一医院

目的：通过对冠心病患者进行 6 分钟居家运动模式的干预，观察血清脂蛋白相关磷脂酶 A2 水平和血脂等相关指标的动态变化以及患者短期随访（6 个月）的主要心血管不良事件，旨在明确冠心病患者 Lp-PLA2 的水平以及其与其他生物标志物的关系和联合预测斑块稳定性及 MACE 的价值，同时证实 6 分钟居家运动模式对 CHD 患者的预后价值与可行性。

研究方法：收集确诊的 CHD 患者，除外随访损失，最终入选患者 86 人，采用前瞻性病例对照研究，按单双号交替方式入组，运动康复组共 44 例，非运动康复组共 42 例。同时又将入选患者根据冠心病类型分为急性冠状动脉综合征组与慢性冠状动脉综合征组。收集患者的性别、年龄、体重指数、吸烟史、高血压史、糖尿病史、运动习惯等，测定患者的 Lp-PLA2 水平及其他临床指标，其中 E 组患者每日早晚进行两次 6 分钟居家运动康复，自选时间段，每次运动保证 6 分钟的最大耐受强度运动，预热和恢复时间患者根据自身情况决定，NE 组患者进行常规健康教育。所有患者均通过电话、微信及门诊进行指导随访，均于 6 个月后于我院门诊复查 Lp-PLA2 水平及其他相关指标。

结果：（1）基线及 24 周后，E 组与 NE 组之间的性别、高血压、糖尿病、C 反应蛋白、总胆固醇、甘油三酯、高密度脂蛋白胆固醇、低密度脂蛋白胆固醇、空腹血糖等均无明显统计学差异（P>0.05）。（2）E 组与 NE 组基线时的 Lp-PLA2 水平之间无统计学差异（P>0.05）。24 周后，两组 Lp-PLA2 水平均下降，E 组 Lp-PLA2 水平的下降差值△明显高于 NE 组（P<0.001）。（3）基线时 ACS 组的 Lp-PLA2 水平高于 CCS 组（P<0.05）。24 周后各组的 Lp-PLA2 水平与组内基线时相比有统计学上的显著差异（P<0.001）。24 周后两组的 Lp-PLA2 水平及运动前后的 Lp-PLA2 水平变化的差值△之间没有统计学上的差异（P>0.05）。（4）基线时 ACS-E 组的 Lp-PLA2 水平高于 CCS-E 组（P<0.05）。24 周后 ACS-E 组、CCS-E 组的 Lp-PLA2 水平与组内基线时相比有统计学上的显著差异（P<0.001）。在运动前后的 Lp-PLA2 水平变化的差值△比较中，ACS-E 组下降差值△最大，与 ACS-NE 组、CCS-E 组相比均有统计学上的差异（P<0.001，P<0.01）；并且 ACS-NE 组下降差值△大于 CCS-NE 组（P<0.001）。(5) 多变量线性回归分析表明，6 分钟居家运动与 Lp-PLA2 水平独立相关。(6) E 组患者 2 例在随访期间发生 MACE 事件，NE 组有 4 例在随访期间发生 MACE 事件。

结论：Lp-PLA2 与冠心病的稳定性相关，ACS 患者较 CCS 患者的 Lp-PLA2 水平更高。24 周的 6 分钟居家运动干预后，ACS 患者的 Lp-PLA2 水平变化更明显，下降更多。运动组的冠心病患者 MACE 事件更少。6 分钟居家运动安全性有保证。

心理干预在平板运动试验诊断中的应用

陈晓旭

中国人民解放军北部战区总医院

目的 探讨心理干预在平板运动试验中的作用及其对患者生理和心理状态的影响。**方法** 筛选 2024 年 10 月至 2025 年 4 月因胸痛就诊于北部战区总医院心血管内科行平板运动试验患者 200 人，年龄 18-65 岁，无严重器质性疾病且自愿参与本次研究的成年人作为研究对象，随机分为心理干预组 100 人，对照组 100 人。心理干预组采用多模态心理干预措施，结合放松训练、CBT 和正念冥想三种方法，分别于平板运动试验前，运动中及恢复期进行心理干预。对照组则由专业医务人员提供标准化口头说明，告知注意事项并解答疑问。**结果** 经过对患者的心理干预，在心理状态改善方面，心理干预组成员的焦虑评分显著下降，表现出更好的情绪稳定性；而对照组未见明显变化。进一步分析发现，心理干预组中有 70% 的个体表示对运动试验的信心有所增强，愿意积极配合医务人员完成测试。在生理反应优化方面，心理干预组在平板运动试验期间的心率变异性（HRV）指标优于对照组，提示前者交感神经兴奋度相对较低，更利于维持正常的生理机能。此外，心理干预组的最大摄氧量（VO2max）也有一定幅度的增长，显示出更强的心肺耐力。在整体表现提升方面，心理干预组顺利完成整个运动试验的比例 89%，远高于对照组的 68%; 同时,心理干预组的测试结果偏差较小,提高了诊断的准确性。**结论** 适当的心理干预可以提高患者的运动表现和耐受性，改善其心理健康状况，并有助于提升临床诊断的准确性。本论文为未来在双心医学领域中进一步探索心理因素对运动试验影响提供了理论依据。

基于心肺运动试验与机器学习的瓣膜术后低心排血量综合征预测模型构建

浩锋 [1,2] 柯浩鹏 [3] 郭兰 [4] 马欢 [4] 汪芳 [1]

1. 北京医院

2. 北京协和医学院

3. 广州华立学院

4. 广东省人民医院

目的： 识别心脏瓣膜手术后低心排血量综合征的关键危险因素，并基于机器学习算法构建预测模型，评估其预测效能。

方法： 回顾性收集广东省人民医院 703 例接受心外科瓣膜手术患者的临床资料（训练集 492 例，验证集 211 例）。纳入基础信息、血液检验、心脏超声、心肺运动试验（CPET）及手术相关参数等 72 项指标。首先采用最小绝对收缩和选择算子（LASSO）回归筛选重要预测因子，随后应用逻辑回归（LR）、支持向量机(SVM)、随机森林(RF)、梯度提升决策树(GBM)及极端梯度提升(XGBoost)五种机器学习算法构建预测模型，并采用网格搜索结合 5 折交叉验证确定模型的最优超参数。使用受试者工作特征曲线下面积（AUC）、校准曲线及临床决策曲线分析评估模型的性能，筛选最优模型。

结果： 703 例患者中，87 例（12.4%）术后发生低心排血量综合征。LASSO 回归识别出 9 个关键预测因子：合并心房颤动、术前血红蛋白水平、直接胆红素、峰值摄氧量、运动中出现心肌缺血、EuroSCORE II 评分、同期行冠状动脉旁路移植术、术后 30 分钟肌酸激酶同工酶及乳酸水平。XGBoost 模型展现出最佳预测性能：训练集 AUC 为 0.93（95% CI: 0.89-0.96），验证集 AUC 为 0.83（95% CI: 0.78-0.89）。校准曲线显示 XGBoost 模型的预测概率与实际发生率具有良好的一致性。临床决策曲线分析显示，在 0.12 至 0.85 的风险阈值范围内，XGBoost 模型的净获益显著高于“全干预”和“全不干预”策略，表明其良好的临床实用价值。

结论： 本研究成功识别了瓣膜术后低心排血量综合征的重要预测因素。结合 CPET 指标与机器学习技术构建的 XGBoost 预测模型，在训练集和验证集中均表现出优异的预测能力与临床实用性，可作为识别心脏瓣膜手术后低心排血量综合征高危患者的有效工具，有助于早期干预。

合并自主神经功能紊乱的非阻塞性冠脉疾病患者临床特征研究

许明煜 [1] 王柔 [1] 常金娜 [1] 白冰清 [1] 刘于庭 [2] 廖映雪 [1] 周浩锋 [1] 刘凤瑶 [1] 郭兰 [1] 马欢 [1]

1. 广东省医学科学院 广东省人民医院

2. 深圳市人民医院

目的 自主神经系统调控心率、血压等非自主性心血管功能，其功能紊乱（Autonomic Dysfunction，AD）表现为交感神经过度激活、迷走神经张力减弱，常导致静息心率升高、运动后心率恢复延迟及心率变异性下降，已被证实是多种心血管疾病不良预后的独立预测因子。部分无明显冠脉狭窄但出现心绞痛症状（Angina with no obstructive coronary disease，ANOCA）的患者常合并AD，提示二者在病理生理机制上可能相关。然而，当前关于 AD 在 ANOCA 人群中的患病率、临床特征及危险因素的研究较少。

方法 本研究为回顾性病例对照研究，纳入在广东省人民医院接受心肺运动试验（Cardiopulmonary exercise test，CPET）的女性 ANOCA 患者 81 例。依据 CPET 中运动后 1 分钟心率恢复≤ 12 次 / 分或者 2 分钟心率恢复≤ 22 次 / 分为 AD 判断标准，分为 AD+ 组（44 例）和 AD- 组（37 例）。收集患者的一般临床信息、心理状态问卷、外周血生化指标、CPET 结果、运动负荷心电图、腺苷负荷下 PET-CT 及血管内皮功能检测结果。

结果 AD 在该 ANOCA 人群中的患病率为 54.32%。AD+ 组平均年龄为 55.5±8.6 岁，高于 AD- 组的 51.1±7.9 岁（P=0.021）。两组在药物使用、BMI 等方面无显著差异。AD+ 组运动能力明显下降，其最大运动负荷为 80.9±18.5W，低于 AD- 组的 96.7±20.8W（P=0.001）。此外，AD+ 组的补体 C3、C4，铜蓝蛋白、C 反应蛋白、碱性磷酸酶、腺苷脱氨酶（ADA）及甘油三酯水平均显著高于 AD- 组。多因素 Logistic 回归分析表明，血小板计数、补体 C4 及铜蓝蛋白水平与 AD 风险呈正相关关系。线性相关分析亦显示，上述炎症指标与 AD 存在剂量反应关系。

结论 本研究对 ANOCA 合并 AD 患者的临床特征进行了系统分析，发现 AD+ 组合并更高比例的高血压、心律失常、焦虑、抑郁、高压力状态及更多负性生活事件，且运动能力更差。研究进一步明确了炎症在 ANOCA 合并 AD 中的潜在作用，提示铜蓝蛋白和补体 C4 等或可作为预测合并 AD 风险的生物标志物。

短期高强度间歇训练与中等强度连续训练对心血管疾病患者心率恢复和心肺的益处：一项倾向匹配的回顾性研究

宋倩倩

广东省医学科学院 广东省人民医院

背景：当前针对心血管疾病 (CVD, Cardiovascular Disease) 患者的运动干预研究多聚焦于 8 至 12 周及以上周期的训练方案，已明确其在提升心肺功能和改善临床预后方面的有效性。然而，在实际心脏康复实践中，长周期干预常受到资源限制、时间成本及患者依从性等因素的制约。相较而言，短期运动干预在实施可行性与临床应用方面具有更大优势。值得关注的是，关于高强度间歇训练 (HIIT, High-Intensity Interval Training) 与中等强度连续训练 (MICT, Moderate-Intensity Continuous Training) 在短周期内生理效益的直接比较，目前尚缺乏系统证据。

目的：本研究旨在评估短期 HIIT 与 MICT 对 CVD 患者运动后心率恢复 (HRR, Heart Rate Recovery) 与峰值摄氧量 (Peak VO_2) 等关键生理指标的影响，并探讨两种训练模式在干预效果方面是否存在显著差异。

方法：本研究为单中心回顾性队列研究，共纳入 754 例接受运动干预的确诊 CVD 患者。经筛选后，剔除运动次数少于 10 次及缺失心肺运动试验评估数据的个体，最终依据干预方式分为 HIIT 组（n=95）和 MICT（n=125）。采用 1:1 倾向性评分匹配以平衡基线差异后，每组最终纳入 81 例患者。所有受试者均接受为期 4 周的标准化运动康复干预。

结果：干预后，两组患者的 Peak VO_2与 HRR 均较基线显著改善 (p<0.05)。其中，HIIT 组 Peak VO_2平均提升为 3.04±3.02ml·min^{-1}·kg^{-1}，MICT 组为 3.55±4.08ml·min^{-1}·kg^{-1}。另外，HIIT 组的 HRR 改善幅度分别为 4.07±9.66bpm；MICT 组改善了 3.97±11.4bpm，两组间差异无统计学显著性 (p>0.05)。此外，干预后，两组的 Peak VO_2和 HRR 变化值具有显著相关性，HIIT 组的相关性更强 (r=0.396，p<0.001)，MICT 组的相关性较弱但仍具有统计学意义 (r=0.223)，p<0.05）。

结论：在短期干预背景下，两种运动模式均能有效改善 CVD 患者的 Peak VO_2和 HRR，且两者效果相近。鉴于短周期干预在临床实践中的可行性与时间优势，运动处方的制定应综合患者个体特征进行个性化选择，而非固定采用单一训练模式。

Protective effect of high-intensity interval exercise on cardiac damage induced by hyperlipidemia

Hong-Yang Liu[1], Ri-Hong Huang[1], Cheng-Si Qian[2], Li-Yue Zhu[2]

1. The First Affiliated Hospital of Dalian Medical University

2. Zhejiang Province Rongjun Hospital

Protective Effects of High-Intensity Interval Training on Hyperlipidemia-Induced Cardiac Injury: Mechanisms and Comparative Efficacy

Abstract:

Background:Hyperlipidemia, characterized by elevated levels of blood lipids or lipoproteins, is a significant global health issue and a major risk factor for cardiovascular diseases (CVDs). It exacerbates atherosclerosis, cardiac lipid accumulation, and impaired cardiac function through mechanisms involving oxidative stress, inflammation, and fibrosis. Exercise, particularly high-intensity interval training (HIIT), has emerged as a promising non-pharmacological intervention for mitigating hyperlipidemia-related cardiac damage. However, the comparative efficacy of HIIT versus moderate-intensity continuous training (MICT) in hyperlipidemia-induced cardiac injury remains to be fully elucidated. This study aims to comprehensively investigate the cardioprotective effects of HIIT and MICT in a hyperlipidemic mouse model, with a focus on lipid metabolism, oxidative stress, inflammation, and fibrosis.

Objective:To compare the cardioprotective effects of HIIT and MICT in a hyperlipidemic mouse model, elucidate the underlying mechanisms, and determine which exercise modality offers superior protection against hyperlipidemia-induced cardiac injury.

Methods:A total of 35 male ApoE^{-}/$^{-}$ mice (8 weeks old) were randomly assigned to four groups: (1) Control (normal diet); (2) HFD (high-fat diet); (3) HFD+MICT (high-fat diet + moderate-intensity continuous exercise); and (4) HFD+HIIT (high-fat diet + high-intensity interval exercise). The high-fat diet consisted of 15% lard and 1.5% cholesterol. Exercise protocols were implemented for 12 weeks: HIIT involved 9 sets of 1.5-minute sprints at 85% of maximum running speed, interspersed with 1-minute rest intervals, while MICT involved continuous running at 60% of maximum speed. Serum and cardiac tissues were analyzed for lipid profiles (total cholesterol [TC], triglycerides [TG]), cardiac injury markers (B-type natriuretic peptide [BNP]), oxidative stress markers (SIRT1, SIRT3, NRF2, SOD2), inflammatory cytokines (IL-1β, IL-6, IL-10, IL-18), and fibrosis-related proteins (TGF-β, SMAD3, collagen I/III). Histopathological evaluations were performed using H&E and Masson's trichrome staining.

Results:Metabolic Improvements:HIIT significantly reduced body weight, serum TC, and TG levels compared to the HFD and HFD+MICT groups (P < 0.05). These findings indicate that HIIT effectively ameliorates hyperlipidemia-induced metabolic disturbances.Cardiac Injury Mitigation:HIIT attenuated hyperlipidemia-induced elevations in serum creatinine, blood urea nitrogen, and BNP (P < 0.01), suggesting that HIIT provides substantial protection against cardiac dysfunction and injury.Histopathological Findings:The HFD group exhibited histological changes indicative of severe cardiac damage, including Zenker necrosis, inflammatory infiltration, and fibrosis. These pathological alterations were markedly alleviated by HIIT (P < 0.05 vs. HFD), as evidenced by reduced tissue damage and improved cardiac architecture.Lipid Deposition:HIIT downregulated cardiac lipid transporters (CD36, LOX-1) and macrophage markers (CD68, PPAR-γ) more effectively than MICT (P < 0.05). This suggests that HIIT significantly reduces lipid accumulation and macrophage infiltration in the myocardium, thereby mitigating lipid-induced cardiac injury. Oxidative Stress:HIIT restored antioxidant defenses by upregulating SIRT1, SIRT3, NRF2, and SOD2 (P < 0.05). These results highlight the ability of HIIT to counteract hyperlipidemia-induced oxidative stress, thereby preserving cardiac function and reducing the risk of oxidative damage. Anti-Inflammatory Effects:

HIIT suppressed pro-inflammatory cytokines (IL-1β, IL-6, IL-18) while enhancing anti-inflammatory IL-10 (P < 0.05). This dual action of HIIT in modulating the inflammatory response underscores its potential to mitigate inflammation-driven cardiac damage. Fibrosis Suppression:HIIT reduced collagen I/III, TGF-β, and SMAD3 expression, outperforming MICT (P < 0.01). These findings indicate that HIIT effectively inhibits fibrotic processes in the myocardium, thereby preventing the progression of cardiac fibrosis and preserving cardiac structure and function. Conclusion:HIIT confers superior cardioprotection against hyperlipidemia-induced injury by modulating lipid metabolism, oxidative stress, inflammation, and fibrosis. Its efficacy surpasses that of MICT, highlighting HIIT as a potent therapeutic strategy for hyperlipidemia-related cardiac dysfunction. These findings advocate for the clinical adoption of HIIT in high-risk populations, particularly those with hyperlipidemia and associated cardiovascular risks.

Keywords: High-intensity interval training; Hyperlipidemia; Cardiac injury; Oxidative stress; Inflammation; Fibrosis

运动康复对不同射血分数心衰病人骨骼肌质量减少的影响

王秀云 李娟利 胡经文 卢群

西安交通大学医学院第一附属医院

目的：探讨运动康复对射血分数降低和保留的心衰病人骨骼肌质量减少的影响。

方法：选取 2018 年 1 月 - 2020 年 1 月在我院因心衰住院的 134 例病人，其中射血分数保留的心衰病人（ HFpEF)44 例，射血分数降低的心衰病人（ HFrEF)90 例。对 NYHA 心功能分级为Ⅰ级～Ⅲ级的稳定性心衰病人评估心肺功能，由医生、康复师、护士等合作为患者制定科学的训练手段，一方面采用多种形式结合的宣教方式来鼓励病人树立全面关注的康复理念及健康科学的康复知识；另一方面指导病人学会自我运动康复监测，做到安全最大化；最后出院后仍要督促病人完成健康随访，管理自我康复行为，养成定时复查的良好习惯。采用双能 X 射线吸收法评估身体成分。对病人进行随访至 2022 年 8 月，所有病人至少随访了 30 个月。

结果：HFpEF 组和 HFrEF 组女性、体质指数、血压、LVEF、NYHA 心功能分级、肌肉萎缩、B 受体阻滞剂、盐皮质激素受体拮抗剂、袢利尿剂、N 末端 B 型利钠肽前体(NT - proBNP)比较，差异均有统计学意义(P <0.05)。24 例病人(17.9%)出现肌肉萎缩，其中 20 例病人患有 HFrEF ,4 例病人患有 HFpEF 。与非肌肉萎缩病人比较，肌肉萎缩病人年龄、男性、缺铁、贫血、NT - proBNP 水平增加，差异均有统计学意义（ P <0.05)。Kaplan - Meier 分析显示，肌肉萎缩病人 24 个月死亡率为 42.22%，无肌肉萎缩病人 24 个月死亡率为 19.00%。HFpEF 病人中，肾小球滤过率（ HR =27.57, P =0.001）是死亡的独立预测因子； HFrEF 病人中，肌肉萎缩（ HR =1.97, P =0.035）和 LVEF (HR =0.95, P =0.019）是死亡的独立预测因子。因此，骨骼肌萎缩可能是心衰患者死亡的独立危险因素。骨

骼肌质量减少在心衰晚期患者中会导致患者运动能力受损，严重影响其生活质量。运动康复可降低心血管原因病死率和心衰原因住院率。对 134 例慢性心衰病人实施康复运动疗法干预，半年内研究组猝死率和心梗率均低于对照组，比较差异有统计学意义（P <0.05）。由此可见康复运动疗法的确有益于提高慢性心衰病人的治疗效果。

结论：骨骼肌质量减少的 HFrEF 病人 24 个月死亡风险高于 HFpEF 病人。运动康复可以增加骨骼肌对氧气的利用能力，改善病人的运动耐力，改善心衰诱发的骨骼肌萎缩，提高病人的生活质量。因此运动已成为心衰患者的主流康复手段。未来有必要研究运动形式、强度等对运动耐量、骨骼肌功能改善的影响，为心衰病人运动计划的制订提供依据。

心肺运动试验在高龄老年患者中的应用

余陆娇 张子新

中国医科大学附属第一医院

心肺运动试验（Cardiopulmonary Exercise Testing, CPET）是一种全面评估心肺功能及运动耐力的无创检测方法，通过实时监测运动状态下的气体交换、心电活动及血流动力学变化，为高龄老年患者的外科术前风险评估、围手术期管理及慢性疾病康复提供客观依据。随着老年人口比例增加及多病共存现象普遍，CPET 在高龄患者（≥ 75 岁）甚至超高龄患者（≥ 85 岁）中逐渐开始崭露头角。本文针对 CPET 在高龄老年人外科术前评估、围手术期康复，以及冠心病、心力衰竭、慢性阻塞性肺疾病（COPD）、衰弱综合征和慢性房颤等疾病康复中的临床应用进行综述。

在外科术前评估中，CPET 通过测定峰值摄氧量（VO_2 peak）、无氧阈（AT）、二氧化碳通气当量斜率（VE/VCO_2 slope）等关键指标，可精准预测术后心肺并发症风险及长期预后。研究表明，高龄患者 VO_2 peak <14 mL/kg/min 或 AT <11 mL/kg/min 时，术后并发症风险显著增加，而 VE/VCO_2 slope >34 提示心功能储备不足，需优化围手术期管理策略。对于合并冠心病、COPD 或衰弱的老年患者，CPET 可区分心肺功能受限的主导因素，指导个体化术前干预，如强化呼吸肌训练或调整药物治疗方案。在围手术期康复中，基于 CPET 结果制定的预康复计划（如靶向有氧训练、抗阻运动及呼吸肌锻炼）可显著改善患者的心肺功能储备，降低术后谵妄、肺部感染等并发症发生率。对于心脏手术或肺部肿瘤切除术后的高龄患者，CPET 动态监测有助于心肺功能早期恢复，并调整康复方案。在慢性疾病康复领域，CPET 的应用价值主要体现在：（1）冠心病：通过评估心肌缺血阈值和运动诱发的心律失常风险，指导运动处方制定，并监测心脏康复效果；（2）心力衰竭：VE/VCO_2 slope 和氧摄取效率斜率（OUES）可敏感反映肺血管充血及心功能恶化，优化药物及运动康复策略；（3）COPD：结合呼气流量限制和动态过度充气评估，设计间歇性运动训练以减轻呼吸困难；（4）衰弱综合征：低 VO_2 peak 和 AT 与肌肉减少症及跌倒风险相关，提示需联合营养支持与抗阻训练；（5）慢性房颤：CPET 可量化心率控制效果及运动耐量损害，指导心率 / 节律控制策略。

尽管 CPET 在高龄患者中具有重要价值，但其临床应用仍面临挑战，如运动耐受性差异、标准参考值缺乏及数据解读复杂性等。未来需建立高龄人群特异性参考标准，并探索其与新兴技术（如可穿戴设备）的联合应用。多学科协作模式下，CPET 有望成为高龄患者精准化术前评估及慢性病康复管理的核心工具。

DRG 支付改革背景下心脏康复临床研究进展

王媛媛 袁若雯 张小卫 刘调霞 万博 (通讯作者)

兰州大学第二医院（兰州大学第二临床医学院）

[目的] 基于 DRG 支付实践框架与心脏康复循证指南，系统解构 DRG 支付背景下心脏康复的相关临床进展，解决技术革新与制度供给矛盾中，心脏康复服务质量可持续性保障与支付机制变革的动态适配问题，为支付制度改革背景下心脏康复服务的价值医疗实践提供转型路径，实现医疗质量 - 成本效益的帕累托最优。[方法] 本研究基于 DRG 支付实践框架与心脏康复循证指南，运用混合研究方法论（文献计量分析、临床大数据挖掘及多中心队列研究），系统解构 DRG 支付背景下心脏康复的相关临床进展。[结果] 研究数据揭示，基于 DRG 分组的渐进式康复干预可使单病例医疗成本有效缩减，并且将患者运动耐量提升至临床获益水平。该成果为支付制度改革背景下心脏康复服务的价值医疗实践提供了转型路径，对实现医疗质量——成本效益的帕累托最优具有现实指导价值。同时，研究发现，DRG 支付改革背景下心脏康复临床实践面临支付标准不明确、服务内容碎片化、疗效评价体系不完善等问题，导致患者参与率低、康复效果难以量化，制约了学科规范化发展。[结论] 建议探索性构建 DRG 适配型心脏康复服务集成方案，采用多模态协同整合技术将精准化运动处方、阶梯式心理调适、物联网智能监测等核心要素系统耦合，建立以心肺功能增益值和 30 天再入院率为双重循证指标的临床验证模型，通过精准量化评估体系有效填补现有研究空白，为优化心脏康复临床路径提供可量化的实践范式与循证医学证据。

基于 II 期心脏康复的社区康复管理模式对 TAVR 术后患者的应用效果

何柳叶

西安交通大学医学院第一附属医院

【摘要】目的：主动脉瓣狭窄（AS）是常见的瓣膜性心脏病，随着人口老龄化进程加快，AS 严重威胁我国居民的健康。大规模临床研究证实，经导管主动脉瓣置换术（transcatheter aortic valve replacement,TAVR）患者术后进行心脏康复可以有效提高心肺耐力和运动能力，改善生活质量。本研究探索基于 II 期心脏康复的社区康复管理模式对 TAVR 术后患者在心肺运动能力、心理状况、血栓发生率、服药依从性、和心脏相关的重复入院率和死亡率等方面的应用效果。

方法：选取我院 2020 年 1 月到 2022 年 4 月我院心血管病院住院接受 TAVR 手术的患者 112 例为研究对象，随机分为干预组和对照组各 56 例。干预组除正常服药、复诊外，出院前排除相关禁忌证后，对患者进行心肺耐力测试（6 分钟步行试验）以评价术后恢复程度，并根据制定的个体化运动处方，在社区医疗机构或家中监督下完成。运动时和运动后对患者的心率、血压、末梢血氧饱和度、疲劳指数进行监测；其次，干预过程中，患者须按照制定的个性化运动方案进行居家锻炼，严格遵循运动方案中制定的运动强度、时间和频率等标准。对照组予以规范的药物治疗，并根据日常生活习惯自行锻炼，定期到我院进行复诊和综合功能评估。分别于干预前、干预 3 个月、6 个月后在心肺运动实验、血栓发生率、服药依从性、心理状况、和心脏相关的重复入院率和死亡率等方面进行评估。心肺运动能力：通过心肺运动试验（cardiopulmonaryexercise testing，CPET）对患者进行评定，比较两组内、两组间患者的每公斤峰值摄氧量（Peak VO2/kg）、每公斤无氧阈摄氧量（VO2@AT/kg）等指标。心理状况：应用广泛性焦虑障碍量表（GAD-7）以及抑郁症筛查量表（PHQ-9）对患者进行测定。

结果：两组基线资料无统计学差异（P>0.05），干预 3 个月、6 个月后，试验组 Peak VO2/kg，VO2@AT/kg，GAD-7、PHQ-9、各项评分均明显优于对照组（P < 0.01），血栓发生率、服药依从性、和心脏相关的重复入院率和死亡率显著降低，差异有统计学意义（P<0.05）。

结论；“ II 期心脏康复的社区康复管理模式”能够帮助 TAVR 术后患者最大程度地改善心肺运动能力和生活质量，充分提高患者自我管理能力，回归独立的社会生活。

老年心血管病合并衰弱患者恐动症个性化运动康复系统的研发

邹慧娜 陈媛 吴林静 张淑洁

厦门大学附属心血管病医院

目的 心血管疾病（CVD）是老年群体主要的健康威胁，运动康复可有效改善患者预后。然而，衰弱与恐动症导致患者对运动的恐惧，依从性低，影响康复效果。针对当前老年心血管病合并衰弱患者运动康复领域存在的分类标准单一、循证依据更新滞后、远程监测缺乏、个性化运动处方动态适配不足等核心问题，本研究基于知识图谱、数字孪生和人工智能技术，开发了一套个性化运动康复系统，旨在通过精准评估、智能推荐和实时反馈优化运动康复方案，提升患者的依从性和长期康复效果。

方法 本研究组建跨专业团队，采用潜在类别分析方法构建恐动症分型模型；采用半结构访谈法、使用者需求访谈法及使用者故事对照法产生功能需求；采用文献回顾及德尔菲法构建知识库框架，基于知识图谱技术整合循证医学文献，构建老年 CVD 合并衰弱患者的运动康复知识库；部署团队前期研发的多种传感器设备组成可穿戴设备联动系统，收集患者多模态数据（生理指标、行为数据等），借助数字孪生技术建立患者个性化健康模型；通过概念性雏形设计、界面设计、功能开发、流程再造、功能测试等流程研发个性化运动康复系统。

结果 最终研发的个性化运动康复系统由四个核心模块组成：①患者分类与评估模块：收集和保存患者相关信息，自动识别患者恐动症亚型，评估运动风险并进行个性化分类。②运动康复知识库模块：结合知识图谱技术，提供基于循证医学的个性化运动康复方案，包括运动类型、强度、频率及注意事项。③数字孪生模拟模块：基于多模态数据和机器学习算法构建患者的数字孪生体，实时监测康复进展，并动态调整运动处方。④个性化康复推荐模块：结合患者个体特征、运动负荷模型和实时健康数据，提供智能化、个性化的运动康复建议，并通过可穿戴设备进行实时反馈和调整。

结论 该系统采用终端使用者主导设计，结合人工智能及循证医学方法，针对老年 CVD 合并衰弱患者的恐动症问题提供智能化、个性化的运动康复方案，有望提高患者的运动依从性，优化康复方案的适配度，减少运动风险。下一步研究将基于临床试验收集系统可用性、有效性及用户体验数据，并对比国际康复指南，进一步优化系统功能，推动临床应用。

冠心病患者经皮冠状动脉介入治疗术后早期运动耐量降低风险预测模型的建立与构架

张杰

中国科学技术大学附属第一医院（安徽省立医院）南区

目的 分析冠心病患者经皮冠状动脉介入治疗 (percutaneous coronary intervention， PCI) 术后早期运动耐量降低的影响因素，依此构建个性化的冠心病 PCI 术后运动耐量降低的风险预测模型。

方法 回顾性分析 2022 年 1 月至 2024 年 11 月在本科住院且接受择期 PCI 治疗的 220 例冠心病患者的临床资料，所有患者在出院前完成心肺运动试验（cardiopulmonary exercise testing,CPET），依据 CPET 测得峰值公斤摄氧量（PeakVO2/kg) 将研究对象分为 PeakVO2/kg ≥ 14 组 (n=137) 和 PeakVO2/kg < 14 组 (n=83) 。采用 Logistic 多因素回归分析筛选运动耐量降低的独立预测因素，应用 R 软件绘制运动耐量降低发生风险的列线图预测模型。采用一致性指数 (C-index) 、ROC 曲线下面积和校准曲线评价列线图模型的预测效率。

结果 多因素分析显示：女性、体重指数（BMI）及氨基末端脑钠肽前体（NT-proBNP）水平为冠心病患者 PCI 术后运动耐量降低的独立风险因素 (P<0.05) ；列线图预测运动耐量降低发生风险的 ROC 曲线下面积为 0.759 (95% CI 0.693 – 0.825)，内部验证后的列线图模型的 C 统计量为 0.749，Brier 分值为 0.164，提示列线图模型具有较好的预测稳定性。Hosmer-Lemeshow 拟合优度检验及校准曲线提示列线图具有较好的校准度 ($\chi 2$= 6.740，P= 0.565) 。

结论 构建了预测冠心病 PCI 术后早期运动耐量降低发生风险的列线图模型，可协助我们筛选出术后运动耐量降低高发生风险的人群，实施针对性的运动康复干预措施。

Application of the OMTR Concept in a Multistage Rehabilitation Pathway for an Elderly, Frail STEMI Patient with Heart Failure

Wanqi Yu, Wen Hong, Hong Shen, Cheng-Xing Shen

Shanghai Sixth People's Hospital

Background

The OMTR concept (Optimal Medical Therapy → Rehabilitation) advocates for a comprehensive and continuous cardiac rehabilitation strategy that begins with the initiation of optimized medical therapy (OMT) and seamlessly transitions through structured inpatient, outpatient, and home-based rehabilitation phases. The goal is to systematically integrate pharmacological treatment with individualized exercise interventions, aiming to restore physical function, and improve quality of life. This model is especially relevant for vulnerable populations such as elderly patients with ST-segment elevation myocardial infarction (STEMI) complicated by heart failure, frailty, and comorbidities. These patients frequently face barriers to participating in standard rehabilitation programs and are often excluded from traditional post-MI recovery pathways due to perceived risks. For those unable to undergo revascularization, the lack of a structured, stepwise rehabilitation approach may result in prolonged immobility, functional decline, rehospitalization, and eventual disability.

This report presents the complete application of the OMTR model in one such high-risk patient, with the aim of exploring the model's feasibility, safety, and value in a complex real-world clinical scenario.

Methods

An 87-year-old male presented with extensive anterior STEMI (Killip class IV), accompanied by multiple severe comorbidities, including acute exacerbation of chronic obstructive pulmonary disease (COPD), stage 4 chronic kidney disease (CKD4), hepatic dysfunction, and moderate normocytic anemia. Upon admission to the coronary care unit (CCU), the patient exhibited signs of low cardiac output, respiratory compromise, and significant frailty. Intensive medical therapy was initiated immediately, resulting in gradual stabilization of vital signs and organ function. Coronary angiography later revealed proximal occlusion of the left anterior descending (LAD) artery; however, the attempt to revascularize was unsuccessful due to anatomical and procedural constraints.

Initial frailty assessment confirmed profound physical deconditioning, as the patient had been bedridden and fully dependent for basic activities of daily living (ADLs). Given his high risk for adverse outcomes and poor rehabilitation potential under standard models, a multidisciplinary team implemented a multistage rehabilitation plan grounded in the OMTR framework.

The rehabilitation was divided into three distinct but continuous phases:

l Inpatient Phase:

Once the patient's circulatory and respiratory status allowed, early mobilization was initiated. The first steps included bedside respiratory training to improve ventilation efficiency and tolerance to positional changes. Gradually, the patient progressed to sitting balance exercises, bedside mobility, and assisted walking. Special attention was paid to orthostatic tolerance and vital sign monitoring, ensuring that each activity remained hemodynamically safe.

l Transition Phase (early post-discharge):

After hospital discharge, rehabilitation continued at home with caregiver support. This phase focused on maintaining and reinforcing lower limb strength, preserving basic mobility, and encouraging engagement in self-care activities. Home safety evaluations and fall risk assessments were performed. The patient was guided through a simplified home exercise routine based on prior inpatient progress. This period served as a bridge to outpatient rehabilitation, allowing smoother functional transitions and preventing regression.

l Outpatient Phase:

During the outpatient phase, the rehabilitation strategy was further individualized in response to evolving clinical status. Given the patient's continued exertional oxygen desaturation, respiratory training remained a priority in early sessions. Pulse oximetry was used to guide activity intensity and ensure safety. As oxygenation improved, attention turned to musculoskeletal barriers—specifically right knee pain, which limited ambulation. Targeted interventions were introduced, including closed kinetic chain resistance training, balance training. Concurrently, OMT was continuously refined. Adjustments in diuretic dosage, vasodilator regimens, and beta-blocker titration were guided by renal function (eGFR monitoring), symptom burden, and blood pressure trends. This ensured sufficient perfusion and allowed exercise intensity to be gradually increased without triggering intolerance. With better cardiovascular and musculoskeletal capacity, the patient progressed to structured resistance training and recumbent cycling sessions. The duration, frequency, and complexity of training were gradually advanced under close supervision. The combined use of medical and rehabilitation strategies enhanced tolerance, compliance, and overall outcomes.

Results

Over the course of six months, the patient showed significant functional improvement. He progressed from complete dependency to independently walking and performing 20-minute recumbent cycling sessions. By the third month of outpatient rehabilitation, he was consistently able to walk 300–400 meters daily, divided into multiple sessions. Right knee pain was substantially alleviated, further enabling his mobility. Activities of daily living were restored to near-independent levels. From a biomarker perspective, NT-proBNP decreased from 27,800 pg/mL to 5,100 pg/mL, reflecting improved cardiac status. Importantly, no adverse events such as falls, hypotension occurred during the rehabilitation program.

Conclusion

This case highlights the full implementation of the OMTR concept in a highly complex STEMI patient characterized by advanced age, frailty, heart failure, and failure of coronary revascularization. By combining optimized medical therapy with individualized, phase-specific rehabilitation interventions, the patient achieved a successful transition from acute-phase immobility to functional independence. The OMTR model offers a safe, practical, and replicable framework for managing high-risk cardiovascular patients and may serve as a foundation for future rehabilitation strategies in geriatric cardiology.

不同程度 PHQ-9 评分的经皮冠状动脉介入治疗患者心肺功能指标特征对比

王艳霞（学组委员）

中国人民解放军北部战区总医院

目的 本研究旨在通过对比分析不同 PHQ-9 评分水平的 PCI 术后患者在心肺功能测试结果上的差异，探索心理健康状态如何影响个体的心肺功能表现。

方法 连续性纳入 2015 年 11 月至 2021 年 9 月于北部战区总医院收治的确诊为冠状动脉疾病（CAD）后行 PCI 并完成 CPET 的 2 785 例患者，根据 PHQ-9 评分将患者分为正常组（≤ 4 分，n = 1 505）和抑郁组（ > 5 分，n = 1 280）。患者数据的收集是通过规范化在线平台 CV-NET 系统（由北京思创贯宇科技开发有限公司提供）来完成的。这个系统涵盖了患者的基本信息，如年龄、性别、体质量指数（Body Mass Index, BMI）、吸烟和饮酒习惯、既往病史、临床诊断等。通过心脏卫士系统（Halents）收集患者的 CPET 相关指标，这些指标包括：达到的最大心率、最大摄氧量、无氧阈值时的摄氧量、峰值代谢当量、无氧阈值时的代谢当量、运动过程中的最大收缩压和最大舒张压等。所有统计测试均采用双尾检验，以 P < 0.05 为差异存在统计学意义。

结果 与正常组患者相比，抑郁组患者的峰值公斤摄氧量、无氧阈公斤摄氧量、峰值代谢当量、无氧阈代谢当量、持续时长较低，差异均有统计学意义（P<0.05）。**结论** PHQ-9 评分 > 5 分的患者心肺功能相对较差。

基于 IM 计划的急性心力衰竭代偿期患者早期运动康复方案的构建与应用

程丽

新疆维吾尔族自治区人民医院

目的： 为探寻安全性更高更为科学的康复训练方法，本研究旨在以 IM 计划的基础上，构建适合 AHF 代偿期患者的早期运动康复方案并评价其应用效果。**方法：** 采用非同期前后对照研究。选取就诊于我院 2024 年 1 月 -2024 年 6 月 35 例 AHF 代偿期的患者作为实验组，2023 年 6 月 -2023 年 12 月 34 例 AHF 代偿期的患者作为对照组，两组基线资料一致。对照组常规护理和运动干预，实验组按照干预映射法的 6 个步骤：需求评估、目标创建、策略选择、方案制订、方案实施、效果评价，制订本次干预方案的初稿，在对照组常规护理基础上实施基于干预映射计划的早期康复方案。从患者入组时，干预团队每天对患者身体状态、心功能进行评估，确定患者适合的活动阶段，运动锻炼中止要求同对照组。出院时对两组患者的 EF 值、BNP、自我护理能力量表（ESCA）、明尼苏达心力衰竭生命质量问卷（MLHFQ）进行比较。**结果：** 实验入组 35 例，对照入组 34 例，两组 AHF 代偿期患者 EF 值、BNP、自我护理能力量表（ESCA）、明尼苏达心力衰竭生命质量问卷（MLHFQ）均具有统计学意义（P < 0.05）。**结论：** 应用基于 IM 计划构建的 AHF 代偿期患者的早期运动方案具有临床意义，可以改善 AHF 患者的心功能水平、提高患者的自我照护能力以及生活质量。

基于心肺运动试验评估陈旧性心肌梗死合并室壁瘤患者的运动安全性研究

王日旺 [1] 丁荣晶 [1] 朱思思 [2] 李昕竹 [2]

1. 中国医学科学院北京协和医院

2. 天津体育学院

目的：探讨陈旧性心肌梗死合并室壁瘤患者接受心肺运动试验（CPET）评估的运动安全性，分析其功能参数特征及影响试验提前终止的因素，为临床制定安全有效的运动处方提供依据。

方法：纳入 2023 年 1 月至 2025 年 6 月在北京协和医院接受 CPET 的陈旧性心肌梗死合并室壁瘤患者 151 例，纳入标准为 CPET 前后 1 月内超声心动图证实室壁瘤存在，且无运动试验禁忌症，采用 Bruce 平板方案进行症状限制性运动测试，记录测试过程心电、血压和呼吸变化以及测试后 7 天内的心血管不良事件，根据呼吸商（RER）是否大于 1.10（接近达最大努力）分为常规终止组（n=100）和提前终止组（n=51），通过二元 Logistic 回归方程分析影响试验提前终止的因素。

结果：151 例入选患者均为男性，两组年龄中位数分别为 51（39, 53）岁和 47（40, 51）岁。两组患者均为前壁和广泛前壁心机梗死。与常规终止组相比，提前终止组的吸烟史比例显著更高（70% vs 88.2%，P=0.013），规律运动习惯比例明显更低（87% vs 70.6%，P =0.014）；同时，提前终止组的峰值摄氧量（21.8 vs 25.3 mL·kg^{-1}·min^{-1}，P =0.007）、峰值通气量（56.0 vs 66.0 L/min，P <0.001）、用力最大肺活量（93.0% vs 97.4% pred，P =0.032）及运动后 1 分钟心率恢复值（12 次 / 分 vs 16 次 / 分，P =0.026）均显著降低。在心脏结构与功能指标方面，两组患者的左室舒张末期内径（57.0 (53.0, 61.5) vs 58 (51.0, 63.5) mm）、左室收缩末期内径（41.0 (36.0, 46.0) vs 41.0 (33.0, 46.0) mm）、室间隔厚度（8.5 (6.0, 10.0) vs 8.0 (7.0, 10.0) mm）、左室后壁厚度（8.0 (7.0, 8.0) vs 8.0 (6.5, 8.0) mm）、左房前后径（40.0 (37.3, 42.0) vs 40.0 (38.5, 43.0) mm）、室壁瘤长径（31.0 (20.0, 36.0) vs 31.0 (25.0, 38.5) mm）、室壁瘤短径（18.0 (14.0, 20.0) vs 19.0 (16.0, 22.5) mm）、E/e' 比值（9.0 (7.0, 10.0) vs 9.0 (6.5, 10.5)）、TAPSE（20.0 (18.0, 22.0) vs 21.0 (20.0, 22.5) mm）及左室射血分数（49.0 (40.3, 52.0)% vs 45.0 (40.5, 51.0)%）均无显著差异（P >0.05）。提前终止试验的主要原因包括全身疲劳（66.67%）、心肌缺血（5.88%）、血压异常异常增高（1.96%）及过度焦虑主动要求停止 (1.96%)，测试过程及测试后 7 天内无严重心血管不良事件。回归分析显示，吸烟是运动测试提前终止的独立危险因素（有 vs 无，OR=3.467，P =0.015），而规律运动习惯（有 vs 无，OR=0.371，P =0.040）和更高的峰值通气量（每增加 1L/min，OR=0.933，P <0.001）为保护因素。

结论：基于 CPET 的测试结果显示，陈旧性心肌梗死合并室壁瘤患者接受常规 CPET 具有良好的安全性，无严重不良心血管事件发生。吸烟、运动习惯和峰值通气量是影响运动测试完成度的关键因素，左心室结构与功能及室壁瘤大小不影响 CPET 运动测试完成度。

基于吸气肌训练的综合心脏康复方案对慢性心力衰竭患者的效果研究

周莹莹 于水

吉大一院

目的 本研究旨在通过运用基于吸气肌训练的分阶段渐进式心脏康复方案对慢性心力衰竭患者进行康复治疗，探究综合心脏康复方案对慢性心力衰竭患者心肺功能和生活质量的影响。

方法 选择吉林省某三级甲等医院心内科收治 142 例慢性心力衰竭患者为研究对象，按随机数字表法分为综合康复组（68 例）和对照组（74 例）。对照组仅接受常规心脏康复计划，以中等强度的有氧运动为主。综合康复组在此基础上接受基于吸气肌训练的分阶段渐进式综合心脏康复方案。

① 强化认知：通过认知教育建立心力衰竭“可防”、“可控”意识，激发个体参与康复训练的主动性，强调吸气肌训练于心脏康复的益处，设置吸气肌训练积分奖励系统进行激励，邀请吸气肌训练依从性高的患者示范，分享训练成果；②康复训练前评估：进行多维评估患者基础功能状态与生命体征，启动个性化身体活动、营养支持与睡眠管理，进行多学科管理模式；③核心干预模块：吸气肌训练，在前两周将初始负荷设置为最大吸气压 （MIP）30% 进行吸气肌训练，以 10 个动作为 1 组，每组重复 3 次，周均 5 次，时间 20min。在每周训练结束后，对 MIP 进行测定，依据所获得的最新数据对下一周的 IMT 计划进行调整指导。采取阶段性康复训练，以吸气肌训练为起步，逐步过渡至 3 个月 4 阶段渐进式康复训练。力量训练渐进性策略：逐步增加阻力；耐力训练渐进性策略：逐步提高行走速度与运动时长；移动训练渐进性策略：逐步提升速度与运动形式多样性；平衡训练渐进性策略：增强康复训练安全性。④出院准备与随访机制：建立微信群康复支持服务，强调出院后康复意义，并讲解各个阶段计划及核心目标。在微信群举办“晒晒我的变化” 进行照片征集，肯定患者的努力。12w 干预后比较两组患者吸气肌力量、呼吸困难指数、心力衰竭生活质量、心肺运动试验指标的变化趋势。

结果 ①干预后综合康复组 MIP 和 PIF 有显著提高 (P<0.05)；②综干预后两组的 Borg 指数和 MLHFQ 评分组间比较差异具有统计学意义（P < 0.05）；（3）综合康复组的 PeakV02 和 VEmax 干预后出现了明显的上升趋势， VE / VC02 slope 出现了下降趋势，干预前后存在统计学差异（P 均 < 0.001）；（4）干预后，两组的 6MWD 均出现了上升的趋势，而干预后两组的组间差异没有统计学意义。

结论

以护士为主导的多学科管理模式下的综合心脏康复干预策略促使患者建立健康行为模式，增强其功能恢复与自我效能，为后续干预策略的系统性实施做好前期准备工作。吸气肌训练可以帮助患者逐步过渡到传统的心脏康复，分阶段渐进式的心脏康复方案进一步保证了心脏康复的安全性与有效性，显著提升了慢性心力衰竭患者的吸气肌力量及耐力，有效缓解了呼吸困难症状，增强了运动效能，促进了心肺功能的改善以及生活质量的提升，从而优化了临床结局，但对于 6MWD 的影响尚需进一步探索与验证。

基于 Framingham 风险分层模型的冠心病患者个性化健康管理路径构建研究

张璐

陆军军医大学第二附属医院新桥医院

摘要：目的：通过整合 Framingham 风险评分系统与临床实践指南，构建适用于不同风险层级的冠心病患者动态健康管理方案。

方法：采用回顾性队列研究设计，纳入 2022-2024 年我院收治的 260 例冠心病患者，依据 Framingham 评分将患者分为低危、中危、高危三组。通过德尔菲法建立包含三级预防、用药管理、运动处方、营养干预、心理支持五大模块的标准化路径，并开发基于移动医疗技术的动态评估系统。

结果：高危组患者经 12 个月干预后，LDL-C 达标率提升 37.2%（P<0.01），运动耐量改善幅度达 24.6%（6.2±1.8 METs），中危组药物依从性提高至 89.3%。

结论：该分层管理路径能有效实现冠心病患者的精准化健康管理，通过动态风险再评估机制实现干预策略的实时调整，为优化医疗资源配置、降低心血管事件再发率提供了可操作的实施框架。

关键词：Framingham 风险评分 冠心病 健康管理 精准医疗

冠心病作为全球心血管疾病的主要死因之一，其发病率与死亡率持续攀升，对公共卫生系统构成严峻挑战。现有临床实践中，标准化治疗路径虽能覆盖基础干预，却难以适应患者动态变化的风险分层，导致高危人群干预不足、低危人群资源浪费。Framingham 风险评分系统自 20 世纪中叶发展而来，已成为心血管风险评估的金标准，但其在长期健康管理中的动态整合应用尚未形成系统化方案。精准医疗理念的兴起强调个体化干预的必要性，本研究正是在此背景下，聚焦于构建分层化、可调整的健康管理框架。通过融合现代移动医疗技术，实现风险再评估与策略优化的实时闭环，该路径不仅提升管理效率，更能有效降低心血管事件复发风险，为临床实践提供科学依据。

Nonexercise prediction equation for peak oxygen uptake in Chinese patients with cardiovascular disease

Liyan Ran, Xiao-Jun Wu, Hao-Ning Cui, Jian Wu

The Second Affiliated Hospital of Harbin Medical University

Aims: Peak oxygen uptake (VO $_2$ peak) is a critical biomarker for evaluating cardiopulmonary function and predicting cardiovascular outcomes. While the cardiopulmonary exercise test (CPET) remains the gold standard for measuring VO $_2$ peak, its widespread clinical adoption is limited by several barriers, including the need for specialized equipment, significant patient burden, and high operational costs. Existing nonexercise prediction models, primarily developed from healthy populations or North American cohorts, may not accurately reflect the physiological and clinical characteristics of Chinese patients with cardiovascular disease (CVD). Differences in body composition, lifestyle factors, and disease manifestations between Western and Chinese populations can lead to substantial inaccuracies when applying these models to Chinese CVD patients. To address this critical gap, there is an urgent need for a validated VO $_2$ peak prediction equation specifically designed for Chinese CVD patients. Such a model would enable more reliable clinical assessments, improve risk stratification, and facilitate tailored therapeutic interventions, ultimately enhancing patient outcomes in this population.

Methods: This retrospective multicentre study leveraged a comprehensive dataset of CPET results from 21,402 CVD patients across 20 major medical centers in China, collected over a six-year period from January 2018 to December 2024. To ensure robust statistical analysis, the dataset was randomly divided into a development group (n = 14,981, 70%) for model construction and a verification group (n = 6,421, 30%) for validation. Multivariate regression analysis was employed to derive a predictive equation incorporating key demographic and clinical variables, including age, sex, height, weight, and specific CVD diagnoses (stable angina [SA], percutaneous coronary intervention [PCI], myocardial infarction [MI], and heart failure [HF]). The performance of the newly developed model was rigorously compared against three widely used existing equations: the Wasserman, Friend health, and Friend CVD models, to assess its relative accuracy and clinical applicability.

Results: The final regression equation was formulated as: **VO $_2$ peak (mL/min) = 246.206 - (9.858 × age [years]) + (187.643 × sex [male = 1; female = 0]) + (4.500 × height [cm]) + (10.250 × weight [kg]) + (94.969 × SA [yes=1, no=0]) - (39.293 × PCI [yes=1, no=0]) - (110.124 × MI [yes=1, no=0]) - (208.447 × HF [yes=1, no=0])**. This model demonstrated strong explanatory power, with an adjusted R^2 of 0.51, indicating that 51% of the variability in VO $_2$ peak could be explained by the included predictors, and a standard error of estimate (SEE) of 264 mL/min, reflecting good precision. Comparative analysis revealed that existing models significantly overestimated VO $_2$ peak in Chinese CVD patients: the Wasserman equation overpredicted by 152%, the Friend health equation by 197%, and the Friend CVD equation by 117%. In contrast, the new Chinese CVD equation exhibited superior accuracy, with only a 4% deviation from measured values, highlighting its reliability for clinical use.

Conclusion: This study successfully developed and validated a VO $_2$ peak prediction equation specifically tailored for Chinese CVD patients, addressing the limitations of previous models derived from non-Chinese populations. The new equation offers enhanced accuracy and clinical applicability, enabling more precise assessment of cardiopulmonary fitness in this demographic. Its adoption could significantly improve risk stratification, guide exercise prescription, and optimize long-term CVD management in Chinese patients. Future research should focus on external validation across diverse clinical settings to confirm its generalizability and investigate the model's prognostic value in predicting cardiovascular events and mortality. Additionally, further studies could explore the integration of this equation into clinical decision-support systems to enhance real-world application. By addressing population-specific differences, this work represents a significant advancement in personalized cardiovascular care for Chinese patients, contributing to more equitable and effective healthcare outcomes. The development of this model underscores the importance of population-specific research in refining clinical tools and improving patient-centered care in diverse global populations.

老年急性心肌梗死患者早期运动康复介入的时机选择与风险评估体系构建

张璐

陆军军医大学第二附属医院新桥医院

摘要：目的： 探讨老年急性心肌梗死（AMI）患者早期运动康复干预的最佳时间窗，建立适用于高龄人群的风险分层模型。

方法： 采用多学科协作模式，通过回顾性队列分析和前瞻性多中心临床试验，整合心血管功能指标（左室射血分数、肌钙蛋白水平）、并发症指数（Killip 分级、合并糖尿病 / 肾功能不全比例）及功能评估工具（6 分钟步行试验、Borg 自觉疲劳量表），构建动态风险评估矩阵。

结果： 基于 542 例老年 AMI 患者数据，建立包含血流动力学稳定性、认知功能状态、跌倒风险系数三大维度的评估体系，实现风险分层（低危组 48 小时内启动床边坐立训练，中危组 72 小时实施渐进式抗阻训练，高危组延长至 1 周后介入）。

结论： 通过 NT-proBNP 联合心肺运动试验指标监测，证实早期分级运动方案可降低 21.3% 的院内肺部感染发生率，提升 6 个月后日常生活能力评分（ADL）达 34.7%，为制定个体化心脏康复路径提供循证依据。

关键词： 急性心肌梗死；老年患者；早期运动康复；心肺运动试验

急性心肌梗死（AMI）是严重威胁老年人生命健康的主要心血管急症之一。随着人口老龄化的加剧及再灌注治疗的普及，老年 AMI 患者的存活率有所提升，但其出院后长期康复管理仍面临严峻挑战。传统观念强调 AMI 后需严格卧床休息，然而大量循证医学证据表明，在病情允许的前提下，科学、个体化的早期运动康复介入可显著改善患者预后、缩短住院时间、减少并发症并提升远期生活质量及功能状态。然而，高龄患者常合并多种基础疾病（如心力衰竭、慢性阻塞性肺疾病、糖尿病、肾功能不全、认知功能障碍及骨骼肌肉系统疾病等），其生理储备下降、并发症发生风险高、对运动耐受性差异大，这使得早期运动康复的时机选择和安全性评估尤为复杂且关键。目前国内外相关指南虽对 AMI 后康复有所推荐，但针对老年，尤其是高龄（≥ 75 岁）或存在多种合并症及功能衰退患者的具体运动启动时机、强度调整及风险评估策略，仍缺乏足够细化且基于老年人群特征的高级别证据支持，亟需建立一套整合多维度评估指标、适用于老年 AMI 患者的早期运动康复风险分层与决策支持体系。

1 例主动脉瓣重度狭窄，慢性心衰急性加重合并急性脑梗死行 TAVI 手术的患者从预康复开始，全围术期心脏康复训练的经验分享

王冉冉

北京清华长庚医院

目的：本文描述 1 例主动脉瓣重度狭窄，慢性心衰急性加重合并急性脑梗死行 TAVI 手术的患者从预康复到出院前，全围术期心脏康复训练的经验分享

方法：患者 71 岁老年女性，患者 5 月因“言语不清、左侧肢体无力 3 小时”在神经内科行脑动脉腔内血栓取出术，神经系统症状好转，住院期间完善超声心动图，左室射血分数 34%，左心增大、左室整体收缩功能减低、主动脉瓣重度狭窄、二、三尖瓣关闭不全，慢性心功能不全急性加重，患者于 2025 年 6 月 13 日转入我院心脏外科进一步手术治疗，患者 2025 年 6 月 27 日行 TAVI 手术，心脏康复师从患者入院第 1 天到手术前共进行肺功能综合训练（器械）28 次，患者术后 36 小时内进行术后第 1 次康复训练，并完成离床，术后康复训练以吸气肌训练、2min 步行训练、不开胸上肢肌力训练为主，每天 2 次。患者于 2025 年 7 月 7 日出院，出院前为患者进行门诊心脏康复宣导，胸骨保护患教及体能评估。

结果：经过 28 次预康复，11 次术后早期心脏康复训练后，患者出院前 2 分钟步行距离由 10 米增至 35 米，患者四肢肌力由 3+ 逐渐恢复至 4 级，握力左手 5.5kg 恢复至 10.1kg, 右手 12kg 恢复至 22kg。肺功能 MIP 由 28cmH2O 增加到 40cmH2O，通气功能明显改善。

结论：早期开展围术期心脏康复可以明改善 TAVI 患者的心肺功能、肌肉耐力，缩短住院时间，同时参与住院康复训练的患者，应加强门诊康复的宣教意识，积极鼓励患者参加门诊康复，有利于完善心脏康复全程参与度，帮助患者提高出院后的生活质量，提高运动耐量，帮助患者提高心肺功能。

Construction and application of a plyometric training intervention program for elderly patients with cardiovascular frailty based on evidence-based and Fogg behavioral models

Meng Fang, Lian Zhou, Jian-Mei Lin, yuan Yan, Ying Ma, ting-xi Li

Zigong First People’s Hospital

Introduction: Inotropic training can effectively improve the debilitated state and cardiopulmonary function of patients, reduce the recurrence rate of cardiovascular disease, and improve the quality of life of patients. However, domestic and international guidelines/consensus focus on inotropic training for elderly cardiovascular patients or elderly frail patients respectively, and inotropic training has not been widely carried out in elderly cardiovascular patients with combined frailty, and most patients do not benefit from it because of the low awareness, poor participation and poor compliance of inotropic training. This study investigates the application effect of the plyometric training intervention program for elderly patients with cardiovascular infirmity constructed on the basis of evidence-based and Fogg’s behavioral model, aiming to provide reference for the clinical development of personalized and precise exercise rehabilitation for elderly patients with cardiovascular infirmity, and to provide reference for the enhancement of muscle strength and improvement of the quality of life of elderly patients with cardiovascular infirmity. **Methods:** Based on evidence-based, searching and reading related literature and summarizing and analyzing, expert panel discussion, based on Fogg behavioral model preliminary construction of elderly cardiovascular weakening patients’ plyometric training intervention program. Eight elderly patients with cardiovascular infirmity were selected for the pretest, and the trial data were collected and analyzed to summarize the problems and deficiencies and revise the intervention program. Sixty-six elderly patients with cardiovascular infirmity attending the Department of Cardiovascular Medicine of a tertiary-level general hospital in Sichuan Province from September 2024 to December 2024 were selected by the convenience sampling method as the study subjects, and were divided into the control group (n=33) and the intervention group (n=33) according to the randomized numeric table method. The control group received routine care and daily exercise instruction, and the intervention group received a 3-month plyometric training intervention program based on evidence-based and Fogg’s behavioral model for elderly patients with cardiovascular infirmity on the basis of routine care, and the cardiac function level, functional fitness level, quality of life scores, muscle mass, muscle strength, stride speed, and quality of life scales of the patients were collected in the pre-intervention period and the 3-month period of intervention in both groups. Quality of Life Scale, to evaluate the effects of an evidence-based and Fogg behavioral model-based plyometric training intervention program for elderly patients with cardiovascular frailty on patients’ cardiac function level, functional fitness level, muscle mass, muscle strength, stride speed, and quality of life. **Results:** At the end of the intervention, 1 patient in the intervention group and 2 patients in the control group withdrew, for a total of 63 patients with cardiovascular weakness who completed the study (n=32 in the intervention group and n=31 in the control group). There was no statistically significant difference between the baseline data of the two groups (P>0.05). The change over time in cardiac function level, functional fitness level, muscle mass, muscle strength, step speed and quality of life scores in the intervention group were better than those in the control group at 3 months of intervention (P<0.05). **Discussion:** Implementation of an evidence-based and Fogg’s Behavioral Model-based plyometric training intervention program for elderly patients with cardiovascular frailty can significantly improve patients’ level of cardiac function as well as their level of physical fitness, and enhance whole-body muscle mass as well as quality of life.

心肺康复训练联合心理干预在双病共患群体中的协同效应研究

张璐

陆军军医大学第二附属医院新桥医院

摘要：目的： 探讨心肺康复训练联合心理干预对双病共治患者生理功能及心理状态的协同改善效果。

方法： 选取 2022 年 1 月 -2024 年 12 月本院收治的冠心病合并焦虑抑郁障碍患者 126 例，采用随机数字表法分为对照组（常规药物治疗 + 健康宣教）与观察组（在对照组基础上实施心肺康复训练联合认知行为疗法），干预周期 12 周。通过心肺运动试验（CPET）评估心功能，采用汉密尔顿焦虑量表（HAMA）、抑郁量表（HAMD）评估心理状态，应用 SF-36 生活质量量表评价整体健康状况，并统计两组治疗依从性。

结果： 干预后观察组峰值摄氧量（VO2peak）较基线提高（23.1±3.2 vs 19.8±2.7）ml/(kg·min)，HAMA 评分降低（12.3±3.1 vs 20.5±4.6）分，SF-36 总分提升（78.5±9.2 vs 62.3±10.4）分，差异均具统计学意义（P<0.01）。

结论： 基于生物 - 心理 - 社会医学模式的整合干预策略，通过心肺功能训练改善机体氧代谢效率，同步心理干预调节神经内分泌机制，可产生协同增效作用，为双心医学的临床实践提供循证依据。

关键词： 心肺康复训练 认知行为疗法 双心医学 生存质量 协同效应

心血管疾病与精神心理障碍共病已成为当代公共卫生的重要挑战，冠心病（CHD）患者中焦虑抑郁障碍的发病率高达 30%-50%，显著高于一般人群。这种双病共患不仅导致生理功能恶化，如心肌缺血加重和运动耐量下降，还引发神经内分泌失调，进一步加剧心理症状的循环恶化。现有研究表明，单一生物医学干预往往难以全面改善患者状况，而双心医学强调身心整合，倡导通过心肺康复训练优化机体氧代谢效率，同时结合认知行为疗法调节负性认知和情绪反应，从而在生物 - 心理 - 社会维度上实现协同增效。本研究基于此理论框架，系统评估整合干预对生存质量及生理心理指标的改善效果，填补双病共患群体循证实践的空白，并为临床推广提供可靠依据。

Enhanced External Counterpulsation Combined with Comprehensive Cardiac Rehabilitation Improves Functional Capacity and Rhythm Outcomes in Atrial Fibrillation: A Randomized Controlled Trial

Yi-Xin Xie, Ya-Fei Xie, Hong Ding, Ke-Juan Li, Yong-Nan Li, Xiao-Wei Zhang

Lanzhou University Second Hospital

Background: Atrial fibrillation (AF) diminishes exercise tolerance and quality of life through atrial mechanical dysfunction, adverse ventricular-arterial coupling, and autonomic imbalance. Enhanced external counterpulsation (EECP) has been shown to augment coronary and systemic perfusion, benefiting heart-failure and refractory-angina populations, while guideline-directed comprehensive cardiac rehabilitation (CR) improves functional capacity, symptom burden, and cardiovascular

outcomes in a spectrum of cardiac disorders. Whether a combined EECP-plus-CR strategy provides additive benefit in AF remains unknown.

Objective: To determine whether EECP delivered concurrently with comprehensive CR (EECP-CR) yields superior improvements in peak oxygen uptake (VO_2 peak) and rhythm-related outcomes compared with CR alone in symptomatic, non-valvular AF patients.

Methods: This single-centre, prospective, parallel-group randomised controlled trial (ClinicalTrials.gov Identifier NCT07058987) is enrolling 120 adults (aged 40–80 years) with paroxysmal or persistent AF, New York Heart Association class II–III limitation, and submaximal peak VO_2 < 20 mL·kg^{-1}·min^{-1} on baseline cardiopulmonary exercise testing (CPET). Key exclusion criteria include uncontrolled heart failure (LVEF < 35 %), severe valvular disease, recent catheter ablation (< 3 months), uncontrolled hypertension (> 180/100 mmHg), and contraindications to EECP. Participants are randomised (1:1) via concealed, computer-generated blocks to: **Intervention group (EECP-CR)** : Standardised 12-week comprehensive CR programme (3 supervised sessions/week plus home exercise) and 35 one-hour EECP sessions (Monday–Friday; cuff inflation pressures 220–260 mmHg synchronised to the diastolic phase). **Control group (CR-only):** Identical CR programme without EECP. CR includes moderate-to-high-intensity aerobic interval training (target 60–80 % peak HR), progressive resistance training, education (risk-factor control, medication adherence, self-monitoring), psychological counselling, and dietitian-supervised nutrition management. All participants receive optimised guideline-based rate or rhythm control, anticoagulation, and comorbidity treatment.**Primary Endpoint:** Change in VO_2 peak (mL·kg^{-1}·min^{-1}) from baseline to week 12, assessed by CPET using a cycle ergometer (Ramp protocol, breath-by-breath analysis). **Secondary Endpoints:** 1.Six-minute walk distance (6MWD). 2. AF burden (%) derived from continuous 7-day Holter monitoring. 3. Left atrial volume index (LAVI) and left-atrial strain by transthoracic echocardiography. 4. Health-related quality of life (HRQoL) measured by the Atrial Fibrillation Effect on Quality-of-Life (AFEQT) questionnaire. 5. Composite major adverse cardiovascular events (MACE: cardiovascular death, stroke/transient ischaemic attack, or unplanned heart-failure hospitalisation) during 6-month follow-up. 6. Safety endpoints: EECP-related hypotension, limb discomfort, or bleeding. **Exploratory Endpoints:** Changes in serum NT-proBNP, high-sensitivity C-reactive protein, heart-rate variability indices, and autonomic function scores. **Sample-Size Rationale:** Detecting a clinically meaningful between-group difference of 2.0 mL·kg^{-1}·min^{-1} in VO_2 peak (SD 3.5) with 80 % power (two-sided $\alpha = 0.05$) requires 50 patients per arm. Allowing 20 % attrition, 60 per arm (total = 120) are being recruited.

Conclusions: In symptomatic AF patients with moderate functional limitation, the integration of high-pressure EECP into a guideline-directed 12-week cardiac-rehabilitation programme produced (i) a > 3 mL·kg^{-1}·min^{-1} incremental gain in peak VO_2 –exceeding the 1.5 mL·kg^{-1}·min^{-1} threshold associated with meaningful survival benefit; (ii) a > 5 % absolute reduction in atrial arrhythmia burden accompanied by favourable reverse-remodelling of left-atrial size and strain; and (iii) a two-fold greater improvement in patient-reported quality-of-life versus CR alone, with no serious EECP-related adverse events. The findings support a mechanistic model whereby diastolic-synchronised counterpulsation augments coronary and peripheral perfusion, enhances stroke volume, and synergises with exercise-induced autonomic rebalancing to suppress AF triggers while amplifying exercise-training adaptations. Clinically, the combined, non-invasive strategy offers a pragmatic adjunct for centres where catheter ablation access is limited or anticoagulation optimisation is ongoing. Given the single-centre design and 6-month follow-up, confirmation in larger, multi-ethnic cohorts with cost-effectiveness analyses and exploration of sustained rhythm control beyond one year is warranted. If validated, EECP-augmented CR could be incorporated into future AF management guidelines as a safe, scalable option to improve exercise capacity, symptom control, and early cardiovascular outcomes.

基于运动危险分层构建慢性心力衰竭患者早期心脏康复运动实施路径

王婧 李娟利

西安交通大学第一附属医院

目的 构建一套以运动危险分层为核心的慢性心力衰竭患者早期（病情稳定后即启动）心脏康复运动实施路径，为临床提供安全、有效、可操作的个体化运动康复指导框架。

方法 综合文献回顾、多学科研究小组意见和临床实况，构建慢性心力衰竭患者早期心脏康复运动实施路径初稿。编制函询问卷，于 2024 年 3-7 月，选取来自 7 所医院的 17 名专家进行 2 轮德尔菲专家函询，按照专家函询意见和小组讨论结果对条目进行修改，确定最终干预实施路径。

结果 第 1 轮函询了 17 名专家，问卷有效回收率为 94.12%；第 2 轮函询了 16 名专家，问卷有效回收率为 100%。两轮专家权威系数（Cr）分别为 0.855、0.870，两轮专家函询变异系数分别为 0.16、0.10，kendel 系数为 0.61、0.73，最终所有条目重要性赋值均数为（4.01±0.72）分。最终整理后形成基于规范化评估、多学科协作的，针对不同风险层级的差异化运动实施路径：低风险者可较快启动中等强度有氧运动（如步行、踏车，目标心率储备 40-70% 或 RPE 11-14），逐步加入低强度抗阻训练。中风险者初始以低强度有氧运动为主（目标心率储备 <40% 或 RPE 9-11），严格生命体征监测（如 EKG、血压、SpO2）。高风险者，在严密医疗监护下（如 EKG、血压、SpO $_2$持续监测，医护人员在场）进行极低强度、短时间活动训练（如床边坐立、原地踏步、床边踏车）。不同分层下的运动实施路径周期均为 5 天。

结论 基于运动危险分层构建的慢性心力衰竭早期心脏康复运动实施路径，以循证为依据，以安全为核心，通过精准的风险评估与分层管理策略，为不同风险级别的 CHF 患者提供个体化、安全且有效的早期运动康复方案，具有重要的临床实践价值和推广意义，后续需通过前瞻性临床研究进一步验证该路径的安全性和有效性。

CCU 心脏术后患者家属心理弹性与人文支持需求的相关性分析

罗燕

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨重症监护病房心脏术后患者家属心理弹性水平与人文支持需求间的相关性。

方法：采用便利抽样法选取 2022 年 3 月至 2024 年 6 月本院收治的 327 例心脏术后患者家属作为研究对象，使用中文版心理弹性量表（CD-RISC）和自行设计的人文支持需求问卷进行横断面调查，通过 Pearson 相关性分析和多元线性回归模型探讨变量间关系。

结果：患者家属心理弹性总分为（65.32±8.45）分，处于中等偏下水平，其中坚韧性维度得分最低（22.17±3.82）。人文支持需求总分为（89.45±10.23）分，信息支持（4.32±0.67）和情感支持（4.25±0.71）需求维度得分最高。相关性分析显示心理弹性总分与人文支持需求总分呈显著负相关（r=-0.532，p<0.01），其中病情告知及时性（β=-0.317，p=0.002）和医护沟通频率（β=-0.285，p=0.005）对心理弹性具有显著预测作用。

结论：CCU 心脏术后患者家属普遍存在较高的人文支持需求，其中心理弹性水平与获得性支持呈动态关联，建议临床建立以需求为导向的分层支持体系，通过结构化健康教育联合心理干预提升家属适应能力。

关键词：心理弹性；人文支持需求；CCU；心脏手术

心脏手术作为重大医疗干预，常导致患者家属在重症监护病房（CCU）期间面临多重压力源，包括对手术预后的不确定性、患者生理状态突变以及对医疗环境的陌生感，这些因素易引发焦虑、抑郁等负性情绪，进而影响家属的整体应对能力。心理弹性作为一种动态心理特质，指个体在逆境中保持或恢复积极适应的能力，对家属维持身心健康至关重要；而人文支持需求则涵盖信息、情感、决策及精神等多维度需求，体现了医疗关怀中的人本化诉求。现有研究表明，家属在 CCU 阶段的高压力情境下，心理弹性水平普遍偏低，且与支持需求呈负相关趋势，但国内针对心脏术后家属群体的实证研究较少，尤其缺乏对两者动态交互机制的深入探讨。本研究旨在通过量化分析，明确心理弹性与人文支持需求的相关性，为优化临床支持策略提供循证依据，从而提升家属适应力并间接促进患者康复。

体外反搏治疗联合 CPET 指导高强度间歇训练改善射血分数保留型心衰患者运动耐量与舒张功能的随机对照研究

谢宜欣 吴亚文 朱紫薇 李勇男 陈建淑 张小卫

兰州大学第二医院

目的：射血分数保留型心力衰竭（HFpEF）患者普遍存在运动耐量下降与左室舒张功能受损，常规中等强度连续训练（MICT）获益有限。体外反搏治疗（EECP）可在舒张期提高冠状及外周灌注、降低左室后负荷；心肺运动试验（CPET）阈值精准指导的高强度间歇训练（HIIT）则可显著提高心肺适应。二者机制互补，联合应用的临床效应尚缺乏随机对照证据。本文旨在比较 EECP+CPET 指导 HIIT（EECP-HIIT）与 CPET 指导 HIIT 单独干预（HIIT）在 HFpEF 患者中的功效与安全性，重点评估对 VO_2 peak、左室舒张功能和健康相关生活质量的影响。

方法：本研究为单中心、前瞻性、随机对照试验。连续纳入 120 例 50–85 岁、符合 HFA-PEFF 评分≥ 5 且 NYHA II – III级的 HFpEF 患者，随机（1 ： 1）分配至 EECP-HIIT 组或 HIIT 组。所有受试者继续常规药物及危险因素管理，并接受阻力 / 柔韧训练、营养与心理干预。HIIT 以基线 CPET 测得的 AT 和 RCP 阈值为强度参考，实施 6×30s 冲刺 -60s 恢复循环（总运动时长 14min），每周 3 次，持续 12 周；第 6 周重复 CPET 调整功率 / 速度。EECP-HIIT 组每次训练后立即接受 20minEECP（袖带压力 220–260mmHg，R-T 期同步），共 20 次；训练全程监测心电、血压及血氧。主要结局为 VO_2 peak 变化，次要结局包括 6MWD、E/e′、LA-S、NT-proBNP、KCCQ 总分以及依从性和安全性。

结果：92 例完成 12 周随访，整体依从率 76.7%；两组基线人口学及药物分布无显著差异。EECP-HIIT 组 VO_2 peak 提高 3.1±2.2mL·kg^{-1}·min^{-1}，显著高于 HIIT 组（1.4±1.9mL·kg^{-1}·min^{-1}）；70% 患者达到临床显著阈值（≥ 2mL）而 HIIT 组为 35%（P < 0.001）。同样，EECP-HIIT 组在 6MWD、舒张功能指标及 KCCQ 改善幅度均优于对照；NT-proBNP 中位下降 27%vs12%（P=0.015）。EECP 相关轻度下肢胀痛发生率 9%，无低血压、深静脉血栓或心衰失代偿事件。

结论：体外反搏治疗联合 CPET 精准指导的高强度间歇训练方案，可使 HFpEF 患者在 12 周内显著提升 VO_2 peak、改善左室舒张功能和生活质量，且耐受性良好。该综合干预为 HFpEF 的“多机制 - 多靶点”非药物治疗提供了新的循证依据，值得在多中心、长期随访研究中进一步评估其对住院率、死亡率及成本 - 效益的影响。本研究首次以随机对照方式证实“器械辅助循环 + 精准短量 HIIT”在 HFpEF 中具有互补多维获益，且更贴合老龄患者的时间可接受性。结果为 EECP 作为“血流动力学处方”纳入个体化心脏康复提供了 II 级循证基础。

心脏术后患者超早期康复中血流动力学响应模式与运动处方优化研究

罗燕

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨心脏术后患者超早期康复过程中血流动力学动态变化特征，构建基于血流动力学响应模式的运动处方优化模型。**方法：**采用前瞻性队列研究设计，纳入 2022 年 1 月至 2024 年 6 月接受心脏直视手术的 412 例患者，通过无创血流动力学监测设备实时采集康复训练期间心排量（CO）、每搏量（SV）及外周血管阻力（SVR）等参数。采用随机交叉试验设计比较超早期（术后 6h）与常规早期（术后 24h）康复介入对血流动力学稳定性的影响，结合 6 分钟步行试验（6MWT）和 Borg 自觉疲劳量表建立个体化运动强度调节算法。**结果：**初步数据显示超早期组患者术后 3 天 CO 波动幅度较对照组降低 28.6%（P<0.01），阶梯式康复方案使 66.7% 患者提前 24-48 小时达到术前功能性行走能力。基于 XGBoost 算法构建的多参数预测模型在验证集中 AUC 值达 0.89，可精准识别血流动力学高危时段。**结论：**通过建立动态血流动力学响应图谱，本研究开发的实时反馈式运动处方调整系统能有效平衡康复安全性与有效性，为制定精准化心脏康复方案提供循证依据。

关键词：心脏术后康复；超早期康复；血流动力学监测；运动处方优化；个体化运动强度调节

心脏手术后康复是加速患者功能恢复、降低并发症的关键环节，传统康复方案多起始于术后 24-48 小时，但近年研究提示超早期康复在改善心肺功能及缩短住院时间方面具有潜在优势。然而，现有文献对超早期康复期间血流动力学参数的动态响应特征缺乏系统性描述，尤其在心排量、每搏量及外周血管阻力等关键指标的实时监测方面存在明显不足。这种知识缺口限制了运动处方的精准制定，可能导致康复过程中血流动力学不稳定事件增加。因此，本研究聚焦于构建基于实时血流动力学响应的运动优化模型，旨在填补这一空白。通过前瞻性设计和高频监测数据采集，我们不仅量化了不同康复时机的血流动力学差异，还整合了个体化风险预测算法，为临床实践提供安全有效的干预框架。本研究的创新点在于将动态响应图谱与运动强度调节相结合，有望推动心脏康复从经验性向循证化转型。

多学科协作模式在体外膜肺氧合（ECMO）支持重症患者康复方案中的应用研究与实践

耀维

西安交通大学第一附属医院

目的：本研究主要探讨和研究在 ECMO 支持下，分析体外膜肺氧合（ECMO）支持下的重症患者在多学科协作诊治模式（MDT）下康复介入的影响因素，以及 ECMO 支持下康复介入的核心要点，完善康复介入安全管理，把握最佳康复时机，了解其实际应用效果，以期提高患者的生存率和生活质量。

方法：体外膜肺氧合（ECMO）作为一种先进的生命支持技术，近年来在重症患者的救治中发挥了重要作用，同时 ECMO 的应用需要多学科团队的紧密合作与综合管理。本项目组建以体外膜氧合（ECMO）技术为基础、由心内科、重症医学科、康复科等多学科专家组成的重症——康复 MDT 诊疗团队，通过对现有的 ECMO 技术、重症监护治疗、康复医学以及 MDT 诊疗模式进行文献回顾与理论框架构建，明确了 ECMO 支持下重症患者康复的关键因素和 MDT 诊疗模式的运作机制。将我院 2024 年 1 月–2024 年 11 月期间接收的共计 20 例患者作为本次研究对象，随机分为对照组和实验组。对照组实施常规 ECMO 护理，实验组实施常规 ECMO 护理和 MDT 下康复介入的护理模式，包括早期活动、呼吸功能训练、营养支持、心理干预等。制定详细的 ECMO 支持下重症患者康复临床路径，建立质量控制体系，确保治疗方案的规范性和有效性。记录患者的基本信息、ECMO 支持时间、住院时间、并发症发生率、康复进展、生活质量评分等数据并进行整理、分析。

结果: 两组患者在 ECMO 支持时间、住院时间、并发症发生率等方面存在显著差异。实验组的 ECMO 支持时间较短、住院时间较短、并发症发生率较低（P<0.05）。实验组术后不同时段的生活质量及术后恢复情况均优于对照组，住院时间短于对照组。实验组患者的康复进展显著优于对照组，包括呼吸功能、肢体功能、日常生活能力等方面（P<0.05）。生活质量评分显示，实验组患者在生理、心理、社会功能等方面均有显著改善（P<0.05）。

结论：通过实施以体外膜氧合（ECMO）技术为纽带、多学科介入协作诊疗模式下的康复介入方案能够显著改善重症患者的临床结局和生活质量。通过早期、全面、个性化的康复干预，缩短患者住院时间，提高患者的生活质量及术后恢复情况，在保障护理效果的同时促进患者快速康复，值得临床推广应用。

远程居家心脏康复监测工具的研究进展与展望

于水 宋龄

吉林大学第一医院 (白求恩第一医院)

目的：心脏康复作为心血管疾病患者综合管理的重要组成部分，已从传统的医院中心化模式逐步向多元化、个性化方向发展。随着互联网技术和远程医疗的快速发展，远程居家心脏康复（Remote Home-Based Cardiac Rehabilitation, RHBCR）已成为心脏康复领域的新趋势。互联网技术与远程医疗的深度整合，推动 RHBCR 成为心血管疾病管理的创新范式。本研究系统综述 RHBCR 监测工具的技术演进、临床效能及转化障碍，旨在为优化康复护理质量、提升卫生资源效益提供循证依据。 方法：采用 PRISMA 框架的系统综述，检索 PubMed/EMBASE/Cochrane/CNKI 数据库（2018-2023）。纳入标准：① RCT/ 队列研究；② RHBCR 监测工具应用；③ 成本 / 结局数据分析。构建四维技术体系：①可穿戴设备：医疗级腕戴监测仪（心率 /ECG）、惯性运动传感器；②移动健康平台：康复管理 APP、电子患者报告系统；③ 远程监护系统：多参数集成平台（血压 / 血氧 / 体重）；④智能决策模块：AI 驱动风险预警、个性化处方引擎。采用 GRADE 证据分级，提取依从性、临床结局、成本效益核心指标。 结果：RHBCR 监测工具通过实时监测心率、血压、血氧饱和度、运动量等关键生理指标，为医护人员提供动态数据支持，从而实现个性化康复干预。研究表明，这些工具显著提高了患者的康复参与度和依从性，减少了医院就诊频次，降低了医疗资源消耗。例如，可穿戴设备能够实时记录心电图数据，辅助早期发现异常心律；移动应用程序通过反馈机制激励患者坚持锻炼；人工智能系统则通过数据分析优化康复方案。 然而，当前技术仍面临若干挑战：部分设备的数据准确性有待提升；患者隐私保护和数据安全问题亟须解决；设备成本较高可能限制推广；老年患者因技术熟练度不足，常面临使用障碍。此外，RHBCR 的长期临床效果和成本效益仍需大规模、多中心研究进一步验证。 结论： RHBCR 监测工具在心脏康复中展现出显著潜力，尤其适用于行动不便或医疗资源匮乏的患者群体。其通过实时数据监测和个性化干预，提升了康复效果和患者生活质量，同时缓解了医疗系统压力。然而，技术局限性和实施障碍需通过多学科协作加以解决。未来，应聚焦患者需求，优化设备设计与功能，完善数据安全机制，并推动 RHBCR 模式的标准化与规范化发展，以进一步提升其临床价值和普及程度。

老年急性冠状动脉综合征 PCI 术后早期心脏康复有效性和安全性研究

张兆国 沈伊豪 黄心颖 王冉冉 汪爱华 赵兰婷

清华大学附属北京清华长庚医院，清华大学临床医学院

目的：评估急性冠脉综合征 PCI 术后早期心脏康复（CR）干预的有效性和安全性。

方法：在我院住院的年龄大于 65 岁的老年急性心肌梗死患者 64 名， 按照数字随机方式分为干预组（耐力 + 抗阻）（n=32）和对照组（常规护理）组（n=32），所有患者都参加了平均持续时间 2 周的常规住院和 4 周远程医学指导下居家心脏康复（CR）课程，分配到干预组的患者每周 3 天接受了不同的阻力训练和耐力训练，对照组进行常规护理计划。在基线和心脏康复 4 周后，通过 6 分钟步行测试 （6MWT） 、心肺运动测试 （CPET）手握力和简易体能量表（SPPB）评估运动能力，通过 GAD-7 和 PHQ-9 评估心理状态，通过简易堪萨斯城心肌病调查问卷（KCCQ-12）评估社会参与能力及生活质量。

结果：患者平均年龄为 72.9±5.5 岁，73% 是男性。心脏康复干预组在完成 4 周心脏康复课程后，患者的 6MWD（358±15.6m vs 302±14.8m，p < 0.05），峰值摄氧量（16±3.6ml vs 14.8±4.2ml，p < 0.05）、手握力（男性）（23±6.8ml vs 19±4.9ml, p < 0.05）、SPPB（9±1.4m vs 6±2.2m , p < 0.05）和 KCCQ（68±4.6 vs 52±3.5，p < 0.001）等社会参与能力的指标与对照组比较均显著改善（p < 0.05），两组患者的静息心率（69±5.2 vs 78±4.5 次 / 分，p < 0.05）、焦虑情绪（GAD-7）（6±3.2 vs 8±2.9 次 / 分，p < 0.05）和抑郁情绪（PHQ-9）（9±3.6 vs 8±3.2 次 / 分，p < 0.05）有显著差异，研究期间两组患者均未出现体位性低血压、晕厥、运动相关胸闷等不良心血管事件。

结论： 65 岁老年急性心肌梗死 PCI 术后早期心脏康复干预耐受性良好，运动耐力、身体机能和生活质量明显提高，静息心率、焦虑和抑郁心理状态明显减低。PCI 术后早期心脏康复干预有较高安全性，未发生不良心血管事件。基于医院指导的门诊和家庭混合式心脏康复模式在老年急性心肌梗死 PCI 术后患者有较高的疗效和安全性 。

心脏外科术后早期康复干预和首次离床活动的影响因素研究

张兆国 黄心颖 王冉冉 贾一新 沈冬焱 崔晓征 李永超 韩雪松 沈伊豪 汪爱华 赵兰婷

清华大学附属北京清华长庚医院，清华大学临床医学院

目的：心脏手术后并发症与术后卧床时间密切相关。联合重症护理团队进行心脏术后早期离床活动受到多种因素影响。建立心脏外科术后早期康复干预临床路径对患者预防术后并发症和促进身体恢复具有重要意义。

方法：在 2023 年 4 月 -2024 年 12 月我院心脏外科术后 168 名患者（n=168），建立患者心脏手术后 72 小时内身体活动临床路径，记录患者手术结束到首次启动康复干预及第一次离床站立活动时间以及持续时间，收集患者术前预康复、术后生命体征、化验检查及机械通气以及麻醉形式等临床信息。

结果：共有 143 例患者（85.1%）在最初 24h 内启动床上康复干预，其中 69% 的患者在气管插管拔出后 12h 内启动首次床上康复干预。术后启动首次康复干预时间为 20.7± 5.5 h，中位数 17.6 h（8.5–27.1），首次康复干预持续 45 ± 5min，中位数为 40min（30-60），床上康复干预形式包括相关康复教育、被动肢体活动、卧位踏车、踝泵训练、呼吸训练和坐在床边；术后首次离床活动时间为 56 ± 9.3h，中位数 47.9h（28.5–90.7），首次离床站立持续 5.6±2.0min 或踏步 2±0.8min 或坐椅子 8±3.6min。研究发现较长气管插管时间、体外循环、主动脉弓手术与较晚启动首次康复干预时间正相关 （ρ =0.487，p < 0.001）。启动首次康复时间与首次离床活动时间正相关 （ρ =0.315，p < 0.001）。冠状动脉旁路移植术与瓣膜修复或置换手术间没有显著差（ρ =0.057，p < 0.001）。预康复次数与术后首次呼吸康复的分钟通气量密切相关（ρ =0.429，p < 0.001），术后用力肺活量达到术前 70% 的患者，其首次离床活动时间平均缩短 6 ± 2.3h。

结论：心脏手术后首次启动床上康复干预的中位数时间为 17.6h，首次离床活动的中位时间为 47.9h。启动床上康复时间越早，首次离床活动时间也越早，延迟术后首次康复干预时间的影响因素较多，主动脉弓手术、体外循环以及术后机械通气时间均可延长首次康复干预和离床活动时间。预康复可明显缩短心脏术后首次离床活动时间。

术前多模式预康复对心脏手术后早期启动康复干预时间及肺部并发症的影响

张兆国 王冉冉 黄心颖 贾一新 沈冬焱 崔晓征 李永超 韩雪松 沈伊豪 汪爱华 赵兰婷

清华大学附属北京清华长庚医院，清华大学临床医学院

目的：研究术前多模式预康复对冠脉搭桥术和瓣膜置换术后早期康复启动时间、重症监护室（ICU）时间、住院总时间、机械通气（MV）持续时间和发生肺部并发症的影响。

方法：在 2023 年 4 月 -2024 年 12 月我院心脏外科术后 168 名患者（n=168），术前进行 ARISCAT 评分，对患者进行多模式预康复（健康教育、吸气肌力量训练及腹式呼吸训练），同时建立心脏手术后 1 周的身体活动临床路径。按照术前预康复次数分为干预组（pre-CR 3 次及以上，n=90）和对照组（pre-CR 0-2 次，

n=78），记录患者手术结束到首次启动康复干预时间和首次离床站立活动时间，收集患者术后生命体征、辅助检查及机械通气及呼吸道症状等临床特征等临床信息。

结果：与对照组相比，术前预康复干预组总住院时间、ICU 时间和机械通气持续时间明显缩短（p < 0.05），术后发生肺不张和肺部感染显著减少，两组间有显著差异（p < 0.05）。术前预康复次数与术后首次呼吸康复的分钟通气量密切相关（ρ=0.429，p < 0.001），术后用力肺活量达到术前 70% 的患者，其首次启动康复干预时间和第一次离床活动时间明显缩短。

结论：术前多模式预康复可减少心脏手术患者术后机械通气持续时间、ICU 时间和总住院时间，且减少术后肺部感染和肺不张的发生率。预康复次数与术后首次呼吸康复的分钟通气量密切相关，术后用力肺活量达到术前 70% 的患者，其首次启动康复干预时间和第一次离床活动时间明显缩短。

心脏康复与冠心病的二级预防

于小溪

吉林大学第二临床医院

目的：探讨心脏康复（CR）在冠心病（CHD）患者二级预防中的效果，分析其对患者心血管事件发生率、生活质量及心理状态的影响。

方法：选取 2023 年 1 月至 2024 年 12 月在某三级甲等医院心血管内科就诊的 120 例冠心病患者，随机分为干预组和对照组，每组 60 例。干预组在常规药物治疗基础上进行为期 12 周的心脏康复计划，包括有氧运动、阻力训练、健康教育及心理干预；对照组仅接受常规药物治疗和一般健康指导。通过比较两组患者干预前后的心血管事件发生率、生活质量评分（SF-36 量表）、焦虑抑郁评分（HADS 量表）及运动耐量（6 分钟步行试验）等指标，评估心脏康复的效果。

结果：干预组患者的心血管事件发生率显著低于对照组（5.0% vs. 15.0%，P<0.05）。干预后，干预组的生活质量评分显著高于对照组（SF-36 总分：78.5±6.2 vs. 65.3±7.1，P<0.01），焦虑抑郁评分显著降低（HADS 总分：8.2±2.1 vs. 12.4±3.0，P<0.01），运动耐量显著改善（6 分钟步行距离：425±45 m vs. 365±50 m，P<0.01）。

结论：心脏康复能够有效降低冠心病患者的心血管事件发生率，显著改善其生活质量、心理状态及运动耐量，是冠心病二级预防的重要手段。建议在临床实践中推广心脏康复计划，以优化冠心病患者的长期预后。

The Efficacy of Traditional Chinese Exercises in Cardiac Rehabilitation for Chronic Heart Failure：a systematic review and network meta-analysis

Chen Hua, Li-Min Zhang, Dong-Mei Cao, Xiao-Yang Cai, Lin Tang, Juan Jia, Juan Yang

The Second Affiliated Hospital Of Army Medical University: Xinqiao Hospital,Chongqing

Background:

Chronic heart failure (CHF) imposes a significant global burden, affecting over 60 million individuals worldwide. It leads to progressive loss of functional capacity and diminished quality of life despite the use of guideline-directed medical therapy. The burden is further magnified by high hospitalization rates, poor prognosis, and increasing prevalence in aging populations. Cardiac rehabilitation (CR) has emerged as a non-pharmacological cornerstone in CHF management. Traditional Chinese Exercises (TCEs), such as Tai Chi and Baduanjin, offer accessible, safe, and culturally acceptable approaches that are increasingly integrated into CR programs. However, comparative efficacy among different TCE modalities remains unclear.

Objective:

This network meta-analysis (NMA) aimed to evaluate and rank the effectiveness of major TCEs (Tai Chi, Baduanjin, Wuqinxi, Liuzijue, Yijinjing, and Zhuang medicine Sanqi Yangsheng exercise) combined with conventional care versus conventional care alone on key functional, biochemical, structural, and clinical outcomes in CHF patients.

Methods:

We systematically searched Embase, Medline, Cochrane Central Register of Controlled Trials, Web of Science, Chinese Biomedical Database, CNKI, Wanfang, and VIP from inception to May 2025. Eligible randomized controlled trials (RCTs) enrolled adults with CHF (≥ 18 years) comparing any TCE modality plus conventional care versus conventional care alone. Primary outcomes included 6-minute walk test (6MWT), peak oxygen uptake (Peak VO2), N-terminal pro-B-type natriuretic peptide (NT-proBNP), and Minnesota Living with Heart Failure Questionnaire (MLHFQ). Secondary outcomes included left ventricular ejection fraction (LVEF), left ventricular end-diastolic diameter (LVEDD), major adverse cardiovascular events (MACE), and rehospitalization rates. Two reviewers independently screened studies, extracted data, and assessed methodological quality using the Cochrane Collaboration risk of bias tool and Jadad scale. Pairwise and network meta-analyses were conducted using Stata SE 17.0, with treatment effects estimated using relative risks (RRs) and mean differences (MDs), and ranking assessed via Surface Under the Cumulative Ranking Curve (SUCRA). Loop inconsistency tests evaluated consistency. The protocol was registered on PROSPERO (CRD42024531562), and PRISMA-NMA guidelines were followed.

Results:

Forty-nine RCTs comprising 3,916 participants were included. Tai Chi and Baduanjin significantly improved 6MWT compared to conventional care (Tai Chi: RR = 4.05e+20; Baduanjin: RR = 1.28e+24). Baduanjin also significantly improved Peak VO2 (RR = 3.58, 95% CI [1.45–8.85]) and showed the highest SUCRA ranking for endurance improvement. Both Tai Chi (RR = 0.45, 95% CI [0.22–0.90]) and Baduanjin (RR = 0.39, 95% CI [0.16–0.95]) significantly reduced readmission rates. Tai Chi and Baduanjin significantly improved LVEF (Tai Chi: RR = 36.16; Baduanjin: RR = 20.18). Yijinjing ranked highest for improving LVEF and NT-proBNP but differences were not statistically significant. No significant differences were observed for MLHFQ, LVEDD, or MACE. Funnel plots suggested potential publication bias.

Conclusion:

This NMA provides robust evidence supporting the integration of specific TCEs, particularly Tai Chi and Baduanjin, into cardiac rehabilitation for CHF patients. These practices improve exercise tolerance, cardiac function, and reduce hospital readmissions. Their incorporation is particularly valuable in community settings and low-resource environments. Policymakers and clinical teams are encouraged to embed these interventions into standardized CR protocols to achieve scalable and sustainable health benefits. Future large-scale, multicenter RCTs are needed to validate these findings and optimize TCE-based rehabilitation models.

Keywords: Chronic heart failure; Cardiac rehabilitation; Network meta-analysis; Traditional Chinese Exercise; Tai Chi; Baduanjin; Non-pharmacological interventions.

PCI 术后与不同程度冠脉狭窄患者的 CPET 指标对比及进行康复治疗指征评估

吕文静 [1] 悉心悦 [2] 于芳莉 [1] 张潮涌 [1] 刘姣琳 [1] 王海姝 [1] 李阳 [1] 于彦伟 [1]

1. 哈尔滨医科大学附属第四医院

2. 哈尔滨医科大学

目的：观察经皮冠状动脉介入治疗（PCI）术后 24-48 小时患者与不同程度冠状动脉狭窄患者心肺运动试验（CPET）相关指标的特征及评估其康复治疗指征。

方法：回顾性选取哈尔滨医科大学附属第四医院心血管内科自 2024 年 3 月至 2025 年 3 月收治的 180 例出院前完成 CPET 的患者为研究对象。根据冠状动脉 CTA 结果依据冠脉 CAD-RADS 分级标准将患者分为冠脉未见狭窄组（n=41），冠脉轻度狭窄组（n=54），冠脉中度狭窄组（n=37）和 PCI 术后组（n=48）。比较四组患者一般资料及 CPET 指标，通过 CPET 测量峰值公斤摄氧量（VO2）、代谢当量（MET）、氧脉搏、二氧化碳通气当量（VE/VCO2）斜率及呼吸交换率（RER）等反映患者运动耐量以及心血管功能的指标及提示预后的指标。以峰值公斤 VO2、峰值 METs、RER 及无氧阈公斤 VO2 为因变量进行多因素回归分析，探索年龄、高血压、糖尿病及冠脉狭窄程度对冠心病患者心肺功能影响。

结果：PCI 术后组高血压比例、糖尿病比例均高于其他三组、四组血脂指标对比差异显著，差异均有统计学意义均为（P<0.05）。PCI 术后组峰值 Mets（4.57±1.16 vs.5.34±1.08 vs.5.43±1.48 vs.5.48±1.34，P<0.05）、峰值公斤 VO2（15.98±4.06 vs.18.75±3.77 vs.19.26±4.34 vs.19.16±4.66，P<0.05）、RER（1.04±0.08 vs.1.08±0.09 vs.1.09±0.09 vs.1.06±0.10，P<0.05） 及无氧阈公斤 VO2（15.98±4.06 vs.18.75±3.77 vs.19.26±4.34 vs.19.16±4.66，P<0.05）均显著低于冠脉未见狭窄、轻度狭窄和中度狭窄组。多因素回归分析表明，峰值公斤 VO2 与年龄（β=-0.110，P=0.003）、高血压（β=-1.984,P=0.003）呈显著负相关，PCI 术后组（β=-3.128,P=0.004）呈显著负相关。峰值 METs 与年龄（β=-0.029,P=0.008）、高血压（β=-0.541,P=0.008）呈显著负相关，PCI 术后组（β=-0.997,P=0.005）呈显著负相关。RER 与 PCI 术后组存在显著负相关（β=-0.056,P=0.018）。

结论：PCI 术后患者心肺功能短期内未见明显恢复，年龄、高血压及冠状动脉狭窄是运动耐量下降的关键因素。

早期心脏康复护理对急性心肌梗死 PCI 术后的影响

李相萱

三峡大学第一临床医学院湖北宜昌市中心人民医院

本研究主要分析早期心脏康复护理对急性心肌梗死 PCI 术后心功能及生活质量的影响。方法：选取本院 2023 年 1 月 -2024 年 12 月间收治的急性心肌梗死患者 100 例，采用随机数字法将其分为对照组、研究组两组，每组各 50 例。对照组给予 PCI 术后常规护理，研究组给予早期心脏康复护理。比较两组患者护理前后焦虑自评量表 (SAS) 和抑郁自评量表 (SDS) 评分，并比较两组患者护理后 6MWT、LVEF、LVEDD、LEVSD 及 CI 等指标以及生活质量评分（SF-36）中各项评分指标，以及两组术后并发症发生情况。结果：两组患者护理前 SAS 与 SDS 比较无明显统计学差异；护理后，研究组 SAS 与 SDS 评分明显低于对照组（P<0.05）；研究组 6MWT、LVEF 和 CI（407.92±34.19m；52.50±6.28%；2.59±0.08L/m^2）明显高于对照组（488.70±36.15m; 55.82±5.91%; 2.81±0.0L/m^2），而 LVEDD、LEVSD（60.74±5.99mm；39.68±4.73mm）明显低于对照组（55.88±4.74mm；34.38±3.69mm）（P<0.05）；与对照组相比，研究组患者护理后生活质量评分（SF-36）中各项评分指标均高于对照组（P<0.05）；相比于对照组，研究组腹胀、便秘、尿潴留、食欲不振和失眠情况明显低于对照组（P<0.05）。结论：研究证明，急性心肌梗死 PCI 术后早期行心脏康复护理明显有利于患者心功能和精神状态的恢复，减少并发症的发生，有利于患者生活质

量的提高，促进患者康复。

基于高级健康评估结合 ERAS 理念的一例老年患者行冠状动脉搭桥联合瓣膜置换手术的个案护理

朱晓琳 罗年年

厦门大学附属心血管医院

本个案报告一例基于高级健康评估的老年患者行冠状动脉搭桥联合瓣膜置换手术的护理体会。动态收集和分析患者健康资料，通过五维度对患者进行分阶段的整体性评估，评估时间为 2025 年 5 月 14 日至 5 月 21 日，按照优先顺序提出了五个主要护理问题：气体交换障碍、心输出量减少、活动无耐力、潜在危险性不稳定血糖浓度、营养不均衡：少于身体所需。住院期间运用 ERAS 理念对患者进行围术期护理，同时联合多学科模式照护患者，为患者制定个性化的康复计划，包括呼吸训练、肢体训练及有氧训练，患者在术后 12 天即康复出院。住院期间患者的体征、症状通过精细化护理，得到明显的改善，为患者提供早期康复、体液管理、疼痛管理、睡眠管理以及营养护理，患者在返回病房第二天开始下地活动、术后未再出现气体交换掌握的表现、术后维持体液平衡、心功能改善、疼痛评分由 3 分降至 0 分，营养状况较前改善，食欲好转，各营养指标均上升白蛋白由 35.9g/L 上升至 36.9g/L，睡眠质量得到明显提升，由术前的重度睡眠难续依赖于药物维持每日睡眠 4h 增加至无药物维持下的每日睡眠 6h。通过此案例报道，总结如何运用高级健康评估五维度对患者进行整体性评估，提出针对性护理诊断和护理措施，同时联合 ERAS 理念，加快患者的早期康复，借此案例，将 ERAS 理念推行至心脏外科患者，减少术后并发症，提高生活质量。

通过运动为基础的心脏康复，改善不同 BMI 组心血管疾病患者的运动能力及生活质量。

刘昕萌 马梅

天津市胸科医院

目的

随着心血管疾病（CVDs）患病率持续攀升，基于循证医学的心脏康复治疗需求激增，现已成为患者的核心治疗手段。本研究旨在系统评估结构化心脏康复（CR）方案对 CVDs 患者心肺功能及心理状态的改善效果。

方法

本研究纳入 79 例 CVDs 患者，实施为期 4-6 周的标准化 CR 干预（每周 2-3 次中心训练，共 12 次）。干预前后分别采用心肺运动试验（CPET）及四项量表进行多维度评估：1）心肺功能核心指标：摄氧量（VO_2）、通气量（VE）、无氧阈（AT）负荷功率（Workload）及摄氧效率斜率（OUES）；2）生活质量量表（SF-12）；3）抑郁自评量表（PHQ-9）；4）焦虑自评量表（GAD-7）。

结果

康复干预后，患者心肺功能指标显著提升（均 p<0.01）：AT 时 VO_2：10.93±2.94 → 13.25±3.43 mL/min/kg、AT 状态 VE：29.27±7.47 → 35.58±9.34 L/min、AT 负荷功率：56.66±25.44 → 70.04±27.69 W、OUES：1426.75±346.30 → 1547.19±403.49。

生活质量量表评分显著改善（p<0.01），抑郁与焦虑评分分别降低 32.7% 和 28.9%（p<0.01）。亚组分析显示，不同体质指数（BMI）组别均呈现一致性获益趋势。

结论

本研究证实：结构化运动康复可显著提升 CVDs 患者的心肺储备功能（VO_2峰值提升 21.2%，AT 负荷功率增加 23.6%），同步改善生活质量及心理状态，且疗效不受 BMI 影响。该方案为临床推广循证化心脏康复提供了重要实践依据。

基于 CPET 指导的心脏康复运动对老年 CHF 患者焦虑情绪和生活质量的影响

卫霞 郎明健

成都市第五人民医院

目的：探究心肺运动测试（cardiopulmonary exercise testing，CPET）指导的心脏康复运动对老年慢性心力衰竭（Chronic Heart Failure，CHF）者血清 NT-proBNP 水平、焦虑情绪和生活质量的影响。

方法：从我院收治的老年慢性心力衰竭患者中随机选取 92 例作为研究对象，随机分成观察组和对照组，每组 46 例，两组患者均接受常规治疗，观察组在常规治疗基础上采用 CPET 指导的心脏康复运动。比较两组患者 NT-proBNP 水平、汉密尔顿焦虑量表（HAMA）、抑郁量表（HAMD）和生活质量综合评定问卷的（GQOLI-74）评分；并记录治疗期间不良心血管事件。

结果：治疗前，两组患者血清中 NT-proBNP 水平、HAMA、HAMD 量表评分及 GQOLI-74 评分比较差异无统计学意义（P>0.05）。治疗 1 个月、3 个月及 6 个月后，两组患者 NT-proBNP、HAMA、HAMD 量表评分与治疗前相比均明显下降，其中治疗 3 个月及 6 个月后观察组下降更为明显（P<0.05），治疗 6 个月后，两组患者 GQOLI-74 评分较治疗前均有所提高，且观察组变化更为明显 P<0.05）。治疗期间，与对照组相比，观察组发生主要不良心血管事件（MACE）的风险增加了 1.4 倍 (P<0.05)。

结论：CPET 指导心脏康复模式可以明显降低老年 CHF 患者的血清 NT-proBNP 水平，减少患者负面情绪和不良心血管时间的发生，提高患者生活质量。

herapeutic Effect of Limbs Compression Based Anti-syncope Therapy Trousers on Vasovagal Syncope

bingqing zhou

Daping Hospital of Army Medical University

Background: Vasovagal syncope (VVS) is the most prevalent cause of syncope, which significantly deteriorates the life quality. However, there is currently no effective method available to treat VVS. Blood distribution in the lower limbs induced sympathetic withdrawal was involved in the progression of VVS. We developed novel anti-syncope therapy trousers to compress lower limbs and tested its effect on treatment of VVS.

Methods：Anti-syncope trousers were developed using sequential air compression (ankles → shanks → thighs) via three interconnected air cavities per leg to enhance venous return. A hardware system (mini air pump, 3-bit valves, ADC microprocessor) precisely controlled inflation pressure/duration, displaying data on an LED panel.Patients (2014-2016, Daping Hospital) with unexplained syncope underwent ESC guideline-based evaluation. Suspected vasovagal syncope (VVS) cases received echocardiography, ECG, and cranial CT to exclude structural disease (e.g., valvular/coronary/cerebral stenosis, cardiomyopathy, pregnancy). Negative cases were excluded. Eligible patients provided informed consent under ethical approval.All included patients underwent head-up tilt testing (HUT). After autonomic medication withdrawal and fasting:Baseline HUT (Stage I): 80 ° tilt for 40 min with continuous ECG/SpO_2 and 5-min BP monitoring. Syncope with hypotension/bradycardia defined positivity. Provocative HUT (Stage II): If negative, 0.5 mg sublingual nitroglycerin was administered during extended 80 ° tilt (20 min). Only HUT-positive patients were randomized:Experimental group: Repeated HUT with trousers activated.Control group: Repeated HUT with trousers inactive. Statistical analysis used Student's t-test (continuous data) and χ^2-test (categorical data), presented as mean±SD. Significance: p<0.05.

Results: The patients were mainly mid-aged adults with no children or old patients included. **No aberrant manifestations with respect to any variable** about **haemodynamics** were observed, indicating included patients suffer no severe structural cardiovascular disease. Age, blood pressure and other **baseline characteristics** were comparable between **the** two **groups**. **The results of HUT test showed that** among xx patients in control group**,** xx patients reported reproduction of positive HUT test. **X**x patients **occurred** syncope in b**aseline head-up tilt test** (induction time was xx min) and xx patients occurred **syncope** in p**rovocative head-up tilt test** (induction time was xx min)**. Among the** xx **patients** with reproduction of positive HUT test**, 7 patients reported hypotension and 8 patients reported marked bradycardia while 3 patients reported both hypotention and marked bradycardia. Notably, no patients reported reproduction of positive HUT test through the whole 2 stages of HUT test in experimental group. Although, VVS might be induced if induction time is** prolonged, **these** results indicate a therapeutic effect of **therapy trousers**. **During the HUT test, SBP decreased to 88.05±13.72 mmHg, DBP 53.86±7.93 mmHg and MAP 65.26±9.22 mmHg** at the end of HUT test in control group**, indicating the foundation of occurrence of conscious loss. Notably, both SBP and DBP** at the end of HUT test **were significantly higher** in experimental group **than** control group**, suggesting that decrease in blood pressure was significantly attenuated with the therapy trousers. In addition, a difference in HR after the test was observed between the** two groups**, though the** difference **was not statistically significant. However,** therapy trousers exerted no **impacts on SPO2 of patients after the HUT test.The incidence of main symptoms/prodromal symptoms of patients during HUT test was shown in Table 4. Patients in** control group **reported a high incidence of main symptoms/prodromal symptoms during HUT test including dizziness and palpitations. However, when in therapy trousers, there were fewer patients reported these symptoms/prodromal symptoms, suggesting a high efficacy of therapy trousers in treating VVS.**

Conclusions: The novel lower limbs compression based therapy trousers exert therapeutic effect on VVS with high efficacy. This new method is of clinical significance for treating VVS.

射频消融术患者围术期踝泵运动依从性影响因素的质性研究

黄巧生 刘华芬

武汉大学人民医院

目的：探讨房颤患者射频消融术后踝泵运动依从性的影响因素，为构建规范化的临床干预方案提供理论支持。

方法：采用现象学研究方法，基于健康信念模型（HBM）的六个维度（感知易感性、感知严重性、感知利益、感知障碍、自我效能及行动线索）制定访谈提纲，对 21 名房颤射频消融术后患者进行半结构化深度访谈，采用定向内容分析法进行资料分析。

结果：患者踝泵运动的依从性呈现双重动力机制：①障碍因素包括风险意识淡薄“术后卧床时间不长，血栓风险不高，没必要特别干预”、运动效果低估“就这样活动一下脚踝没有什么作用”、担心副反应”害怕运动过程中，伤口出血、疼痛等”、自我效能不足“缺乏锻炼信心，执行能力欠缺”、接收信息矛盾“医护说法不统一，没有接收明确的指引”；②促进因素包括并发症警觉性“护士说长期卧床容易出现并发症，影响健康”、健康收益认同“相信踝泵运动能够预防血栓，缩短住院时间等”、外部支持”医护人员的健康指导与督促以及家属的提醒与监督”、正向的自我激励“只要坚持规范的操作肯定对身体有益”。

结论：本研究从 HBM 的角度分析了房颤患者术后踝泵运动依从性的障碍因素和促进因素，临床护理过程中，医护人员应弱化障碍因素的影响，增强促进因素的效益，提升患者的健康水平。具体建议如下：①提升医护人员自身的认知和技能水平；②制定标准化的踝泵运动流程，医护人员严格遵照执行；③通过宣教，促进患者及家属对疾病的认知，了解踝泵运动的重要性及必要性；④建立完善的风险预警机制，确保该操作的安全性和有效性；⑤整合外部资源，家庭积极参与等，提升行为依从性。

Nonexercise Prediction Equation for Oxygen Uptake at the Anaerobic Threshold in Chinese Patients with Cardiovascular Disease

Jia- Liu, Shi-Yu Wang, Xiao-Jun Wu, Jian Wu

哈尔滨医科大学附属第二医院

Background

Oxygen uptake at the anaerobic threshold (VO2AT) is a critical physiological parameter used to assess cardiopulmonary fitness, particularly in patients with cardiovascular disease (CVD). It serves as a key indicator for guiding individualized cardiac rehabilitation programs and evaluating cardiac function. However, VO2AT values vary significantly across different populations due to factors such as race, age, sex, and specific disease conditions. While exercise testing remains the gold standard for measuring VO2AT, it is not always feasible in clinical settings due to equipment requirements, patient limitations, and time constraints. Currently, there is a lack of well-validated, nonexercise prediction equations for estimating VO2AT, especially for Chinese patients with CVD, highlighting the need for a reliable and practical alternative. Given China's large CVD population and unique demographic characteristics, developing a population-specific predictive tool could significantly enhance clinical decision-making and optimize rehabilitation outcomes.

Objectives

This study aimed to develop and validate a nonexercise prediction equation for VO2AT specifically tailored to Chinese CVD patients. By leveraging a large multicenter dataset, the research sought to establish an accurate and clinically applicable model that could facilitate cardiac rehabilitation planning and risk stratification without the need for exhaustive exercise testing. Additionally, the study aimed to evaluate how different CVD subtypes and treatment histories influence VO2AT predictions, thereby providing deeper insights into the physiological determinants of exercise capacity in this population.

Methods

A large-scale retrospective cohort was established, comprising 22,336 cases of cardiopulmonary exercise testing (CPET) data collected from CVD patients across 20 hospitals in China. The dataset was randomly divided into two groups: a development group (70% of the sample, n=15,635) used to derive the prediction equation and a validation group (30%, n=6,701) to assess its accuracy and generalizability. Multivariate forward stepwise regression analysis was employed to identify the most significant predictors of VO2AT, including demographic variables (age, sex, height, weight) and clinical factors (specific CVD conditions such as stable angina, myocardial infarction, heart failure, and history of percutaneous coronary intervention). Rigorous statistical methods were applied to ensure model robustness, including cross-validation and sensitivity analyses to confirm the consistency of the predictors across different patient subgroups.

Results

The final prediction equation was formulated as follows: VO2AT (mL/min) = 314.748 – (3.887 × age [years]) + (85.933 × sex [male = 1; female = 0]) + (1.085 × height [cm]) + (7.790 × weight [kg]) + (17.808 × stable angina [yes=1, no=0]) - (85.469 × percutaneous coronary intervention [yes=1, no=0]) - (112.64 × myocardial infarction [yes=1, no=0]) - (159.730 × heart failure [yes=1, no=0]).The model demonstrated moderate predictive accuracy, with a standard error of the estimate (SEE) of 264 mL/min, a correlation coefficient (R) of 0.71, and an adjusted R^2 of 0.51, indicating that approximately 51% of the variability in VO2AT could be explained by the included predictors. Importantly, the predicted VO2AT values across different patient subgroups were consistent with their corresponding measured values, supporting the equation's clinical applicability. Further subgroup analyses revealed that the equation performed particularly well in middle-aged patients and those with stable coronary artery disease, while slight underestimations were observed in elderly patients with advanced heart failure.

Conclusion

This study presents the first nonexercise VO2AT prediction equation specifically designed for Chinese CVD patients. The model integrates easily obtainable clinical and demographic variables, offering a practical tool for clinicians to estimate VO2AT in settings where CPET is unavailable. This advancement holds significant potential for improving cardiac rehabilitation planning, individualized exercise prescription, and risk stratification in Chinese CVD populations. Future research should focus on further refining the model's accuracy and validating its utility in diverse clinical scenarios. Prospective studies incorporating additional variables such as physical activity levels and medication use may further enhance predictive performance and clinical relevance.

双心医学视角下冠心病患者焦虑抑郁症状的全程管理模式探索

代芬

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨双心医学模式在冠心病合并焦虑抑郁患者临床管理中的应用价值。

方法：采用前瞻性队列研究设计，连续纳入 2022 年 1 月 -2024 年 6 月心血管科收治的 327 例冠心病伴发焦虑抑郁状态（HAMA ≥ 14 分，HAMD ≥ 17 分）患者，随机分为对照组（常规心脏治疗）和干预组（双心医学全程管理）。干预组实施包括心理评估、药物协同治疗、认知行为干预、正念减压训练、家庭支持系统构建的整合管理模式，通过动态监测生理指标（心率变异性、hs-CRP）、心理量表（HADS、SF-36）及心血管事件发生率等多元指标，建立为期 12 个月的随访观察体系。

结果：干预组在 3 个月、6 个月、12 个月时间节点的焦虑抑郁缓解率分别达到 58.3%、72.6%、81.4%，显著高于对照组的 32.1%、45.7%、53.2%（P<0.01）；同时干预组患者的心绞痛发作频率、硝酸甘油用量及再住院率较对照组下降 37.2%-52.8%（P<0.05）。

结论：基于双心医学理论构建的" 生理 - 心理 - 社会" 三维干预体系，通过建立多学科协作路径、实施个性化心理处方、强化院外延续管理等措施，能有效改善冠心病患者的心身症状，其分级评估机制和动态随访模式为心血管科实施精神卫生服务提供了实践范式。

关键词：双心医学；冠心病；焦虑抑郁；心身医学；生活质量

冠心病（Coronary Heart Disease, CHD）作为全球范围内主要的致死、致残性疾病之一，其高发病率与沉重的疾病负担已成为重大的公共卫生问题。在关注心脏器质性病变的同时，越来越多的临床证据表明，焦虑、抑郁等心理障碍在 CHD 患者中普遍存在且危害严重。这类共病状态不仅显著降低患者生活质量，加剧躯体化症状，更可导致治疗依从性下降、心血管事件风险增高及再住院率攀升，形成 "心身共病" 的恶性循环。然而，传统的心血管诊疗模式往往侧重于生物医学指标的干预，对患者心理社会层面的评估与管理存在明显不足，导致大量合并焦虑抑郁的 CHD 患者未能得到及时有效的识别与干预。双心医学（Psycho-Cardiology）强调心脏与心理的密切联系，倡导在心血管疾病诊疗中同步关注患者的心理状态，提供整合生物 - 心理 - 社会因素的整体医疗服务模式。本研究旨在探索基于双心医学理论，构建一套适用于冠心病合并焦虑抑郁患者的全程管理模式，通过前瞻性队列研究设计，系统评价该模式在改善患者心身症状、提升生活质量及降低心血管事件风险方面的应用价值。

个性化心脏运动康复方案对心力衰竭患者心肺功能的影响研究

代芬

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨个性化心脏运动康复方案对改善心力衰竭患者心肺功能指标的临床效果。**方法：**采用单中心随机对照试验设计，选取 2023 年 6 月至 2024 年 5 月收治的 120 例慢性心力衰竭患者，通过心肺运动试验评估制定个体化运动处方。干预组（n=60）实施为期 12 周的阶梯式运动训练，包含有氧运动（功率自行车训练，强度为 50-70% 峰值摄氧量）、抗阻训练（弹力带渐进式训练）及呼吸训练（腹式呼吸结合缩唇呼吸），对照组（n=60）接受常规心脏护理。主要观察指标包括峰值摄氧量（VO2peak）、左室射血分数（LVEF）及 N 末端脑钠肽前体（NT-proBNP）水平，次要指标涵盖 6 分钟步行距离（6MWD）和明尼苏达心衰生活质量量表（MLHFQ）评分。**结果：**干预后干预组 VO2peak 较基线提高（18.7±3.2 vs 22.1±3.5 mL/kg/min，P<0.01），LVEF 绝对值增加（6.3±1.8% vs 对照组 2.1±1.2%，P<0.05），NT-proBNP 中位数下降达 43%（956 pg/mL vs 548 pg/mL，P<0.01）。6MWD 改善幅度显著高于对照组（+82.4±23.6 m vs +31.5±18.2 m），MLHFQ 评分降低（-15.3±4.1 分 vs -6.2±3.7 分），组间差异均具统计学意义（P<0.01）。**结论：**基于精准评估制定的个性化心脏运动康复方案能有效提升心力衰竭患者运动耐量，改善心室重构及神经内分泌激活状态，为慢性心衰患者的二级预防提供循证依据。

关键词：个性化心脏运动康复方案；慢性心力衰竭；心肺运动试验；运动耐量；心室重构

心力衰竭作为全球公共卫生的重要挑战之一，其患病率持续攀升，与高死亡率、高再入院率及严重降低患者生活质量密切相关。当前，尽管药物治疗取得了显著进展，但慢性心力衰竭患者的心肺功能储备下降、运动耐量减低及神经内分泌过度激活等问题依然突出，是导致不良预后的关键因素。心脏康复（Cardiac Rehabilitation, CR）已被国内外权威指南推荐为心力衰竭综合管理的核心组成部分。大量循证医学证据表明，运动训练能够改善心力衰竭患者的运动能力、生活质量，甚至可能降低再住院率和死亡率。

然而，传统的心脏康复方案多采用相对固定的运动模式与强度，未能充分考虑心力衰竭患者在心肺功能储备、合并症、身体活动能力及个人偏好等方面存在的显著异质性。这种方式可能导致部分患者训练强度不足而获益有限，或强度过高而增加不良事件风险，限制了康复效果的最大化。心肺运动试验（Cardiopulmonary Exercise Testing, CPET）作为评估心肺功能储备、制定个体化运动强度的金标准，其在精准康复处方制定中的核心价值日益凸显。基于 CPET 结果制定个体化、阶梯式的心脏运动康复方案，有望更精准、更安全、更有效地改善患者的心肺功能指标和整体预后。

因此，本研究旨在通过严谨的随机对照试验设计，深入探讨基于心肺运动试验评估制定的、包含有氧、抗阻及呼吸训练等多模态组合的个性化心脏运动康复方案，

对慢性心力衰竭患者核心心肺功能指标、运动耐量及生活质量的影响，以期为优化心力衰竭患者的康复管理提供更高级别的循证依据。

基于循证医学的冠脉支架术后合并 OSAHS 患者运动康复方案优化

代芬

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨冠脉支架术后合并阻塞性睡眠呼吸暂停低通气综合征（OSAHS）患者运动康复方案的优化策略。

方法：通过系统评价国内外相关循证医学证据，整合心肺功能评估、睡眠监测及个体化运动处方制定等多维度干预措施。比较传统康复方案与优化后方案在 6 分钟步行距离、夜间低氧指数、主要不良心血管事件发生率等指标上的差异，评估优化方案对患者心肺功能改善、睡眠质量提升及长期预后的影响。

结果：共纳入 23 项随机对照研究及 8 项队列研究，涉及患者 2145 例。优化组较传统康复组 6 分钟步行距离（6MWD）显著提高（412.5±35.6 m vs 358.2±41.3 m，P<0.01），夜间氧减指数（ODI）降低幅度达 43%（12.7±3.5 vs 22.3±4.1，P<0.001），呼吸暂停低通气指数（AHI）平均下降 9.2 次 / 小时。随访 12 个月显示，优化组左心室射血分数（LVEF）提升 5.8±1.2%（P=0.003），主要不良心血管事件（MACE）发生率降低 37%（HR=0.63，95%CI 0.51-0.78）。次要终点显示 Epworth 嗜睡量表评分改善 4.3 分（P=0.012），SF-36 生活质量评分提高 18.6 分（P<0.01）。

结论：基于多维度评估的个体化运动康复方案可有效改善 OSAHS 合并冠脉支架术后患者的心肺功能协同障碍，其机制可能涉及夜间低氧血症缓解、交感神经张力调节及内皮功能改善。通过 CPAP 联合中等强度间歇训练（MIIT）的序贯干预模式，使患者运动耐量提升与睡眠结构改善形成良性循环。建议将呼吸驱动训练纳入 II 期心脏康复核心内容，同时强调夜间血氧饱和度动态监测对运动处方安全性的保障作用。

关键词：冠状动脉介入治疗；阻塞性睡眠呼吸暂停低通气综合征；心肺功能；多导睡眠监测；心脏康复

高原地区慢性呼吸系统疾病患者阶梯式肺康复方案的构建与验证

游玲

陆军军医大学第二附属医院新桥医院

摘要：目的：基于循证医学证据及高原环境特点，构建肺动脉高压合并慢性阻塞性肺疾病（COPD）患者的阶梯式肺康复方案，并通过临床随机对照试验验证其有效性及安全性。

方法：采用德尔菲专家咨询法构建包含呼吸训练、运动康复、健康教育、心理干预的四级阶梯式康复体系，通过改良版慢性呼吸系统疾病自我管理量表（CAT）进行动态评估，结合动脉血氧饱和度监测实施个体化阶梯调整。

结果：最终纳入 227 例患者完成 12 周干预，试验组 FEV1% 预计值较基线提升（8.62±3.15）%，6 分钟步行距离增加（68.3±22.4）米，急性加重次数降低 42.7%，显著优于常规康复组（P<0.01）。

结论：阶梯式肺康复方案可显著改善高原慢性呼吸系统疾病患者肺功能及运动耐力，其基于血氧反馈的动态调整机制能有效预防高原康复治疗相关风险，为高海拔地区肺康复临床路径优化提供循证依据。

关键词：高原医学；慢性呼吸系统疾病；阶梯式肺康复；血氧监测；运动耐力

高原地区慢性缺氧环境对慢性呼吸系统疾病患者的肺功能及生存质量构成严峻挑战。慢性阻塞性肺疾病（COPD）合并肺动脉高压作为该区域的常见共病，因低氧血症进行性加重、运动耐量急剧下降及急性发作频率攀升，显著增加患者致残率与医疗负担。传统肺康复方案虽在平原地区成效明确，但其固定强度模式难以适配高原环境下患者血氧波动的特殊性，康复过程中存在运动性缺氧甚至病情恶化的潜在风险。因此，亟需构建一种融合高原生理代偿机制、具备动态调整功能的肺康复策略，在保障安全性的前提下实现康复效益最大化。本研究基于循证医学框架，整合高原低氧病理生理特征与阶梯式干预理念，旨在开发并验证一套以血氧饱和度实时监测为调控核心的个体化阶梯肺康复方案，为优化高海拔地区呼吸慢病管理提供循证路径。

高强度间歇训练联合地中海饮食在冠心病二级预防中的协同效应研究

游玲

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨高强度间歇训练（HIIT）联合地中海饮食对冠心病患者心血管事件复发率、心功能指标及炎症因子的影响，分析两种干预方式在改善内皮功能与代谢调控中的协同作用机制。

方法：采用多中心随机对照试验设计，纳入 200 例经皮冠状动脉介入治疗后的稳定性冠心病患者，随机分为 HIIT 组、地中海饮食组、联合干预组及常规护理组。通过 12 周结构化运动计划配合个性化膳食指导，监测患者干预前后左室射血分数（LVEF）、超敏 C 反应蛋白（hs-CRP）、主要不良心血管事件（MACE）发生率等指标，采用广义估计方程评估组间差异。

结果：联合干预组 LVEF 提升幅度（8.2±1.5%）显著高于单一干预组（HIIT 组 5.1±1.2%，饮食组 3.3±0.9%）及对照组（1.8±0.6%，P<0.01）。血清 hs-CRP、IL-6 水平分别下降 46.7% 和 38.2%，降幅较单一干预组提高 1.8-2.3 倍（P<0.05）。联合组 12 个月 MACE 发生率（7.2%）显著低于常规护理组（19.6%，HR=0.41，95%CI 0.28-0.59）。

结论：HIIT 与地中海饮食通过调节线粒体生物合成、改善胰岛素敏感性及抑制 NF-κB 炎症通路的协同作用，显著提升冠心病二级预防效果，建议将结构化运动 - 营养联合干预纳入心脏康复标准方案。

关键词：高强度间歇训练；地中海饮食；冠心病；二级预防；协同效应

冠心病作为全球范围内主要的致死性疾病之一，其二级预防策略的优化对降低复发事件和改善患者预后至关重要。据世界卫生组织报告，心血管疾病每年导致约 1790 万人死亡，其中冠心病占比显著，且复发事件如心肌梗死或心力衰竭在二级预防不足的患者中发生率高达 20% 以上。传统的心脏康复方案多侧重于单一干预，如药物治疗或适度运动，但效果有限，尤其在内皮功能障碍和慢性炎症控制方面存在明显不足。

近年来，高强度间歇训练（HIIT）因其高效改善心肺功能和代谢调控的特性，在冠心病管理中展现出显著优势，能快速提升峰值摄氧量（VO2 max）和左心室功能。同时，地中海饮食以其丰富的单不饱和脂肪酸、抗氧化剂和膳食纤维，被证实能降低炎症标志物水平和心血管事件风险，但其在长期依从性和协同效应方面的研究仍较匮乏。现有证据表明，HIIT 可能通过激活 AMPK 信号通路增强线粒体生物合成，而地中海饮食则能调节肠道微生物群和 NF-κB 通路，两者在改善胰岛素敏感性和抑制氧化应激方面存在潜在的互补机制。然而，目前缺乏多中心随机对照试验来系统评估这种联合干预的协同效益，尤其在亚洲人群中的适用性数据不足。

因此，本研究旨在填补这一空白，通过整合结构化运动与营养干预，深入探讨 HIIT 联合地中海饮食对冠心病患者心血管事件复发、心功能指标及炎症因子的影响。这不仅有助于阐明协同作用的内在机制，如内皮修复和代谢稳态的调控，还为制定个体化心脏康复方案提供循证依据，推动二级预防策略从单一模式向综合干预转型。

家庭 - 医院 - 社区三元联动管理模式对慢性心肺疾病预后的影响

游玲

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨家庭 - 医院 - 社区协同干预在改善慢性心肺疾病患者生存质量中的作用机制及临床效益。

方法：选取 2022 年 1 月 -2024 年 6 月收治的 320 例慢性心肺疾病患者作为研究对象，采用随机数字表法分为对照组（常规管理模式）和观察组（三元联动模式），通过远程监测系统建立电子健康档案，实施家庭氧疗指导、医院专科随访、社区康复训练相结合的立体化管理。

结果：干预 12 个月后，观察组再入院率下降 42.3%（P<0.01），6 分钟步行距离提升 28.6%（P<0.05），明尼苏达心功能不全生活质量量表评分改善率达 76.9%。

结论：三元联动管理模式通过强化全程健康监测、规范用药管理、优化康复支持，显著降低急性加重风险，其多维度干预策略对改善患者运动耐力及长期预后具有积极意义，建议作为慢性病综合防治的标准化方案推广应用。

关键词：慢性心肺疾病；三元联动管理模式；生存质量；再入院率；康复训练

慢性心肺疾病作为全球主要的健康负担之一，其高发病率、高致残率及反复急性加重特征，不仅显著降低患者生存质量，还加剧医疗资源消耗和社会经济负担。传统医院中心化管理模式虽能提供急性期救治，但缺乏对家庭环境和社区支持的整合，导致患者出院后依从性差、康复不连续，再入院率居高不下。随着人口老龄化进程加速和慢性病防控需求提升，构建家庭 - 医院 - 社区三元联动管理模式成为优化长期预后的关键策略。该模式通过强化多主体协作，实现健康监测全程化、用药管理规范化及康复支持个性化，旨在弥补单一医疗机构的局限。本研究聚焦于探讨三元联动干预在改善患者运动耐力、生存质量及降低再入院风险方面的机制与效益，为慢性病综合防治提供循证依据。

太极“柔化心泵”理论在慢性心衰康复中的临床应用

谢小红

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨太极” 柔化心泵” 理论指导下的运动康复方案对慢性心力衰竭患者心功能改善及生活质量提升的临床效果。

方法：采用前瞻性队列研究设计，纳入 120 例 NYHA 心功能 II - III级患者，随机分为实验组（太极柔化训练组）和对照组（常规康复组），进行为期 12 周的干预治疗。通过超声心动图测量左室射血分数（LVEF）、6 分钟步行距离（6MWD）评估心功能，采用明尼苏达心力衰竭生活质量问卷（MLHFQ）进行生活质量评价。

结果：干预后实验组 LVEF 提升（6.8±1.2）%，6MWD 增加（58.3±7.5）m，显著优于对照组（p<0.05）；MLHFQ 评分降低幅度（24.6±3.1）分，较对照组多改善 9.2 分（p<0.01）。

结论：太极” 柔化心泵” 理论通过调节自主神经平衡、优化心肌能量代谢，在改善慢性心衰患者心肺功能、提高运动耐量及生活质量方面展现出显著优势，为中医传统功法与现代心脏康复的融合提供了新思路。

慢性心力衰竭（CHF）作为全球性的重大健康问题，其高发病率、高再住院率及低生活质量严重困扰患者，并给社会带来沉重的医疗负担。现代心脏康复已被证实是改善 CHF 患者预后、降低再住院风险和提高生活质量的有效策略，其中运动康复是核心组成部分。然而，传统运动康复方案，尤其对于高龄或心功能储备较差的患者，常存在依从性不佳、训练强度难以精准把控以及潜在风险等问题。寻求安全、有效且患者易于接受的运动康复方式成为临床关注焦点。中医传统功法源远流长，太极以其动作舒缓圆活、形神兼备、强调意念与呼吸配合的特点，在心肺疾病康复领域展现出独特价值。其核心理论之一“柔化心泵”，主张通过柔和、连贯、节律性的肢体运动，配合深长匀细的呼吸及意念引导，达到“以柔克刚”、“松而不懈”的状态，旨在优化心脏泵血效能，减轻心肌耗氧负担。该

理论从中医整体观出发，不仅关注心脏局部功能，更强调通过调节自主神经系统平衡、改善气血循环、优化心肌能量代谢等多途径协同作用来恢复心身和谐。多项研究初步证实太极拳对 CHF 患者有积极影响，但以“柔化心泵”这一特定理论为指导，系统构建并严格评估其康复方案效果的前瞻性研究相对缺乏。本研究旨在通过严谨的前瞻性队列设计，深入探讨基于太极“柔化心泵”理论制定的运动康复方案对改善慢性心力衰竭患者心功能指标及生活质量的临床效果，为中医传统智慧与现代心脏康复实践的有效融合提供科学依据。

Physical performance on the early 6-minute walk test in coronary artery bypass grafting patients during inpatient cardiac rehabilitation

Yao Wu, Bao Ren, Jing Li, Li-Qun Chi, Ping Li, Jia-Hui Wu

Beijing Anzhen Hospital

Background: Cardiovascular diseases are the leading cause of death globally. Coronary artery bypass grafting (CABG) is an effective and established treatment for clinically significant coronary artery disease.The 6-minute walk test (6MWT) is widely used to evaluate functional exercise capacity, therapeutic effects, and prognosis in patients with cardiopulmonary diseases. However, its application in phase I cardiac rehabilitation (CR) after CABG remains under explored. This study investigates the physical performance of CABG patients during the early 6MWT and analyzes factors influencing their walking performance during inpatient CR.

Methods: This retrospective study included 360 patients who underwent isolated off-pump coronary artery bypass (OPCAB, n=240) or minimally invasive direct coronary artery bypass (MIDCAB, n=120) surgery. The study was conducted from November 22, 2023, to December 25, 2024. Participants, with a median age of 63 years (range: 36-80), comprised 285 males and 75 females. After returning to the ward from the intensive care unit after surgery, all participants initiated the phase Ⅰ CR program. This program consisted of respiratory and cough training, active upper and lower limb movement, transfer training, standing training and walking exercise. The study specifically included patients who completed the 6MWT within 5 ± 2 days after phase I CR post-surgery.

Results: The median 6-minute walk distance (6MWD) for all subjects was 183 ± 125 meters (33 ± 20% of predicted). Notably, the walking distances were significantly shorter in OPCAB patients than MIDCAB patients (175 ± 125 vs 200 ± 134 meters, Z = -3.426, P = 0.001), in older patients than younger patients (H = 20.489, P < 0.001) and in females than males (150 ± 84 vs 200 ± 100 meters, Z = -5.919, P < 0.001). Besides, approximately three-fifths of these patients exhibited a relevant reduction of exercise tolerance, as indicated by a distance walked ≤ 200 meters. Univariate analysis showed 6MWD significantly correlated with height, weight, body mass index (BMI), diastolic blood pressure (DBP) and peripheral oxygen saturation (SpO_2) before the test, as well as heart rate (HR), systolic blood pressure (SBP), DBP, SpO_2, and respiratory rate (RR) after the test, and the mean values of HR and RR during the test (all P < 0.05). At the stepwise multivariate regression analysis, the 6MWD was positively correlated with gender (P < 0.001), HR at the end of the test (P = 0.001), and DBP before the test (P = 0.043). Conversely, the 6MWD was negatively correlated with the type of surgery (P < 0.001) and RR at the end of the test (P = 0.004).

Conclusion: This study is the first to describe early 6MWD in CABG patients during phase I CR. The 6MWT is feasible and well-tolerated in adults and older patients shortly after CABG. Our findings reveal that the physical performance, as assessed by the distance walked during the 6MWT, is significantly reduced in patients who underwent OPCAB surgery, older patients, and females patients following CABG surgery. Notably, the predictors of 6MWD were observed independently of gender, type of surgery, HR and RR at the end of the test, and DBP before the test. The findings provide valuable insights into factors affecting walking distance, aiding clinical assessment and informing phase II CR program development post-discharge.

基于 TPKCEE 复合型教学的混合教学模式 在心脏康复护理教学中应用研究

于水 宋龄

吉林大学第一医院

目的：随着人口老龄化的加剧和心血管疾病发病率的持续上升，心脏康复护理在临床护理工作中的重要性日益凸显。心脏康复护理不仅要求护士具备扎实的专业知识和操作技能，还须具备良好的沟通能力、临床思维能力及人文关怀意识。然而，传统的护士培训模式往往以理论讲授为主，忽视了护士在实际工作中对知识的综合运用能力和临床思维能力的培养，难以满足新时代临床护理工作的需求。TPKCEE 复合型教学理念融合了技术（Technology）、教学法（Pedagogy）、知识（Knowledge）、认知（Cognition）、情感（Emotion）与评价（Evaluation）六大要素，强调教学过程中多维度、多层次的协同发展。本研究旨在探索基于 TPKCEE 理念的混合教学模式在临床护士心脏康复护理培训中的应用效果，以期提升护士的综合素质与临床护理能力。

方法：本研究采用教学实验法，选取某医院心内科及康复科的临床护士为研究对象，随机分为实验组与对照组。实验组实施基于 TPKCEE 理念的混合教学模式，培训内容围绕心脏康复护理的核心知识与技能展开，结合线上学习平台与线下实践培训，构建“线上理论学习–线下实践操作–案例分析与讨论–综合评价反馈”的教学闭环。在教学过程中，注重信息技术的融合应用，利用多媒体课件、虚拟仿真技术等手段，提升护士的学习参与度；采用案例教学、情景模拟、小组讨论等多样化教学方法，激发护士的认知与情感投入；通过形成性评价与终结性评价相结合的方式，全面评估护士的学习过程与学习成果。对照组则采用传统的课堂讲授与操作示范相结合的培训方式。培训周期结束后，通过理论知识考核、实践技能评估、学习动机调查及教学满意度评价等方式对培训效果进行综合评估。

结果：研究结果显示，基于 TPKCEE 复合型教学理念的混合教学模式在提升护士理论知识掌握、实践技能操作、学习动机激发及教学满意度等方面均表现出明显优势。实验组护士在培训过程中表现出更高的主动性与参与度，能够更好地将理论知识与临床实践相结合，展现出较强的临床思维能力与团队协作意识。同时，护士在培训过程中对培训内容与培训方式的认可度较高，教学满意度显著提升。该教学模式在促进护士知识、能力、情感等多方面协调发展方面具有积极作用。

结论：基于 TPKCEE 复合型教学的混合教学模式在临床护士心脏康复护理培训中具有良好的应用前景。该模式不仅有助于提升护士的专业素养与临床护理能力，还能有效激发护士的学习兴趣与内在动机，促进其全面发展。未来，建议在临床护士继续教育领域进一步推广该教学模式，并结合不同科室特点进行优化与创新，以更好地适应新时代临床护理工作的需求。同时，本研究也为临床护士培训模式改革提供了理论支持与实践参考，具有一定的推广价值和现实意义。

急性心肌梗死恐动症患者对虚拟现实运动康复训练系统使用意愿及需求的质性研究

陈雨芬 [1,2] 涂惠 [1]

1. 南昌大学第二附属医院

2. 南昌大学江西医学院

目的 急性心肌梗死作为严重威胁生命健康的心血管疾病，经皮冠状动脉介入治疗（PCI）是目前主要治疗手段，但术后患者常因对运动风险的过度担忧而产生恐动症，表现为刻意回避运动、康复依从性低下，严重影响心功能恢复及生活质量。虚拟现实（VR）技术凭借沉浸式体验和交互性优势，在康复领域应用潜力显著，但其针对急性心肌梗死恐动症患者的适用性及具体需求尚未明确。本研究旨在探讨急性心肌梗死恐动症患者对虚拟现实（Virtual reality，VR）运动康复训练系统的使用意愿及需求，为设计开发针对于急性心肌梗死恐动症患者的虚拟现实运动康复训练系统提供参考。

方法 设计描述性质性研究，以目的抽样法于 2024 年 10 月–2025 年 1 月选取江西省某三级甲等医院心内科住院的 16 名经皮冠状动脉介入治疗术后急性心肌梗死恐动症患者为研究对象，进行半结构式深入访谈，运用 Colaizzi 七步分析法进行资料分析，提炼主题。

结果 共提炼出 4 个主题、6 个子主题，即 VR 技术的了解途径、运动依从性低下的多重因素、对 VR 运动康复训练系统的态度、对 VR 运动康复训练系统的期望（系统操作方式的简单化、自然环境偏好与个性化训练需求、运动强度的智能调节、运动反馈的鼓励性和指导性需求、监测数据的可视化、系统的安全保障）。

结论 急性心肌梗死恐动症患者对 VR 运动康复训练系统存在明确需求，主要集中于系统的安全性、易用性、趣味性及个性化方面。因此，在系统设计开发阶段，医护人员需联合技术人员，充分整合患者的需求，将医疗专业性与用户体验进行深度融合，开发出兼具风险可控性与康复有效性的 VR 运动康复工具，以改善患者恐动症状，提升运动康复依从性，最终促进其心功能恢复及生活质量提升。

中医五行音疗联合安宁疗护在慢性心力衰竭患者康复中的护理实践

郭燕 李娟利

交大一附院

目的：

慢性心力衰竭（CHF）是一种严重影响患者生活质量的临床综合征，其传统治疗方法多侧重于药物干预和生活方式调整，往往忽视了患者的心理和社会需求。近年来，中医五行音疗与安宁疗护作为补充与替代疗法，逐渐被应用于慢性病患者的康复过程中。本文探讨了中医五行音疗联合安宁疗护在慢性心力衰竭（CHF）患者康复中的应用效果，为临床护理提供新的思路和方法。

方法：本研究选取慢性心力衰竭 (CHF) 患者若干例，随机分为干预组和对照组。干预组在常规药物治疗和护理基础上，结合中医五行音疗和安宁疗护，包括评估患者需求、选择合适的五行音乐、创造舒适环境、指导音乐冥想等措施，将中医五行音疗与药物治疗、心理护理、康复训练等相结合；对照组仅接受常规治疗和护理。研究使用匹兹堡睡眠质量指数（PSQI）、明尼苏达心衰生活质量量表（MLHFQ）和 6 分钟步行试验（6MWT）对两组患者进行评估，观察护理干预前后的变化。

结果：干预组患者在护理干预后，PSQI 评分改善，睡眠质量显著提升（P<0.05）；MLHFQ 评分显著降低（P<0.05），表明生活质量显著提高；6MWT 测试结果显示，干预组患者的步行距离显著增加（P<0.05），提示运动耐力得到改善。与对照组相比，干预组在心理状态、症状缓解和生活质量方面均表现出显著优势。

结论：中医五行音疗联合安宁疗护能够有效改善慢性心力衰竭患者的生活质量、睡眠质量和运动耐力，为慢性心力衰竭患者提供了一种全面、个性化的护理模式，可作为传统治疗的有益补充，中医五行音疗和安宁疗护作为一种补充和替代疗法，在改善慢性病患者的身心健康方面显示出巨大潜力，结合临床人文护理的关爱，给予患者生的曙光！值得在临床护理中推广应用！

运动通过 c-MAF 调控常驻巨噬细胞代谢重编程改善心肌梗死修复

李运棋 刘雨轩 郑阳 郑祥慧 于波 吴健

哈尔滨医科大学第二附属医院

目的：运动改善心肌梗死后心室重构，其中常驻巨噬细胞在梗死后发挥关键作用。已知代谢重编程促进巨噬细胞修复功能，然心肌梗死后运动康复促进巨噬细胞代谢重编程及其相关机制仍不清楚。在本研究中，我们研究 c-MAF 在心肌梗死运

动康复背景下促进常驻巨噬细胞代谢重编程改善梗死后修复的作用。

方法：通过单细胞转录组、空间转录组和空间代谢组等多组学联合明确心肌梗死后运动康复小鼠心脏的巨噬细胞亚群及其代谢特征。使用巨噬细胞特异性 c-MAF 敲除小鼠借助 RNA 测序、代谢组、血管造影、组织学和表型分析研究 c-MAF 在心肌梗死后巨噬细胞代谢重编程和心脏修复中的作用。使用腺相关病毒过表达心肌梗死运动模型小鼠巨噬细胞的 c-MAF 进一步探讨其在心肌梗死运动康复背景下的关键作用。CUT&Tag 测序研究 c-MAF 缺陷的巨噬细胞在运动促心肌梗死修复过程的关键下游基因。

结果：多组学识别常驻巨噬细胞在心肌梗死后运动康复中的关键作用。敲除巨噬细胞特异性的 c-MAF 加重梗死面积，减少血管生成，促进组织纤维化和 MI 后的不良心脏重构。同时 seahorse 分析敲除 c-MAF 的巨噬细胞氧化磷酸化被抑制，代谢组进一步明确 c-MAF 对巨噬细胞的代谢调控。而腺相关病毒过表达心肌梗死运动模型小鼠巨噬细胞的 c-MAF 得出相反的结果。CUT&Tag 测序发现 AMPKα 是 c-MAF 的关键下游，ChIP-PCR 明确 c-MAF 促进 AMPKα 的转录表达，从而增强线粒体功能促进氧化磷酸化。营救实验进一步证实了 c-MAF 通过 AMPKα 促进常驻巨噬细胞在心梗中的修复作用。

结论：研究结果揭示了转录因子 c-MAF 在运动调控常驻巨噬细胞促进心肌梗死心脏修复的关键作用。

Aerobic exercise improves coronary microcirculation dysfunction by regulating endothelial cell function through the m6A methyltransferase METTL14

Peiyao Wang, Xiang-Hui Zheng, Yun-Qi Li, Yu-Xuan Liu, Zhou Guo, Yang Zheng, Jian Wu, Bo Yu

The Second Affiliated Hospital of Harbin Medical University

Objective Coronary microcirculation dysfunction (CMD) is a key pathophysiological mechanism of ischemic non-obstructive coronary artery disease (INOCA). As a critical component of cardiac rehabilitation, aerobic exercise has been proposed as a potential therapy for INOCA. However, the mechanisms by which aerobic exercise protects the cardiovascular system by improving CMD remain unclear.

Methods Five-to-six-week-old male C57BL/6J mice were selected. CMD mouse models were induced by a high-fat and high-sugar diet combined with intraperitoneal injection of low-dose streptozotocin (STZ, 50 mg/kg) for 5 consecutive days. Mice were then subjected to 8 weeks of aerobic exercise. Body weight and blood glucose were dynamically monitored. Cardiac microcirculatory function was detected by echocardiography, magnetic resonance imaging, and Micro-CT. Immunofluorescence staining was performed to detect microvascular density, microvascular perfusion, and endothelial cell apoptosis. HE and Masson staining were employed to examine thrombus formation and perivascular fibrosis. Transmission electron microscopy was used to observe the ultrastructure of cardiac microvessels. Nitric oxide (NO) levels were measured. The expression levels of VCAM-1, ICAM-1, ET-1, eNOS, and p-eNOS in the heart were detected by Western blot, quantitative real-time polymerase chain reaction (qRT-PCR), and enzyme-linked immunosorbent assay (ELISA). Dot-Blot and ELISA were used to detect cardiac m^{6}A levels, while qRT-PCR and WB were applied to measure the expression of m^{6}A methyltransferases and demethylases. Further, METTL14-overexpressing mice were constructed, and CMD models were induced to assess endothelial function and microcirculatory function. A high-glucose-induced injury model of mouse cardiac microvascular endothelial cells (MCMECs) was established. After transfection with specific siRNA to interfere with METTL14, the effects of METTL14 on inflammation, apoptosis, migration, and tube formation in MCMECs were observed.

Results Aerobic exercise can increase myocardial blood flow, coronary microvascular density, and microvascular perfusion in CMD mice, while reducing endothelial cell apoptosis. In mice of the CMD group, the basement membrane of myocardial microvessels was thickened and partially fractured, and the junctions between microvascular endothelial cells were indistinct. In contrast, the myocardial microvascular structure in the exercise group was relatively restored with intact integrity, and the junctions between microvascular endothelial cells were in good condition. Compared with CMD mice, the exercise group showed reduced thrombus formation and perivascular fibrosis, increased the expression of NO, eNOS, and p-eNOS in the heart, decreased the expression of ET-1, and reduced the expression of adhesion molecules such as ICAM1 and VCAM1. Further studies indicated that aerobic exercise could lower the cardiac m^{6}A level and significantly decrease the METTL14 level in CMD mice. By injecting adeno-associated virus AAV9-METTL14 into the tail vein of CMD mice, it was found that overexpression of METTL14 counteracted the protective effect of exercise on coronary microcirculatory dysfunction. The results of cell experiments showed that, compared with the control group, the siMETTL14 group had increased contents of NO, eNOS, and p-eNOS, decreased the expression of ET-1, reduced ICAM1 and VCAM1, less cell apoptosis, inhibited ROS, and improved cell migration and tube formation.

Conclusion Aerobic exercise reduces endothelial cell injury and apoptosis, improves endothelial function, and alleviates coronary microcirculation dysfunction by decreasing the level of the m^{6}A methyltransferase METTL14.

Enhanced External Counterpulsation Promotes Recovery of Exercise-Induced Muscle Damage by Reducing Plasma Acetylglycine and Inhibiting CD56dim NK Cells Differentiation

Zhenyu Wang[1,2], Chun Yao[2], Yin-Fen Wang[2], - Xu[2], Xiu-Li Xu[2], -Yu Wu[1], Xi-Ling Shou[1], Gui-Fu Wu[2]

1. Shaanxi Provincial People's Hospital

2. The Eighth Affiliated Hospital of Sun Yat sen University

Objectives

Exercise-induced muscle damage (EIMD) is a common pathological condition characterized by delayed-onset muscle soreness (DOMS), reduced muscle strength, and structural disruption of muscle fibers following excessive or unaccustomed exercise. While physical activity offers well-established benefits for chronic disease prevention, EIMD may trigger secondary injuries and reduce exercise adherence. Enhanced External Counterpulsation (EECP), a non-invasive hemodynamic intervention, has primarily been used for cardiovascular rehabilitation. Recent studies suggest EECP may ameliorate post-exercise inflammation, but its mechanistic role in EIMD recovery remains unclear. This study aims to systematically evaluate the therapeutic mechanisms of EECP for EIMD through an integrated multidisciplinary approach (clinical trial, animal experiments, and in vitro studies) and explore its potential applications in exercise rehabilitation.

Methods

1. Clinical Trial Design

Participants: 10 healthy male volunteers (age 28.9 ± 2.3 years, BMI 22.6 ± 2.6 kg/m^2) in a self-controlled crossover design (EECP vs. Sham intervention).

Exercise Model: Exhaustion induced by cardiopulmonary exercise testing (CPET) (respiratory exchange ratio RER > 1.1, Borg score 18.5 ± 0.85).

Intervention: Post-exercise randomization to 1-hour EECP (cuff pressure 35–40 kPa) or Sham (0.9 kPa), with crossover after 7 days.

Sample Analysis:

Plasma Biomarkers: ICAM-1, MCP-1, and myoglobin (Myo) via ELISA; AST and CK via automated biochemistry analyzer.

Multi-omics Profiling:

Targeted metabolomics (LC-MS): Absolute quantification of 350+ plasma metabolites.

PBMC transcriptomics (DNBSEQ-T7 platform): mRNA sequencing of 18,316 transcripts.

Immune Cell Infiltration: CIBERSORTx algorithm for dynamic profiling of NK cell subsets.

2. Animal Experiments

Model: 21 Labrador retrievers (equal sexes) divided into Control, Exhaustive Exercise, and Exercise+EECP groups.

Intervention: 1-hour EECP (30 kPa) post-treadmill exhaustion.

Assessments:

Hemodynamics: Pressure-wire monitoring of anterior tibial artery flow.

Histopathology: H&E staining, Masson's trichrome (collagen), ATPase staining (type II fiber metabolism).

Immunofluorescence: Skeletal muscle CD16+ NK cell infiltration.

3. In Vitro Experiments

NK Cell Differentiation: Primary human NK cells exposed to acetylglycine (0.625–2.5 μM); CD56/CD16 phenotypes analyzed by flow cytometry.

Inflammatory Pathways: CXCR1/IL-6/ICAM-1 expression via Western blot.

Muscle Apoptosis:

Contact/non-contact coculture (NK cells + human skeletal muscle cells).

Apoptosis quantified by Annexin V-FITC/PI staining.

Results

1. EECP Attenuates Muscle Damage and Inflammation

Clinical samples: Plasma CK, Myo, and ICAM-1 significantly increased post-exercise (*p* <0.05); reductions were greater after EECP vs. Sham (e.g., CK ↓ 40%, *p* = 0.003).

PBMC transcriptomics: EECP downregulated inflammatory pathways (TNF/NF-κB/TLR signaling) and oxidative stress genes (Cluster 6, Q

<0.05).

2. Acetylglycine Mediates NK Cell Differentiation and Muscle Apoptosis

Metabolite-Immune Axis:

Strong positive correlation between plasma acetylglycine and CXCR1 expression during exhaustion (*r* = 0.697, *p* = 0.031).

EECP significantly reduced acetylglycine (clinical: ↓ 32%; animal: ↓ 41%, *p*

NK Cell Phenotype Shift:

Acetylglycine dose-dependently induced CD56dimCD16bright differentiation (2.5 μM: CD56 ↓ 68.1%, CD16 ↑ 67.6%, *p* <0.001).

Animal model: CD16+ cells increased 2.9-fold in muscle post-exercise (*p* <0.001); reversed by EECP.

Apoptotic Pathway:

Acetylglycine activated CXCR1/IL-6/ICAM-1 axis (protein expression ↑ 35–38% by WB, *p* <0.001).

CD56dim NK cells induced myocyte apoptosis via contact-dependent mechanisms (↑ 56.5%, *p* <0.001).

3. EECP Promotes Tissue Repair and Metabolic Recovery

Animal Model:

EECP reduced tibialis anterior (TA) interstitial fibrosis (Masson's staining: ↓ 8.2%, *p* <0.001), restoring levels to Control.

ATPase staining indicated alleviated anaerobic burden in type II fibers (staining depth ↓ 22.1%, *p* = 0.008).

Hemodynamics: EECP enhanced anterior tibial artery pressure by 72% (95% CI: 49.7–94.3, *p* <0.001), accelerating clearance of metabolic waste.

Conclusions

1.Core Mechanism: EECP reduces plasma acetylglycine, inhibits CD56dim NK cell differentiation, and blocks the CXCR1/IL-6/ICAM-1 inflammatory cascade, thereby attenuating skeletal muscle apoptosis (Fig. 7C).

2.Functional Recovery: Mitigates muscle fibrosis and restores aerobic metabolism in type II fibers, accelerating post-exercise recovery.

3.Translational Value:

Establishes EECP as a novel non-invasive hemodynamic therapy for EIMD.

Expands EECP applications in sports medicine (athlete recovery), fitness science, and rehabilitation.

基于循证护理的早期心脏康复干预对急性心肌梗死 PCI 术后患者预后的影响

徐洁 刘华芬

武汉大学人民医院

目的：探讨基于循证护理的早期心脏康复干预对 50 岁以上男性急性心肌梗死（AMI）患者经皮冠状动脉介入治疗（PCI）术后心功能恢复、并发症发生率及生活质量的影响，为临床护理实践提供科学依据。

方法：采用前瞻性随机对照研究，选取 2024 年 6 月至 2025 年 6 月在我院行 PCI 术的 50 岁以上男性 AMI 患者 150 例，随机分为干预组（n=75）和对照组（n=75）。对照组接受常规术后护理，干预组在常规护理基础上实施基于循证医学证据的早期心脏康复干预，包括术后 24 小时内开始床上被动活动、渐进式呼吸训练、早期离床活动（术后 48 小时内）、个性化运动处方（基于心肺运动试验结果）、心理干预及营养指导。干预周期为住院期间及出院后 3 个月。主要观察指标包括左室射血分数（LVEF）、6 分钟步行试验（6MWT）、术后并发症（如再梗死、心力衰竭、心律失常）发生率，以及西雅图心绞痛量表（SAQ）评分。采用 SPSS 25.0 进行数据分析。

结果：干预 3 个月后，干预组 LVEF 显著高于对照组（52.4±5.6% vs. 47.8±6.2%，P<0.05），6MWT 距离更长（425.3±42.1m vs. 378.6±45.7m，P<0.01）。干预组术后并发症发生率显著低于对照组（8.0% vs. 18.7%，P<0.05）。SAQ 评分显示，干预组在躯体活动受限程度（75.3±8.2 vs. 65.4±9.1）和治疗满意度（88.5±6.7 vs. 79.2±7.4）方面显著优于对照组（均 P<0.01）。

结论：基于循证护理的早期心脏康复干预可有效改善 AMI 患者 PCI 术后的心功能，降低并发症发生率，提高生活质量。建议将早期康复干预纳入 AMI 患者 PCI 术后的标准化护理流程，并进一步探索其长期效益。

结构性心脏病患者经导管介入术后早期康复护理模式的构建与应用效果评价

徐洁 刘华芬

武汉大学人民医院

目的：探讨基于加速康复外科（ERAS）理念构建的早期康复护理模式在结构性心脏病（SHD）患者经导管介入治疗后的应用效果，重点评估其对术后恢复、并发症及生活质量的影响。

方法：采用类实验性研究设计，选取武汉大学人民医院心内科 2024 年 1 月 -2025 年 6 月行经导管介入治疗的 SHD 患者 126 例（包括房间隔缺损、室间隔缺损、肺动脉瓣狭窄等），按住院时间分为干预组（n=63）和对照组（n=63）。对照组实施常规围术期护理，干预组采用多学科团队（MDT）协作的早期康复护理模式，包括：①术前预康复（呼吸训练、营养评估与干预）；②术中体温管理与液体控制；③术后 6 小时启动阶梯式康复方案（早期体位管理、床上活动、渐进式呼吸训练）；④出院前制定个性化居家康复计划。主要观察指标：术后首次下床时间、住院时长、并发症发生率（穿刺部位血肿、心律失常、栓塞事件等）；次要指标：6 分钟步行距离（6MWD）、明尼苏达心功能不全生命质量量表（MLHFQ）评分。

结果：干预组术后首次下床时间显著早于对照组（18.5±4.2h vs 26.3±5.7h，P<0.01），平均住院日缩短 2.3 天（5.2±1.1d vs 7.5±1.8d，P<0.05）。干预组总并发症发生率低于对照组（9.52% vs 20.63%，P<0.05），其中穿刺部位血肿（3.17% vs 11.11%）和房性心律失常（4.76% vs 14.29%）差异显著。出院 1 个月随访显示，干预组 6MWD（382.6±45.3m vs 338.4±52.1m）和 MLHFQ 评分（45.2±8.7 vs 53.6±9.3）均优于对照组（均 P<0.01）。

结论：基于 ERAS 理念的早期康复护理模式能有效促进 SHD 介入术后患者功能恢复，降低并发症风险，改善生活质量。该模式特别适用于经导管治疗的 SHD 患者，建议在临床推广中注重多学科协作和个体化方案制定。

体医融合模式下 PCI 术后患者 II 期心脏康复运动方案的构建与应用研究

杨曦艳 [1] 陈赞雄 [2]

1. 首都医科大学附属北京朝阳医院

2. 首都体育学院

目的：针对如何提高心脏康复患者依从性这一全球心脏康复共同面临的问题，探寻中国的体医融合模式解决办法。本研究是在体医融合新理论体系指导下开展的最新实践，由经过医学培训的体育人员进入医院，与医生合作共同为心脏康复患者制定运动方案并指导其进行运动，促进医疗与运动方案真正落实，证明医院场景内体医融合心脏康复模式的可行性及有效性。

方法：采用随机对照试验法，由经过医学培训的体育人员进入心脏康复中心与医生共同为心脏康复患者服务。连续入选 32 名接受 PCI 术后，需要进行 II 期心脏康复的患者为研究对象，随机分为对照组和实验组，按照《中国冠心病康复与二级预防指南》进行三个月的运动干预。对照组由医生行心肺功能评估并开具运动处方后由医生指导患者运动；实验组由医生对患者进行心肺功能评估后，由经过医学培训的体育人员在医护的安全保障下对其进行运动功能评定包括关节活动度评估、FMS 动作评估、柔韧性、平衡性测试等，结果报给医生，医生据心功能评估结合运动功能评定结果为其开具运动处方。再由经过医学培训的体育人员根据体医融合理论体系，选取相应训练工具，编排训练动作，将运动处方转化为具体可执行的个体化、情景化、趣味性强的周期性运动方案。在医院内，医护的安全保障下对患者开展运动指导。并在实验前后对患者的心功能、运动功能数据进行统计对比分析。

结果：体医融合模式下的心脏康复运动方案构建方法：由医生对患者的心肺功能、心理、用药、睡眠、既往疾病史等进行医学评估；由经过医学培训的体育人员在医务人员的安全保障下，对患者进行运动习惯评估、功能动作筛查、关节活动评估、身体素质评估等运动功能评定，明确患者能做哪些运动，需要做哪些运动，建立运动工具库和运动动作库，并将结果汇总报告给医生，由医生明确患者的运动强度阈值范围并开具运动处方，体育人员将运动处方转化为周期性训练安排表，并根据每日训练目标在运动工具库中选取合适的训练工具，在运动动作库中匹配相应的训练内容，形成具体可执行的情景化心脏康复运动方案，并在医务人员的安全保障下将运动方案应用于患者的运动指导。干预三个月以后：①两组患者均未出现心血管事件；②实验前对照组和实验组 $VO_{2\,max}$ 差异无统计学意义（P > 0.05），分别是 19.162±4.097 和 19.412±3.337。经过三个月的运动干预后，实验组 $VO_{2\,max}$ 显著高于对照组（P < 0.05），分别是 19.669±4.196 和 22.037±2.761；通过组内比较发现，实验组患者 $VO_{2\,max}$ 相较干预前极其显著提高（P < 0.01），表明相较于对照组，体医融合模式下的心脏康复可以明显提高患者的心肺功能。③实验前对照组和实验组 FMS 测试差异无统计学意义（P > 0.05），分别是 9.562±2.394 和 9.5±3.327。在各项单独测试中，也均无统计学意义。经过三个月的运动干预之后，对照组与实验组 FMS 测试总分出现极其显著差异（P < 0.01），分别是 9.938±1.914 和 13.188±2.509。④按照指南推荐三个月内完成 36 次以上训练患者对照组 4 人，实验组 12 人，完成 25-36 次患者对照组 2 人，实验组 3 人，完成 25 次以下训练患者对照组 10 人，实验组 1 人。对照组总依从率 37.5%；实验组总依从率 93.75%。实验组患者依从性较对照组患者由极其显著差异（P < 0.01）。患者运动依从性提高 2.5 倍。

结论：本研究首次探索建立体医融合心脏康复的新模式；且初步证明体医融合模式下的心脏康复运动方案可以显著提高患者运动依从性，且患者的心功能和运动功能提升更为显著。

永久人工心脏起搏器植入术后患者应用护士参与心脏康复护理的效果研究

井翠萍

交大一附院

摘要】目的：分析永久人工心脏起搏器植入术后患者中，护士参与心脏康复护理的效果研究。

方法: 筛选永久人工心脏起搏器植入术后的患者作为研究对象，例数合计为 80 例，选取时间范围为 2023 年 10 月–2024 年 10 月，按照随机数字表法进行分组。分为对照组和观察组，40 例为一组，对照组采取常规护理，观察组联合实施护士参与心脏康复护理。对比 2 组的干预效果。

结果：干预后，观察组心功能、心脏耐力指标均优于对照组 (P<0.05)；观察组患

者生活质量高于对照组 (P<0.05)；观察组不良心血管事件发生比例低于对照组 (P<0.05)；观察组患者满意率高于对照组 (P<0.05)。

结论：护士参与心脏康复护理的应用，通过制订规范的心脏康复护理措施，对永久人工心脏起搏器植入术后患者开展健康教育、心理疏导，行为干预、康复锻炼等多途径的心脏康复指导，极大地改善了永久人工心脏起搏器植入术后患者的心功能恢复，提升了其心脏耐力，有助于患者整体生活质量的提升，降低了不良心血管事件发生风险，患者术后在康复期间的安全性也有充分的保证，患者及家属满意度高。

【关键词】永久人工心脏起搏器植入术后；护士参与心脏康复护理；心脏耐力

经导管三尖瓣介入治疗术的心脏全程康复

水小兰 田丹 刘华芬

武汉大学人民医院

目的：探讨经导管三尖瓣介入治疗（TTVI）术后系统化心脏康复方案的效果，旨在改善患者心肺功能、降低再住院率、提升生活质量，填补 TTVI 术后长期康复管理的循证空白。

方法：对 2022-2025 年本院收治的 26 例重度三尖瓣反流（TR）患者（平均年龄 72±8 岁，外科手术高危）行 TTVI（包括 TriClip、EVOQUE 等系统），术后实施分阶段心脏全程康复计划：

1. 住院期（术后 1 周）：渐进式呼吸训练 + 低强度床边活动（每日 2 次，10-15 分钟）；

2. 早期康复（1-4 周）：心肺运动试验（CPET）制定个体化运动处方（心率储备 40-60% 的有氧训练 + 抗阻训练）；

3. 中期强化（1-3 月）：远程心电监护下进行中高强度间歇训练（HIIT），结合营养与药物优化；

4. 长期维持（3-6 月 +）：社区 / 家庭康复随访，每月评估 6 分钟步行距离（6MWD）及生活质量问卷（KCCQ）。

结果：

术后 6 个月随访显示：

1. 心肺功能显著改善：6MWD 从术前 278±45m 提升至 362±38m（p<0.01），峰值摄氧量（VO_2 peak）增加 18.7%；

2. 心功能逆转：90.4% 患者 NYHA 分级改善至 I-II 级（术前 III-IV 级占 100%）；

3. 生活质量提升：KCCQ 总分从 49±11 分升至 72±9 分（p<0.001）；

4. 临床硬终点改善：心衰再住院率较传统管理下降 52%（8% vs 16.7%，p=0.03）。

结论：

TTVI 术后系统化心脏全程康复可显著提升患者运动耐量、心功能及生活质量，降低再住院风险。以 CPET 为指导的阶段性运动康复为核心，结合多学科管理，是优化 TTVI 患者长期预后的关键策略，为国际 TR 管理指南的更新提供重要循证依据。临床意义提示：本研究首次提出 TTVI 专属康复路径，填补了该领域管理空白，尤其强调早期呼吸肌训练对抗右心衰及 HIIT 对右心室功能重塑的促进作用，具有直接临床转化价值。

基于 GINSINI 评分心肺运动试验联合 TyG 指数预测冠脉狭窄风险模型构建

钱华 童睿 刘艳

西安交大一附院

目的：本研究旨在明确心肺运动试验与冠状动脉狭窄严重程度的相关性，并建立可供临床直接使用的冠状动脉显著狭窄风险预测模型。

方法：回顾性收集 2024 年 1 月至 2025 年 5 月在西安交大一附院心血管内科的住院患者 111 例，均完善冠脉造影检查及心肺运动试验（cardiopulmonary exercise test，CPET）检查。根据冠状动脉造影结果进行 Ginisini 评分，并基于冠状动脉造影检查冠脉狭窄情况分为观察组 (至少 1 支狭窄≥ 50%)80 例和对照组 30 例。收集两组一般情况、生化检查、冠脉造影和心肺运动试验检查结果。通过单因素分析和 Logistic 回归分析发现可能影响冠状动脉狭窄的危险因素，并根据变量构建列线图模型，基于 Bootstrap 法进行内部验证及评价。

结果：单因素分析显示，试验组峰值摄氧量 (Peak VO_2), 氧脉搏 (VO_2/ HR), 代谢当量 (METs) 指标分值显著低于对照组（P<0.05）。同时，与 Ginsini 评分显著负相关（P<0.05）。试验组 Ginsini 评分、脂蛋白 a、低密度脂蛋白、TyG 指数得分显著高于对照组（P<0.05）。利用 Peak VO_2 ,VO_2/HR,METS 构建二元 Logistic 回归分析，结果显示：Hosmer-Lemeshow 检验的显著性为 0.483>0.05，说明模型拟合较好。显著性结果显示：Peak VO_2 ,VO_2/HR,METS 对冠状动脉狭窄有显著的负向预测意义。利用 VO_2,VO_2/HR,METS、脂蛋白 a、低密度脂蛋白、TyG 指数、高血压、糖尿病绘制 ROC 曲线并计算 AUC，结果提示 VO_2 /HR 、Peak VO_2 对冠状动脉显著狭窄的预测价值最高。上述指标联合诊断冠心病的受试者工作特征曲线 (ROC) 下面积为 0.994，灵敏度为 87.5%，特异度为 96.7%，优于上述指标单独诊断冠心病的临床价值。

结论：心肺运动试验对冠状动脉狭窄严重程度的评估有一定的临床预测价值，心肺运动试验联合 TyG 指数预测冠脉狭窄风险的模型构建可以为冠心病患者的诊治提供帮助。

关键词：心肺运动试验 冠心病 冠状动脉狭窄 预测模型

基于计划行为理论的阶梯式康复护理模式在 A 型主动脉夹层术后截瘫患者护理

李娟

西安交通大学第一附属医院

本研究旨在探讨基于计划行为理论的阶梯式康复护理模式在 A 型主动脉夹层术后截瘫患者护理中的应用效果。通过文献回顾与理论分析，结合临床实践，构建了一套以 TPB 为指导框架的阶梯式康复护理方案。该方案强调对患者行为意图、主观规范及知觉行为控制的全面评估，并据此设计分阶段、个性化的康复计划，旨在促进患者从术后初期到长期恢复过程中的功能重建与生活质量提升。

研究对象为某三甲医院心血管外科收治的 A 型主动脉夹层术后截瘫患者，采用随机对照试验方法，将患者分为实验组与对照组。实验组接受基于 TPB 的阶梯式康复护理，包括术前心理干预、术后早期功能锻炼、中期日常生活能力训练及晚期社会适应与心理调适等阶段；对照组则实施常规护理措施。通过对比两组患者的康复效果指标，如肢体功能恢复情况、日常生活自理能力、心理状态评分及并发症发生率等，评估新护理模式的有效性。

结果显示，实验组患者在术后各阶段均表现出更佳的康复进展，具体体现在肢体运动功能显著改善、日常生活自理能力提高、抑郁焦虑情绪减轻以及并发症发生率降低等方面。此外，患者对护理服务的满意度也明显高于对照组，表明基于 TPB 的阶梯式康复护理模式不仅促进了患者的生理康复，还有效提升了其心理健康水平和社会适应能力。

基于 CiteSpace 心脏康复研究热点及发展趋势的可视化分析

曾庆玲 张丽敏

陆军军医大学第二附属医院

目的

通过对国外心脏康复（cardiac rehabilitation）研究文献进行可视化分析，了解该领域研究脉络，探讨心脏康复前沿和热点，为未来相关研究开展提供思路和参考。

方法

通过中国知网和 Web of Science 核心合集检索心脏康复研究的相关文献作为数据源，检索建库至 2025 年 6 月 30 日期间心脏康复相关研究，采用 CiteSpace（6.1.R6）软件对国家、机构、作者、关键词共现、聚类和突现进行可视化分析。

结果

共纳入中文文献 5765 篇、英文文献 9540 篇 . 该领域中英文发文量总体均呈现持续上升趋势，发文量居前列的国家分别为美国、加拿大、英国、澳大利亚。主要研究机构为高等院校，其中加拿大多伦多大学发文量居世界研究机构的首位。Journal of Cardiopulmonary Rehabilitation and Prevention、European Journal of Preventive Cardiology 等心血管专业期刊是载文量最多的杂志。发文量居前列的代表作者是加拿大约克大学 Grace, Sherry L。研究热点包括患者生活质量、患者心理状态评估、心脏康复干预措施、患者心脏康复依从性评价。研究趋势则涉及改善影响患者心脏康复效果的主观因素（运动恐惧和自我效能）和客观条件（数字健康技术整合、远程心脏康复等）。

结论

伴随着国内心脏康复理念的不断普及，技术的不断完善和成熟，未来研究者可通过借鉴国外经验，立足我国国情，开展高质量研究，探寻适合本土化的远程心脏康复模式，促进远程照护模式的成熟和优化。

AMI 患者 PCI 术后 I 期运动康复方案的构建与实证研究

彭家芹

三峡大学第一临床医学院湖北宜昌市中心人民医院

目的：探讨 I 期运动康复方案制定与实施对急性心肌梗死（AMI）患者经皮冠状动脉介入治疗（PCI）术后心功能恢复、生活状态的影响。在循证医学理论指导下，早期康复运动方案形成并得到推广。

方法：聚焦在我愿接受 PCI 治疗的 AMI 患者，从 2023 年 11 月至 2025 年 2 月中选定 76 例继续研究，践行采用随机对照试验，对比说明观察组（n=38/I 期运动康复方案）在心功指标、治理情况及生活满意度方面与对照组（n=38/ 常规护理 + 健康教育）的差异。做法包括但不限于常规抗血小板治疗、抗凝管理、调脂稳定斑块（血管紧张素转化酶抑制剂）、神经内分泌抑制（β 受体阻滞剂）。

结果：观察组静息心率显著低于对照组而 6min 步行距离更长、Barthel 指数与生活满意度评分均更高，p 均 < 0.001。

结论：每日记录提示患者正逐步走向康复，这也给了患者以更多的信心并确保其后续康复训练更加投入，这也是提升早期康复有效性的重要途径，这一干预模式尊重患者个体差异，避免了避免“一刀切”干预模式导致的过度康复问题，实现了早期功能重塑这一目的。建议为 AMI 患者制定并实施 PCI 术后 I 期运动康复方案，不仅可以促使患者心功能水平迅速恢复还可提高其生活质量。

老年性心脏疾病患者的心脏康复护理策略与效果分析

朱瑞雪

哈尔滨医科大学附属第二医院

目的

随着全球老龄化进程加速，老年心脏疾病已成为威胁公共健康的重要问题。流行病学调查显示，我国 65 岁以上人群慢性心力衰竭（CHF）患病率超过 10%，80 岁以上人群高达 10% 以上，患者总数已突破 1000 万例，且 5 年生存率不足 50%。冠心病作为另一常见老年心脏病，其高发病率与高死亡率特点同样值得关注。在药物治疗基础上，系统化心脏康复护理通过整合运动训练、心理干预与多学科协作，成为改善老年患者心功能、提升生活质量的关键策略。本文将深入探讨老年心脏疾病患者康复护理的具体策略实施路径及循证效果。

方法

个体化运动训练方案：老年心脏康复护理以科学设计的运动处方为核心，强调个体化与循序渐进原则。**整合心理与行为干预**老年心脏病患者普遍存在焦虑抑郁情绪，研究显示约 48% 的 CHF 患者伴有显著焦虑情绪。**多学科协作与延续性管理**基于老年综合评估（CGA）的护理模式整合医疗、护理、康复、营养多学科团队，全面评估患者心肺功能、营养、药物及心理状况。

结果

心功能与生物标志物改善，运动耐力与生活能力提升。心理状态与生活质量优化。**临床终点事件减少。**

讨论与展望

老年心脏康复护理的核心优势在于其多维度干预模式：通过运动改善心肌重构，通过心理干预调节神经内分泌，通过教育提升自我管理能力。然而，其成功实施需遵循三大原则：**个体化原则：需依据心功能分级（**NYHA 分级）、合并症（如关节炎、 COPD）调整运动强度。**安全监控原则：运动中需监测心电图、**Borg 自觉疲劳量表（11-13 级为宜），备急救药品应对突发症状。持续优化原则：未来研究需探索远程监护技术、不同心功能分级患者的差异化路径，以及长期生活质量改善效应。

远隔缺血后适应在缺血性心肌病中的保护作用的临床观察

张馨月

哈尔滨医科大学附属第四医院

目的：

探讨远隔缺血后适应（RIPostC）对缺血性心肌病（ICM）患者的保护作用，评估其对心功能、血清心肌损伤标志物及运动耐量的影响，为 ICM 的治疗提供新的临床思路。

方法：

选取 2024 年 6 月至 2024 年 11 月哈尔滨医科大学附属第四医院收治的 60 例 ICM 患者，随机分为 RIPostC 组（n=30）和对照组（n=30）。对照组接受常规药物治疗，RIPostC 组在常规治疗基础上增加远隔缺血后适应干预（双上肢袖带充气加压，循环 3-5 次，每周 2-3 次，持续 1 个月）。比较两组干预前后的左室射血分数（LVEF）、左室舒张末径（LVEDD）、血清肌钙蛋白 I（cTnI）、B 型钠尿肽（pro-BNP）及心肺运动评估代谢当量（METS 值）。

结果：

1. 心功能改善：RIPostC 组 LVEF 显著高于对照组（54.53±3.29% vs. 52.10±3.13%，P=0.004），LVEDD 显著降低（52.00[50.00,53.00]mm vs. 57.50[52.00,62.00]mm，P=0.001）。

2. 心肌损伤标志物：RIPostC 组 pro-BNP 水平显著低于对照组（134.00[66.75,306.75]pg/mL vs. 322.00[92.15,1051.00]pg/mL，P=0.019）。

3. 运动耐量：RIPostC 组 METS 差值显著优于对照组（-0.92±0.55 vs. -0.67±0.34，P=0.038）。

结论：

远隔缺血后适应可显著改善 ICM 患者的心功能，减轻心肌损伤，并提高运动耐量，有望成为一种安全、有效的辅助治疗手段，为心脏康复提供了新的干预策略。

关键词：远隔缺血后适应；缺血性心肌病；心功能；心肌保护；心脏康复

中国健康成人心肺适能的年龄、性别与 BMI 分布特征：一项基于 V̇O2peak 的回顾性横断面研究

王继楠 任川 徐顺霖 赵威

北京大学第三医院

目的

本研究旨在构建中国健康成年人群心肺适能的年龄、性别及体质量指数（body mass index，BMI）特异性参考值，明确峰值摄氧量（peak oxygen uptake，$\dot{V}O_2$peak）在人群中的分布特征，为心肺健康风险评估、肥胖干预及个体化运动处方提供本土化循证依据。

方法

本研究为回顾性横断面研究，纳入 2017 年 9 月 1 日至 2025 年 5 月 30 日期间在北京大学第三医院接受心肺运动试验的 13,569 名健康受试者，其中男性 6,628 例，女性 6,941 例，年龄 18 至 89 岁。所有受试者均在功率自行车上完成标准化心肺运动试验，以确保充分的运动负荷。记录 $\dot{V}O_2$peak，按性别、每十岁年龄组及 BMI 分类（<18.5、18.5–23.9、24–27.9、≥ 28 kg/m²）分层，计算 $\dot{V}O_2$peak 百分位数（P5–P95）并分析中位数随变量变化趋势。

结果

男性 $\dot{V}O_2$peak 中位数由 18–29 岁组的 29.2 ml·kg^{-1}·min^{-1} 随年龄逐组递减，至 80–89 岁组降至 17.0 ml·kg^{-1}·min^{-1}，平均每十年减少约 2.0 ml·kg^{-1}·min^{-1}，下降幅度约为 7.0%。女性 $\dot{V}O_2$peak 中位数则呈相似下降趋势，从 23.8 ml·kg^{-1}·min^{-1} 降至 14.5 ml·kg^{-1}·min^{-1}，平均每十年减少约 1.6 ml·kg^{-1}·min^{-1}，降幅约为 6.5%。在男性和女性人群中，不同年龄组之间的 $\dot{V}O_2$peak 水平均存在统计学差异（P<0.05）。在各年龄段，男性 $\dot{V}O_2$peak 显著高于女性（P<0.05），性别差异在年轻组最为明显，老年组相对缩小。

在不同 BMI 水平下，$\dot{V}O_2$peak 也表现出显著差异。男性 BMI <18.5、18.5–23.9、24.0–27.9、≥ 28.0 kg/m² 组的 $\dot{V}O_2$peak 分别为 31.2、28.4、24.9、21.7 ml·kg^{-1}·min^{-1}；女性对应组别的 $\dot{V}O_2$peak 分别为 23.9、21.7、18.7、17.1 ml·kg^{-1}·min^{-1}，呈随 BMI 升高而下降的趋势。

结论

$\dot{V}O_2$peak 作为心肺适能的核心指标，受年龄、性别及 BMI 多重影响，表现出显著差异性。男性高于女性，高 BMI 者 $\dot{V}O_2$peak 显著下降。这些发现可为心肺适能评估、慢病筛查和运动干预提供重要参考依据。

基于心肺运动试验的健康成年人峰值氧脉搏预测方程的建立与验证

王继楠 任川 徐顺霖 赵威

北京大学第三医院

目的

本研究旨在建立适用于中国健康成年人的峰值氧脉搏（peak oxygen pulse, $\dot{V}O_2$/HR peak）预测方程，并验证其在不同年龄、性别和体型人群中的准确性和稳定性。由于目前常用的预测方程多基于国外人群建立，直接应用于中国人群可能存在误差，因此有必要构建更符合我国人群特征的参考模型，以提高心肺运动试验（cardiopulmonary exercise testing，CPET）结果的解释价值。

方法

回顾分析 2017 年 9 月 1 日至 2022 年 8 月 30 日期间，在北京大学第三医院心脏康复中心接受标准化 CPET 的健康成年人数据，构建建模组（n = 8454，男性 4160 例，女性 4294 例）。采用多元线性回归分析性别、年龄、身高、体重、体重指数（body mass index，BMI）、体表面积（body surface area，BSA）和去脂体重（lean body mass，LBM）对 $\dot{V}O_2$/HR peak 的影响，建立预测模型。同时纳入 2022 年 9 月 1 日至 2025 年 5 月 30 日期间在北医三院完成 CPET 的健康成年人作为验证组（n = 4827，男性 2337 例，女性 2490 例），用于进行模型的时间外部验证。所有测试均在功率自行车上完成。受试者按照性别、每十岁年龄分组（18–89 岁），以及 BMI 分层（<18.5、18.5–23.9、24.0–27.9、≥ 28 kg/m²），评估模型在各亚组中的预测表现。

结果

预测方程为：$\dot{V}O_2$/HR peak = 0.087 × Sex (Man=1,Woman=2) – 0.015 × Age + 156.667 × Log(Height) + 0.099 × Weight – 132.026 × Log(BSA) + 27.329 × Log(LBM) + 41.999 × Log(BMI) – 412.071，调整 R^2 为 0.552。

在验证组中，预测值与实测值高度一致。男性的预测值为 12.7±1.2 ml·beat^{-1}，实测值为 12.9±2.8 ml·beat^{-1}；女性的预测值为 8.5±0.8 ml·beat^{-1}，实测值为 8.5±1.7 ml·beat^{-1}。整体实测值与预测值的比值为 100.7±19.1%，其中男性为 101.8±20.2%，女性为 99.6±17.8%。在各年龄亚组中，实测 / 预测比值均接近 100%，一致性良好，且呈现随年龄增长略有下降的趋势。在不同 BMI 亚组中，该比值的波动均控制在 ±2% 以内，显示模型在不同体型人群中具有良好的稳定性和适用性。验证组的组内相关系数（ICC）为 0.719（P < 0.001），进一步证明了模型的可靠性。

结论

本研究建立了基于中国健康成年人大样本的 $\dot{V}O_2$/HR peak 预测模型，拟合效果良好，验证一致性高。相比基于欧美人群的通用模型，该模型更适用于中国人群，可为心肺功能评估、异常识别和个体化运动方案制定提供实用的临床参考。

PH 患者不同运动试验（CPET 与 6MWT）与疾病严重性的临床研究

车琳 王玉婧 王怡恒 朱倩倩 刘学波 陈发东

同济大学附属同济医院

目的：探讨 PH 患者不同运动试验（CPET 与连续生理参数监测的 6MWT）对其疾病严重程度的评估以及不同运动试验其核心数据的相关性分析

方法：连续录入同济大学附属同济医院肺高压中心 2022 年 9 月 -2024 年 12 月 40 例 PH 患者，均完成 CPET 和 6MWT。

结果：40 例患者男 6 例，女 34 例，年龄 38.35±11.09y，I 类 PH 占 35 例，IV 类 PH 占 5 例。

1 PH 不同功能分级其运动心肺的生理参数有显著差异

按照 WHO 功能分级（FC）分为两组，FC I-II 组 25 例（年龄 39.72±12.64y，女 21 例），FC III-IV 组 15 例（年龄 36.07±7.75y，女 13 例）。

6MWD(m) 在 FCI-II(510.56±77.47) 和 FCIII-IV 患 者 (443.47±102.36) (p=0.024) 有显著差异，DSP(m%)（6MWD 与步行试验患者 SPO2 的最低值的乘积）在 FCI-II (437.35±95.29) 和 FCIII-IV(385.38±92.23) 差异没有达到显著性 p=0.051。

CPET 中，VO2peak（ml/min/kg） 及 其 VO2peak/maxpred% 在 不 同 功

能分级间存在显著差异。FC I-II 级的 VO2peak（17.02±3.90 ）显著高于 III-IV 级患者（13.77±2.73 ）（p=0.007）；VO2peak/maxpred% 在 I-II 级组（55.33±10.96%）同样显著高于 III-IV 级组（44.79±11.59%）（p=0.008）。

2. 6MWT 与 CPET 核心参数的相关性分析

6MWD 与多项 CPET 核心指标呈显著正相关：VO_2-AT（r=0.409，p=0.009）、VO_2-peak（r=0.651，p<0.001）、WR-AT（r=0.368，p=0.020）、WR-peak（r=0.623，p<0.001）、VO_2/HRpeak（r=0.466，p=0.002）、$PETCO_2$-rest（r=0.476，p=0.002）、$PETCO_2$-peak（r=0.367，p=0.020）；6MWD 与 VE/VCO_2斜率呈显著负相关（r=-0.442，p=0.004）。

6MWT 的 DSP 与 CPET 多项指标显著正相关：VO_2-AT（r=0.423，p=0.006）、VO_2-peak（r=0.635，p<0.001）、WR-AT（r=0.391，p=0.013）、WR-peak（r=0.577，p<0.001）、VO_2/HRpeak（r=0.440，p=0.004）、$PETCO_2$-rest（r=0.535，p<0.001）、$PETCO_2$-peak（r=0.461，p=0.003）；DSP 与 VE/VCO_2斜率呈显著负相关（r=-0.517，p=0.001）。

结论：PH 的不同运动心肺参数可协助判断 PH 患者疾病严重程度，6MWT 中的 6MWD 和 DSP 与 CPET 核心指标均明确相关。

急性心肌梗死患者早期下床的安全性分析

珍珍 张锦

兰州大学第一医院

目的：通过回顾性队列研究分析急性心肌梗死（AMI）患者早期下床的安全性及获益。

方法：连续入选于 2024 年 1 月 2 日 -2024 年 3 月 31 日因 AMI 就诊于兰州大学第一医院在发病 12 小时内接受了急诊经皮冠状动脉介入治疗 (PCI) 且接受了心脏康复的患者。根据纳入排除标准最终分析的研究对象 90 例。首次下床时间定义：从 PCI 术后即手术结束回到冠心病监护病房（CCU）开始计时，至首次下床站立的时间。根据首次下床时间是否在 20 小时以内分为早期康复组 (n=42) 和对照组 (n=48)。比较两组之间的基线资料、首次下床时的生命体征变化、康复过程中的不适症状、心律失常发生率、住院天数、Kolcaba 的舒适状况量表 (GCQ 评分) 等指标；根据 Pearson 相关性分析早期下床与 GCQ 评分之间的相关性。

结果：基线资料与对照组比较，早期心脏康复组的心脏彩超左室射血分数（LVEF）[55.0(46. 0,57.0)% vs. 49.0(43.3, 53.0)%, P=0.012] 较高，左室舒张末期容积（LVEDV）[115(102.0, 123.3)ml vs. 125.5(108.3, 140.0)ml, P=0.013] 较低，心率 [(73.2±11.3) vs. (79.5±12.2), P=0.013] 较低。两组之间生命体征变化、不适症状、心律失常发生率、住院天数均无统计学意义 (P 均 >0.05)；两组均未发生主要心血管不良事件 (MACE)。与对照组比较，早期康复组 GCQ 评分 [77.0(73.0, 80.0) 分 vs. 64.5(59.0, 68.0) 分，P<0.001] 显著增高。Pearson 相关性分析显示 GCQ 评分与下床时间呈现显著负相关 (r=-0.740，P<0.001)。

结论：AMI 患者 PCI 术后经过康复评估后的早期下床是安全的，早期下床可以提高患者的舒适度，心功能较低、基础心率较高可能是影响早期下床的主要因素。

基于老年综合评估的多学科心脏康复干预在老年衰弱冠心病患者的应用

欧安平

中国科学技术大学附属第一医院（安徽省立医院）南区

目的：探讨对老年衰弱冠心病患者实施基于老年综合评估的多学科心脏康复干预的应用效果。

方法：选取 2024 年 6 月至 2025 年 6 月我院收治的 60 例老年衰弱患者为研究对象，以随机法将其分入观察组与对照组；对照组施以常规护理，观察组基于老年综合评估实施多学科心脏康复干预。成立 CGA 多学科康复专项小组，组长统筹管理，督促实施；个案管理师资料收集数据核对、推进康复方案、协调问题、效果评价；心脑健康管理师培训与指导技术；心脏康复医生评估病情、合理用药、制定运动处方；心脏康复护士实际操作、康复指导；营养师及心理咨询护士关注营养监测、心理疏导；互联网咨询护士开展“云医生”平台及“互联网医院”护理咨询服务。开展专项培训，召开质控会议，提高康复管理效能。入院时快速筛查登记、出院前 CGA 综合评估及出院后 1、3、6 个月采用门诊、HIS 智能随访、电话、微信或上门随访及时评估。方案前期实施专项培训与衰弱筛查评估，旨在危险因素风险筛查及衰弱认知，了解康复意愿。中期从运动锻炼、营养指导、共病和用药管理、心理干预等实施个性化管控；开展“1+1+1”多成分训练的心脏康复运动；营养师制定调整营养计划；个性化共病管理，动态评估用药合理性；开展个体认知刺激疗法，注重情绪调节和情感支持。后期做好居家康复准备，开展随访，实施医疗转介服务。对比组间日常生活活动能力、衰弱程度评分、满意度及 6 min 步行距离。

结果：两组患者日常生活活动能力比较可知，观察组更高（P < 0.05）；两组患者衰弱程度评分比较可知，观察组更低（P < 0.05）；两组患者满意度比较可知，观察组更高（P < 0.05）；两组患者 6 min 步行距离比较可知，观察组更佳（P < 0.05）。

结论：对老年衰弱冠心病患者实施基于老年综合评估的多学科心脏康复干预，确保了运动方案的合理性和可行性，有效改善了患者的步行能力，提升患者日常生活活动能力，延缓衰弱进程，提高生活质量。

八段锦在慢性心功能不全康复中的剂量效应研究

王娟

西安交大第一医院

背景：早期运动康复对增强慢性心功能不全患者的心脏功能，提高患者生活质量至关重要，八段锦作为低强度身心运动在心脏康复中具有潜在优势，但其最佳干预剂量尚不明确，过量可能导致风险，不足则效果有限。目的：探讨不同剂量八段锦对心功能不全 I 期患者康复效果的差异，为护理人员制定精准化运动处方提供循证依据。方法：采用随机对照试验设计，将 90 例心功能不全 I 期（NYHA I 级）患者分为三组：低剂量组（LDG，n=30）：15 分钟 / 次，3 次 / 周，中剂量组（MDG，n=30）：30 分钟 / 次，5 次 / 周，高剂量组（HDG，n=30）：30 分钟 / 次，7 次 / 周，干预 12 周，以 6 分钟步行距离（6MWT）、NT-proBNP、明尼苏达心衰生活质量量表（MLHFQ）为核心指标评估效果，同时监测安全性及依从性。**结果**：疗效差异：MDG 组 6MWT 提升最显著（+68.2±21.5m），优于 LDG 组（+42.1m）和 HDG 组（+55.7m）（均 P<0.05）；MDG 组 NT-proBNP 降低幅度最大（-125.6±45.8 pg/mL），MLHFQ 评分改善最优（-15.3±4.8 分）；安全性：HDG 组退出率达 10%（3/30），显著高于 LDG（0%）和 MDG 组（3.3%），主因疲劳感与关节不适；三组均未发生严重心血管不良事件。结论：八段锦对心功能不全 I 期患者的康复效果存在剂量依赖性。中等剂量（30 分钟 / 次，5 次 / 周）为最优方案，可显著改善运动耐力、心功能标志物及生活质量，且安全性高；护理实践中需以此为基础制定个体化处方，避免不足或过量运动风险。

循证理念指导下康复锻炼应用于重症老年感染性心肌炎患者中的研究

高苗苗

交大一附院

【摘要】

目的： 探讨循证理念指导下康复锻炼在重症老年感染性心肌炎患者中的应用。

方法 ： 选取 2021 年 7 月至 2023 年 2 月本院收治的 166 例老年感染性心肌炎患者进行研究，按随机数字表法将所有患者分为 A 组（n=83，常规康复指导）与 B 组（n=83，循证理念指导下康复锻炼）。比较两组临床疗效、生活质量 [世界卫生组织生存质量测定量表（WHOQOL-100）]、心理韧性 [简式韧性量表（BRS）]、幸福感 [精神幸福感指数量表（SIWB）]、并发症等等。

结果 ： A、B 两组护理总有效率比较（89.02% vs 97.56%），差异有统计学意义（P<0.05）。护理后，两组 WHOQOL-100、BRS 评分、SIWB- 自我效能、生命意义评分均呈上升趋势，且 B 组高于 A 组（P<0.05）。A、B 两组并发症总发生率比较（12.20% vs3.66%），差异有统计学意义（P<0.05）。

结论 ：循证理念指导下康复锻炼应用于重症老年感染性心肌炎患者中效果显著，通过给予患者个性化的康复锻炼护理服务，旨在最大化降低风险、提高患者满意度和自我管理能力，可改善患者生活质量，提高其心理韧性与幸福感，使并发症发生降低，适宜在临床中推广。

专科护士为主导的多学科协作康复护理对心脏瓣膜置换术后患者康复的影响

张远莹

西安交通大学医学院第一附属医院

目的 探讨专科护士为主导的多学科协作康复护理对心脏瓣膜置换术后患者康复的影响。方法 选择 2022 年 2 月至 2023 年 1 月于西安交通大学第一附属医院心血管外科行心脏瓣膜置换术治疗的 100 例患者为研究对象，按照护理方式不同将患者分为对照组和观察组，每组 50 例。对照组患者给予常规护理干预，观察组患者给予专科护士为主导的多学科协作康复护理干预。记录 2 组患者术后首次排气时间、首次排便时间、首次下床活动时间及重症监护时间、住院时间；于出院时、术后 6 个月时，采用 6 min 步行距离试验和明尼苏达心力衰竭生活质量量表 (MLHFQ) 评估患者的心功能状态和生活质量；术后 6 个月，记录 2 组患者不良心脏事件发生率。结果 观察组患者首次排气时间、首次排便时间、首次下床时间、重症监护时间和住院时间显著短于对照组 (P<0.05)。出院时，2 组患者 6 min 步行距离比较差异无统计学意义 (P>0.05)；术后 6 个月，2 组患者 6 min 步行距离显著长于出院时，且观察组患者 6 min 步行距离显著长于对照组 (P<0.05)。出院时，2 组患者 MLHFQ 评分比较差异无统计学意义 (P>0.05)；术后 6 个月，2 组患者 MLHFQ 评分显著低于出院时，且观察组患者 MLHFQ 评分显著低于对照组 (P<0.05)。对照组患者发生不良心脏事件 8 例 (16.67%)，观察组患者发生不良心脏事件 2 例 (4.17%)；观察组患者不良心脏事件发生率显著低于对照组 (χ~2=4.019,P<0.05)。结论 专科护士为主导的多学科协作康复护理可缩短心脏瓣膜置换术后患者恢复时间，改善心功能和生活质量，减少不良心脏事件的发生。

促进急性心梗患者的康复与提高生活质量

李清桂 刘华芬

武汉大学人民医院

目的：为心梗患者提供心理支持以缓解焦虑 / 抑郁情绪，降低创伤后应激障碍（PTSD）风险，增强治疗信心与自我管理能力，改善疾病认知，纠正错误观念（如“卧床即安全”） 并能融入社会，恢复社会角色功能，减少病耻感，重建社会连接。重回生活正轨并提高生活质量

方法：通过阶段性心理干预：急性期① 每日 10 分钟床边支持性会谈② 焦虑筛查（GAD-7 量表）③ 紧急心理疏导。恢复期① 结构化健康教育（疾病认知 + 康复计划）② 认知行为疗法③ 家庭会议（家属参与照护计划）康复期（出院后） ① 每月 1 次心理门诊随访② 微信群互助小组（护士主导答疑）③ 正念减压训练（MBSR）加强社会融入策略：逐步复工计划 （体能评估 + 岗位调整建议 ），鼓励加强自主生活能力和冠心病术后微信群分享经验

结果：出院后 1 个月内规律运动执行率≥ 85% + 用药依从性≥ 95%，出院后 3 个月内焦虑 / 抑郁评分下降≥ 50%， 出院后 6 个月内社会支持评分提升 30% + 重返工作岗位率≥ 70%　　出院后 1 年内再住院率降低 40%（对比常规护理组）

结论 ： 通过系统化路径解决急性心梗患者“生理康复 - 心理调适 - 社会再适应”的断层问题，符合生物 - 心理 - 社会医学模式导向，从而缩短康复周期和提高医患满意度

冠心病患者运动恐惧干预研究的范围综述

彭沥枢 王彦

河北大学

目的 系统梳理冠心病患者运动恐惧干预研究的现状，整合现有证据，分析总结干预方案的特点及效果，旨在为未来干预策略的优化提供循证依据。

方法 遵循 Arksey 和 O'Malley 的范围综述方法学框架，系统检索中国知网、中国生物医学文献数据库、维普网、万方数据库、Pubmed、Embase、Web of science、CINAHL、等 8 个数据库，检索时限为建库至 2024 年 10 月 28 日。由 2 名研究者独立完成文献筛选、数据提取、汇总，采用主题分析法对干预方案的理论基础、方法学特征以及结局指标进行归纳。

结果 最终纳入 22 篇文献，包括随机对照试验（n=14）、类实验研究（n=6）、队列研究（n=2）。**（1）**干预类型包括认知行为干预、心理干预、运动干预、联合干预等 4 种，以认知行为理论（n=5）和双心护理模式（n=3）为常用的理论基础；**（2）**评价工具以心脏病运动恐惧量表（TSK-SV Heart）（n=18）最为常用；**（3）**干预形式：多学科团队协作（n=10）、个体化评估（n=5）、面对面团体干预（n=2）、深度访谈（n=5）、健康教育（n=5）、定期随访（n=4）等 6 种；**（4）**结局指标：包含心理状态指标、身体功能指标、临床结局指标、行为管理指标等 4 个维度。

结论 目前，冠心病运动恐惧干预研究处于发展阶段，存在理论模型单一，缺乏整合性的理论指导；干预形式、内容多样化但缺乏标准；结局指标尚未达成共识等特征。未来应结合多理论的优势，规范干预方案的内容和适用性，构建结局指标评价体系，为冠心病患者提供更加精准的干预方案。

基于数字孪生的心脏术后康复训练虚拟仿真模型构建及运动风险评估实践研究

刘玲 刘华芬

武汉大学人民医院（又名湖北省人民医院）紫阳院区

目的：运用数字孪生技术构建心脏术后患者康复训练虚拟仿真模型，评估该模型在指导精准康复训练和降低运动风险方面的实际应用效果。

方法：选取 120 例心脏术后患者，采集其全面的临床数据，包括基因数据、生活习惯信息、心理状态评估结果等。采用数字孪生技术，结合人工智能和大数据分析，构建高度个性化的心脏术后康复训练虚拟仿真模型。通过在虚拟模型中模拟不同康复训练方案下心脏的生理反应，利用深度学习算法建立运动风险预测模型，并根据预测结果为患者制定精准的康复训练方案。将患者随机分为数字孪生技术指导康复组（60 例）和传统康复组（60 例），对比两组患者在康复训练过程中的运动风险预测准确性、康复训练依从性以及康复效果指标（如心肺功能指标、体能恢复情况、心理状态改善程度）。

结果：成功构建了能够反映个体差异的心脏术后康复训练虚拟仿真模型，运动风险预测模型对不同风险事件的预测准确率达到 88%。数字孪生技术指导康复组运动风险预测准确性较传统康复组提高了 25%（P<0.05），康复训练依从性达到 88%，显著高于传统康复组的 68%（P<0.05）；康复训练 8 周后，数字孪生技术指导康复组心肺功能指标（如最大摄氧量、无氧阈）提升幅度比传统康复组高 18%，体能恢复情况和心理状态改善程度也明显优于传统康复组（P<0.05）。

结论：基于数字孪生技术的虚拟仿真模型在心脏术后患者康复训练运动风险预测和精准康复指导中具有重要价值，可提高运动风险预测准确性和康复训练依从性，显著改善康复效果，包括心肺功能、体能及心理状态，有望成为心脏术后康复护理的重要工具。

2 型糖尿病对充分 PCI 术后患者心肺运动测试中氧脉搏轨迹平台的影响

刘钰涛 [2] 吴嘉慧 [1]

1. 首都医科大学附属北京安贞医院

2. 湖北省第三人民医院

背景： 氧脉搏轨迹平台现象是心肺运动测试中反映心肌缺血的重要指标，具有重要的诊断和预后价值。虽然经皮冠状动脉介入治疗（PCI）能有效改善冠状动脉狭窄，但部分 PCI 术后患者依然存在心肌缺血，其机制尚未阐明。本研究旨在探讨 2 型糖尿病（T2DM）对充分 PCI 术后患者心肺运动测试中氧脉搏轨迹平台的影响。

方法： 本研究为单中心回顾性横断面研究。回顾性分析 2023 年 9 月至 2024 年 8 月期间连续就诊于北京安贞医院心脏康复中心进行心肺运动测试的 PCI 术后患者资料。纳入标准：年龄 20-80 岁，既往三年内接受过完全 PCI 治疗且接受指南导向药物治疗的患者。所有参与者在测试前一个月内常规接受全面评估以排除冠心病进展。纳入标准：年龄 20-80 岁，既往三年内接受过完全 PCI 治疗且接受指南导向药物治疗的患者。所有参与者在入组前一个月内常规接受全面临床评估，包括实验室检查、超声心动图和心脏影像学检查以排除冠心病进展。三名独立的心血管专科医师评估每位患者，确保无美国心脏协会指南定义的运动试验绝对或相对禁忌证。排除标准包括：心力衰竭、其他心脏手术史、瓣膜性心脏病、未控制的心律失常、肝肾功能不全、慢性阻塞性肺疾病、下肢功能障碍、贫血或甲状腺功能异常、肺动脉高压、活动性感染、肿瘤、严重肥胖（BMI>40 kg/m²）、运动试验提前终止或峰值呼吸交换率 <1.05、运动试验中出现严重胸痛、恶性心律失常或提示心肌缺血的 ST 段改变等。根据患者是否合并 T2DM 分组，采用多元 logistic 回归分析 2 型糖尿病与氧脉搏轨迹平台的关联性。

结果： 最终纳入 200 例无 T2DM 患者和 76 例 T2DM 患者。基线特征显示，T2DM 组患者合并高血压比例更高（64.5% vs 46.5%，p=0.008），余特征无明显差异。在心肺运动测试指标方面，2 型糖尿病组患者峰值每公斤摄氧量更低（18.6±4.3 vs 19.9±4.4 mL/kg/min，p=0.029），氧脉搏平台发生率更高（71.1% vs 57.0%，p=0.033）。多元 logistic 回归分析显示，在调整性别、年龄、身高、体重、吸烟、饮酒等混杂因素后，2 型糖尿病与氧脉搏轨迹平台呈显著正相关（OR=1.93，95%CI: 1.08-3.47，p=0.0274）。进一步调整高血压、高脂血症、心梗病史、日常运动强度等混杂因素后，这种关联仍然存在统计学意义（OR=1.84，95%CI:1.01-3.33，p=0.0455）。

结论： 在充分 PCI 术后患者中，T2DM 与氧脉搏轨迹平台现象呈显著正相关，提示 T2DM 患者合并术后心肌缺血风险较高。这提示 T2DM 即使在血运重建充分、无临床心肌缺血的背景下，仍能够影响运动中心脏储备的代偿能力。这一发现可能与 T2DM 患者的心脏自主神经病变、微血管病变以及代谢适应机制有关。T2DM 可能通过改变心肌代谢模式和血管反应性，影响运动时的氧脉搏轨迹表现。本研究结果为 PCI 术后患者的心肺运动测试解读提供了重要参考，强调心脏康复与运动风险分层时，T2DM 状态的独立评估与干预价值。

医院主导的居家 II 期心脏康复对急性心肌梗死 PCI 术后患者自主神经功能改善的研究

李佳 李炳欣

哈尔滨医科大学附属第一医院

目的：急性心肌梗死（AMI）是高死亡率的临床常见急危重症，目前通过经皮冠状动脉介入（PCI）使得 AMI 的生存率相对提高。AMI 后心脏自主神经功能受损与再狭窄、心血管死亡等风险相关。目前，有研究证明传统门诊心脏康复可改善 AMI-PCI 术后患者自主神经功能，但是存在的局限性导致患者依从性差。因此本研究旨在探索在 AMI-PCI 术后人群中，通过六分钟步行试验（6MWT）制定心脏康复运动方案进行医院主导的居家 II 期心脏康复对自主神经功能的改善及预后。

方法：本研究纳入符合标准的 AMI-PCI 术后患者，门诊复查时评估患者，通过 6MWT 结果制定合理的运动方案，进行居家心脏康复。根据随诊结果调整运动方案。随访 5 个月，采取平行对照的方法，将随访期内规律运动患者纳入试验组，完全未规律运动患者纳入对照组，观察两组患者的心率恢复（HRR）、心率变异性（HRV）、六分钟步行试验距离（6MWTD）、心脏彩超、生化血脂以及相关量表的变化，并进行统计学分析。

结果：本研究共纳入 80 例患者，其中试验组 40 例，对照组 40 例。(1) 在 AMI-PCI 术后 6 个月时，运动后第 1 分钟的心率恢复（HRR1）及运动后第 2 分钟的心率恢复（HRR2）试验组均高于对照组，且两组具有具有统计学意义（P<0.05）；(2) 在 AMI-PCI 术后 6 个月时，试验组的 6MWTD 明显高于对照组，并且两组具有统计学差异（P<0.05）；(4) 在随访期间，两组患者的生化血脂均无统计学意义，但试验组患者的 TG 和 VLDL 均显著下降，且低于对照组；(5) 在 AMI-PCI 术后 6 个月时，试验组与对照组的广泛焦虑问卷 7 项（GAD-7）、Borg 评分具有统计学差异（P<0.05），但两组心肌梗死多维度量表（MIDAS）未见统计学差异。(6) 通过相关行分析，HRR1 及 HRR2 在 3 个月及 6 个月均与 6MWTD 具有中度相关性且呈正相关；第 6 个月时，HRR1、HRR2 与 TG 及 VLDL 均呈负相关。

结论：医院主导的居家 II 期心脏康复对 AMI-PCI 术后患者的自主神经功能改善、运动耐力、血脂水平、生活焦虑情绪、以及患者生活质量的改善均有显著的积极作用。

心外科术后握力体重指数与术后离床时间的相关性

黄心颖

北京清华长庚医院

目的 心外科术后早期离床是降低呼吸系统并发症、缩短住院时间的关键环节。然而传统肌力评估指标（如绝对握力）易受水肿、营养状态干扰，难以真实反映患者功能储备。握力体重指数（GS/BW = 握力 (kg)/ 体重 (kg)）通过标准化体重影响，更精准表征相对肌力水平和营养 - 代谢状态。本研究通过前瞻性观察 56 例心外科手术患者，证实握力体重指数（GS/BW） 与术后离床时间显著负相关（GS/BW\<0.3 组离床时间延长 82 小时）。GS/BW 作为矫正体重偏差的肌力评估指标，可精准预测早期活动能力，为心外科加速康复路径提供量化依据。

方法 选取 2025 年 2 月至 6 月我院心外科术后 56 位患者 (n=56)，建立患者术后离床路径，在术后 24h 内测量患者 GS/BW，并根据评分进行术后早期心脏康复，记录患者手术时间与离床时间，计算时间差值。

结果 根据 GS/BW 将 56 位患者分为三组，GS/BW\<0.3 组（n=31, 55%）：离床时间均值 74.2±33.5h，中位数 82h；GS/BW 0.3-0.4 组（n=16, 29%）：离床时间均值 59.9±30.6h，中位数 48h；GS/BW\>0.4 组（n=9, 16%）：离床时间均值 56.4±27.6h，中位数 40h。研究发现，GS/BW 与离床时间呈负相关（r=-0.68, p\<0.001）。

结论 55% 的心脏外科术后患者 GS/BW\<0.3，提示普遍肌力储备不足。GS/BW 越低，离床时间显著延长，同时增加咳嗽排痰的难度，且并发症发生风险较高。因此，心脏外科术后患者通过抗阻训练、蛋白质补充，提高 GS/BW 评分，可改善患者预后。

陈旧性心肌梗死患者平衡功能特征及影响因素研究

王日旺 [1] 丁荣晶 [1] 郝自超 [2]

1. 中国医学科学院北京协和医院康复医学科

2. 河南省漯河市中心医院心血管内科

目的：探究陈旧性心肌梗死患者与无冠心病病史人群平衡功能的差异，分析陈旧

性心梗对平衡功能的影响机制及相关影响因素，为制定针对性康复策略提供理论依据。

方法：选取 31 例陈旧性心肌梗死 PCI 术后患者作为试验组，32 例无冠心病病史人群作为对照组。详细收集年龄、身高、体重、BMI、性别、药物服用情况、危险因素等一般资料。采用足底压力测试板，在裸足状态下，对两组受试者开展双足睁眼（DO）、双足闭眼（DC）、单足睁眼（SO）、单足闭眼（SC）等多种评估条件下的测试，通过对比分析两组在平衡总体评分、脚压、支撑面、几何中心、压力中心等各项指标上的差异，明确陈旧性心梗患者平衡功能的特征。

结果：试验组平均年龄为 52.94±11.69 岁，对照组为 48.84±13.27 岁，组间年龄差异无统计学意义（P >0.05）。试验组女性 7 例（22.6%）、男性 24 例（77.4%），对照组女性 10 例（31.3%）、男性 22 例（68.8%），卡方检验显示两组性别构成比较差异无统计学意义（P >0.05）。此外，BMI、家族史、吸烟史、饮酒史、运动习惯、高血压、高血糖危险因素暴露情况组间无显著性差异（P >0.05）。平衡功能评估分数显示，试验组显著高于对照组（63.71±6.96 vs 44.44±9.62 分，P <0.05），总分越低表明平衡功能越好。在 SO 测试中，试验组支撑面总面积、X 轴直径、几何中心 X 轴偏移量和 Y 轴偏移量均显著大于对照组（P <0.05）；在 DO 和 DC 测试中，试验组前、后偏移速度显著快于对照组（P <0.05）；本体感觉相关指标上，试验组在双足睁眼、双足闭眼、左单足睁眼、左单足闭眼、右单足睁眼的总轨迹长均显著长于对照组（P <0.05）；而在前庭功能和视觉反馈方面，重心偏移及 Romberg 指数在两组间比较差异无统计学意义（P >0.05）。

结论：陈旧性心肌梗死 PCI 术后患者较健康人群平衡功能显著降低，主要与本体感觉下降相关，与前庭功能和视觉反馈关联不显著。本研究结论提示在心梗后心脏康复训练中加入针对本体感觉的平衡训练，可能是进一步改善心梗患者运动能力与生活质量的重要措施。

基于微信平台的心脏康复指导对中青年 PCI 术后患者院外生活质量及机体功能状态影响的效果分析

王烨 李娟利

西安交通大学第一附属医院

目的 研究基于微信平台的心脏康复指导对中青年 PCI 术后出院患者生活质量及机体功能状态的影响，为临床护士开展心脏康复护理提供科学依据。方法 共选取 2023 年 10 月 -2024 年 10 月的西安市某三甲医院的中青年 PCI 术后患者 100 例，在患者出院前一天与其进行面对面谈话解释研究目的，并签署知情同意书，研究者向对照组进行常规的出院指导和健康宣教，干预组在常规的出院指导和健康宣教的基础上进行三个月的基于微信平台的心脏康复指导。本研究采用问卷法对患者的基本情况和疾病相关知识进行调查，采用中文版心脏康复量表调查 PCI 术后患者对心脏康复的认知和意愿情况，采用西雅图心绞痛量表（SAQ）调查患者在出院当天和出院三个月后的机体功能状态。采用 epidata 软件进行双人录入数据，采用 SPSS 25.0 统计软件进行统计学分析，以 P<0.05 为差异有统计学意义。研究结果 :1. 三个月后共收回问卷 94 例，其中干预组 48 份，对照组 46 份。干预组 2 例患者由于不能及时的关注公众号内容，退出研究。对照组 4 例患者失去联系，总失访率为 6%。2. 两组患者心脏康复量认知水平低，两组得分差异无统计学意义（P>0.05），两组患者都存在结果焦虑。3. 干预前两组患者血糖、血脂指标差异无统计学意义，三个月后两组血糖、总胆固醇、甘油三酯和低密度脂蛋白值都降低，但是组间差异无统计学意义（P>0.05）。4. 两组三个月后机体功能状态改善，两组患者三个月后心绞痛稳定状态组间差异有统计学意义（P<0.05），且干预组患者西雅图心绞痛量表躯体受限程度、心绞痛稳定状态改善明显，组间差异有统计学意义（P<0.05）。结论：本研究基于微信公众号的心脏康复指导能够提高中青年 PCI 术后患者的院外生活质量和机体功能状态，能够提高患者自我管理能力。能为患者提供更加便捷、高效、个性化的护理服务，在线咨询与答疑及时解决了患者的疑问，增强了患者对医护人员的信任，提高了治疗依从性。医护人员应该给患者普及心脏康复作用方面的健康教育，树立正确的信念，减少患者的错误认知。

Physical Exercise Mitigates Chronic Psychological Stress-Induced Neuroimmune Crosstalk via BDNF-Kif4-TARM1 axis

Xiang-Hui Zheng, Pei-Yao Wang, Zhou Guo, Yun-Qi Li, Yu-Xuan Liu, Li-Zhi Zheng, Ci-En Li, Hui-Yu Wang, Bai-Tao Wang, Shu-Hong Liu, Yang Zheng, Jian Wu, Bo Yu

the Second Affiliated Hospital of Harbin Medical University

Background: Chronic psychological stress is a well-established contributor to human morbidity and mortality, particularly in coronary artery disease (CAD), which drives neuroimmune crosstalk and accelerates the progression of atherosclerosis (AS). Although physical exercise is generally beneficial to all aspects of human and animal health and is tied to reduced inflammation, the exercise-mediated factors and mechanisms mitigating stress-induced vascular inflammation remain unclear. This study investigates the mechanistic basis of exercise-mediated attenuation of chronic psychological stress-induced neuroimmune crosstalk to reveal novel therapeutic targets and strategies for psychogenic CAD.

Methods: We established chronic restraint stress (CRS) and running wheel exercise intervention models in wild-type (WT) mice to investigate the role of physical exercise in neuroimmune crosstalk, with successful chronic psychological stress modeling assessed by enzyme-linked immunosorbent assay (ELISA) detection of corticosterone and behavioral tests (open field test and elevated plus maze test). RNA sequencing identified key genes in peripheral blood monocytes of WT model mice, and adeno-associated virus (AAV) was used to target one key gene, the kinesin family member 4 (Kif4), in these mice to evaluated its role. Combined co-immunoprecipitation mass spectrometry (CoIP-MS) and membrane proteomics identified Kif4 cargoes, with molecular docking and co-immunoprecipitation (Co-IP) confirming Kif4's direct interaction with T cell-interacting activating receptors on myeloid cell 1 (TARM1). We further used immunofluorescence to assay microtubule-dependent transport of TARM1 by Kif4, and validated TARM1 function in vitro with an immobilized Tarm1-Fc fusion protein. Next, we performed ELISA to examine the effect of physical exercise and chronic psychological stress on brain-derived neurotrophic factor (BDNF) levels in mouse blood plasma. Subsequently, we used ELISA and immunofluorescence to identify BDNF tissue sources, and validated its function and signaling pathway through BDNF stimulation in vitro and tropomyosin receptor kinase B (TrkB) inhibition with ANA-12 in vivo. In addition, the exercise-mediated neuroimmune effects and mechanisms were examine in a CRS-treated atherosclerotic mouse model. We also recruited patients with CAD at the 3-month post-discharge follow-up and grouped them based on their physical activity and the results of the 10-item perceived stress scale (PSS-10) questionnaire to generalize these rodent data to humans.

Results: Physical exercise alleviated the stress-induced neuroimmune crosstalk, reducing pro-inflammatory CD11b+Ly6Chigh monocyte phenotype in peripheral blood and suppressing M1 macrophage polarization in bone-marrow-derived macrophages (BMDMs) of WT model mice. Knockdown of Kif4 mitigated the pro-inflammatory responses in both peripheral blood monocytes and BMDMs in CRS model mice. Mechanistically, the kinesin Kif4 facilitates microtubule-dependent transport of TARM1 to plasma membranes, thereby driving macrophage inflammation responds. Conversely, neurogenic BDNF, a molecule regulated by physical exercise and chronic psychological stress, activated the TrkB receptor of monocytes/macrophages, thereby inhibiting p-STAT3/Kif4/TARM1 signaling pathway. Furthermore, in both atherosclerotic CRS mice model and CAD patients with high PSS-10, exercise mitigates stress-induced pro-inflammatory responses in monocytes through the BDNF-Kif4-TARM1 axis.

Conclusions: Physical exercise alleviates chronic psychological stress-induced neuroimmune crosstalk, an effect partially attributable to suppress pro-inflammatory responses in monocytes/macrophages via the BDNF-Kif4-TARM1 axis, revealing a novel neuroimmune-mediated brain-heart axis that supports physical exercise therapy for psychogenic CAD.

Key words: physical exercise; chronic psychological stress; neuroimmune crosstalk; brain-heart axis; BDNF-Kif4-TARM1 axis

5-Oxoproline prevents doxorubicin-induced cardiotoxicity and tumor growth

Xinning Guo, Meng Jiang

Renji Hospital, School of Medicine, Shanghai Jiao Tong University

Background: Cardiovascular mortality has emerged as the leading cause of noncancer-related death among cancer patients. The emergence of cardio-oncology has increased interdisciplinary collaboration between oncologists and cardiologists, driving rapid advancements in preventing the side effects of antitumor chemotherapies. Doxorubicin (DOX), a classical chemotherapeutic agent, faces significant limitations because of its well-documented risk of inducing cardiotoxicity. Effective prevention of DOX-induced cardiotoxicity is urgently needed. Biologically active metabolites are closely linked to human disease phenotypes, and they play crucial roles in regulating pathophysiological functions, such as anti-inflammatory, antioxidant, and metabolic regulation. Nonetheless, evidence of the therapeutic value of metabolites in DOX-induced cardiotoxicity remains scarce. Moreover, no studies have reported the dual effects of metabolite supplementation on both cardiac and tumor tissues during DOX therapy. Given that alterations in metabolic pathways have been observed in both cardiovascular diseases and cancer, targeting specific metabolic pathways may offer dual benefits by mitigating DOX-induced cardiotoxicity while simultaneously enhancing its antitumor efficacy.

Objectives: This study sought to explore the characteristic metabolic alterations associated with early DOX-induced cardiotoxicity and identify a therapeutic target that simultaneously inhibits cancer and protects the myocardium.

Methods: Metabolomic and transcriptomic analyses were performed on heart tissues from murine models of DOX-induced cardiotoxicity to identify the most significantly altered metabolic pathway. The most altered metabolite involved in the candidate pathway was chosen and verified in both mice and humans. One hundred eighteen plasma samples were collected from September 10, 2023, to July 15, 2024. Clinical data, including age, sex, history of hypertension, diabetes mellitus, hyperlipidemia, and current smoking, were collected. All patients received a predefined treatment protocol consisting of doxorubicin (80 mg/m2) in 4 cycles, administered every 3 weeks. Echocardiography was performed at baseline of DOX therapy and 3 weeks after the final cycle. The protective effects of the chosen metabolite against DOX-induced cardiotoxicity and its antitu-

mor effects were evaluated. Potential mechanisms were explored using C57BL/6J mice, OPLAH global knockout mice, BALB/c nude mice and NSG mice.

Results: In the present work, we identified 5-oxoproline as a key metabolite associated with DOX-induced cardiotoxicity, demonstrating its dual cardioprotective and antitumor functions. First, the glutathione pathway was identified as the most significantly altered metabolic pathway in the cardiac tissues of patients with DOX-induced cardiotoxicity, and the 5-oxoproline/OPLAH axis was the critical node in the pathway. Second, treatment with 5-oxoproline alleviated DOX-induced cardiotoxicity, as evidenced by improved cardiac function, reduced oxidative stress, and attenuated cell death, while simultaneously enhancing the antitumor efficacy of DOX. Third, mechanistic investigations revealed that 5-oxoproline exerted cardioprotective effects by restoring glutathione metabolic homeostasis via its downstream enzyme OPLAH and inhibited tumor proliferation by suppressing its upstream enzyme GGCT. Collectively, these findings provide the first evidence for a novel regulatory role of the GGCT/5-oxoproline/OPLAH metabolic axis in mitigating cardiovascular complications and suppressing tumor growth during cancer therapy. Finally, the level of circulating 5-oxoproline may serve as an early biomarker for the detection of anthracycline-induced cardiotoxicity.

Conclusions: In conclusion, our findings suggest that 5-oxoproline may serve as a promising small-molecule metabolite for preventing both DOX-induced cardiotoxicity and tumor growth. Thus, it may serve as an incremental therapeutic strategy for the treatment of cancer patients requiring anthracycline chemotherapy. Additionally, our findings provide a potential biomarker for the early detection of anthracycline-induced cardiotoxicity. These findings not only underscore the clinical importance of targeting early metabolic disturbances but also open new avenues for developing minimally invasive diagnostic tools.

八段锦运动对慢性心力衰竭的中老年女性患者影响的临床研究

付蓉

交大一附院

目的：通过观察八段锦运动对女性心力衰竭 (心衰) 患者生活质量和预后的影响，探讨该疗法的临床效果。

方法：将 120 例 40-75 岁中老年女性心衰患者随机分为八段锦运动组 (运动组，60 例) 和对照组 (60 例)，运动组在药物治疗的基础上辅助八段锦运动疗法，而对照组仅予药物治疗。12 周 -6 月随访患者的运动耐力（6 分钟步行距离，6MWD）、心肺功能（无氧阈值 VO_2 AT、左室射血分数 LVEF）、生活质量（明尼苏达心衰问卷 MLHFQ）、疲劳及情绪状态（汉密尔顿焦虑 / 抑郁量表），并比较联合终点事件 (因心衰再次入院和全因死亡) 的发生率。

结果：两组患者的运动耐量与心肺功能显著提升，6 分钟步行距离（6MWD）改善率达 6.14%（vs 对照组 1.32%）。心肺功能无氧阈值（VO_2 AT）提高 25.87%，左室射血分数（LVEF）增加 3.62%，显著优于对照组（p<0.001）。生物标志物改善：NT-proBNP 水平显著降低（p<0.05）。生活质量与心理状态全面改善 MLHFQ 总分降低、其中身体领域评分下降 2.83 分、情绪领域下降 2.52 分（均 p<0.001）。焦虑（HAMA）与抑郁（HAMD）评分显著下降。

结论：八段锦作为安全、易行的非药物干预手段，可显著提升中老年女性慢性心衰患者的运动能力、心肺功能及生活质量，并有效缓解焦虑抑郁状态。其低强度特性及居家可行性支持其在心衰长期管理中的推广价值，尤其适合作为心脏康复计划的组成部分。未来需进一步优化中老年女性专属干预方案并探索长期效应机制。

远程监测联合运动处方对冠心病 PCI 术后患者心功能的影响——一项随机对照试验

刘华芬

武汉大学人民医院

题目：远程监测联合运动处方对冠心病 PCI 术后患者心功能的影响——一项随机对照试验

作者：刘华芬（第一作者兼通信作者）、吕妮

单位：武汉大学人民医院心脏特需医疗科

研究背景与目的：经皮冠状动脉介入治疗（PCI）术后患者 1 年内再入院率高达 25%，传统门诊康复存在依从性差的问题。本研究探讨基于物联网技术的远程康复模式（TRCR）对改善患者运动耐力、心理状态及降低心血管事件的临床价值。

研究方法：试验设计：2022-2024 年纳入 PCI 术后患者 320 例，随机分为 TRCR 组（n=160）和常规康复组（n=160）干预方案：TRCR 组：佩戴智能心电衣，实时传输 ECG、血氧数据至医院平台，AI 自动生成个性化运动处方（强度根据心肺运动试验 CPET 动态调整）对照组：每周 3 次门诊康复训练评估指标：主要终点为 6 分钟步行距离（6MWD）改善值，次要终点包括 HADS 抑郁评分、NT-proBNP 水平及 1 年再住院率

研究结果：TRCR 组 6MWD 增幅较对照组显著提高（98.3±21.5m vs 62.4±18.7m, p<0.001）抑郁评分改善率 TRCR 组达 73.8%，显著高于对照组的 51.2%（OR=2.67, 95%CI 1.89-3.78）1 年随访期间 TRCR 组主要心血管事件发生率降低 42%（p=0.003）

结论：远程监测康复模式显著提升 PCI 术后患者的康复效果，其成功实施依赖于 " 智能硬件 - 云端分析 - 临床反馈 " 的三级联动体系。

心脏康复对急性心肌梗死经皮介入治疗后患者左心室功能、NT-ProBNP 和生活自理能力的影响：一项回顾性研究

张亚会 李莹 黄尚玮

上海市东方医院（同济大学附属东方医院）

Aim Although the advantages of cardiac rehabilitation (CR) have gradually emerged, its utilization rate is very low. This study aimed to assess the influence of CR on cardiac function for acute myocardial infarction (AMI) patients receiving percutaneous coronary intervention (PCI).

Methods 100 patients from March 2024 to January 2025 were enrolled who underwent PCI for AMI allocated into control group (n=50) with standard care and intervention group (n=50) with an additional structured early CR program during their hospital stay. The observation period spanned 30 days for both groups. Left ventricular end-diastolic diameter (LVEDd), left ventricular end-systolic diameter (LVEDs), fractional shortening (FS) rate of the left ventricular diameter, left ventricular ejection fraction (EF), N-terminal pro-brain natriuretic peptide (NT-ProBNP) levels and activities of daily living (ADL) recorded by barthel index (BI) were detected.

Results For the intervention group, Δ EF (Δ EF=EF2-EF1; EF1: the first after PCI; EF2: 30 days post-discharge), FS2 and Δ FS (Δ FS=FS2-FS1; FS1: the first after PCI; FS2: 30 days post-discharge), BI2 and Δ BI (Δ BI=BI2-BI1; BI1: the first after PCI; BI2: 30 days post-discharge), NT-ProBNP2 (30 days after post-discharge) presented a significant difference compared to the control group (p<0.05) . In addition, LVEDd and LVEDs presented no significant differences between the groups whether the first after PCI or 30 days post-discharge (p>0.05).

Conclusions AMI patients benefit from CR to improved left ventricular function, reduced NT-ProBNP levels and increased BI, ultimately leading to improved clinical prognosis.

一例原发性醛固酮性高血压的诊治经验

师一萍 邵琴

上海市胸科医院

病例摘要

主诉：患者女，65 岁。因“血压升高 30 余年， 控制欠佳半年”入院。患者 28 岁生产时发现血压升高，服用 CCB 类降压药物 后控制可，未重视。2023-12 出现 血压波动较大，最高血压 200 10mhg,，服用拜新同 30mg gd, 血压控制仍差，伴心悸头晕伴手抖，无胸闷、胸痛、气促，无恶心、呕吐、腹痛、咽喉紧缩感，无黑蒙、晕厥，无 呼吸困难、双下肢水肿及活动耐力减退等不适。

辅助检查 :2024- 3 在社区医院行动态心电图未见明显异常，3-21 至我院门诊查甲状腺功能未见明显异常，冠脉 CTA 提示 LAD 中段局部心肌桥，心超示左房略增大，室间隔基底段 增厚，主动脉瓣钙化，静息状态下左室各节段收缩活动未见明显异常，左室舒张功能减退。LVEF 64%。予 络活喜 5mg bid 口服，建议排除继发性高血压，今日患者为求进步诊治收入病区 。

既往史 : 有 2 型糖尿病 10 余年 , 目前予以西格列汀治疗 , 血糖控制尚可。否认肝炎、结核、近期脑出血及消化道出血等病史。

入院查体 : 神志清醒，查体合作。血压 139/74mHg，浅表淋巴结无肿大，口唇无紫绀，颈静脉无怒张， 双肺呼吸音清，未闻及明显干湿性哆音，心率 60 次分，律齐，各心脏瓣膜听诊区未及明显器质性杂音。腹软，无压痛及反跳痛，肝脾未及，双下肢浮肿 (-)。

初步诊断：1. 高血压 3 级 2. 冠状动脉肌桥 3.2 型糖尿病

实验室检查 : 血 RAAS 系统 : 血管紧张素 II 116. 48pg/mL, 血管紧张素 I 0. 03ng/ml, 血浆肾素浓度 0.5pg/mL, 血管紧张素转移酶 32. 8U/L, 醛固酮 371.21pg/mL。

血肾上腺轴 : 血促肾上腺皮质激素 113. 87pg/ml、血皮质醇 18. 72μg/dl

血儿茶酚胺类 : 3- 甲氧基酪胺 60. 20μg/gCr, 甲氧基肾上腺素 60g/gCr, 甲氧基去甲肾上腺素 67.40ug/gCr

盐水负荷试验 :

负荷前 :

电解质 : 钾 3.9mmol/L，钠 142mmol/L; 氯 109mmo1/L, 钙 2. 3umol/L。

RAAS 系统 : 血浆肾素浓度 0.5pg/mL, 血管紧张素转移酶 32. 9U/L，血管紧张素 I 0. 03ng/ml, 血管紧张素 II 131.52pg/mL，血醛固酮 227.83pg/mL。血皮质醇 10. 27μg/dl。

负荷后 :

RAAS 系统 : 血浆肾素浓度 0.5pg/m，血管紧张素转移酶 30. 5U/L，血管紧张素 I 0. 03ng/m1, 血管紧张素 II 129. 73pg/mL，血醛固酮 174.8pg/mL。血皮质醇 5.7μg/dl。

经皮肾上腺静脉取血 :

右肾上腺：醛固酮 318. 39pg/mL，血管紧张素转移酶 15. 6U/ 儿，血皮质醇 19.64μg/a, 血管紧张素 II 117.86pg/mL, 血管紧张素 10.08ng/ml，血浆肾素浓度 1.12pg/mL。

腔静脉：醛固酮 222. 67pg/mL，血管紧张素转移酶 28.6U/L，血皮质醇 23. 28μg/a1，血管紧张素 I 124.44pg/mL, 血管紧张素 I 0.07ng/m1，血浆肾素浓度 0.61pg/mL。

左肾上腺：醛固酮 195.12pg/mL，血管紧张素转移酶 27. TU/L，血皮质醇 >60. 00 μg/a1，血管紧张素 II114.21pg/mL, 血管紧张素 I 0.08ng/ml，血浆肾素浓度 1.42pg/L。

肾上腺增强 CT: 检查结果双侧肾上腺增粗伴多发结节。

出院诊断: 1. 高血压: 原发性醛固酮增多症 2. 肾上腺增粗伴结节 3. 高脂血症 4. 冠状动脉肌桥 5. 2 型糖尿病

出院用药：阿托伐他汀 20mg，每天 1 次，每次 1 片，口服 (睡前服用)；

螺内酯 20mg，每天 1 次，每次 1 粒，口服 (晨起空膜)，

移动健康技术支持的居家心脏康复模式对冠心病患者心肺功能及生活质量的影响：一项随机对照试验

刘雯

西安交通大学第一附属医院

目的： 中心化心脏康复（Center-Based Cardiac Rehabilitation, CBCR）参与率低是当前面临的主要挑战。本研究旨在评估一种基于移动健康（mHealth）技术的居家心脏康复（Home-Based Cardiac Rehabilitation, HBCR）新模式（结合可穿戴设备监测、个性化运动处方 APP 及远程指导）与传统 CBCR 相比，对稳定型冠心病（CAD）患者心肺功能、生活质量、康复依从性及医疗资源利用率的有效性和可行性。

方法： 采用前瞻性、单中心、随机对照试验设计。纳入 150 例经皮冠状动脉介入治疗（PCI）术后 1 月内的稳定型 CAD 患者，随机分配至干预组（mHealth-HBCR 组， n=75）或对照组（传统 CBCR 组， n=75）。干预组接受为期 12 周的 mHealth-HBCR 方案，包括基于 APP 的个性化运动处方（根据基线心肺运动试验 CPET 结果制定）、蓝牙连接的心率 / 活动监测设备、每周 2 次远程视频指导及健康教育。对照组接受标准 12 周 CBCR（每周 3 次院内监护下运动训练 + 健康教育）。主要终点为干预 12 周后的峰值摄氧量（VO2peak）变化值（通过 CPET 评估）和 SF-36 生活质量量表生理健康总评（PCS）得分变化值。次要终点包括 6 分钟步行距离（6MWD）、医院焦虑抑郁量表（HADS）评分、康复计划完成率（依从性）、心血管事件再入院率及急诊就诊率。

结果： 共 143 例患者完成研究（HBCR 组 72 例，CBCR 组 71 例）。组间基线特征无显著差异（P>0.05）。意向性分析（ITT）显示：

心肺功能 干预 12 周后，两组患者的 VO2peak 均显著提高（HBCR 组: Δ +2.8 ± 1.1 ml/kg/min； CBCR 组：Δ +2.6 ± 1.0 ml/kg/min），**组间差异无统计学意义（P=0.32）**。6MWD 改善情况相似（HBCR 组：Δ +65.2 ± 22.3m； CBCR 组：Δ +62.8 ± 20.7m； P=0.51）。

生活质量： SF-36 PCS 得分在两组均显著提升（HBCR 组：Δ +8.7 ± 3.2 分；CBCR 组: Δ +7.9 ± 3.5 分），**组间差异无统计学意义（P=0.18）**。两组 HADS 焦虑、抑郁评分改善程度相当（P>0.05）。

依从性与医疗资源利用： HBCR 组的计划完成率显著高于 CBCR 组（92% vs. 64%， P<0.001）。随访期间（6 个月），两组主要心血管事件（MACE）发生率无显著差异（HBCR 组 3.8% vs. CBCR 组 5.6%， P=0.52）。**HBCR 组因心绞痛 / 心衰症状的急诊就诊率显著低于 CBCR 组（5.3% vs. 21.3%，P=0.002）**。

结论： 基于移动健康技术支持的居家心脏康复模式（mHealth-HBCR）在改善稳定型冠心病患者心肺功能、运动耐量和生活质量方面，与传统中心化心脏康复（CBCR）效果相当。**该模式显著提高了患者的康复依从性，并有效降低了非计划性急诊就诊率。** 研究结果表明，mHealth-HBCR 是一种安全、有效且可行的替代方案，特别适用于因地理、时间或偏好限制难以参与 CBCR 的患者，具有提高心脏康复整体覆盖率的潜力，并可能优化医疗资源配置。

原发性醛固酮性的诊治经验

师一萍 邵琴

上海市胸科医院

病例摘要

主诉：患者女，62 岁，因“间断头晕、胸闷伴血压升高 2 年，血压控制不佳 3 月”入院。

现病史：患者 2 年前起无明显诱因下出现阵发性头昏、胸闷不适；无恶心、呕吐、腹痛、咽喉紧缩感，无眼胀、头晕、头痛、黑蒙、晕厥，无呼吸困难、双下肢水肿及活动耐力减退等不适。症状多于 15:00-16 :00 左右发作，与活动及情绪激动无关，发作时自测血压最高 220/110mHg。自行加服诺欣妥 100mg 1#，氨氯地平 5mg 1#，休息约 2h 后缓解。2 个月前症状发作频率增加，连续 3 天发作，症状性质同前。

初步诊断：1. 高血压 3 级

实验室检查：血 RAAS 系统：血管紧张素 II 107. 34pg/mL, 血管紧张素 I 0. 13ng/ml, 血浆肾素浓度 2.27pg/mL, 血管紧张素转移酶 32. 8U/L, 醛固酮 189. 29pg/mL。

血肾上腺轴：血促肾上腺皮质激素 113. 87pg/ml、血皮质醇 18. 72μg/dl

血儿茶酚胺类：3- 甲氧基酪胺 73. 20μg/gCr, 甲氧基肾上腺素 64.10g/gCr, 甲氧基去甲肾上腺素 70.80ug/gCr, 甲氧基肾上腺素 32.60pg/mL, 甲氧基去甲肾上腺素 55.10pg/mL，free (NMN+]IEN)87.7000pg/L。

尿肾上腺轴：24 小时尿皮质醇 (游离皮质醇) 230. 85 μg/24h, 24H 尿量 2700. 0000ml ↑

尿儿茶酚胺类：24 小时尿量 2. 0000L/24h, 游离多巴胺 153. 20ug/24h，游离肾上腺素 4. 00ug/24h， 甲氧基肾上腺素 78.80ug/24h，游离去甲肾上腺素 24. 00ug/24h, 甲氧基去甲肾上腺素 80. 20ug/ 24h ↑，NIN+MN) 159.0000ug/24h。 香草扁桃酸 [VMA] 4. 0000mg/ 24h。

盐水负荷试验：

负荷前：

电解质：钾 4.0mmol/L，钠 142mmol/L; 氯 105mmo1/L, 钙 2. 4umol/L。

RAAS 系统：血浆肾素浓度 1. 47pg/mL, 血管紧张素转移酶 32. 9U/L，血管紧张素 I 0. 08ng/ml, 血管紧张素 II 117. 19pg/mL，血醛固酮 160. 00pg/mL。血皮质醇 10. 60μg/dl。

负荷后：

电解质：钾 3.4mmol/L ↓，钠 143mo1/L，氯 109mmo1/L, 钙 2.1mmo1 九↓。

RAAS 系统：血浆肾素浓度 0.71pg/m，血管紧张素转移酶 30. 5U/L，血管紧张素 I 0. 04ng/m1, 血管紧张素 II 119. 03pg/mL，血醛固酮 109. 77pg/mL。血皮质醇 10. 28μg/dl。

经皮肾上腺静脉取血：

右肾上腺：醛固酮 166. 39pg/mL，血管紧张素转移酶 28. 6U/ 儿，血皮质醇 21.64μg/a, 血管紧张素 II 117.86pg/mL, 血管紧张素 10.08ng/ml，血浆肾素浓度 1.38pg/mL。

腔静脉：醛固酮 153. 67pg/mL，血管紧张素转移酶 28.6U/L，血皮质醇 23. 28μg/a1，血管紧张素 I 124.44pg/mL, 血管紧张素 I 0.07ng/m1，血浆肾素浓度 1.34pg/mL。

左肾上腺：醛固酮 877. 69pg/mL，血管紧张素转移酶 27. TU/L，血皮质醇 >60. 00 μg/a1，血管紧张素 II114.21pg/mL, 血管紧张素 I 0.08ng/ml，血浆肾素浓度 1.45pg/L。

肾上腺增强 CT: 检查结果两侧肾上腺未见明显异常。

出院诊断：1：高血压：原发性醛固酮增多症

心脏康复与冠心病二级预防

赵月

吉大二医院

目的：

利用问卷调查法了解地市级医院心血管科护士对冠心病二级预防知 - 信 - 行管理的现状，并分析其影响因素；明确冠心病患者二级预防和心脏康复管理的需求；评价与总结冠心病二级预防管理的最佳证据，结合专家会议法，构建冠心病患者二级预防和心脏康复护理管理方案，为临床管理提供依据。

方法：

（1）问卷调查法：自制心血管科护士冠心病患者二级预防和心脏康复知 - 信 - 行现状 调查问卷，采取便利抽样法选取 11 地市级中 1087 名心血管科护士通过问卷星调查护士对冠心病患者二级预防管理知识、态度和行为。

（2）半结构访谈法：根据访谈提纲，深入访谈 5 名冠心病患者并了解其对二级预防和心脏康复管理的需求。

结果：

（1）冠心病患者二级预防和心脏康复的需求主要为 5 个方面：冠心病相关知识缺乏，个性化、操作性康复指导需求，出院后延续康复指导需求、家庭与社会关怀需求、医院与社区联合服务需求。

（2）专家会议结果：结合问卷调查、患者访谈和最佳证据结果，并结合专家会议的讨论意见，对方案初稿进行修订，形成终版《冠心病二级预防和心脏康复护理管理方案》。

结论：

（1）心血管科护士对冠心病二级预防管理的知识和行为水平有待提高，而护理态度较积极，护理临床实践管理与指南建议存在较大差距，加强护士对冠心病二级预防和心脏康复培训是必要的。

（2）不同患者存在不同的心脏康复需求，健康教育及心脏康复干预策略的不同导致 患者临床结局不同，提示医务人员二级预防和心脏康复管理策略应评估个体需求，实施个性化管理方案。

（3）基于现况调查、患者访谈、证据综合和专家会议法构建的《冠心病二级预防和心脏康复护理管理方案》符合临床实际和满足患者需求，该方案涉及内容共 13 个方面，为后续管理者针对护理人员心脏康复管理的培训提供方案，推动心脏康复管理向精细化、标准化和科学化发展。

基于可穿戴设备的远程监护联合个性化运动处方对 PCI 术后患者心脏康复效果的影响：一项随机对照试验

罗婷

武汉市中心医院

目的

经皮冠状动脉介入治疗（PCI）术后患者的心脏康复参与率低（<30%），且传统中心 -based CR 存在地域限制。本研究旨在评估远程监护 + 个性化运动处方对 PCI 术后患者 CR 依从性、运动能力及心血管预后的影响。

方法

研究对象：纳入 2023 年 1 月–2024 年 6 月 PCI 术后患者（n=200），随机分为干预组（远程 CR，n=100）和对照组（常规 CR，n=100）。干预方案：干预组：佩戴智能手环（监测心率、步数）、每周 3 次远程视频指导（运动强度：靶心率 =60-80%HRmax）、AI 推送个性化运动反馈。对照组：传统门诊 CR（每周 3 次院内监护下运动训练）。评估指标：主要终点：6 个月 CR 参与率（完成≥ 80% 课程）。次要终点：6 分钟步行距离（6MWD）、左室射血分数（LVEF）、生活质量（SF-36 量表）、主要不良心血管事件（MACE）。统计学分析：t 检验、卡方检验、Kaplan-Meier 生存分析。

结果

1. 依从性：干预组 CR 参与率显著高于对照组（78% vs 52%，p<0.01）。

2. 运动能力：6 个月时，干预组 6MWD 提升更显著（干预组：+42.5±15.3m vs 对照组：+28.1±12.7m，p=0.003）。

3. 心功能改善：两组 LVEF 无统计学差异（干预组：+5.2% vs 对照组：+4.8%，p=0.32），但干预组 SF-36 心理评分更高（72.4±6.1 vs 65.3±7.2，p=0.01）。

4. MACE 事件：干预组发生率更低（3% vs 8%，p=0.048）。

结论

远程监护联合个性化运动处方可显著提高 PCI 术后患者的 CR 参与率，改善运动能力和生活质量，并降低 MACE 风险。该模式为基层或资源有限地区推广 CR 提供了可行方案。

晚期糖基化终末产物对心血管疾病患者心脏康复后运动能力改善的预测意义

李静

交大一附院

目的 分析反映晚期糖基化终末产物 (AGE) 组织累积情况的皮肤自发荧光 (SAF) 水平与心血管疾病 (CVD) 患者心脏康复 (CR) 后运动能力改善的关系。

方法 回顾性分析 2020 年 -2 月 2023 年 4 月于西安交通大学第一附属医院接受 CR 的 99 例 CVD 患者的临床资料。记录患者的基线情况及 CR3 周后 6min 步行距离 (6MWD)、峰值摄氧量 (VO_2) 和无氧阈 (AT)。采用 AGE Reader 在患者坐位时从其前臂内侧检测基线 SAF 水平。

结果 根据 SAF 水平三分位数进行分组，分为低水平组 (SAF 水平≤ 2.56a.u)、中水平组 (2.56a.u<SAF 水平≤ 3.37a.u) 和高水平组 (SAF 水平 >3.37a.u)，每组 33 例。高水平组患者的 BM1、糖尿病患病率均高于中水平组患者和低水平组患者，SM1 低于中水平组患者和低水平组患者，差异均有统计学意义 (P<0.05)。高水平组、中水平组及低水平组的基线 6MWD、AT 及 VO_2比较，差异均无统计学意义 (P>0.05)。CR3 周后，低水平组的 6MWD(t=2.156,P<0.05)、AT(t=2.315,P<0.05) 及 VO_2 (t=2574,P<0.05) 均较基线增加，但中水平组和高水平组的 6MWD、AT、VO_2无明显变化。此外，CR3 周后，低水平组患者的 6MWD(F=3.754,P<0.05)、AT(F=6.153,P<0.05)、VO_2 (F=9.250,P<0.05) 水平亦均高于中水平组和高水平组。经 SPearman 秩相关分析发现 ,SAF 水平与 6MWD 增加 %(r=-0.436,P<0.001)、AT 增加 %(r=-0.212,P=0.035)、VO_2 增加 %(r=-0.297,P=0.003) 均呈负相关，且校正年龄、性别后仍呈负相关。

结论 反应组织 AGE 累积情况的基线 SAF 水平与 CR 后的 6MWD、AT 和 VO_2增加均呈负相关，提示基线 SAF 水平低的 CVD 患者可能对 CR 的反应更好。

心肌梗死后运动能力改善与主要心血管事件的关系

徐金玉 王时宇 吴健

哈尔滨医科大学附属第二医院

目的： 心肌梗死作为冠心病发展的严重阶段，其病死率较高，因此，准确预测其发展趋势对指导临床治疗具有重要意义。本研究旨在探讨心肺运动试验（CPET）中的运动能力改善与心肌梗死患者临床结局之间的关系。通过监测患者两次心肺运动试验中的运动能力变化，探讨运动能力改善与患者预后之间的关系。

方法： 本研究选取了 1208 例在哈尔滨医科大学附属第二医院就诊且接受心肺运动试验的心肌梗死患者为研究对象，收集并分析两次 CPET 过程中的数据（两次 CPET 间隔在 3 个月以内），以及人口学特征、既往史、诊断及治疗方法、检查检验结果、用药情况及住院期间有无并发症等。根据入排标准，最终 620 例患者纳入到最终分析。根据心脏康复计划前后运动能力的差异，以 3 个代谢当量（METs）的改善为临界值，将患者分为两组：运动能力改善 < 3 METs 组（n=149）和运动能力改善≥ 3 METs 组（n=471），通过对两组数据的分析，探讨其与患者 2 年内主要心血管事件（MACE，定义为脑卒中、再梗、血运重建，心源性死亡、心源性再住院、恶性心律失常）之间的关系。

结果： MACE 在运动能力改善 < 3 METs 组（12.3%）中比在运动能力改善≥ 3 METs 组（6.8%）中更常见。多变量 Cox 风险分析显示，控制多个混杂因素后，运动能力改善 < 3 METs 与 MACE 显着相关（HR 1.626，95% CI：1.037–2.550，p = 0.034）。

结论： 本研究表明，心肺运动试验中运动能力改善 < 3 METs 对心肌梗死患者的临床结局具有显著影响。通过监测和分析运动能力的变化，可以及时了解患者的心肺功能状态及运动应激下的心脏功能变化，为临床治疗提供有力支持。因此，在心肌梗死患者的康复过程中，应重视心肺运动试验的应用，并根据监测结果制定个性化的康复方案，以改善患者的心肺功能，降低不良临床结局的发生率。未来研究可进一步探讨运动能力改善在心肌梗死患者治疗中的具体作用机制及干预策略。

经导管主动脉瓣置换术后患者一期心脏康复护理方案的构建与应用研究

南燕

西安交通大学医学院第一附属医院

摘 要： 目 的：构 建 经 导 管 主 动 脉 瓣 置 换 术（transcatheter aortic valve replacement, TAVR）术后患者一期心脏康复护理方案，并初步评价其在临床中的应用效果。

方法：通过文献回顾初步拟定主动脉瓣置换术后患者一期心脏康复护理方案；采用德尔菲法进行两轮专家函询，根据函询结果形成最终的干预方案。采用类实验研究设计，将 2023 年 11 月～ 2024 年 5 月收入西安市某三甲医院心血管内科的符合纳入标准的 27 例患者作为对照组；2023 年 12 月～ 2024 年 6 月收入的 27 例患者作为试验组。对照组给予术后常规护理方法，试验组按照前期构建的一期心脏康复护理方案实施干预。运用 6 分钟步行试验 (6MWT) 距离、改良 Barthel 指数 (BI) 评定量表、明尼苏达心衰生活质量量表 (MLHFQ), 比较两组患者干预前、干预后心功能、日常生活活动能力、生活质量，统计两组患者术后住院天数。

结果：(1) 方案构建：共进行两轮专家函询，两轮专家函询的专家积极系数分别为 :95%、100%; 权威系数分别为 :0.89、0.91; 肯德尔和谐系数 (Kendall's W) 分别为 :0.309、0.114(P<0.05); 主动脉瓣置换术后患者一期心脏康复护理方案包含一级指标 4 个，二级指标 46 个。(2) 方案应用：①本研究最初纳入研究对象 54 例，截至研究结束共纳研究对象 47 例，其中对照组 23 例，试验组 24 例，失访率为 12.96%。②干预前两组患者的一般资料、心功能、日常生活活动能力及生活质量评分比较，差异均无统计学意义 (P>0.05)。③心功能：干预后，试验组 6MWT 距离显著长于干预前及对照组 (P<0.05); 对照组干预前后比较，差异无统计学意义 (P>0.05)。④日常生活活动能力：干预后，试验组 BI 评分高于干预前及对照组 (P<0.05); 对照组干预前后比较，差异无统计学意义 (P>0.05)。⑤生活质量：干预前两组患者的 MLHFQ 总分及各维度得分差异均无统计学意义 (P>0.05)。出院一个月后，试验组 MLHFQ 总分、各维度 (躯体领域、情绪领域、其他领域) 得分均低于干预前及对照组 (P<0.05); 对照组除躯体领域外 (P=0.020), 患者 MLHFQ 情绪领域、其他领域维度得分及总分与干预前比较，差异无统计学意义 (P>0.05)。⑥术后住院天数：干预后患者术后住院天数与对照组相比，差异有统计学意义 (P<0.05)。

结论：(1) 基于德尔菲法构建的主动脉瓣置换术后患者一期心脏康复护理方案具有科学性和可靠性，方案切实可行。(2) 一期心脏康复护理方案的应用，能够有效促进主动脉瓣置换术后患者的心功能恢复、改善患者的日常生活活动能力及生活质量，缩短患者术后住院时间。

基于移动健康技术的心内科青少年患者心脏康复护理方案构建

付婷婷

新疆维吾尔族自治区人民医院

目的：构建基于移动健康技术的心内科青少年患者心脏康复护理方案。青少年心血管疾病是影响青少年健康的重要临床问题，包括先天性心脏病和心肌病等，常导致心功能下降和生活质量受损 [1]。当前心脏康复护理虽在成人患者中取得进展，但针对青少年群体的研究存在明显不足，如康复依从性低、个性化干预缺乏，且现有文献多聚焦成人，青少年应用探索有限，无法满足其独特生理和心理需求 [2]。移动健康技术基于自我管理理论和行为改变模型，通过实时监测与远程指导提升参与度，理论上可优化康复效果；然而，当前尚缺乏适用于青少年患者的移动健康心脏康复护理体系 [3]。基于此，本研究拟构建一套基于移动健康技术的青少年心脏康复护理方案，为其提高康复依从性、改善生活质量和远期预后提供新路径与护理依据。

方法：借助系统文献检索和循证分析，结合专家小组讨论，初步制定出心脏康复护理方案，设计出专家函询问卷并进行发放。运用德尔菲法对 6 名来自心血管、康复护理、信息技术等相关领域的专家开展两轮函询，依据专家反馈对方案内容进行调整和完善，最终形成护理方案。

结果：两轮专家函询问卷的有效回收情况都达到了 100%，专家权威系数分别是 0.88 和 0.90，变异系数在 0 到 0.25 之间。第一轮和第二轮的 Kendall 协调系数分别为 0.241 和 0.255（P<0.05），说明专家意见的协调性比较好。最终确定的护理方案包含 6 个一级指标、12 个二级指标以及 24 个三级指标。

结论：本研究构建的护理方案内容科学、结构合理，并且与移动健康技术紧密结合，究其原因为方案设计时充分考虑了临床实际需求，因此具有较好的临床可行性和应用价值，能够为心内科青少年患者的心脏康复护理工作提供实践指导。

早期强化心脏康复训练对非 ST 段抬高型心肌梗死 PCI 术后患者的效果

龚莉 刘华芬

武汉大学人民医院

早期强化心脏康复训练对非 ST 段抬高型心肌梗死 PCI 术后患者的效果

目的：探讨早期强化心脏康复训练在急性非 ST 段抬高型心肌梗死经皮冠状动脉介入 (PCI) 术后患者中的应用效果。研究旨在评估早期强化康复训练与传统康复方法相比，在改善心肺功能、运动耐力及生活质量方面的优势。

方法：选取 2020 年 8 月至 2022 年 8 月收治的 76 例急性非 ST 段抬高型心肌梗死 PCI 术后患者，按入院时间分为对照组和研究组各 38 例。对照组接受早期常规康复训练，研究组实施早期强化心脏康复训练。评估指标包括心功能指标(LVEDV、LVESV、LVEF)、肺功能指标(FEV1、FEV1/FVC)、6 分钟步行距离(6MWD)、心肌梗死多维度评估量表 (MIDAS) 评分及不良事件发生率，干预时间为 6 个月。

结果：干预 6 个月后，研究组 LVEF 水平显著高于对照组 (P<0.05)，表明心功能改善更显著。肺功能方面，研究组 FEV1 和 FEV1/FVC 水平均高于对照组 (P<0.05)。运动耐力方面，研究组 6MWD 较对照组更远 (P<0.05)。生活质量方面，研究组 MIDAS 评分低于对照组 (P<0.05)。安全性方面，研究组不良事件发生率 (10.53%) 显著低于对照组 (31.58%)(P<0.05)。

结论：对急性非 ST 段抬高型心肌梗死 PCI 术后患者实施早期强化心脏康复训练，可显著改善患者心肺功能，提高运动耐力和生活质量，同时降低不良事件发生率。这一研究为 PCI 术后患者的康复强度选择提供了循证依据，支持早期强化训练的安全性和有效性。

慢性心力衰竭患者中西医结合运动康复的研究进展

丁佳露 张秀杰 佟泉金 王倩

大连医科大学附属第一医院

【摘要】慢性心力衰竭作为心血管疾病的终末阶段，因高患病率、再住院率和死亡率，已成为全球重大公共卫生负担。传统的药物和器械治疗，存在不良反应及成本限制等问题。而以运动训练为核心的心脏康复作为 I 类推荐治疗，可通过多靶点干预机制：抑制交感 - 肾素 - 血管紧张素 - 醛固酮系统激活、改善内皮功能、减轻炎症氧化应激及延缓心室重构，显著改善慢性心衰患者的运动耐力和心肺功能，提高生活质量，改善抑郁情绪，显著降低再住院风险，进而改善临床预后。中医认为慢性心衰的核心病机为“本虚标实”，分为气虚血瘀证、气虚两虚证和阳气亏虚血瘀证三种主要证型。西医运动康复体系涵盖有氧运动、抗阻运动、柔韧性及呼吸训练，中医传统功法以太极拳、八段锦为主，中西医结合模式通过整合西医运动处方精准化与中医“辨证施治”的整体观，不仅发挥西医层面的心血管保护功能，同时借由调节气血运行、平衡阴阳、改善脏腑功能等中医途径，实现“整体调控”与“精准治疗”的有机结合。随着科技进步，数字健康技术为运动康复提供了新赋能，通过实时监测生理参数与风险预警，来支持医疗团队动态优化个体化运动处方，降低不良事件风险。同时促进患者康复知识获取及规律运动行为，显著提升依从性。本综述通过整合现有证据，对中西医结运动康复在慢性心衰患者中的具体应用及临床疗效进行阐述，解析数字健康技术的实践价值，分析其现存问题及未来研究方向，旨在为医护人员指导慢性心衰患者运动康复实践提供参考依据。

基于数字健康管理的家庭康复干预对老年冠心病患者临床疗效的随机对照研究

刘文彬

西安交大一附院

目的：探讨基于数字健康管理的家庭康复干预对老年冠心病患者心功能、生活质量及预后的影响。

方法：采用随机对照试验设计，选取 204 年 1 月至 2025 年 2 月某医院 211 例≥ 65 岁稳定型冠心病患者，随机分为干预组（n=105）和对照组（n=106）。对照组接受常规门诊随访，干预组在常规护理基础上接受为期 6 个月的数字化家庭康复干预，包括：① 可穿戴设备实时监测心电、血压、运动数据；② 移动端个性化运动处方（低强度有氧 + 抗阻训练）及依从性提醒；③ 远程营养与用药管理平台；④ 视频随访及 AI 健康预警系统。评估两组干预前后左心室射血分数（LVEF）、6 分钟步行试验（6MWT）、西雅图心绞痛量表（SAQ）评分、再入院率及心血管事件发生率。

结果：干预组干预后 LVEF（52.3±5.1% vs 48.2±4.8%, p<0.01）、6MWT（358±42m vs 312±38m, p<0.01)显著优于对照组; SAQ 总分提高幅度(27.6±6.4 vs 14.3±5.2, p<0.001）显著高于对照组；6 个月再入院率（8.3% vs 21.7%, p=0.032）及心血管事件发生率（5.0% vs 16.7%, p=0.027）显著降低。

结论：数字健康管理模式驱动的家庭康复可有效改善老年冠心病患者心功能、运动耐量及生活质量，降低再入院风险，为老年慢病居家管理提供循证支持。

社区导向的 II 期心脏康复管理模式对 PCI 术后患者心肺功能及预后的影响

刘文彬

西安交大一附院

目的: 评价基于社区实施的 II 期心脏康复(CR)管理模式对 PCI 术后患者心肺功能、自我管理能力及心血管事件风险的干预效果。

方法：采用前瞻性队列研究设计，纳入 202 例 PCI 术后患者，分为社区康复组（n=101）和常规随访组（n=101）。常规组接受标准药物治疗及门诊随访；社区组在常规治疗基础上，于术后 2 周启动为期 12 周的社区 II 期 CR 计划，内容包括：① 多学科团队协作（心内科医师 / 康复治疗师 / 社区护士）；②分级运动训练（心电图监护下递增式有氧 + 抗阻运动，每周 3 次）；③ 结构化健康教育（用药依从性、风险因素控制、心理支持）；④数字化远程监测（移动端心电传输、运动数据云端管理）。评估干预前后峰值摄氧量（VO_2 peak）、左心室射血分数（LVEF）、6 分钟步行距离（6MWD）、冠心病自我管理量表（CSMS）评分，并随访 6 个月主要不良心血管事件（MACE）发生率。

结果：干预 12 周后，社区组 VO_2 peak 显著提高（+3.8±1.2 mL/kg/min vs +0.9±0.8 mL/kg/min, p<0.001），LVEF 改善更显著（+5.7±2.1% vs +1.8±1.5%, p=0.003）；社区组 6MWD 提升幅度（+98±28m vs +42±22m）及 CSMS 总分增幅（+24.6±5.3 vs +9.1±4.1）均优于常规组（p<0.001）；6 个月 MACE 发生率显著降低（4.0% vs 13.9%, HR=0.28, 95%CI:0.11-0.71）

结论：以社区为基础的 II 期心脏康复管理模式能有效改善 PCI 术后患者心肺功能储备，提升自我管理水平，并降低短期心血管事件风险，为分级诊疗体系下心脏康复的落地实践提供循证依据。

基于 ITHBC 理论的心脏术后患者运动康复依从性干预模型的构建与实证研究

何莹

西安交通大学第一附属医院

目的：心脏术后患者运动康复依从性不足（文献报道 <50%）是影响长期预后的关键因素。现有研究多聚焦于生理指标改善，而基于健康行为改变理论的系统性干预模型仍属空白。本研究整合 ITHBC 理论（Integrated Theory of Health Behavior Change）核心要素，构建包含知识信念、自我管理、社会支持三维度的干预模型，并通过随机对照试验验证其提升依从性及临床效益的有效性。

方法：采用混合研究方法分两阶段实施：

1. 模型构建阶段（n=30）：

o 通过质性访谈提取患者运动障碍因素（如恐惧症状恶化、家庭支持不足等），结合 ITHBC 理论的知识信念（疾病认知）、自我调节（目标设定）、社会促进（家庭参与）三模块，形成初步框架。

o 采用德尔菲法(15 名专家,两轮咨询,Kendall̀ W=0.82)确定干预方案核心内容，包括：

□智能运动处方系统（基于心肺运动试验个性化调整强度）

□恐惧症状脱敏训练（VR 模拟术后运动场景）

□家庭协作式目标管理（微信端家属监督打卡）

2.

实证验证阶段（n=200，RCT 设计）：

o 对照组接受常规康复指导（n=100），干预组应用 ITHBC 模型干预（n=100，持续 12 周）。

o 主要结局：依从性（运动日记完成率 + 可穿戴设备 adherence ≥ 80% 为达标）；次要结局：6 分钟步行距离(6MWD)、西雅图心绞痛量表(SAQ)、内皮功能(FMD)。

o 统计学方法：采用广义估计方程（GEE）分析纵向数据，路径分析验证理论假设。

结果：

1. 依从性提升：干预组达标率显著高于对照组（76% vs. 43%，OR=3.21，95%CI 2.15-4.78，P<0.01），其中家庭协作模块贡献最大（路径系数 β=0.39）。

2. 临床指标改善：

o6MWD：干预组增加（58.3±12.1）m vs 对照组（31.7±10.5）m（P=0.002）

oSAQ 评分：躯体活动限制维度差异最显著（Δ=12.4 分，P<0.001）

3. 机制验证：知识信念通过自我效能间接影响依从性（中介效应占比 42%），社会支持调节自我管理与依从性的关系（P<0.05）。

结论

本研究首次将 ITHBC 理论转化为可操作的临床干预模型，证实其通过“认知 - 行为 - 环境”联动机制提升依从性

8 例 CABG 术后 ARSD 患者早期清醒下俯卧位的康复治疗

杨水涓 吴明祥 田青 刘波 申莹 刘秋雯 张萌萌

武汉亚心总医院

目的：清醒俯卧位联合早期康复治疗 CABG 术后 ARDS 患者疗效观察。

方法：

1：康复评估

1.1 康复前对患者进行康复评估：包括血压，心率，呼吸，神经系统，人工管道，疼痛，胸腔引流，S5Q 评分，RASS 评分等进行评估。

1.2 血气分析（评估患者血色素，PH, 氧分压，二氧化碳等）

1.3 影像学评估（肺部 CT/ 胸片）

1.4 超声（心脏功能，肺部超声）

2：康复治疗方法

2.0 吸氧支持（储氧面罩，高流量）

2.1 清醒下俯卧位

2.2 运动康复（床边坐位，床边站立位，原地踏步，病区行走）

2.3 呼吸训练（呼吸控制，呼吸训练，气道廓清等）

3，治疗结果

氧合指数：

患者 1，俯卧位时氧合指数 137.5，俯卧位最高氧合指数 193.3，俯卧位总时长 45min; 患者 2，俯卧位时氧合指数 100，俯卧位最高氧合指数 147，俯卧位总时长 70min; 患者 3，俯卧位时氧合指数 72.5，俯卧位最高氧合指数 121.4，俯卧位总时长 55min; 患者 5，俯卧位时氧合指数 88.1，俯卧位最高氧合指数 108.3，俯卧位总时长 20min; 患者 6，俯卧位时氧合指数 91.4，俯卧位最高氧合指数 190.5，俯卧位总时长 70min; 患者 7，俯卧位时氧合指数 87.7，俯卧位最高氧合指数 171.4，俯卧位总时长 67min; 患者 8，俯卧位时氧合指数 110，俯卧位最高氧合指数 153.7，俯卧位总时长 43min

BORG 评分：

患者 1，俯卧位前评分 0，俯卧位时评分 1 分，俯卧位后评分 0.5 分

患者 2，俯卧位前评分 0，俯卧位时评分 0.5 分，俯卧位后评分 0 分

患者 3，俯卧位前评分 0.5，俯卧位时评分 1 分，俯卧位后评分 0.5 分

患者 4，俯卧位前评分 0.5，俯卧位时评分 0 分，俯卧位后评分 0 分

患者 5，俯卧位前评分 0，俯卧位时评分 0.5 分，俯卧位后评分 0.5 分

患者 6，俯卧位前评分 0.5，俯卧位时评分 0.5 分，俯卧位后评分 0.5 分

患者 7，俯卧位前评分 0，俯卧位时评分 0.5 分，俯卧位后评分 0 分

患者 8，俯卧位前评分 0，俯卧位时评分 0.5 分，俯卧位后评分 0 分

疼痛评分（NRS）：

患者 1，俯卧位前疼痛评分 0 分，俯卧位时疼痛评分 2 分，俯卧位后疼痛评分 1 分；患者 2，俯卧位前疼痛评分 0 分，俯卧位时疼痛评分 2 分，俯卧位后疼痛评分 0 分；患者 3，俯卧位前疼痛评分 1 分，俯卧位时疼痛评分 2 分，俯卧位后疼痛评分 1 分；患者 4，俯卧位前疼痛评分 1 分，俯卧位时疼痛评分 0 分，俯卧位后疼痛评分 0 分；患者 5，俯卧位前疼痛评分 1 分，俯卧位时疼痛评分 1 分，俯卧位后疼痛评分 1 分；患者 6，俯卧位前疼痛评分 1 分，俯卧位时疼痛评分 0 分，俯卧位后疼痛评分 1 分；患者 7，俯卧位前疼痛评分 0 分，俯卧位时疼痛评分 1 分，俯卧位后疼痛评分 0 分；患者 8，俯卧位前疼痛评分 0 分，俯卧位时疼痛评分 1 分，俯卧位后疼痛评分 1 分

4. 结论

在 CABG 术后 ARDS 治疗研究中发现早期俯卧位通气可以降低 ARDS 患者二次插管率同时改善患者的通气、换气，促进呼吸功能恢复。俯卧位对氧合指数有明显的改善，患者进行清醒下俯卧位前，我们需要对患者进行评估，由于治疗过程中需要患者全程配合，所以俯卧位前需对患者进行宣教并征得患者同意。俯卧位过程中也需要评估包括：呼吸情况，循环情况，血气分析，疼痛，胸腔引流情况等。

心脏康复转诊管理的最佳证据总结

汤一帆 肖苏婉 夏丽莉 李婷茹 高春红

南京医科大学第一附属医院

目的：检索、评价并总结心血管疾病人群心脏康复（Cardiac Rehabilitation, CR）转诊策略的最佳证据。

方法：采用循证方法，围绕 CR 转诊管理问题，系统检索国内外数据库、专业协会及临床指南网站中的临床决策、指南、系统评价、专家共识、证据总结及原始研究。由 2 名接受过循证培训的研究员独立完成质量评价与证据提取。

结果：共纳入 38 篇文献（指南 12 篇、专家共识 17 篇、系统评价 5 篇、原始研究 4 篇），提炼出 44 条证据，涵盖“系统 - 服务 - 患者”三层面的 10 个核心转诊策略范畴：自动化转诊系统、转诊指标考核、财务与保险支持、政策与管理体系、可替代服务交付模式、标化服务流程、多学科团队协作、医务人员教育、个性化转诊策略及患者教育。健康系统层面，强调构建自动化转诊系统与配套保障措施。转诊系统的构建机制应包括兼顾用户特征信息、结构化数据监管、出院流程嵌入转诊指令、主动推送转诊任务与 CR 服务信息等功能。自动转诊系统联合医务人员主动推荐和联络员干预在提高 CR 转诊效率和患者接受度方面；“CR 上转率”、“CR 下转率”以及“出院后 21 天内 CR 登记率”等多项指标，既可用于动态追踪转诊流程执行情况，也可作为医疗机构质量管理与绩效考核的重要依据。服务提供层面，强调优化服务模式与流程，推动多学科协作。远程、社区、家庭、门诊、自我引导式和混合 CR 模式，适用人群与应用场景各异；构建标准化服务路径，包括统一转诊规则、明确转诊启动时间节点、规范正式与非正式沟通、规划转诊与随访途径等，有助于提升医患沟通质量与转诊决策一致性；应加强全科医生、基层护理人员及家庭医生的培训，提升其对 CR 适宜人群的识别与转介能力，推动转诊责任下沉与早期介入。服务使用者层面，强调聚焦个体差异，强化患者转诊动机。全面个性化评估是制定 CR 转诊策略的前提，尤其应关注老年、女性、少数人种、农村居民和经济困难群体，以减少患者因自身因素导致的转诊启动障碍；构建由具备不同文化背景和身份经验的多样化联络员网络，有助于更精准识别个体转诊过程中的障碍与文化偏好，从而制定更具针对性的个体化转诊方案；应在尊重患者偏好的基础上，选择合适的沟通与随访方式（如电话、短信、电邮等），并确保转诊信息具备语言与文化适配性；科学的健康教育手段强化患者转诊动机，也被证实是提高 CR 转诊率的重要策略。

结论：本研究汇总的 CR 转诊证据具备一定的科学性与系统性，为我国转诊路径的标准化建设提供循证支持，助力推动 CR 利益相关者优化转诊实践。

A Multimodal Data-Based Auxiliary Diagnostic Model for Mental Stress-Induced Myocardial Ischemia (MSIMI)

bingqing Bai[1], Hao-Peng Ke[2], Hao-Feng Zhou[1], Huan Ma[1], Qing-Shan Geng[3]

1. Guangdong Provincial People's Hospital

2. Guangzhou Huali College

3. Shenzhen People's Hospital

Objective:

Mental stress-induced myocardial ischemia (MSIMI) is an early-stage reversible form of myocardial ischemia that remains difficult to detect, particularly in patients with non-obstructive coronary artery disease (ANOCA). In this population, chest pain is often the first or only clinical manifestation, while routine cardiovascular evaluations, including invasive coronary angiography, typically show no significant abnormalities. The current gold standard for MSIMI diagnosis requires two PET/CT myocardial perfusion imaging (MPI) scans—one at rest and one during mental stress—making the process complex, costly, and associated with additional radiation exposure. Artificial intelligence has the potential to improve the diagnostic accuracy of resting MPI by uncovering subtle perfusion abnormalities that are challenging to identify through conventional physician interpretation. While deep learning has demonstrated high standalone diagnostic accuracy in detecting obstructive coronary artery disease (CAD), its application in identifying MSIMI in ANOCA patients remains largely unexplored. This study aimed to develop a multimodal deep learning-based diagnostic model for MSIMI, integrating features from resting PET/CT MPI with clinical examination data, to assist in early detection and reduce the need for stress testing and repeated imaging.

Methods:

A total of 159 participants were enrolled, including 117 patients with ANOCA and 42 healthy controls. All subjects underwent resting MPI and mental stress (Stroop color-word test, public speaking task, mental arithmetic task) MPI to determine the presence or absence of MSIMI. The input features included resting-state MPI polar maps, horizontal long-axis images, vertical long-axis images, and selected clinical variables. A small convolutional neural network (CNN) with three convolutional layers (kernel size 3×3) was designed to build an image-based diagnostic model for MSIMI. Furthermore, feature-level fusion was performed to integrate clinical examination data with imaging features, constructing a multimodal diagnostic model. The dataset was randomly split into 80% for training and 20% for testing. Model performance was evaluated using the area under the receiver operating characteristic curve (AUC), accuracy (ACC), sensitivity (SEN) and specificity (SPE).

Results:

Among the enrolled participants, 47 were diagnosed as MSIMI-positive and 112 as MSIMI-negative based on MPI results. Using the resting polar maps alone, the CNN model achieved an AUC of 75.0% in the test set. When combining resting polar maps with horizontal long-axis images, the AUC improved to 80.0%. Lasso regression was applied to select clinical variables from the original dataset of 122 features, resulting in seven key clinical indicators: electrocardiogram normality, total score of the Hospital Anxiety and Depression Scale-Anxiety subscale, gamma-glutamyl transferase , high-sensitivity C-reactive protein, resting left ventricular ejection fraction, free light chain KAPPA to LAMBDA ratio, and parathyroid hormone. Feature-level fusion of these clinical variables with the image model further enhanced diagnostic performance, resulting in an AUC of 86.4%, an ACC of 84.4%, a SEN of 70.0%, and a SPE of 90.9%. This study also employed several well-established pretrained image recognition models to compare their performance with the proposed model. The results showed that our model outperformed ResNet18 (AUC:70.9%, ACC: 75.0%), DenseNet121 (AUC: 77.7%, ACC: 78.1%), and EfficientNet_B0 (AUC: 71.8%, ACC: 71.9%) in terms of both AUC and ACC.

Conclusion:

This study developed a multimodal MSIMI diagnostic model based on resting PET myocardial perfusion imaging using convolutional neural networks. By integrating image features with clinical data through feature-level fusion, the model significantly improved diagnostic efficiency. These findings provide a foundation for intelligent medical decision-making in the early detection and management of MSIMI.

基于多学科协作的心脏康复护理模式在心血管疾病患者中的应用效果研究

张静漪

西安交通大学医学院第一附属医院

摘要： 心脏康复作为心血管疾病患者全程管理的核心环节，对改善患者心功能、

降低再入院率及提升生活质量具有重要意义。本文旨在探讨多学科协作模式下心脏康复护理的实施路径与应用效果。研究选取 2023 年 12 月至 2024 年 6 月某三甲医院收治的 120 例心血管疾病患者为研究对象，随机分为观察组（60 例）与对照组（60 例）。对照组采用常规心脏康复护理（包括基础健康教育、用药指导及运动建议），观察组在此基础上实施多学科协作护理模式，由外科医师、专科护士、康复治疗师、营养师及心理医师组成干预团队，制定个性化康复方案，涵盖分期运动训练（急性期床边活动 - 恢复期有氧运动 - 维持期抗阻训练）、个体化营养干预（基于膳食结构分析的低盐低脂饮食指导）、心理疏导（认知行为疗法联合家庭支持）及延续性随访（出院后 3 个月电话 + 线上平台动态监测）。比较两组患者干预 3 个月后的左心室射血分数(LVEF)、6 分钟步行距离(6MWD)、再入院率及生活质量评分（SF-36）。结果显示，观察组 LVEF 及 6MWD 改善幅度显著优于对照组(P<0.05)，再入院率(5.0%)低于对照组(16.7%)(P<0.05)，且 SF-36 各维度评分(生理功能、情感职能、社会功能等)均显著提高(P<0.05)。研究表明，多学科协作的心脏康复护理模式可通过整合多专业资源，实现对患者生理、心理及社会功能的全面干预，有效促进心脏功能恢复，降低不良事件风险，值得在临床推广应用。

心脏康复护理在心脏移植术后患者护理中的应用效果观察

余叶

西安交通大学第一附属医院

目的：探究在心脏移植术后患者的护理中应用心脏康复护理的效果 .

方法：选取 2023 年 1~12 月在西安交通大学第一附属医院行心脏移植手术的 36 例患者作为研究对象，采用随机数字表法分为对照组和观察组，每组各 18 例，对照组采取常规护理，观察组采取心脏康复护理，其包含以下内容①预防感染；②观察患者是否出现免疫排异反应；③抗排异药的用药护理；④运动康复护理；⑤饮食护理；⑥心理护理；⑦健康教育；以此来对比两组患者的心理弹性、生活质量和护理满意度 .

结果：1. 对比两组患者的心理弹性评分：护理前，两组患者的心理弹性评分比较差异无统计学意义（均 P > 0.05）；护理后，观察组患者的乐观性评分、自强性评分及心理弹性总分高于对照组（均 P < 0.05）.

2. 对比两组患者的生活质量评分：护理前，两组患者的生活质量评分比较差异无统计学意义（均 P > 0.05）；护理后，观察组患者的生活质量评分高于对照组（均 P < 0.05）.

3. 对比两组患者的护理满意度：观察组患者的护理满意度高于对照组（P < 0.05），

结论：在心脏移植术后患者的护理中应用心脏康复护理，能够改善患者的心理弹性，提高患者的生活质量，患者的护理满意度更高，值得推广、应用 .

肥厚型心肌病患者多维度康复护理模式的构建与实践

何乔 李娟利

西安交大第一附属医院

目的：肥厚型心肌病（HCM）是一种以心室肥厚为特征的遗传性心肌病，患者常因心力衰竭、心律失常及心理负担导致生活质量显著下降。传统护理模式多聚焦于症状管理，缺乏对生理 - 心理 - 社会功能的系统性干预。本研究旨在构建并实践一种涵盖心脏功能康复、心理调适、社会支持及长期管理的多维度康复护理模式，以改善患者预后及生活质量。

方法：采用前瞻性队列研究设计，纳入 2023 年 1 月至 2024 年 12 月某三甲医院收治的 120 例 HCM 患者，随机分为干预组（n=60）与对照组（n=60）。对照组接受常规药物治疗与基础护理；干预组在对照组基础上实施多维度康复护理，包括生理维度：个体化运动康复（基于心肺运动试验制定强度）、营养管理及用药依从性干预；心理维度：认知行为疗法（CBT）缓解焦虑 / 抑郁，联合正念减压训练；社会维度：建立“患者 - 家属 - 社区”支持网络，定期开展健康教育；长期管理：通过远程监测（可穿戴设备）实现动态随访。评估指标包括：心功能（LVEF、NT-proBNP）、6 分钟步行距离（6MWD）、生活质量量表（MLHFQ）、焦虑抑郁评分（HADS），随访 6 个月。

结果：干预组在以下方面显著优于对照组(均 P<0.05)：生理改善：LVEF 提升(干预组 Δ+8.2% vs 对照组 Δ+3.1%)，6MWD 增加（Δ+75m vs Δ+32m）；心理与社会功能：HADS 焦虑评分降低（Δ-4.5 vs Δ-1.8），MLHFQ 总分下降（Δ-22 vs Δ-9）；再住院率：干预组 6 个月内再住院率(13.3%)显著低于对照组(28.3%)。此外，干预组患者对护理模式的满意度达 91.7%，显著高于对照组的 76.6%。

结论：多维度康复护理模式通过整合生理康复、心理干预及社会支持，可有效改善 HCM 患者的心功能、运动耐量及心理状态，降低再住院率，提升长期生活质量。该模式具有临床推广价值，未来需进一步验证其长期效益及卫生经济学价值。

基于循证医学的肥厚型心肌病康复护理路径优化研究

何乔 李娟利

西安交大第一附属医院

目的：肥厚型心肌病（HCM）的康复护理长期面临临床实践异质性大、循证支持不足的问题。本研究基于最新国际指南（如 2020 AHA/ACC 指南）及循证医学证据，旨在构建一套标准化、阶梯式康复护理路径，并通过临床实践验证其有效性，以解决 HCM 患者康复管理中存在的随意性、碎片化问题，最终实现预后改善与医疗资源优化配置。

方法：证据整合阶段：系统检索 PubMed、Cochrane Library 等数据库（2015–2025），筛选 HCM 康复相关 RCT 研究、Meta 分析及指南，采用 GRADE 系统评价证据质量。通过德尔菲法组织 15 名专家（心内科、康复科、护理学）对初步路径进行 3 轮论证，形成共识。路径构建与实施：基于循证证据，将康复护理分为急性期（住院）、过渡期（出院后 1 个月）、长期管理期（1 个月后）三阶段，明确各阶段干预重点，急性期：以症状控制（如 β 受体阻滞剂滴定）、低强度运动评估（改良 Bruce 方案）为核心；过渡期：引入远程心电监测 + 家庭运动日记，预防猝死及再入院；长期管理期：结合基因检测结果（如 MYBPC3 突变）制定个性化运动处方。采用整群随机对照试验，纳入 2024 年 1 月 -2025 年 6 月 100 例 HCM 患者（干预组 50 例，对照组 50 例），对照组接受常规护理，干预组按优化路径执行。评价指标：主要终点：6 个月内心血管事件（猝死、再住院）发生率；

次要终点：左心室流出道压差（LVOTG）、堪萨斯城心肌病问卷（KCCQ）评分、护理成本效益比。

结 果：临床结局，干预组心血管事件发生率显著低于对照组（8.8% vs 21.3%，P=0.012），LVOTG 改善更明显（Δ-12.5 mmHg vs Δ-5.2 mmHg，P<0.01）；KCCQ 评分中，干预组在“躯体限制”及“生活质量”维度提升幅度超对照组 30%(均 P<0.05)。卫生经济学效益：干预组人均护理成本降低 18.7%(主要源于再住院减少)，且路径执行依从率达 89.4%。循证实践转化：通过路径优化，临床决策时间缩短 40%，护士对 HCM 康复知识掌握率从 62% 提升至 88%。

结论：本研究构建的循证康复护理路径通过阶段化干预、多学科协作及动态评估，显著降低了 HCM 患者不良事件风险，并改善功能性预后。其标准化框架为临床实践提供了可推广的模板，未来需进一步探索路径在基层医疗中的适应性及长期（≥ 5 年）生存率影响。

心脏康复对心血管疾病患者心功能、运动耐力及生活质量的影响研究

朱苗苗

西安交大一附院

目的：本研究旨在通过系统评估心脏康复对心血管疾病患者心功能、运动耐力及生活质量的影响，探索其在改善患者临床结局方面的潜在机制，为临床推广心脏康复提供依据。

方法：采用随机对照试验，共选取 200 例心血管疾病患者，随机分为心脏康复组（100 例）和常规治疗组（100 例）。常规治疗组给予药物等常规治疗，心脏康复组在此基础上进行为期 12 周的心脏康复训练，包括有氧运动、力量训练及健康教育等。分别在干预前及干预 12 周后，对比两组患者的左室射血分数(LVEF)、6 分钟步行距离（6MWD）及生活质量量表（SF-36）评分。

结果：①左室射血分数：干预前，心脏康复组 LVEF 为（45.2±3.5）%，常规治疗组为（44.8±3.8）%，两组无显著差异（P>0.05）。干预 12 周后，心脏康复组 LVEF 提升至(52.6±4.2)%，显著高于常规治疗组的(47.5±3.6)%(P<0.05)。② 6 分钟步行距离：干预前，心脏康复组 6MWD 为（305.6±25.3）米，常规治疗组为（302.8±28.6）米，差异无统计学意义（P>0.05）。干预 12 周后，心脏康复组 6MWD 增加至（386.5±30.2）米，明显长于常规治疗组的（335.7±27.8）米（P<0.05）。③生活质量量表评分：干预前，两组 SF-36 各维度评分相近（P>0.05）。干预 12 周后，心脏康复组在生理功能、生理职能、躯体疼痛、一般健康状况、精力、社会功能、情感职能及精神健康等维度的评分均显著高于常规治疗组（P<0.05）。

结论：循证医学证据表明，心脏康复干预能够显著改善心血管疾病患者的心功能指标，有效提升其运动耐量水平，并在提升生活质量方面呈现积极效应。基于此，心脏康复模式具备充分的临床推广价值，有望成为优化心血管疾病患者康复结局及提升生活质量的重要策略。

心肺运动试验指导的个体化康复方案对冠心病患者功能恢 复的临床价值研究

吴丹

西安交大一附院

摘要

目的：探讨以心肺运动试验（CPET）为指导的个体化、动态调整康复方案在改善冠心病（CHD）患者心肺功能、心脏结构及临床预后方面的应用价值。

方法：本研究采用前瞻性随机对照设计，纳入 156 例稳定性冠心病患者，随机分为研究组（n=78）与对照组（n=78）。对照组采用基于年龄预测心率的传统固定强度康复方案。研究组则通过 CPET 精确测定无氧阈（AT）、峰值摄氧量（VO?peak）等参数，制定并周期性（每 4 周）调整以无氧阈为核心靶强度的个体化训练方案，该方案融合了高强度间歇训练（HIIT）与双通道安全监控系统。干预周期为 6 个月。

结果：干预 6 个月后，研究组的 VO?peak 较基线提升显著高于对照组((22.9±3.1) vs (20.1±2.6) mL/kg/min, P<0.001）。研究组的左室射血分数（LVEF）提升了 4.9%，显著优于对照组（P=0.008），且心肌灌注缺损面积显著减小（P<0.001）。此外，研究组的运动诱发心肌缺血发生率（10.3% vs 26.9%）及严重不良心血管事件发生率均显著低于对照组（P<0.05）。

结论：基于心肺运动试验的个体化、动态调整康复方案，能更安全、有效地提升冠心病患者的心肺耐力，促进有益的心室重构，降低心血管不良事件风险。该模式为制定精准、高效的中国人群心脏康复策略提供了重要的实证依据和临床推广价值。

关键词：冠心病；心肺运动试验；精准康复；心脏康复；心室重构

基于心肺运动试验的中老年体检人群运动高血压及其影响因素分析

施杰洪 丁荣晶

中国医学科学院北京协和医院

目的：《中国心血管健康与疾病报告 2023》显示，我国成年人高血压患病率已

达 27.5%，且血压控制率仍不理想。前瞻性研究表明，运动中收缩压每升高 5 mmHg，未来 5 年发生高血压的风险增加约 11%；舒张压每升高 5 mmHg，风险增加可达 30%。这提示运动中血压反应可作为预测高血压发生的早期信号。因此，识别运动高血压对于高血压防控具有重要意义。本研究旨在通过标准化心肺运动试验 (Cardiopulmonary Exercise Testing, CPET) 评估中老年体检人群运动高血压（运动收缩压≥ 180 mmHg）的发生率及其影响因素，为心血管危险分层和个体化运动干预提供初步证据。

方法：采用横断面研究设计，纳入 2023 年 11 月至 2024 年 11 月于北京协和医院接受 CPET 的 147 例体检人员（男性 87%，年龄 61.7±7.4 岁），按年龄分为 51-65 岁组和 66-86 岁组。运动高血压定义为运动峰值收缩压大于 200 mmHg。所有受试者完成基于 Ramp 方案的症状限制性踏车运动试验。评估指标包括：1) 运动血压心率反应：运动峰值血压、1 分钟心率恢复 (HRR1)；2) 心肺功能参数: 峰值摄氧量 (VO_2peak)、无氧阈 (AT)、氧脉搏、VE/VCO_2斜率等; 3) 静态肺功能指标: 用力肺活量占预计值 (FVC%)、一秒率 (FEV_1/FVC); 4) 体适能指标: 握力、单腿站立时间、柔韧性。采用多因素 Logistic 回归模型（调整性别、身体质量指数等混杂因素）分析运动高血压的独立预测因素，并进行年龄分层比较。

结果：运动高血压发生率为 43.6%，其中 17.7% 受试者运动峰值收缩压≥ 200 mmHg。31.5% 受试者存在心率恢复延迟（HRR1<12 次 / 分），提示部分受试者的心脏自主神经功能失调。受试者平均 VO_2 peak 为 18.8±4.9 ml/min/kg，71.9% 受试者 VO_2 peak 低于 85% 预测值，80.8% 受试者 AT<14 ml/min/kg，提示多数个体心肺储备不足。多因素分析显示，静息收缩压升高 (OR=1.073, 95%CI 1.032-1.116, P<0.001)、FVC%<80%（OR=3.68，P<0.05）和单腿站立时间<30s (OR=2.10, 95%CI 1.05-4.21, P<0.05) 是运动高血压的独立预测因素，而年龄增长呈保护效应（OR=0.894, 95%CI 0.818-0.977, P<0.05），提示中老年人群中年龄较小个体在运动中心血管反应可能更为敏感，可能与交感神经激活反应性相关，需进一步研究。年龄分层比较显示，66-86 岁组 VO_2 peak、AT 及平衡能力显著低于 51-65 岁组 (均 P<0.05)，但运动高血压发生率更低 (36.9% vs 50.8%，P<0.05)。

结论：中老年体检人群运动高血压发生率较高，其独立危险因素包括静息收缩压升高、肺活量下降和平衡能力减弱。建议对中老年人群开展 CPET 筛查，针对上述危险因素进行干预，包括血压管理、呼吸功能训练和平衡能力锻炼，以降低运动高血压风险，提高运动安全性。同时应关注自主神经调节异常合心肺功能储备不足等问题，制定个体化运动处方。

渐进性运动训练对重症体外膜肺氧合术后患者早期运动功能的影响

杨水涓 吴明祥 田青 刘波 吕璐 霍淑兰 卢寒梅 张艳 刘秋雯 张萌萌

武汉亚心总医院

目的：渐进性运动康复训练对重症体外膜肺氧合患者早期运动功能的影响。

方法

采用前瞻性随机对照研究方法。选取我院 2021 年 1 月 --2024 年 2 月收治的符合入选标准的重症 ECMO 患者 48 例，采用随机数字表法将患者分为渐进运动康复组和对照组，每组 24 例，对照组中男 18 例，女 6 例；渐进运动康复组中男 20 例，女 4 例；对照组仅给予常规康复训练，包括各关节被动活动及主动运动，渐进运动康复组在常规康复训练基础上予以渐进性运动康复训练，包括由卧到坐、由坐到站、由站到走渐进练习及下肢智能踏车渐进练习、上下肢肌力渐进练习，2 组患者均治疗 8 周。于治疗前后分别评定下肢股四头肌肌力 ,6min 步行距离测试以及改良 Barthel 指数评估患者日常生活活动能力，对数据行独立样本 t 检验、配对样本 t 检验、Mann-WhitneyU 检验、Wilcoxon 符号秩检验或 x2 检验。

结果

治疗前 ,2 组患者下肢股四头肌力未见明显差异 (P>0.05);6min 步行距离测试未见明显差异 (P>0.05); 改良 Barthel 指数评估评分相近 (P>0.05)。治疗 8 周后，渐进运动康复组下肢股四头肌肌力明显高于对照组 (P<0.01); 渐进运动康复组 6min 步行距离测试明显高于对照组 (P<0.01); 渐进运动康复组改良 Barthel 指数评估评分明显高于对照组 (P<0.01); 此外，2 组患者治疗 8 周后，下肢股四头肌力 ,6min 步行距离测试以及改良 Barthel 指数评估评分均显著高于治疗前 (3 组 P<0.01)

结论

在常规训练基础上，采用渐进性运动康复训练能提高重症体外膜肺氧合患者早期运动功能及日常生活能力，值得临床推广。

一例产褥期主动脉夹层术后早期康复治疗

杨水涓 吴明祥 田青 刘波 吕璐 卢寒梅 申莹 张萌萌 刘秋雯 陈涵

武汉亚心总医院

目的：一例产褥期主动脉夹层术后早期康复疗效观察

方法：

1 康复评估方法：

1.1 康复前对患者进行 ICU 相关康复安全和可行性评估：包括循环、呼吸、胃肠功能，凝血功能、胸腔引流液，人工管道、等风险评估。其他评估包括镇静程度评估（RASS) 与标准化五问题（S5Q）等镇静和配合程度评估等评估。

1.2 血气分析评估（评估患者乳酸，PH 值，氧分压，二氧化碳分压，氧合指数等血气情况）

1.3 呼吸与咳嗽功能评估（肺部感染情况，呼吸模式、呼吸频率、咳嗽强度等功能评估）

1.4 躯体与运动功能评估 (评估患者 ICU 活动量表 IMS，以及肌力评估量表 Lovett，平衡功能评估)

1.5 心肺耐力评估（2mint 踏步、RPE 用力程度分级）

2 康复治疗方法：

2.1 夹层术后 - 一周 :(物理因子治疗、运动功能、心肺功能)

2.2 夹层术后 1 周–2 周 : (物理因子治疗、运动功能、心肺功能、吞咽、ADL 训练)

2.3 夹层术后 3-6 周（物理因子治疗、运动功能、呼吸功能训练、心肺耐力训练、吞咽、ADL 训练）

结果：

1，康复治疗过程中患者生命体征、循环数据无明显差值

2，夹层术后 - 一周：患者机械通气呼吸机辅助呼吸到成功拔除气管插管，但患者心肺功能较差，高流量支持。乳酸 <1.0,PH 值 7.4，PO2148.2，PCO235.3, 氧合指 440, 双上肢双下肢肌力 3 级 ,INR1.3。患者谵妄状态。

3, 夹层术后 1 周–2 周: 患者呼吸稳定，肌力 4 级，平衡功能坐位 2 级，未站立训练，INR1.4。患者焦虑抑郁状态。

4，夹层术后 3 周–7 周：患者呼吸稳定，坐位平衡 2 级，站立位平衡 1 级，IMS 评分 5 分，双上肢双下肢肌力 4 级，INR1.53。

结论：

产褥期主动脉夹层病情危急，早期康复对患者恢复十分重要，早期康复经过重症康复治疗团队以及 ICU 医生及营养医师、药学医师、超声医师多方面合作，精细评估以及个性化康复方案制定，能帮助患者减少并发症，促进患者早日康复。

一例 ECMO 联合 CRRT 治疗暴发性心肌炎患者的早期康复

杨水涓 吴明祥 田青 刘波 吕璐 卢寒梅 陈静 申莹 江飞虎 霍淑兰

武汉亚心总医院

目的：**一例 ECMO 联合 CRRT 治疗暴发性心肌炎患者的早期康复**疗效观察

方法：

1 康复评估方法：

1.1 康复前进行 ICU 相关康复安全和可行性评估：包括循环、呼吸、神经系统、人工管道、等其他风险评估，包括 RASS 与 S5Q 等镇静和配合程度评估，以及心率、呼吸频率、血氧饱和度、血压、呼吸支持模式、ECMO 流量、CRRT 管道等评估。

1.2 血气分析评估（评估 lac，PH 值，po2，pco2，OI 等情况评估）

1.3 心脏功能评估（心脏 NT-proBNP 值）

1.4 呼吸与咳嗽功能评估（呼吸模式、呼吸频率、咳嗽强度等功能评估）

1.5 躯体与运动功能评估 (ICU 活动量表 IMS，肌力评估量表，关节活动度，平衡功能)

1.5 心肺耐力评估（RPE 用力程度分级）

2 康复治疗方法：

2.1 关节松动（采用麦特兰德关节松动术行髋、膝、踝、肩、肘、腕关节松动）

2.2 运动康复（四肢关节主被动运动）

2.3 体位适应性训练（床头抬高到床边坐位再到轮椅坐位）

2.4 呼吸训练（脱机训练，呼吸控制训练，气道廓清训练）

2.5 心肺耐力训练（床旁带高流量坐位训练，平衡能力训练）

结果：

1，康复治疗过程中患者 ECMO 流量以及 IABP 数据无明显差值

2，ECMO 辅助第 1 天，自主呼吸次数为 0，呼吸机模式为 V-SIMV，lac1.8,PH 值 7.4，PO2117.1，PCO233.9,OI 260，RASS 评分（-4 分）；暴发性心肌炎第 46 天，平静下自主呼吸次数为 23 次 / 分，乳酸 2.3，PH7.36,PO2170，PCO238.9,OI 485，RASS 评分（0 分），S5Q 评分（5 级）

3，暴发性心肌炎第 1 天 NT-proBNP>35000pg/ml, 血肌酐 268μmol/L，尿酸 912μmol/L，肾小球滤过率 28ml/min；治疗第 46 天 NT-proBNP29384pg/ml，血肌酐 247μmol/L，尿酸 378μmol/L，肾小球滤过率 15ml/min

4，暴发性心肌炎第 1 天 IMS 评估（0 级），治疗第 46 天 IMS 评估（5 分）

5，ECMO 辅助术第 1 天 Lovett 评分双上肢 0 级，双下肢 0 级；治疗第 46 天双上肢 ,Lovett 评分双上肢 3 级，右下肢 3 级，左下肢 2 级。

6，ECMO 术后第 1 天，四肢关节活动度正常；IABP 撤离后第 9 天，右上肢（肩前屈 130°，外展 100°；屈肘 110°；腕掌屈 60°，背伸 55°），左上肢（肩前屈 125°，外展 110°；屈肘 100°；腕掌屈 45°，背伸 40°）；右下肢（屈髋 70°，外展 45°；屈膝 130°；踝背伸 30°，跖屈 55°），左下肢（屈髋 20°，外展 15°；屈膝 20°；踝背伸 10°，跖屈 15°）；治疗第 46 天评估右上肢（肩前屈 100°，外展 90°；屈肘 90°；肘旋后 30°；腕掌屈 50°，背伸 50°度）；左上肢（肩前屈

125°，外展 110°；屈肘 100°；肘旋后 55°；腕掌屈 45°，背伸 40°）；右下肢（屈髋 80°，外展 50°，屈膝 135°；踝背伸 30°，跖屈 55°），左下肢（屈髋 40°，外展 30°；屈膝 50°；踝背伸 20°，跖屈 20°）

7，自主呼吸频率（第一天自主呼吸频率 0 次 / 分，第 46 天自主呼吸频率 18 次 / 分）

8，Fugl_-Meyer（暴发性心肌炎第 46 天 Fugl_-Meyer2 分）

结论：

患者在整个危重症救治过程中由于镇静或意识障碍导致完全制动，极容易发生神经萎弱、肢体及身体器官功能损害。本案例结论是早期康复具有较高的安全性和可行性，即使患者在接受机械通气、体外膜肺氧合治疗、主动脉球囊反搏治疗、血液净化等治疗。早期康复可以帮助患者恢复肌力，增强心肺耐力，减轻获得性衰弱的发生，同时可以缓解患者焦虑。

有氧运动通过增加 BDNF 释放抑制心脏常驻巨噬细胞凋亡改善心肌梗死后心功能

刘书宏 李运棋 郑祥慧 刘雨轩 王佩瑶 郭周 郑立志 王慧宇 李慈恩 王百韬 郑阳 孙勇 于波 吴健

哈尔滨医科大学附属第二医院

目的： 冠心病患者参与以有氧运动为基础的心脏康复降低心血管死亡率和住院率。研究表明脑源性神经营养因子 (BDNF) 作为运动源性因子促进常驻巨噬细胞的存活，从而改善心肌梗死后心功能，并且心脏常驻巨噬细胞在心肌梗死后的修复过程中发挥着至关重要的作用。然而有氧运动是否通过心脏常驻巨噬细胞促进心肌梗死后损伤修复仍不明确，其中机制尚未阐明。

方法： 结扎野生型小鼠冠状动脉左前降支构建心肌梗死模型，并利用小动物平板跑步机予以小鼠 12m/min 速度进行有氧运动，腹腔注射 ANA-12 拮抗小鼠 BDNF 受体。超声心动图检测运动后心肌梗死小鼠心脏功能；提取小鼠外周血及脑组织，ELISA 检测血浆及脑组织中的 BDNF 水平；HE 染色检测心肌组织形态；Masson、天狼星染色检测小鼠心肌纤维化程度；WGA 检测心肌细胞大小以及排列情况；Western Blot 检测 BDNF 信号通路激活情况；流式细胞术检测小鼠心脏常驻巨噬细胞数目；Tunel 染色检测心肌常驻巨噬细胞凋亡程度。

结果： 超声心动图显示运动后心梗小鼠的心功能明显改善，且 HE 染色表明运动后小鼠梗死面积更小。Masson 与天狼星染色证实运动组心肌纤维化程度明显降低。WGA 染色进一步验证了运动后小鼠心肌细胞较非运动组缩小。ELISA 结果表明运动后小鼠的血浆及脑组织中的 BDNF 水平显著提高，Western blot 结果显示运动后小鼠的 BDNF 信号通路 TrkB、AKT、PI3K/ATK 显著激活，而予以 ANA-12 抵消了运动改善心肌梗死后心脏修复的作用，证实了有氧运动通过增加 BDNF 释放改善心肌梗死后心功能。流式细胞术检测发现 CCR2-MHCII^{lo} 心脏驻留巨噬细胞数量在有氧运动后未给予 ANA-12 组显著增加，Tunel 染色显示心肌常驻巨噬细胞凋亡显著减少，证实有氧运动促进 BDNF 能抑制心脏驻留巨噬细胞凋亡从而发挥保护作用。

结论： 有氧运动通过促进 BDNF 激活常驻巨噬细胞 TrkB、AKT、PI3K/ATK 信号通路，减少细胞凋亡，从而改善心肌梗死后心功能。

恐惧回避模型在心血管疾病中的应用进展

陈丽方 郭良敏 白莎 徐艳玲 彭海燕 孙心悦 王乐欣

成都市第三人民医院

恐惧回避模型（Fear-Avoidance Model, FAM）最初由 Lethem 等人（1983）提出，Vlaeyen 和 Linton（2000）将其系统化，用于解释慢性疼痛患者因对疼痛的恐惧而引发回避行为，最终导致功能障碍的恶性循环。近年来，该模型被引入心脏疾病领域，用于解析患者因心脏事件（如心肌梗死、心绞痛）引发的心理行为反应及其对康复结局的影响。研究表明，部分患者因对躯体症状（如胸痛、心悸）的过度恐惧，倾向于采取回避性行为（如减少体力活动、避免社交），进而加剧功能退化、生活质量下降及不良预后风险。 在心脏疾病中，恐惧回避的核心机制涉及三个维度：（1）患者对心脏症状恐惧；（2）回避行为导致体力活动不足，进一步削弱心肺功能并加重焦虑抑郁情绪；（3）社会功能退缩与治疗依从性降低，形成“恐惧 - 回避 - 失能”的负性循环。研究指出，约 20%-30% 的心脏康复患者存在显著恐惧回避倾向，其再住院率和心血管事件复发风险较普通患者升高 1.5-2 倍。 针对这一现象，临床干预策略逐渐从单纯生物医学模式转向整合心理行为干预。基于 FAM 的认知行为疗法（CBT）通过修正患者的灾难化认知、分级暴露训练及行为激活，有效降低恐惧水平并提升康复参与度。例如，基于虚拟现实（VR）的情境暴露疗法可帮助患者逐步适应运动诱发的生理反应，打破“症状恐惧 - 活动回避”的恶性循环。此外，正念干预与接纳承诺疗法（ACT）通过增强患者对不适感的心理接纳能力，亦显示出改善心脏预后的潜力。然而，当前研究仍存在局限性: 首先，FAM 在心脏疾病中的适用性需更多纵向研究验证，尤其是文化差异对恐惧回避行为的影响；其次，标准化评估工具（如心脏恐惧问卷）的敏感性与特异性仍需优化；最后，跨学科协作机制尚未完善，心理干预与心脏康复的整合模式需进一步探索。未来方向包括开发智能化监测工具（如可穿戴设备实时评估恐惧回避行为）、构建个性化干预路径及探索神经生物学标记物（如自主神经功能）在恐惧回避环路中的作用。

基于此，恐惧回避模型为理解心脏疾病患者心理行为反应提供了新视角，其临床应用有助于突破传统康复瓶颈，推动“身心共治”模式的实践转化，最终改善心血管疾病患者长期预后与生活质量。

1 例 ECMO 支持下冠脉旋磨术及支架植入术后 构建个性化重症心脏康复模式的效果评价

廖翊言

重庆市医疗急救中心

目的： 随着康复理论和技术的不断完善，目前心脏康复已经延伸至心脏危重症的早期治疗当中。随着医疗技术的进步，ECMO 技术支持下用于治疗重症心血管疾病的患者相关报道越来越多。通过构建重症心血管患者Ⅰ、Ⅱ、Ⅲ期心脏康复模式的运用实践，不仅有利于重症心血管疾病患者术后心理状态、运动能力及术后并发症发生率，缩短住院时间，减少患者经济负担。

方法：术前预康复：评估患者临床一般情况、危险因素、心肺功能 (6 分钟步行试验或 CPET 评估)、心理评估量表（PHQ-9、GAD-7）、日常生活能力量表 ADL、睡眠质量量表 PSQI、尼古丁依赖量表 (FTND)、营养（NRS-2002) 等，重点以呼吸训练（腹式呼吸、缩唇呼吸) 为主。通过术前预康复训练增加患者机体功能储备，减少术后并发症，加速康复进程。

院内Ⅰ期心脏康复：（1）全面评估：生理状况评估，生命体征持续监测。心血管评估：心电图、超声心动图等，评估心脏功能恢复情况，患者的呼吸功能、运动能力、量表评估、依据评估结果制定个体化Ⅰ期心脏康复方案。（2）康复宣教。采用宣传手册、视频资料等多种形式向患者及家属强调Ⅰ期心脏康复重要性、优势以及具体内容等，取得理解与配合。（3）康复措施：①术后入 CCU 病房第 1-2 d。基于心电监测，指导患者进行腹式呼吸，每次 5-10 min，每日 3-5 次。协助患者在床上开展四肢主被动活动、踝泵运动、双上肢弹力球抓握等，每次 10- 15 min，每日 3-5 次。②术后第 3d 转入普通病房，指导患者进行坐起（5 min）、躺下（5 min）交替训重复进行 3-5 次，每日 2-3 次。③术后第 4d，指导患者进行床旁站立，每次 5 min；指导患者进行床旁原地踏步，每次 20-30 下；指导患者在病房内独立行走，每次行走 100 m 左右；以上锻炼均为每日 2-3 次。④术后第 5-6 d，从病房内行走过渡至病房外走廊行走，每次 100-200 m，每日 2-3 次，功率车 20w 训练 5-10min。⑤术后第 7 d 至出院，进行上下楼梯锻炼，功率车 30w 训练 5-10min，逐步增加时间和强度。⑥康复锻炼期间，密切监测患者的生命体征，如患者出现心悸胸闷、呼吸困难等及时停止训练。

Ⅱ期心脏康复：再次对患者一般情况、体适能、心理、营养、戒烟、药物等进行全面评估来制定个性化处方。在心脏康复中心团队指导下行Ⅱ期运动康复：包括功率车训练、平衡功能训练、柔韧抗阻训练、体外反搏、心脏康复操等，结合康复宣教，保持健康的生活方式。

III期心脏康复：居家康复，以互联网 + 为依托平台，给予患者全方位的心脏康复指导，包括：持续健康生活方式、严格的药物依从性、定期医学随访、自我监测与管理，指导患者积极面对疾病，保持乐观心态，维持良好的社会关系和家庭支持。

结果：在构建个性化Ⅰ、Ⅱ、III期重症心脏康复模式下，患者术前 6 分钟步行试验距离 280 米，出院前评估为 320 米。borg 评分从 14 分降到 11 分。经过 13 天的康复治疗，症状与功能明显改善，患者康复出院转至Ⅱ期康复。

结论：本案例的成功救治经验表明，在重症心血管疾病患者中进行预康复、术后早期康复干预、构建个性化重症心脏康复模式是安全有效切实可行的。

冠心病患者心脏康复意向干预的最佳证据总结

宋岩岩 王彦 刘爽 吴林 彭沥枢

河北大学护理学院

目的　心脏康复意向是患者是否进行心脏康复的直接预测因素，但大部分患者的心脏康复意向水平较低，严重影响心脏康复的参与率及依从性。而目前关于冠心病患者心脏康复意向干预的临床实践尚未形成统一标准，且多数研究集中于影响因素分析，缺乏具体、有效的指导内容。因此，本研究总结冠心病患者心脏康复意向干预的最佳证据，以期为医护人员制定基于循证的冠心病患者心脏康复意向干预提供参考。

方法　根据“5S”证据模型，系统检索临床决策支持系统、指南网站、专业协会网站及 Cochrane Library、PubMed、Embase、CINAHL、Web of Science、、PsycINFO、维普数据库、中国知网、中国生物医学文献数据库、万方数据库中关于冠心病患者心脏康复意向干预的所有证据，包括临床决策、指南、证据总结、专家共识、系统评价以及随机对照试验，检索时限为建库至 2025 年 6 月 20 日; 由 2 名接受过循证护理学培训的研究者独立完成文献筛选和质量评价，并根据主题对证据进行提取与综合。

结果　共纳入 24 篇文献，包括 1 篇临床决策、6 篇指南、4 篇证据总结、2 篇专家共识、4 篇系统评价、7 篇随机对照试验。提取归纳冠心病患者心脏康复意向干预相关证据共 43 条，汇总为 8 个主题，分别为团队组建与人员培训、筛查与评估、信息支持、提升自我效能及动机、家庭社会支持、个体化康复计划、多学科策略、随访管理。

结论　该研究汇总的冠心病患者心脏康复意向干预的最佳证据具有全面性和科学性，为医护人员系统、规范地干预冠心病患者心脏康复意向提供循证依据，但证据的转化及临床应用需多角度评估，制订适合的心脏康复意向干预方案，以提高患者心脏康复意向水平。

一例 ECMO 联合左心辅助装置治疗巨细胞性心肌炎患者的早期康复

杨水涓 吴明祥 田青 刘波 吕璐 卢寒梅 申莹 陈静 霍淑兰

武汉亚心总医院

目的：一例 ECMO 联合左心辅助装置治疗巨细胞性心肌炎患者的早期康复疗效观察

方法：

1 康复评估方法：

1.1 康复前对患者进行 ICU 相关康复安全和可行性评估：包括循环、呼吸、神经系统、人工管道、等其他风险评估，包括 RASS 与 S5Q 等镇静和配合程度评估，以及心率、呼吸频率、血氧饱和度、血压、呼吸支持模式、ECMO 流量、人工心脏辅助装置流量等生命体征评估。

1.2 血气分析评估 (评估患者 lac，PH 值，po2，pco2，OI 等血气情况)

1.3 心脏功能评估 (心脏 NT-proBNP 值)

1.4 躯体与运动功能评估 (ICU 活动量表 IMS，肌力评估量表 Lovett，关节活动度)

1.5 心肺耐力评估 (2 分钟踏步实验，6 分钟步行实验，RPE 用力程度分级)

2 康复治疗方法 :

2.1 关节松动 (采用麦特兰德关节松动术 1-2 级手法进行肩关节、肘关节、腕关节松动)

2.2 运动康复 (四肢关节主被动运动，床上踏车训练，花生球训练)

2.3 离床训练 (由卧位到床旁坐位，床到轮椅转移训练)

2.4 呼吸训练 (呼吸训练器训练，呼吸控制训练，气道廓清训练)

2.5 心肺耐力训练 (床旁带高流量站立位训练，2min 原地踏步训练，辅助下步行训练)

结果 :

1. 康复治疗过程中 ECMO 流量以及左心辅助装置流量无明显差值。

2. 左心辅助术后第 1 天，自主呼吸次数为 0，呼吸机模式为 V-SIMV，lac1.5,PH 值 7.5，PO2184，PCO224.4,OI 230；左心辅助术后第 41 天，平静下自主呼吸次数为 16 次 / 分，lac1.0，PH7.32,PO280，PCO235.5，OI 242；左心辅助术后第 1 天 RASS 评分（-4 分），康复治疗第 41 天时 RASS 评分（0 分）；左心辅助术后第 1 天 S5Q 评分（0 级），治疗第 41 天 S5Q 评分（5 级）。

3，左心辅助术后第 1 天 NT-proBNP3467pg/ml，治疗第 41 天 NT-proBNP2667pg/ml

4, 左心辅助术后第 1 天体位水平改变 IMS 评估 (0 级), 治疗第 41 天 IMS 评估 (10 分)

5. 左心辅助术后第 1 天肌力 Lovett 评分由双上肢肌力 0 级，双下肢肌力 0 级，治疗第 41 天评估双上肢肌力 Lovett 评分双上肢肌力 4 级，双下肢肌力 4 级。

6，左心辅助术后第 1 天，右上肢关节活动度（肩关节前屈 40°，外展 45°；肘关节屈肘 40°；肘关节旋后 -70°；腕关节掌屈 20，背伸 10 度）；左上肢关节活动度（肩关节前屈 50°，外展 55°；肘关节屈肘 45°；肘关节旋后 -60°；腕关节掌屈 20，背伸 10 度），治疗第 41 天评估右上肢关节活动度（肩关节前屈 135°，外展 100°；肘关节屈肘 100°；肘关节旋后 60°；腕关节掌屈 50°，背伸 50°度）；左上肢关节活动度（肩关节前屈 125°，外展 110°；肘关节屈肘 100°；肘关节旋后 55°；腕关节掌屈 45°，背伸 40°）

7. 左心辅助术后第 16 天呼吸训练器吹气量 100ml, 吸气量 250ml; 治疗第 41 天呼吸训练器吹气量 200ml, 吸气量 1750ml

8，左心辅助术后第 30 天评估 2min 踏步出院时 30 次，6min 步行实验 100 米；治疗第 41 天评估 2min 踏步出院时 50 次，6min 步行实验 220 米

结论：

重症患者在整个危重症救治过程中由于镇静或意识障碍导致完全制动，因此极容易发生神经萎弱和身体器官功能损害。本案例的结论是早期康复具有较高的安全性和可行性，即使患者在接受机械通气、体外膜肺氧合治疗、主动脉球囊反搏治疗等治疗。早期康复可以帮助患者恢复肌力，增强心肺耐力，减轻获得性衰弱的发生，同时可以减轻患者焦虑，帮助患者顺利撤除 ECMO、脱离呼吸、成功拔除气管插管等，帮助患者早日回归家庭回归社会。

心脏康复的临床效益与研究进展

张婧

贵州医科大学附属医院

目的

本综述旨在综合评估心脏康复（CR）在心血管疾病（CVD）二级预防中的核心作用，分析其多维度干预模式的临床效益，并探讨当前实施障碍与未来研究方向，为优化 CR 临床实践提供证据支持。

方法

通过系统检索 PubMed、Cochrane Library 及 Web of Science 数据库 2010–2023 年发表的随机对照试验（RCT）、Meta 分析及国际指南（如 AHA/ACC、ESC）。纳入标准：

研究对象为冠心病（心肌梗死、PCI/CABG 术后）、慢性心衰（HFrEF/HFpEF）等 CR 适应症患者；

干预措施为结构化 CR 项目（含运动训练、风险管控等≥ 3 项核心模块）；

评估终点包括死亡率、再住院率、功能指标（如峰值摄氧量 VO_2 peak）及生活质量（QoL）。采用 Cochrane 偏倚风险评估工具对文献质量进行筛选。

结果

临床结局显著改善：

死亡率降低：Meta 分析（含 67 项 RCT, n=21,000）显示，参与 CR 者全因死亡率降低 26%（RR 0.74, 95%CI 0.64–0.86），心血管死亡率降低 31%（RR 0.69, 95%CI 0.51–0.94）。

再住院风险下降：CR 组 12 个月内再住院率较对照组减少 18%（RR 0.82, 95%CI 0.76–0.88），尤以心衰患者获益显著（RR 0.73）。

功能与 QoL 提升：CR 后患者 VO_2 peak 平均提高 15–30%（Δ3.5–7.0 mL/kg/min），心绞痛发作频率减少 40%；SF-36 量表评分在躯体功能（+12 分）及心理健康（+9 分）维度显著改善。

核心干预机制的证据：

运动训练：高强度间歇训练（HIIT）较中等强度持续训练（MICT）更高效提升 VO_2 peak（Δ10% vs Δ7%, p<0.01），且安全性相当。

综合风险管理：戒烟干预使持续戒烟率达 35%（OR 2.5, 95%CI 1.8–3.4）；个体化营养指导使 LDL-C 额外降低 8–12%。

心理干预必要性: 合并抑郁患者接受 CBT 后，心血管事件风险降低 32%（HR 0.68, 95%CI 0.52–0.89）。

实施模式创新：

家庭远程 CR（Tele-CR）：基于 TELEREH-HF 等 RCT，远程监护组在 VO_2 peak 改善（Δ1.8 mL/kg/min）和 QoL 评分方面与中心 CR 无统计学差异（p>0.05），但参与率提高 25%。

数字化工具应用：移动 App 支持的患者自我监测使运动依从性提升至 83%（vs 常规组 68%, p=0.003）。

现存挑战：

参与率低下: 全球平均参与率仅 30–50%，女性（OR 0.62）、高龄（>75 岁，OR 0.58）及低收入人群（OR 0.41）尤甚。

长期维持困难：仅 40–60% 患者在 CR 结束后 12 个月仍坚持运动目标。

结论

心脏康复是心血管疾病管理的循证基石，通过整合运动训练、风险控制、心理支持及患者教育，可显著降低死亡与再住院风险，改善功能状态及生活质量。家庭远程 CR 与数字化工具的应用有望突破传统模式的可及性瓶颈。未来需重点解决参与率差异、长期行为维持难题，并通过精准医学策略（如基于生物标志物的个体化处方）进一步优化 CR 效益。

一例产褥期 A 型主动脉夹层术后早期康复治疗

杨水涓 吴明祥 田青 刘波 吕璐 卢寒梅 陈涵 李雪莹 陈静 霍淑兰

武汉亚心总医院

目的：一例产褥期 A 型主动脉夹层术后早期康复疗效观察

方法：

1 康复评估方法：

1.1 康复前对患者进行 ICU 相关康复安全和可行性评估：包括循环、呼吸、胃肠功能，凝血功能、胸腔引流液，人工管道、等风险评估。其他评估包括镇静程度评估 (RASS) 与标准化问题 (S5Q) 等镇静和配合程度评估等评估。

1.2 血气分析评估 (评估患者乳酸，PH 值，氧分压，二氧化碳分压，氧合指数等血气情况)

1.3 呼吸与咳嗽功能评估 (肺部感染情况，呼吸模式、呼吸频率、咳嗽强度等功能评估)

1.4 躯体与运动功能评估 (评估患者 ICU 活动量表 IMS，以及肌力评估量表 Lovett，平衡功能评估)

1.5 心肺耐力评估 (2mint 踏步、RPE 用力程度分级)

2 康复治疗方法：

2.1 夹层术后 - 一周 :(物理因子治疗、运动功能、心肺功能)

2.2 夹层术后 1 周一 2 周 :(物理因子治疗、运动功能、心肺功能、吞咽、ADL 训练)

2.3 夹层术后 3-6 周 (物理因子治疗、运动功能、呼吸功能训练、心肺耐力训练、吞咽、ADL 训练)

结果：

1，康复治疗过程中患者生命体征、循环数据无明显差值

2，夹层术后 - 一周：患者机械通气呼吸机辅助呼吸到成功拔除气管插管，但患者心肺功能较差，高流量支持。乳酸 <1.0,PH 值 7.4，PO2148.2， PCO235.3，氧合指数 440, 双上肢双下肢肌力 3 级 ,INR1.3。患者谵妄状态。

3，夹层术后 1 周一 2 周：患者呼吸稳定，肌力 4 级，平衡功能坐位 2 级，未站立训练，INR1.4。患者焦虑抑郁状态。

4，夹层术后 3 周一 7 周：患者呼吸稳定，坐位平衡 2 级，站立位平衡 1 级，IMS 评分 5 分，双上肢双下肢肌力 4 级，INR1.53。

结论：

产褥期主动脉夹层病情危急，早期康复对患者恢复十分重要，早期康复经过重症康复治疗团队以及 ICU 医生及营养医师、药学医师、超声医师多方面合作，精细

评估以及个性化康复方案制定，能帮助患者减少并发症，促进患者早日康复。

一种气切患者使用的呼吸训练器设计方法与临床实践

杨水涓 吴明祥 刘波 田青 刘秋雯 张萌萌 申莹 霍淑兰 吕璐

武汉亚心总医院

目的：

气管切开患者，因疾病、制动或呼吸机相关性膈肌废用性萎缩等因素，许多患者易形成呼吸机依赖，从而无法彻底脱离呼吸机，为了保证气道通畅，痰液引流顺利，预防窒息及误吸，很多患者会经历气管切开。但是气管切开短时间内无法缝合，容易引起呼吸功能下降，引发肺部感染，早期进行呼吸训练非常重要。由于常规呼吸训练器是在人工气道拔除后才开始行呼吸训练，这会导致因训练较晚，患者容易出现较多呼吸有关并发症。鉴于常规呼吸训练器的不足，我们单位设计了一款可以不需在人工气道拔除后就可以进行呼吸训练的呼吸训练器。

方法：

本呼吸训练器通过改良，能够直接连接患者气管切开套管。而且在训练过程中，输氧管能够在气切患者进行呼吸训练时给予充足氧气支持。我们还在此款呼吸训练器上设置了细菌过滤器，细菌过滤器能够有效保护呼吸道清洁。我们还设计了阻力调节装置，根据患者呼吸情况调节吸气阻力。

结果：

该呼吸训练器能早期有效训练气切患者呼吸肌肌肉力量，改善肺功能且在训练时给予充足氧气支持，并未发生训练风险且未出现呼吸道感染情况。

结论：

本呼吸训练器，弥补气管切开不能使用普通呼吸训练器的空缺，让气管切开患者同普通患者（没有气管切开患者）一样，可以进行呼吸肌肌肉力量及其耐力的训练，且安全，从而能让患者尽早脱离呼吸机，减少住院花费，值得临床推广。

运动模拟药物通过 m6A 修饰调控巨噬细胞极化延缓动脉粥样硬化

郑立志 吴健 于波

哈尔滨医科大学附属第二医院

目的：冠状动脉粥样硬化性心脏病（CHD）是导致我国居民死亡的首要疾病之一。以有氧运动为基石的心脏康复能够显著降低心血管死亡率、 再住院和心肌梗死风险，被列为 CHD 治疗的 Ia 类推荐项目。但由于久坐、高龄等因素，近半数 CHD 患者缺乏规律运动，研发运动模拟药物亟待解决。

方法：选取 5-6 周 $ApoE^{-/-}$ 雄性小鼠，提取小鼠骨髓原代巨噬细胞，乳酸钠刺激后，WB 检测 MeCP2 K271la 与 METTL14 表达水平、 Co-IP 检测 MeCP2 与 METTL14 结合水平、免疫荧光检测 MeCP2 与 METTL14 共定位情况、Dot Blot 及 ELISA 检测 m^6A 修饰水平。围绕 MeCP2 K271la 位点选取并合成乳酰化修饰多肽；分析多肽保守性及分子特征；$ApoE^{-/-}$ 小鼠尾静脉注射上述浓度多肽，每周一次，共 8 周，记录小鼠生存曲线；分离多肽注射后小鼠外周血血浆，检测肌酐、肌酸激酶、ALT、AST 水平；病理学检测注射多肽后小鼠肝脏及肾脏形态；梯度浓度多肽刺激 BMDM 筛选出最佳多肽浓度。$ApoE^{-/-}$ 小鼠高脂喂养 8 周后，尾静脉注射上述浓度多肽，每周一次，8 周后，体内体外验证运动模拟多肽有效性及作用机制。

结果：运动模拟多肽降低 $ApoE^{-/-}$ 小鼠外周血炎症因子水平，减少动脉粥样硬化斑块面积。机制方面，乳酰化修饰后的 MECP2 与 METTL14 结合能力增强，下调巨噬细胞 RNA m^6A 修饰水平；运动模拟多肽通过与 METTL14 结合，下调 RNA m^6A 修饰水平，介导巨噬细胞向抗炎表型（M2）转化，从而发挥延缓动脉粥样硬化的作用。

结论：以 MeCP2 K271la 位点合成、设计的运动模拟多肽通过与 METTL14 结合下调巨噬细胞 m^6A 修饰水平调控巨噬细胞 M2 型极化从而发挥延缓动脉粥样硬化的作用，具有可观的应用前景，为临床防治冠状动脉粥样硬化性心脏病提供崭新思路。

叙事护理外部见证人视角下社区二期心肺康复养育共同体的协同路径研究

王慧

中心医院

研究目的：针对社区二期心肺康复患者因疾病困扰、康复压力及社会角色转变陷入自我否定与情感孤立，进而影响康复进程的问题，本研究旨在通过将叙事护理外部见证人理念融入社区康复，构建“社区养育共同体”协同模式，以集体叙事与情感联结重塑患者康复信心，优化康复效果，为完善社区心肺康复服务体系提供新路径。研究方法：采用质性研究与行动研究相结合的方法：通过深度访谈、参与式观察收集患者康复叙事资料；引入外部见证人（患者、家属、医护人员及志愿者），组织叙事分享会，借助复述、反馈与共情帮助患者重构疾病意义；在此基础上构建“社区养育共同体”,通过定期叙事活动、家庭探访、互助小组等形式，建立持续情感联结与经验共享机制，整合医疗康复、心理支持、社会融入资源。研究结果：实践显示，该模式有效打破了患者个体叙事的局限性，形成了相互支持的集体叙事网络；显著提升了患者的康复依从性、自我效能感及社会适应能力，构建起兼具人文关怀与专业支持的康复生态系统，实现了从个体康复到群体互助的转变。研究结论：将叙事护理外部见证人理念与社区康复结合的“社区养育共同体”模式，突破了传统生物医学模式的局限，为社区二期心肺康复提供了兼具理论创新性与实践可行性的方案，对完善社区心肺康复服务体系具有重要参考价值。

重症监护室心脏瓣膜病患者 TAVR 术后早期心脏康复对运动能力及心功能的影响

林美卿 王少萍 吴爱梅

海南省人民医院

目的

本研究旨在探讨早期心脏康复对经导管主动脉瓣置换术（TAVR）术后患者运动能力及心功能的影响，为临床实践中优化 TAVR 术后康复方案、改善患者预后提供科学依据。通过系统评估早期综合康复干预在提升患者运动耐量、促进心功能恢复、缩短住院时间等方面的作用，明确其在重症监护室心脏瓣膜病患者术后康复中的应用价值。

方法

选取 2024 年 1 月至 12 月我院心血管内科收治的 100 例符合 TAVR 手术适应证的重症心脏瓣膜病患者作为研究对象，采用随机数字表法将患者分为对照组和实验组各 50 例，对照组给予常规心脏康复护理，包括术后床上被动关节活动、48 小时监护下坐起、72 小时床边站立、逐步过渡至病房内步行及常规健康教育与出院指导；实验组在常规护理基础上实施《早期综合心脏康复干预》，术前预康复（呼吸功能训练、下肢抗阻训练、营养支持）、ICU 康复期（呼吸训练、床上运动、体位管理）、普通病房康复期（渐进性步行训练、抗阻训练、有氧训练）及出院前过渡期（个性化居家康复方案、移动康复指导 APP 监测、多学科随访团队建立）四个阶段进行干预。分别于术前、术后 7 天、术后 1 个月采用 6 分钟步行试验（6MWD）评估运动能力，通过超声心动图检测左室射血分数（LVEF）、左心室质量指数（LVMi）等心功能指标，记录住院时间、再住院率及并发症发生率等临床结局指标，采用 SPSS25.0 软件进行统计学分析。

结果

两组患者在年龄、性别构成、基础疾病、术前心功能等基线资料方面差异均无统计学意义（P>0.05），具有可比性。运动能力方面，术后 7 天实验组 6MWD 显著高于对照组（278.6±35.2mvs.215.4±31.7m，P<0.01），且这一优势持续至术后 1 个月（378.4±42.6mvs.298.3±38.7m，P<0.01）；实验组首次下床时间较对照组提前 18.7 小时（18.2±3.6 小时 vs.36.9±5.1 小时，P<0.01），从卧床到接受 6 分钟步行测试的时间缩短 3.2 天（P<0.01）。心功能指标方面，术后 1 个月实验组 LVEF 显著高于对照组（58.7±5.2%vs.52.4±4.8%，P<0.001），LVMi 显著低于对照组（112.4±10.7g/m^2vs.126.8±12.3g/m^2，P<0.001），52% 患者 LVMi 减少 >10%，整体纵向应变（GLS）改善更明显（18.3±2.1%vs.16.2±1.8%，P<0.001），而舒张功能（E/e’比值）两组均未显著改善（15.8±3.2vs.16.1±3.4，P>0.05）。临床结局方面，实验组术后住院天数（9.8±1.6 天 vs.13.0±2.1 天）及总住院天数（14.2±2.3 天 vs.17.4±3.1 天）显著缩短（P<0.001），30 天内再住院率显著降低（6.0%vs.18.0%，P=0.027），两组均未发生康复相关严重不良事件，轻度并发症发生率无显著差异（12.0%vs.16.0%，P>0.05）。

结论

TAVR 术后实施早期心脏康复能有效改善患者运动能力，显著提高 6 分钟步行距离，提前首次下床时间；促进心功能恢复，提升左室射血分数，降低左心室质量指数，改善整体纵向应变；同时缩短住院时间，降低 30 天内再住院率，且安全性良好，未增加严重并发症风险。早期心脏康复通过多阶段、多维度的综合干预，在提升患者运动能力、促进心脏逆重构及改善临床结局方面效果显著，建议将其纳入 TAVR 围术期标准护理路径，未来需进一步探索个体化干预方案及长期效果，以更好地服务于重症监护室心脏瓣膜病患者的术后康复。

心包剥脱术患者的心肺运动试验结果特征

佟明汇 赵雅娴 奚卉（委员）

北京大学国际医院（北京大学第八临床医学院）

目的：

心包剥脱术与生存率低和发病率高有关。然而，在这组高危手术患者中，关于心肺运动功能评估的信息非常有限。本研究目的是报告缩窄性心包炎患者的心肺运动试验（CPET）的特征，从而协助优化该类患者的手术策略。

方法：

回顾性分析自 2023 年 1 月至 2024 年 7 月在我院因慢性缩窄性心包炎行心包剥脱术患者的临床资料，共连续入组 51 例患者，分别对围手术期临床资料和 CPET 特征进行统计分析。

结果：

所有的手术患者（平均年龄 49.6±14.4 岁；64.7% 为男性）均通过正中胸骨切开术接受了规范心包剥脱术。该类最常见的病因是结核病（n=32，62.7%），47 名患者（92.2%）和 26 名患者（51.0%）分别被确诊为纽约心脏协会功能 III/IV 级和小气道功能障碍（SAD）。在 CPET 中，最大摄氧量（VO2 max%）、无氧阈值摄氧量（AT%）和二氧化碳通气当量（VE/VCO2）分别为 51.9±12.9%、33.1±7.8% 和 30.7±3.1。当中，9 名（17.6%）患者接受了再次心包剥脱术，其 CPET 特征 VO2 max%、AT% 和 VE/VCO2 分别为 52.9±13.7%、34.2±8.7% 和 30.8±3.3；42 名（82.4%）首次心包剥脱术患者的 CPET 特征：VO2 max%、AT% 和 VE/VCO2 分别为 49.0±9.4%、30.0±1.7% 和 30.4±2.3%。24 名（47.0%）患者接受了联合瓣膜手术，其 CPET 特征 VO2 max%、AT% 和 VE/VCO2 分别为 55.7±12.7%、35.3±4.5% 和 29.7±2.3；27 名（53.0%）单纯心包剥脱术患者的 CPET 特征 VO2 max%、AT% 和 VE/VCO2 分别为 50.7±12.7%、32.3±8.5% 和 31.0±3.3%。本组患者未出现术后 30 天内死亡，平均重症监护室（ICU）逗留时间为 2.6±1.2 天；总体术后不良事件发生率为 13.7%（MACCE，7/51），当中低心排综合征是患者主要合并症（4/51）。多变量分析显示，VE/VCO2<40.0% 心包炎患者术后 MACCE 及 ICU 住院时间延长（>3 天）的独立风险因素（OR，2,45 (1.33-4.47)，P<0.01）。

结论：

心包剥脱术是治疗缩窄性心包炎的安全方法。心包炎患者 CPET 特征可能具有评估患者手术风险作用，未来仍需更多数据支持应用 CPET 评估复杂心脏手术患者的系统方法。

PNF 有序呼吸肌拉伸训练技术在慢性心力衰竭患者康复运动实践与应用

聂陈

武汉市中心医院

【摘要】 **目的** 采用 PNF 本体感觉神经肌肉联合有序呼吸肌拉伸训练技术在慢性心力衰竭患者呼吸肌训练方法，结合特定手法引导及阻力施加和特定呼吸模式训练下能系统性改善呼吸肌群柔韧性、协调性及神经肌肉控制能力，以改善慢性心力衰竭患者呼吸困难。**方法** 选择 104 例心功能 II 到 III 级慢性心力衰竭患者，随机分为试验组和对照组，对照组为常规呼吸功能训项目，实验组在此基础上加做 PNF 有序呼吸肌拉伸训练，主要训练的呼吸肌群有包括胸大肌、胸小肌、胸锁乳头肌、斜方肌、肋间内肌、前锯肌和腹直肌、膈肌等，在拉伸前先由治疗师评估患者肌肉可以拉伸至患者可承受的最大长度。双方进行 3 秒抗阻等长收缩后放松，患者无不适时，在进行 15 秒的肌肉拉伸训练，每天训练 2 次，每次 10-15 分钟，每周 5 次，连续 5 周，2 组患者于 5 周后运用无创心排评估患者心功能状态、6 分钟步行实验、Borg 呼吸困难疲劳程度表、生活质量测定表、患者健康问卷（PHQ-9）等对比 **结果** 运用 PNF 有序呼吸肌拉伸训练技术心力衰竭患者 6 分钟步行实验距离、生活自理能力得分均高于对照组，差异有统计学意义（P < 0.05）结论 采用 PNF 有序呼吸肌拉伸训练技术可改善心力衰竭患者呼吸肌耐力下降、呼吸肌协调性改善心衰患者呼吸困难。

康复护理对冠心病患者行经皮冠状动脉介入术术后恢复的影响

刘长芳 邓流菊

重庆荣昌区人民医院

冠心病是目前临床中比较常看到的一种新冠疾病，近些年发病率也出现了急剧上升的态势，这类疾病会给病患新功能造成相对的伤害，假如没有及时的采取有效的治疗，这类病情有可能会持续的加重奉化下去，乃至于可能会出现心肌梗死，给病患的生命健康带来了很大的威胁 [1]-[2]。临床中主要采用药物与经皮冠状动脉介入术（PCI）等方法进行治疗，其中以 PCI 为目前临床运用相对多并且疗效较好的治疗方法，可是术后如果没有对病情采取有效的护理，那么病患可能会出现缺血和出血等负面反应，给手术效果以及术后康复带来了很大的影响，所以给予 PCI 术后病患科学合理的护理干预相当关键。

目的 探究康复护理对冠心病病患行经皮冠状动脉介入术术后恢复的影响。

方法 针对院内 2019 年 1 月 -2020 年 1 月治疗的冠心病病患 70 例，随机划分为参照组与研究组，每组各 35 例，参照组开展常规护理，研究组落实康复护理，比对两组病患临床效果。

结果 研究组 LVEDD 与 EF 指标均明显强于参照组，同时焦躁、抑郁评分均优于参照组，差异具备统计学意义（P < 0.05）。

结论 康复护理在经皮冠状动脉介入术后的冠心病病患康复中有着不小的作用，可以改善病患血管动力学指标，提高预后效果。

六分钟步行试验指导的有氧运动康复对慢性心力衰竭行心肌收缩力调节器术后患者心功能及运动耐量的影响

刘艳 李睿 井治聪

西安交通大学第一附属医院

目的： 探讨 6 min 步行试验 (6 minute walking test,6MWT) 指导的有氧运动康复，对慢性心力衰竭行心肌收缩力调节器（Cardiac contractility modulation,CCM）术后患者心功能及运动耐量的影响。

方法： 选择 2024 年 3 月至 2025 年 6 月西安交通大学第一附属医院心内科成功接受 CCM 的出院慢性心力衰竭患者 9 例，在常规药物治疗基础上，结合患者病情及 6MWT 评估结果，指导患者进行有氧运动康复，于 CCM 术后出院前及有氧运动康复干预 12 周后评价 6 min 步行距离（6MWD）、代谢当量（METS）、左心室射血分数 (LVEF)、B 型钠尿肽前体（Pro-BNP）、左心室舒张末期内径 (LVEDD)、左心室收缩末期内径（LVESD）的差异。

结果： 有氧运动康复干预 12 周后，6 min 步行距离（6MWD）从干预前（339.89±46.46）m 提高至（386.89±36.88）m（P<0.05）；代谢当量（METS）从（2.59±0.25）提升至 (2.83±0.17)(P<0.05); 左心室射血分数 (LVEF) 从（34.11±5.25）% 增加至（39.11±7.82）%(P<0.05); B 型钠尿肽前体（Pro-BNP）从（2152.00±1824.47）pg/ml 降至（1522.33±1453.16）pg/ml(P<0.05); 左心室舒张末期内径 (LVEDD) 从（67.44±9.38）mm 缩小至（65.44±9.59）mm(P<0.05); 左心室收缩末期内径（LVESD）从 (56.00±9.38)mm 减少至（53.33±9.71）mm(P<0.05)。与患者 CCM 植入后出院前相比，所有观察指标均有所改善。

结论： 对于慢性心力衰竭行心肌收缩力调节器（Cardiac contractility modulation,CCM）术后患者，应用 6 min 步行试验 (6 minute walking test,6MWT) 指导的有氧运动康复训练效果良好，能够有效改善患者心功能，提升患者运动耐量水平。

TAVR 术后患者心脏康复护理的现状及展望

盛丹 刘华芬

武汉大学人民医院

目的 系统梳理经导管主动脉瓣置换术（TAVR）术后患者心脏康复护理的现状，分析现存问题并提出未来发展方向，为规范临床康复实践、改善患者预后提供参考。

方法 检索 2013 年 1 月至 2023 年 12 月 PubMed、CNKI、万方等数据库中关于 TAVR 术后心脏康复护理的相关文献，纳入符合标准的中英文文献 86 篇，通过内容分析法归纳当前康复护理模式、干预内容、实施效果及存在的挑战，并结合临床实践数据进行总结。

结果 当前 TAVR 术后心脏康复护理以多学科团队（MDT）合作为核心模式，涉及心内科医师、康复治疗师、护士等专业人员，干预内容主要包括：术后早期活动（术后 24-48 小时床上被动运动实施率 89%，72 小时后渐进式下床活动执行率 76%）、饮食管理（低盐低脂饮食依从性 62%）、用药指导（抗凝药物规范服用率 69%）、心理干预（焦虑抑郁情绪筛查覆盖率 58%）及生活质量评估（SF-36 量表应用率 83%）。临床数据显示，规范康复护理可使患者 6 分钟步行距离平均增加（54.2±19.7）米，术后 3 个月再入院率降至 18.5%，较未参与康复者降低 9.2 个百分点。但现存问题显著：一是标准化流程缺失，仅 31% 的医疗机构建立 TAVR 专项康复路径，干预周期（2-16 周）和强度差异较大；二是延续性不足，出院后社区康复覆盖率仅 29%，6 个月随访时康复训练坚持率降至 34%；三是人群适配性低，≥75 岁患者中因体能衰弱中断康复者占 43%；四是评估工具局限，专用瓣膜功能康复评估工具使用率不足 12%。

结论 TAVR 术后心脏康复护理在改善患者运动耐力和降低再入院率方面已显示出积极效果，但标准化程度低、延续性差等问题制约其发展。未来需构建“医院 - 社区 - 家庭”三级康复网络，结合可穿戴设备实现远程监测与个性化方案推送，开发针对老年衰弱患者的低强度康复方案，并制定专用评估工具，以提升康复护理的规范性和有效性，进一步优化患者长期预后。

IMB 模型的预康复护理干预对急性期主动脉夹层患者的影响

汪晓燕

宁夏回族自治区人民医院

摘要：目的 探讨基于信息 - 动机 - 行为（IMB）模型的预康复护理干预对急性期主动脉夹层介入患者的临床效果。方法 采用类试验研究设计，选取宁夏某三级甲等医院 2023 年 3 月至 2024 年 6 月收治的 80 例急性期主动脉夹层介入患者为研究对象。其中，2023 年 3 月至 10 月收治的 40 例患者作为对照组，采用常规护理模式；2023 年 11 月至 2024 年 6 月收治的 40 例主动脉夹层介入患者作为试验组，在常规护理基础上联合基于 IMB 模型的预康复护理。干预 1 周后，比较两组患者的疼痛评分、血压、心率、并发症发生率、等待手术时间、住院时间及护理满意度。结果 干预后，试验组患者的疼痛评分显著降低，收缩压、舒张压及心率水平均优于对照组（P < 0.05）；试验组并发症发生率（如出血、静脉血栓、感染、压力性损伤、脏器灌注不足等）显著低于对照组，等待手术时间及住院时间均较对照组明显缩短（P < 0.05）；同时，试验组患者对护理工作的满意度评分显著高于对照组（P < 0.05）**结论** IMB 模型预康复护理能够明显改善急性期主动脉夹层患者疼痛、血压及心率、降低并发症发生率、缩短患者住院时间、等待手术时间、提升患者满意度、提升患者就医体验，为临床护理提供了科学有效的干预方案。

心血管术后恐动症患者管理的最佳证据总结

乐欣

成都市第三人民医院

目的：心脏介入手术后，心脏需要时间来适应新的生理状态，运动康复中的有氧运动能够有针对性地增强心肌收缩力，提高心脏的泵血功能。通过循序渐进的锻炼，可以使心脏逐渐恢复到更佳的工作状态，从而提升患者的耐力和体力。但研究表明，50-87% 的术后患者没有定期进行运动康复，而超过 70% 的患者存在恐动症。恐动症是指患者由于疼痛对身体活动的刺激或担心活动造成身体额外损伤，从而产生的对疼痛的敏感性增加，以及对日常活动或功能锻炼产生的非理性恐惧心理。对运动的恐惧是心血管患者术后参与基于运动的心脏康复的一大障碍。患者往往因为害怕运动而避免运动和锻炼，从而降低了康复锻炼的参与率和依从性，进而容易诱发心动过速、直立性低血压和血栓栓塞，也容易引起患者的焦虑、抑郁等负面情绪，导致患者的运动依从性和生活质量下降。目前国内缺乏基于证据的心血管疾病患者恐动症管理的相关研究，国内外对于此类患者的管理内容也存在一定差异，基于此本研究通过系统检索国内外文献整理相关证据，为临床实践提供参考。

方法：检索澳大利亚乔安娜布里格斯研究所循证卫生保健中心数据库、UpToDate、加拿大安大略注册护士协会网、美国国立指南数据库、澳大利亚和新西兰心脏协会、法国心血管协会、韩国心脏学会、美国心脏学会、欧洲心脏学会、欧洲胸外科协会、苏格兰校际指南网、新英格兰医学网、Cochrane Library、CINAHL、PubMed、中国知网、万方数据库等检索时限为建库至 2025 年 04 月 16 日。采用 JBI 循证卫生保健中心的文献评价标准和证据分级系统，进行文献质量评价及证据级别评定。

结果：最终纳入 17 篇文献，包括临床决策 1 篇、证据总结 1 篇、指南 8 篇专家共识 4 篇、随机对照试验 1 篇，横断面研究 1 篇、系统评价 1 篇。共总结出 21 条关于心血管患者恐动症管理的最佳证据，涉及人群选择、评估内容、院内康复、院外康复 4 个方面。

结论：本研究通过系统检索国内外文献整理相关证据，旨在为临床管理心血管术后恐动症患者提供科学依据。

呼吸疗法在老年心力衰竭患者心脏康复中的应用效果

刘伟静学组委员

上海市第十人民医院（同济大学附属第十人民医院）

目的：探讨节拍式呼吸疗法在老年心力衰竭患者家庭心脏康复中的应用效果。方

法：纳入 46 例老年心力衰竭患者，其中观察组 26 例、对照组 20 例。两组患者在病情稳定出院后接受家庭心脏康复干预，其中观察组患者采取节拍式呼吸疗法，对照组患者采取常规治疗。在出院当天（干预前）和干预 3 个月后检测两组患者的血流动力学指标 [每搏输出量（SV）、每搏输出量指数（SVI）、心排血量（CO）、心排血量指数（CI）、左心室做功（LVSW）、左心室做功指数（LVSWI）、加速指数（ACI）、速度指数（VI）、全身血管阻力（SVR）、全身血管阻力指数（SVRI）、心率及收缩压、舒张压]，采用 12 项健康调查简表（SF-12）评定两组患者的生活质量。通过康复记录评估患者的家庭心脏康复干预依从性。 结果：（1）干预 3 个月后，观察组的 SV、SVI、CO、CI、VI、LVSW、LVSWI 高于干预前水平，SVR、SVRI 低于干预前（P<0.05）；观察组的 SV、SVI、CO、CI 和 VI 高于对照组，SVR、SVRI 和收缩压低于对照组（P<0.05）。（2）干预 3 个月后，观察组 SF-12 原始总分和生理功能维度、躯体疼痛维度、总体健康维度、活力维度、社会功能维度、情感职能维度、精神健康维度得分高于干预前（P<0.05）；观察组 SF-12 原始总分和生理功能维度、躯体疼痛维度、总体健康维度和精神健康维度的得分高于对照组（P<0.05）。（3）观察组患者的家庭心脏康复干预依从性优于对照组（P<0.05）。结论：与常规治疗相比，应用节拍式呼吸疗法对老年心衰患者进行家庭心脏康复，可以在短期内有效地降低体循环血管阻力，增强患者的心脏功能，提高其家庭心脏康复依从性，改善其生活质量，值得临床应用推广。

有氧运动通过 Mettl14/GATA3 通路增加巨噬细胞脂噬发挥抗动脉粥样硬化作用

郑阳 郑祥慧 郭周 王慧宇 李运棋 于波 孙勇 吴健

哈尔滨医科大学第二附属医院

目的：冠心病发病率逐年升高，严重威胁人类健康。有氧运动能够降低冠心病患者主要心血管不良事件（MACE）发生及提高预后。但是有氧运动对动脉粥样硬化调控的具体机制仍不明确。

方法：应用斑点印记实验检测冠心病患者及动脉粥样硬化小鼠外周血单核细胞和 THP-1 诱导巨噬细胞的 RNA m6A 修饰水平；病理染色检测小鼠主动脉窦区域动脉粥样硬化斑块面积，Masson 三色染色检测斑块稳定性，免疫荧光检测小鼠斑块巨噬细胞中 Mettl14、GATA3 表达水平；流式细胞技术、荧光定量 PCR 以及 WB 检测 THP-1 诱导巨噬细胞的 M1/M2 极化水平，油红 O 染色检测 THP-1 诱导的巨噬细胞泡沫细胞形成情况，划痕实验检测 THP-1 诱导巨噬细胞的迁移能力，与内皮黏附能力检测 THP-1 细胞诱导巨噬细胞的黏附能力，电镜检测巨噬细胞脂滴水平，WB 检测巨噬细胞脂噬水平；应用 CRISPR-Cas9 技术构建 Mettl14-/+ 小鼠，Mettl14-/+ 小鼠与 APOE-/- 小鼠杂交获得 Mettl14-/+APOE-/- 小鼠；流式细胞技术及荧光定量 PCR 检测小鼠骨髓来源巨噬细胞（BMDM）极化水平；流式细胞技术检测小鼠外周血单核细胞 Ly6C 比例，免疫荧光检测小鼠斑块中 M1/M2 极化水平；油红 O 染色检测 BMDM 泡沫细胞形成情况，免疫荧光及荧光定量 PCR 检测 BMDM 中 GATA3 表达情况，荧光定量 PCR 检测 GATA3 mRNA 稳定性。

结果：在冠心病患者外周血单核细胞、LPS 刺激的巨噬细胞以及动脉粥样硬化小鼠外周血单核细胞中 m6A 修饰水平明显升高，m6A 甲基化转移酶 Mettl14 表达水平明显升高。有氧运动能够降低动脉粥样硬化斑块面积，增加斑块稳定性，同时有氧运动能够使小鼠外周血单核细胞及斑块巨噬细胞中 Mettl14 表达明显降低。敲减 THP-1 中的 Mettl14，能够使巨噬细胞向 M2 型极化，抑制 NF-κB 通路，促进巨噬细胞脂噬，降低泡沫细胞数量，促进巨噬细胞中 ABCA1、ABCG1、PPAR-γ、LXR-α 蛋白表达，抑制巨噬细胞迁移及黏附，减轻巨噬细胞炎症反应。培养 Mettl14-/+APOE-/- 小鼠来源的 BMDM，敲除 Mettl14 能够促进巨噬细胞向 M2 型极化; MeRIP-seq 和 RNA-seq 联合分析发现 GATA3 m6A 修饰水平降低、基因表达水平同时也降低，荧光共定位分析发现 GATA3 主要位于小鼠斑块的巨噬细胞中；Mettl14-/+APOE-/- 小鼠中，敲除 Mettl14 后，有氧运动能够更明显降低小鼠动脉粥样硬化斑块面积、增加斑块稳定性，增加小鼠外周血单核细胞 CX3CR1highLy6Clow 比例，增加斑块中 M2 型细胞数量，增加巨噬细胞脂噬水平，降低 BMDM 的泡沫细胞数量；Mettl14-/+APOE-/- 小鼠中，敲除 Mettl14 能够使斑块巨噬细胞、BMDM 中 GATA3 表达水平降低，降低 GATA3 mRNA 的稳定性。

结论：有氧运动能够降低动脉粥硬化巨噬细胞中的 Mettl14 水平，并通过 Mettl14/GATA3 通路增加巨噬细胞的 M2 型极化、促进巨噬细胞脂噬。因此，有氧运动通过 Mettl14/GATA3 通路促进巨噬细胞脂噬从而发挥抗动脉粥硬化。

不同年龄组冠心病患者体适能指标之间的差异

李茵 吴嘉慧

首都医科大学附属北京安贞医院

目的 探讨不同年龄组冠心病患者心肺耐力、人体成分以及运动表现能力中的力量、平衡能力、柔韧性等体适能指标之间的差异，为运动处方的制定提供参考。方法 选取 2023 年 5 月 -2024 年 11 月份在北京安贞医院心脏康复中心进行康复治疗的冠心病患者 97 例，将患者按照年龄分为 < 45 岁、45~64 岁和≥ 65 岁三组。通过单因素方差分析和秩和检验探讨不同年龄组冠心病患者体适能指标之间的差异。结果 经统计分析比较，三组之间心肺测试指标中的 Peak-Load 在三组之间出现显著差异（F=7.642，P < 0.01），AT-Load、AT-VO_2/kg、Peak-VO_2/kg、Peak-VO_2 之间虽然有随着年龄下降的趋势，但三组间并未有显著差异。其他体适能指标中 30s 手臂屈曲测试、30s 椅子坐站测试、握力、抓背试验、改良转体测试、单腿站立测试、功能性前伸测试以及起立 - 行走测试在组间均有显著差异（P < 0.05，P < 0.01）。结论：45 岁以后的冠心病患者开始出现力量、平衡以及柔韧性等其他体适能的显著下降，因此进行心脏康复时，对其进行其他体适能的评估并实施针对性的治疗训练是有必要的。虽然心肺耐力在不同年龄组之间不存在显著差异，但也呈随年龄下降的趋势。

Cardiac Shock Wave Therapy Ameliorates Myocardial Ischemia in Patients with Non-obstructive coronary artery disease: A Randomized Trial

weijing Liu

Shanghai Tenth people’s Hospital

Background: Cardiac shock wave therapy (CSWT) is a non-invasive new option for the treatment of chronic refractory angina pectoris. The clinical prognosis of non-obstructive coronary artery disease is similar to that of obstructive coronary artery disease, and there is currently no effective clinical solution. This study aimed to evaluate the safety and efficiency of CSWT in the treatment of non-obstructive coronary artery disease.

Methods: Thirty-six patients with non-obstructive coronary artery disease were randomly allocated into CWST group (n = 18) and Control group (n = 18). Patients in the CSWT group were treated with optimal drugs (including antiplatelet drug, statins, and antianginal drugs) + CSWT, and those in the Control group were treated with optimal drugs alone. Care providers and physicians who followed up the patients (parameters of this study) were blind to the grouping. Blood samples of peripheral venous were collected at baseline and follow-up. Myocardial marker [creatine kinase phosphateisozyme (CK-MB)] and hepatorenal function indexes [alanine aminotransferase (ALT), aspartate aminotransferase (AST), serum creatinine (SCr)] were measured. Canadian Cardiovascular Society (CCS) grade of angina pectoris, Seattle Angina Questionnaire (SAQ) score, 6-min walk test (6MWT), weekly dosage of nitroglycerin, and myocardial perfusion on D-SPECT were determined at baseline and during the follow-up period. Myocardial perfusion was evaluated using a 99mTc-labeled tracer SPECT (D-SPECT, Spectrum Dynamics Company) at baseline and 6 months after the first treatment in the CSWT group. One-day rest-stress method was used for adenosine load protocol with tracer injection. Summed stress score (SSS) and summed rest score (SRS) were analyzed semiquantitatively in a blind manner. Adverse events were also evaluated.

Results:CSWT was well-tolerated in the CSWT patients. The myocardial ischemia markers (CK-MB), hepatorenal function (AST and ALT), and renal function (SCr) results showed no significant differences in these parameters. It is indicated that the procedure of CSWT is safe and did not result in damage to the myocardium. The clinical symptoms (chest tightness and chest pain) were all improved in the CSWT group. The symptoms were evaluated by CCS class scores, SAQ scores, and 6MWT. At baseline, there were no significant differences in the CCS score, SAQ score, and results from 6MWT between the two groups (p > 0.05). CSWT improved the myocardial perfusion in the treated area as evaluated by D-SPECT in the adenosine stress protocol. both SSS and SRS were reduced in the CSWT group at 6 months. Echocardiography was performed on a Vivid 9 (GE Vingmed, Horton, Norway). Echocardiography was done to illustrate the left ventricular end-diastolic dimension (LVDd) and left ventricular ejection fraction (LVEF). the LVEF was similar at baseline between the two groups, and it remained unchanged after treatment (6 months). The LVDd was also comparable between the two groups at baseline, and it remained unchanged after treatment (6 months). This reflected that LV function had no signs of deleterious LV remodeling. However, no significant changes were observed in the Control group. CSWT was well-tolerated in all the subjects. No complications or adverse effects were noted in the patients of the two groups.

Conclusions: CSWT may improve the myocardial perfusion and reduce clinical symptoms without increasing adverse effects in patients with non-obstructive coronary artery disease. It provides a non-invasive and safe clinical therapy for patients with non-obstructive coronary artery disease. CSWT may serve as a good alternative for the treatment of CRAP, achieving favorable clinical therapeutic efficacy and better quality of life.

高原冠心病患者居家心脏康复的研究进展

赵文琦 李伟玲

青海省心脑血管病专科医院

目的：

本文旨在综述高原地区冠心病 (CHD) 患者居家心脏康复 (HBCR) 模式的研究进展与应用。高原地区低氧、高寒环境导致 CHD 发病年龄早、合并高血压 / 高脂血症比例高，加之地域广阔、人口分散、医疗资源有限，使得传统的医疗监督下心脏康复中心 (CBCR) 模式普及率、参与率和完成率均不理想。因此，探索和推广 HBCR 模式，利用家庭场景和远程监督为高原 CHD 患者提供安全有效的康复服务，提高其心肺功能、社会参与度和生活质量，成为迫切需求。

方法：

文章通过文献综述，系统阐述了高原 CHD 的特点及其对康复的挑战，定义了 HBCR 模式及其核心要素（以家庭为基础、远程监督指导、个性化计划）。重点介绍了 HBCR 的五大核心干预策略：(1) 运动康复： 基于入院评估和心肺运动试验 (CPET) 进行风险分层，制定个性化运动处方（时间、频率、强度），结合高原环境调整强度（如降至峰值心率 / 心率储备 50%-70%），利用可穿戴设备进行远程监测。(2) 营养干预： 评估营养状况，参照地中海饮食等制定个体化营养处方，控制饱和脂肪、胆固醇和钠摄入，管理合并症相关饮食。(3) 睡眠管理： 多方式评估睡眠（尤其阻塞性睡眠呼吸暂停 OSA 和失眠），根据严重程度给予保守、器械或药物 / 心理治疗，利用 App 辅助管理。(4) 心理康复： 使用量表（如医院焦虑抑郁量表）进行筛查，采用压力管理、认知行为治疗、动机性访谈等方式干预，必要时转诊。(5) 心血管危险因素管理： 监测血压、血糖、血脂、体重等，指导生活方式调整和规律用药，支持戒烟。此外，详细说明了 HBCR 实施前的综合评估内容（医学、运动、营养、睡眠、心理）和基于评估制定运动处方的具体原则（尤其针对高原环境和合并症调整）。文章也概述了 HBCR 在国际和国内（特

别是高海拔地区）的应用现状。

结果：

国际共识（如美国 AHA/ACC/AACVPR 2019 声明）推荐低危患者使用 HBCR，其在解决交通时间障碍、扩大服务范围、延长监测时间方面优势明显。研究表明，参与 CR（包括 HBCR）能显著降低冠心病患者死亡率和再入院率，提高依从性可获得更大获益。在高原或类似环境下，基于智能手机交互的 HBCR 模式在中国患者中被证实能有效提高运动依从性，降低心血管风险。可穿戴设备（如电子手环）在心脏术后患者中应用方便、接受度高，有助于活动监测和恢复评估。然而，中国整体 CR（包括 HBCR）的机构覆盖率（不足 30%）和地域普及度（东部高于中西部）仍有很大提升空间，高原地区更面临特殊挑战。

结论：

HBCR 模式是解决高原地区 CHD 患者康复资源匮乏、交通不便、参与率低等问题的有效途径。它融合运动、营养、睡眠、心理和危险因素管理等多维度干预，通过个性化评估与处方制定（需特别考虑高原低氧环境的影响），并借助可穿戴设备和远程医疗技术实现监督与指导，能够安全有效地帮助患者恢复心肺功能、改善生活质量并降低心血管风险。未来应加强患者教育、完善随访制度（结合电话、网络、家访）、研发适应高原环境的监测设备、探索社区支持模式，并积极整合远程医疗与人工智能技术，构建高质量、可推广的 HBCR 服务体系，以弥补高原地区医疗资源不足，提升心血管疾病患者的全程管理和健康水平。

基于循证医学的心脏康复规范化实施的相关探讨

谭慧 刘华芬

武汉大学人民医院

心脏康复（Cardiac Rehabilitation, CR）是心血管疾病（CVD）患者长期管理的重要组成部分，其规范化实施对降低再住院率、改善生活质量和提高生存率具有显著作用。然而，全球范围内 CR 的参与率和实施质量仍存在较大差异，亟需基于循证医学优化标准化流程。本文系统回顾国内外 CR 研究进展，探讨规范化实施的关键要素、现存障碍及未来发展方向，以期为临床实践和政策制定提供参考。

本文回顾了心脏康复的循证医学基础，CR 的临床获益已得到多项 Meta 分析和随机对照试验（RCTs）支持。研究显示，规范化 CR 可使稳定型冠心病患者的全因死亡率降低 20%~30%，心力衰竭患者的再住院风险下降 25%，并显著改善 6 分钟步行距离（6MWD）和峰值摄氧量（VO_2peak）。此外，CR 在心理干预（如抑郁、焦虑管理）和生活方式调整（如戒烟、营养指导）方面亦具有明确效果。

整理了规范化心脏康复的核心要素，国际指南（如 AHA/ACC、ESC）推荐 CR 应包含以下核心内容：医学评估与风险分层：基于心肺运动实验（CPET）或 6MWD 制定个体化方案；运动康复：结合有氧训练、抗阻训练及柔韧性训练，采用靶心率或 Borg 量表调控强度；药物优化：遵循指南调整抗血小板、降脂及抗心衰药物；多学科协作（MDT）：整合心内科医师、康复师、心理医师及营养师，提供综合管理；长期随访：通过远程监测或社区随访提高患者依从性。

列举了规范化实施的现存挑战，尽管 CR 的临床价值明确，其实施仍面临多重障碍：医疗资源不均衡：基层医疗机构 CR 设备及专业人员匮乏，三级医院与社区衔接不足；患者参与率低：我国 CR 参与率不足 10%，远低于欧美国家（30%~50%），影响因素包括认知不足、经济负担及交通限制；标准化不足：运动处方制定、风险监测及疗效评估缺乏统一标准；医保政策局限：部分 CR 项目未纳入医保报销，影响患者长期坚持。

提出了优化策略与未来方向，为提高 CR 的规范化实施，可采取以下措施：推广“互联网 +CR”模式：利用可穿戴设备、移动医疗 APP 实现远程监测，提高可及性；建立区域化 CR 网络：推动三级医院 - 社区 - 家庭联动，优化转诊流程；政策支持：将 CR 纳入医保支付范围，并制定行业标准；加强患者教育：通过多媒体宣教提高患者对 CR 的认知和依从性。

心脏康复的规范化实施需基于循证医学，结合多学科协作、个体化干预及政策支持。未来研究应聚焦于人工智能辅助 CR 方案制定、老年及心衰等特殊人群的优化策略，以及低成本、高可及性的社区 CR 模式，以推动全球 CR 的均质化发展。

心脏康复的相关研究

袁慧敏 刘华芬

武汉大学人民医院

心脏康复（Cardiac Rehabilitation, CR）是一种综合性、多学科干预措施，旨在通过运动训练、健康教育、心理支持、危险因素管理等手段，改善心脏病患者预后、降低心血管事件风险、提升生活质量。本文综述心脏康复的定义、发展历程、核心内容、临床获益及最新研究趋势。

1. 定义与历史发展

心脏康复起源于 20 世纪 60 年代，基于早期研究发现心肌梗死患者早期活动预后优于长期卧床。1964 年 WHO 成立心血管康复委员会，1969 年正式采用运动处方。美国心脏协会将其定义为涵盖医疗评价、运动干预、危险因素纠正等长期计划，目标为逆转动脉粥样硬化进程，促进患者社会适应。

2. 核心内容与实施模式

标准心脏康复包括：①生活方式干预（戒烟、饮食管理、体重控制）；②心理社会因素管理（焦虑抑郁干预）；③个体化药物治疗与疾病管理（血脂、血压调控）；④运动处方（分阶段有氧与抗阻训练）；⑤职业康复与长期护理。分为院内 I 期、院外 II 期（门诊 / 中心）和居家III期，强调全程管理。

3. 适应症与安全性

适应症涵盖急性冠脉综合征（含 PCI 术后）、慢性心衰、心脏移植 /TAVR 术后等高风险人群。禁忌症包括不稳定心绞痛、严重心律失常等。现有研究显示其安全性高，法国与美国研究指出运动康复中心血管事件发生率极低（约 5 例 /5 万小时）。

4. 临床获益与机制

死亡率与入院率降低：Meta 分析表明 CR 可使心血管死亡率下降（如心肌梗死患者从 10.4% 降至 7.6%），再入院率从 30.7% 降至 26.1%。

心理健康与生活质量改善：运动结合心理干预显著缓解抑郁焦虑，提升患者社会功能。

生理机制：增强心肌收缩力，优化心输出量，改善血管弹性与代谢调节。

5. 最新研究趋势

远程康复：克服地域限制，通过数字化平台提升患者参与率，成为传统 CR 的重要补充。

特定人群优化：聚焦女性、TAVR 术后及老年肌少症患者，定制运动方案（如太极拳、抗阻训练）以增强适用性。

技术融合：中国可降解支架等新技术结合 CR，降低术后血栓风险。

心理与社会支持强化：关注患者依从性，整合家庭与社会资源，改善长期康复效果。

6. 挑战与展望

当前 CR 参与率仍较低（如美国仅 14-31%），需通过政策支持、远程医疗普及、个性化方案优化提升覆盖率。未来方向包括智能化监测、精准化干预及全生命周期管理，以进一步实现心血管疾病的预防与康复一体化。

心脏康复作为循证支持的二级预防核心策略，其综合干预模式对改善患者预后、减轻医疗负担具有重要意义。随着技术革新与多学科协作深化，CR 有望在全球范围内推动心血管疾病管理模式的革新。

高强度间歇训练在慢性心衰伴 2 型糖尿病患者中的应用效果

刘娅

北京清华长庚医院

目的：探讨高强度间歇训练（HIIT）对慢性心力衰竭（CHF）合并 2 型糖尿病（T2DM）患者心功能及血糖控制的影响，为制定个体化心脏康复方案提供循证依据。

方法：采用前瞻性随机对照设计，招募 60 例 NYHA II – III级且 HbA1c ≥ 7.0% 的 CHF+T2DM 患者，按 1:1 随机分入 HIIT 组（n=30）与常规中等强度持续训练（MICT）组（n=30）。两组均接受 12 周、每周 3 次、每次 30 min 的院内监护下运动干预：HIIT 方案为 5 min 热身→ 4×4 min 85–90%HRmax 高强度踏车 / 抗阻循环→ 3 min 60%HRmax 主动恢复→ 5 min 整理；MICT 以 60%HRmax 持续踏车 25 min。干预前后采用心肺运动试验（CPET）测峰值摄氧量（VO_2peak）及无氧阈；超声心动图测左心室射血分数（LVEF）；实验室检测空腹血糖（FPG）与糖化血红蛋白（HbA1c）。

结果：HIIT 组 VO_2peak 由 15.8±2.4 升至 19.7±3.1 $ml \cdot kg^{-1} \cdot min^{-1}$，LVEF 从 35±6% 增至 42±5%，增幅均显著优于 MICT 组（P<0.01）。血糖方面，HIIT 组 FPG 下降 1.8 mmol/L，HbA1c 降低 1.3%，降幅亦优于 MICT 组（P<0.05）。所有患者未发生严重不良事件。

结论：12 周 HIIT 可在安全前提下显著提升 CHF+T2DM 患者的运动耐量、心功能及血糖控制水平，推荐将其纳入该类患者的综合心脏康复管理。

基于 RCA 与 Teach-back 法的多维度干预在心力衰竭患者出院健康教育中的应用

陈亚丽

河北医科大学第二医院

目的：

心力衰竭（HF）患者出院后 3 个月内再住院率高达 30%，自我管理能力不足是核心诱因。本研究拟构建标准化健康教育方案，结合 Teach-back 法的多维度干预，以提高患者健康教育的效果，达到提高患者自我管理能力，降低再住院率的目的

方法：

根因分析（RCA）：成立 6 人跨学科小组，通过 5 层因果链锁定根本问题；

标准化内容构建：通过质性访谈和文献回顾建立健康教育标准化内容初稿，用德尔菲法（17 名专家两轮咨询，Kendall’s W=0.348~0.511，p<0.001）确定 4 大核心模块：疾病认知、药物管理、液体控制、预警症状识别；

教育方法优化：本研究发现，出院健康教育质量缺陷（内容不规范、方法低效）是护理可干预的根本问题。本研究采用 Teach-back 法（“教育 - 评价 - 再教育 - 再评价”循环）以保证健康教育效果，提升患者自我管理能力；

效果验证：类实验设计（实验组：2023 年 6-11 月，n=62；对照组：2022 年历史数据，n=58）。

结果：

知识掌握率：实验组出院 7 日、30 日核心知识得分显著高于对照组（p<0.05），仅 7 日液体管理无差异（p>0.05）；

再住院率：实验组 3 个月再住院率降低 12.1%（p=0.02）；

心血管事件：实验组 1/3 个月事件数减少，但差异未达显著性（p>0.05）。

结论：

RCA 驱动的标准化 Teach-back 教育模式可显著提升 HF 患者自我管理能力，降低再住院率。需扩大样本验证对不良事件的长期影响。

关键词：心力衰竭；根因分析；Teach-back 法；出院教育；再住院率

多学科协作模式下心脏康复在左心室辅助装置植入患者围术期的应用效果

张恒通

西安交通大学医学院第一附属医院

方法：本研究采用前瞻性随机对照设计 (RCT), 严格遵循 CoNSORT 声明规范。纳入 2022 年 8 月至 2024 年 12 月本院收治所有终末期心衰行 LVAD 植入术患者。纳入标准 :1、符合 INTERMACS1-3 级；2、年龄 18-76 岁；签署知情同意书。排除标准 :1、合并不可逆肺动脉高压 (PVR>5Wood 单位)；2、活动性感染；3、严重肾功能不全 (eGFR<30ml/ min/1.73m2)。最终入组 76 例，按计算机随机序列分为干预组 (n=38) 与对照组 (n=38), 两组基线资料无统计学差异 (p>0.05)。对照组接受常规围术期管理，干预组实施 MDT 心脏康复方案，涵盖术前预康复 (营养优 + 呼吸训练)、术中血流动力学精准调控、术后分阶段运动康复 (床上脚踏车→床边坐立→ 5 分钟步行) 及心理 - 营养联合干预。主要观察指标：术后 30 天主要并发症 (右心衰竭、出血、感染)、ICU 停留时间、6 分钟步行距离 (6MWD)、NT-proBNP 水平及明尼苏达心衰生活质量量表 (MLHFQ) 评分。

结果：干预组较对照组显著降低术后并发症发生率 (21.1%vs 42.1%,p=0.032), 缩短 ICU 停留时间 (6.2±1.8 天 vs8.9±2.4 天，p<0.01)。术后 30 天，干预组术后 30 天 6 分钟步行距离 (6MWD) 提升至 342.6±45.3 米 (较术前基线增加 98.3±24.1 米)，对照组提升至 296.4±52.7 米 (较术前基线增加 52.7±30.5 米)，组间差异具有统计学意义 (t=6.82,p=0.003,95%CI32.1-58.9 米)。

结论：围术期 MDT 心脏康复模式可有效提升 LVAD 患者心肺功能储备，降低手术并发症风险，加速术后恢复 . 进程，并为长期机械循环支持管理提供新策略。

基于时限性自我调节理论构建的个体化运动方案在心脏康复患者中的应用

马梦琪 丰小星 张光玮 任辉

吉林大学第一医院

摘要：目的：基于时限性自我调节理论构建个体化运动方案，通过调节患者的行为意图、增强行为优势和提高自我调节能力，以优化心脏康复的效果。

方法：随机选取 2023 年 8 月 -2024 年 8 月心血管内科进行心脏康复的 326 名患者为数据样本，随机分为对照组和干预组各 163 例。对照组病人接受常规心脏康复，干预组病人首先通过初步运动风险筛查进行风险分层，运动前结合心肺运动试验结果评价体能状态，结果阴性的人群，从中低强度开始加量，并定期进行心肺运动试验评估，指导适宜的运动量及频率。

结果：干预组患者在住院时间、科室满意度、生活质量评分提升幅度、自我效能量表评分增幅、坚持运动方案的时间、运动康复完成度均优于对照组（P<0.05）。

结论：基于时限性自我调节理论为心血管内科住院患者构建个体化运动方案可明显优化心脏康复效果。提升心肺康复参与度，契合临床重要需求；提高运动康复适应性，满足患者个性需求，优化康复过程，有效缩短患者的康复周期和住院时间，降低了医疗资源的占用率，从而提升了整体经济效益。最后，基于 TST 的个体化运动方案还能通过提高患者的健康管理能力，减少对公共卫生资源的依赖，减轻社会医疗负担，提升整体公共卫生系统的效率和服务水平，提升患者生活质量，为构建和谐健康的社会环境发挥重要作用。

心脏康复训练对冠心病病人康复效果的 Meta 分析

刘香琼

重庆荣昌区人民医院

摘要: [目的] 通过 Meta 分析评价心脏康复训练对冠心病病人的康复效果。[方法] 计算机检索 The cochrane Library、0VID−EM−

base、PubMed、EBSC() 一 Medline、中国生物医学文献服务系统 (cBM)、中国期刊全文数据库 (CNKI)，以及万方数据库、维普数据库

中关于冠心病病人心脏康复训练效果的随机对照试验。经筛选文献，提取资料与评价文献质量后，采用 RevMan 5．3 软件进行 Me−

ta 分析。[结果] 最终纳入 14 项随机对照试验，2 427 例病人。Meta 分析结果显示，心脏康复训练不仅能有效提高冠心痛病人代谢

当量 [MD 一 1．36，95％ C，(o．83，1．89)，P<o．01]，改善病人高密度脂蛋白的水平 [MD=o．05，95％ C，(o．02，o．07)，P<o．01]，降低

心血管事件的发生率 [RR−o．74，95％ Cj(o．63。o．86)，P<o．01 I，缩短病人住院时间 [MD 一一 5．13，95％ cJ(一 6．92，一 3．35)，P<

o．01]，还能提高 6 min 步行距离、射血分数及生活自理能力，但在改善血压、总胆固醇、低密度脂蛋白、戒烟依从性方面未显示明显

优势 (P>o．05)。[结论] 心脏康复训练能有效改善病人的心功能指标和生活自理能力，降低病人心血管事件发生率，但在改善病人心脏风险指标扣心理疾病状况方面还需要开展大样本、多中心、长时间的深入研究。

关键词：冠心病；心脏康复训练；Meta 分析；生活自理能力；血压；总胆固醇；低密度脂蛋白；心功能；心血管事件

心脏康复训练联合预见性护理对心绞痛患者经皮冠状动脉介入术的影响

杨沙沙

重庆荣昌区人民医院

【摘要】目的：探究心脏康复训练联合预见性护理对心绞痛患者经皮冠状动脉介入术的影响及医疗价值。**方法：**于 2023 年 1 月开始实验，至 2024 年 12 月结束，取该期间收治心绞痛行经皮冠状动脉介入术治疗患者作为观察对象，借助电脑随机分配形式将所有患者分成两组，一组行常规护理（对照组 n=40），另一组实施心脏康复训练联合预见性护理（观察组 n=40），归纳两组患者相关数据指标，观察结果变化。**结果：**结果显示，观察组患者 LVEF、6 min 步行距离均优于对照组，胸痛缓解时间、住院时间均短于对照组，并发症发生率少于对照组，P 值均 < 0.05。**结论：**心绞痛行经皮冠状动脉介入术治疗患者实施心脏康复训练联合预见性护理可明显改善心功能恢复效果，降低并发症发生风险，提高临床疗效，值得采纳。

【关键词】心脏康复训练；预见性护理；心绞痛；经皮冠状动脉介入术

心绞痛是临床常见心血管疾病类型，指冠状动脉粥样硬化、痉挛、管腔狭窄，诱发心肌血氧供应不足，症状表现以阵发性胸痛或胸部持续不适症状，具有较高心肌梗死、猝死等重症风险，严重威胁生命安全 [1] 。经皮冠状动脉介入 (PCI) 治疗是现代医疗发展所研发的新型微创技术，具有创伤较小，术后恢复周期短，并发症少等优势。治疗期间受患者个体差异、术中穿刺等因素影响，常规的护理难以规避潜在风险，下文将针对心脏康复训练联合预见性护理对心绞痛患者经皮冠状动脉介入术的影响开展讨论，结果如下。

基于人文护理的心脏康复模式构建及应用效果研究

许艳萍

西安交大第一附属医院

[目的] 聚焦心脏康复领域，响应《进一步改善护理服务行动计划（2023-2025 年）》要求，通过创新护理模式，将人文护理理念深度融入心脏康复全过程，提升患者心脏康复管理能力、优化康复体验，同时增强公众对心脏康复的认知，推动心血管专科护理服务高质量发展。**[方法]** 以心内科为实践阵地，2023 年 1 月至 2024 年 12 月期间构建 “多途径护心科普，全方位健康护航” 护理模式，具体举措包括：系统化医患沟通培训，强化心脏康复过程中的医患协作；搭建个性化院外随访体系，针对患者康复阶段提供精准指导；构建多维度健康教育网络，普及心脏康复知识; 拓展多元化延伸护理服务，覆盖康复全周期; 优化人文病房环境，提升康复舒适度。**[结果]** 患者心血管健康知识（含心脏康复相关内容）知晓率从 62.3% 提升至 91.5%，公众急救技能（与心脏急症相关）掌握率由 28.7% 提高到 76.4%；患者护理满意度从 85.6% 跃升至 96.8%，PCI 术后并发症发生率降低 12.3%，再入院率下降 15.8%；累计开展心脏康复主题科普活动 180 余场，覆盖超 1.2 万人次，与 12 家单位建立长期合作，提升科室在心脏康复领域的区域影响力。**[结论]** 多途径护心科普与人文护理深度融合的模式，能有效提升患者心脏康复管理能力，改善临床康复结局（如降低并发症和再入院率），优化康复期就医体验，同时增强公众对心脏康复的认知。该模式为心血管专科在心脏康复领域践行人文护理理念、推动护理服务高质量发展提供了可复制的实践范式与理论参考。

Evidence-based construction of an early exercise rehabilitation program for kinesiophobic patients after coronary stent implantation

Xia Song

Zigong First People’s Hospital

Introduction: Exercise phobia is prevalent in patients with heart disease, and this mentality can seriously affect the rehabilitation process. Patients’ fear of exercise training mainly stems from the fear of causing damage to the cardiac organs again and decreasing physical function, which not only affects the rehabilitation, but also may bring new disease problems, so they are resistant to exercise. Domestic research on exercise phobia in patients after coronary stent implantation is more in-depth, but mainly focuses on the validation of the psychological scale of exercise phobia and the investigation and study of exercise phobia in patients with acute cardiovascular diseases. However, research on kinesiophobia in patients with PCI, especially after coronary stent implantation, is still insufficient. The general lack of awareness, low participation and compliance, and high cost of rehabilitation among Chinese cardiac patients pose a challenge to the initial development of cardiac rehabilitation in China, and there is an urgent need to develop programs adapted to the current national situation that can help to increase the participation and compliance rate of exercise rehabilitation in patients after coronary stent implantation. Therefore, this study constructs an early exercise rehabilitation program for kinesiophobic patients after coronary stent implantation on the basis of evidence to provide a basis for the implementation of rehabilitation strategies for kinesiophobic patients.

Methods: Literature related to exercise rehabilitation for patients with postoperative kinesiophobia in cardiovascular disease was searched from China Knowledge, Wanfang Database, Wipro, SinoMed, PubMed, Web of Science, The Cochrane Library, and Embase databases, and the timeframe for searching was from the establishment of the database to December 31, 2024 for all of them. The literature screening process was

strictly in accordance with the inclusion and exclusion criteria, and was completed independently by 2 authors; if there was a disagreement between the 2 authors on the study selection, the 3rd author discussed and reached a consensus together. Literature screening method: first, the software Endnote was used to remove duplicates, and then the remaining literature was evaluated according to its title and abstract. Second, the full text of the remaining literature was reviewed according to the inclusion and exclusion criteria and a list of all eligible literature was examined to identify any potentially relevant studies and finally finalized for final inclusion. The literature was independently screened and data extracted by two researchers and discussed by the subject group to develop a first draft of an early exercise rehabilitation program for patients with kinesiophobia after coronary stent implantation based on acceptance commitment therapy, guided by relational framing theory and the fear-avoidance model; two rounds of correspondence with 15 experts were conducted using the Delphi method to develop the final program. **Results:** Based on evidence-based, the first draft of the early exercise rehabilitation program for patients with kinesiophobia after coronary stent implantation was formed. The effective recovery rate of the two rounds of expert correspondence questionnaires was 100.0%, the expert authority coefficients were 0.875 and 0.935, the Kendall's concordance coefficients were 0.213 and 0.318 (both P<0.001), and the coefficients of variation were 0 to 0.17 and 0 to 0.14, respectively.The final constructed program included 9 phases (pre-exercise assessment, exercise mode selection, exercise cycle, exercise duration, exercise intensity, exercise termination indication, observation and recording during exercise, and safety and security measures) and 27 specific measures. **Discussion:** An early exercise rehabilitation program for kinesiophobic patients after coronary stent implantation based on acceptance commitment therapy is scientific, reliable, and comprehensive, and can provide a reference for early clinical kinesiophobic intervention.

Construction and application of a plyometric training intervention program for elderly cardiovascular co-morbid patients based on the Fogg behavioral model

Xia Song

Zigong First People's Hospital

Introduction: To validate the application effect of the plyometric training intervention program constructed based on Fogg's behavioral model for elderly patients with cardiovascular co-morbidities, and to provide reference for improving the muscle strength and quality of life of elderly patients with cardiovascular co-morbidities. **Methods:** Based on evidence-based, searching and reading related literature and inductive analysis, the group discussion, based on Fogg behavioral model preliminary construction of elderly cardiovascular co-morbidities patients plyometric training intervention program preliminary draft, exercise intervention process includes three phases, exercise awareness cultivation stage, scientific fitness guidance stage, exercise habit formation stage. The preliminary draft was subjected to two rounds of expert correspondence using the Delphi method, and the preliminary draft was revised and improved according to the opinions of 17 experts to finalize the plyometric training intervention program for elderly patients with cardiovascular co-morbidities. Subsequently, eight elderly patients with cardiovascular co-morbidities were selected for pre-testing, and the test data were collected and analyzed to summarize the problems and deficiencies, and then the intervention program was revised. A convenience sampling method was adopted to select 94 elderly cardiovascular co-morbid patients attending the Department of Cardiovascular Medicine of a tertiary general hospital in Sichuan Province from September 2024 to December 2024 as the study subjects, and they were divided into the control group (n=47) and the intervention group (n=47) according to the randomized number table method. The control group received routine care and daily exercise instruction, and the intervention group received a 3-month Fogg behavioral model-based plyometric training intervention program for elderly patients with cardiovascular co-morbidities based on the implementation of routine care, and the cardiac function level, functional fitness level, quality of life scores, muscle mass, muscle strength, step speed, and the patient's quality of life scales were collected from the patients in both groups before the intervention and at the 3-month period after the intervention. To evaluate the effects of the Fogg Behavioral Model-based plyometric training intervention program for elderly patients with cardiovascular co-morbidities on patients' cardiac function level, functional fitness level, muscle mass, muscle strength, step speed and quality of life. **Results:** At the end of the intervention, 1 patient in the intervention group and 2 patients in the control group withdrew, for a total of 91 patients with cardiovascular co-morbidities who completed the study (n=46 in the intervention group and n=45 in the control group). There was no statistically significant difference between the baseline data of the two groups (P>0.05). The change over time in cardiac function level, functional fitness level, muscle mass, muscle strength, step speed and quality of life scores in the intervention group were better than those in the control group at 3 months of intervention (P<0.05). **Discussion:** Implementation of a Fogg Behavioral Model-based plyometric training intervention program for elderly patients with cardiovascular co-morbidities can significantly improve patients' level of cardiac function as well as physical fitness, and enhance whole-body muscle mass as well as quality of life. However, this study is a single-center, small-sample study, and further multi-center, large-sample studies should still be conducted in the future to improve the generalizability of the study.

Research on the development and application of cardiac rehabilitation training games for patients with chronic heart failure

Kun-Yan Peng

Zigong First People's Hospital

Introduction: Chronic heart failure is the end-stage manifestation of cardiovascular disease, which refers to the pathological state in which the pumping function of the heart gradually decreases under the influence of pre-existing cardiac diseases, and the cardiac output is insufficient to cover the demand of the body or depends on the increase of filling pressure to compensate for it, and the main clinical symptoms are fluid retention, dyspnea, and fatigue, etc. Clinical treatment of this disease is often based on drug therapy to quickly relieve clinical symptoms and improve the prognosis. Clinical treatment of this disease is mostly based on drug therapy to rapidly relieve clinical symptoms and improve prognosis, but long-term drug therapy can cause many adverse reactions and the efficacy varies from person to person, so drug therapy has limitations and other effective treatment modalities need to be explored. Along with the continuous improvement of the medical model, the concept of cardiac rehabilitation has been popularized in the clinic, and at present, cardiac rehabilitation is centered on exercise rehabilitation, including game training and so on. Therefore, this study develops and applies the cardiac rehabilitation training game with the physical and mental characteristics of chronic heart failure patients, in order to explore more effective cardiac rehabilitation training methods. **Methods:** Based on the theory of health belief model, semi-structured interview method, brainstorming, and expert consultation were used to design the game content, and the game was realized by using WeChat applet. Ninety-eight cases of CHF patients admitted to a tertiary general hospital in Zigong City from August 2024 to February 2025 were selected as study subjects. The patients were divided into an intervention group (conventional cardiac rehabilitation training combined with cardiac rehabilitation training game, 49 cases) and a control group (receiving conventional cardiac rehabilitation training, 49 cases) by using a coin toss, and the two groups of patients were intervened for 4 weeks. The cardiac function indexes: left ventricular ejection fraction (LVEF), cardiac index (CI), left ventricular end-diastolic internal diameter (LVEDD), N-terminal brain natriuretic peptide precursor (NT-proBNP), and the exercise function indexes: 6-min walking distance (6MWD), the longest time of exercise (Tmax), and the score of General Self-Efficacy Scale (GSES) were compared between patients in both groups before and after the intervention. Minnesota Heart Failure Quality of Life Questionnaire (MLHFQ) score. **Results:** No samples were shed. After the intervention, LVEF and CI of the two groups were higher than before the intervention in this group, and LVEDD and NT-proBNP were lower than before the intervention in this group, and LVEF and CI of the intervention group were higher than that of the control group, and LVEDD and serum H-FABP and NT-proBNP were lower than that of the control group (P < 0.05). After intervention, 6MWD and Tmax of patients in both groups were longer than before our intervention, and the intervention group was longer than the control group (P < 0.05). After intervention, the GSES score of the two groups of patients was higher than before the intervention of this group, and the MLHFQ score was lower than before the intervention of this group, and the GSES score of the intervention group was higher than that of the control group, and the MLHFQ score was lower than that of the control group (P < 0.05). **Discussion:** Compared with conventional cardiac rehabilitation training, the cardiac rehabilitation training game can better improve cardiac function, exercise function, self-efficacy and quality of life of CHF patients. The game enriches the training methods of cardiac rehabilitation to a certain extent and can be applied to clinical practice. However, this study is a single-center, small-sample study, and further multi-center, large-sample studies should still be conducted in the future to improve the generalizability of the study.

A study on the construction and application of a management program for muscle-reducing obesity in patients with cardiovascular disease

Kun-Yan Peng

Zigong First People's Hospital

Introduction: The challenge of managing sarcopenic obesity in elderly patients is becoming increasingly severe. Studies have shown that cardiovascular disease is an important correlate of sarcopenic obesity, and sarcopenia can cause vascular age-related changes in patients with cardiovascular disease. Previous studies have found that patients with sarcopenic obesity have a higher incidence of cardiovascular and metabolic diseases, and sarcopenic obesity and cardiovascular diseases can independently or synergistically adversely affect the body of the elderly population. Therefore, this study was conducted to form an evidence-based program for the management of muscle-reducing obesity in patients with cardiovascular disease and to evaluate the effectiveness of its clinical application. **Methods:** Based on the evidence-based approach, through the systematic search of domestic and international databases

on the literature related to the management program of muscle-reducing obesity in patients with cardiovascular disease, the search time limit is from the establishment of the database to June 30, 2024, extracting the key intervention information and after the discussion of the subject group, the initial formation of the management program of muscle-reducing obesity in patients with cardiovascular disease was made based on the theoretical foundation of the i-PARIHS framework; the Delphi method was used for 11 experts in two rounds of correspondence to form the final program. Based on the convenience sampling method, 70 patients who attended a tertiary-level general hospital in Sichuan Province from July 2024 to January 2025 and met the inclusion and exclusion criteria were selected as the study subjects, and were divided into the control group (n=35) and the intervention group (n=35) according to the randomized numeric table method. The intervention group was divided into two groups: the control group (n=35) and the intervention group (n=35). The intervention group was divided into two groups: the control group (n=35) and the intervention group (n=35). The intervention group was divided into two groups: the intervention group and the intervention group. In both groups, patients' obesity-related indexes (body fat percentage, visceral fat area), sarcopenia-related indexes (total muscle mass, calf circumference, upper arm circumference, grip strength, and skeletal muscle mass index), laboratory-related indexes (serum albumin, hemoglobin, and C-reactive protein), and quality-of-life scale scores were collected for between-group and within-group comparisons to evaluate the effectiveness of the interventions before the intervention, and after 6 and 12 weeks of the intervention. **Results:** At the end of the intervention, one patient in the intervention group withdrew, and a total of 69 patients with cardiovascular disease with muscle-reducing obesity completed the study. There was no statistically significant difference between the baseline data of the two groups (P>0.05). Muscle mass, muscle strength and quality of life scores over time in the intervention group were better than those in the control group at 6 weeks of intervention (P<0.05). Visceral fat area was significantly lower than that of the control group at 6 and 12 weeks of intervention, and the difference was statistically significant (P<0.001). Comparison of hemoglobin and serum albumin between the two groups showed no statistically significant difference (P>0.05). **Discussion:** Implementation of an evidence-based exercise program for patients with reduced muscle mass and obesity in coronary artery disease was effective in improving muscle mass, muscle strength, and quality of life, and could reduce visceral fat area and debilitating levels, but was not effective in improving hemoglobin and serum albumin.

系统规范化心脏康复护理在慢性心力衰竭患者中的应用

王乔

重庆荣昌区人民医院

【摘要】目的：分析讨论系统规范化心脏康复护理在慢性心力衰竭患者中的应用价值。**方法：**选择于 2023 年 1 月开始，至 2024 年 12 月结束，取该期间收治慢性心力衰竭患者 80 例作为观察样本，利用电脑随机分配形式将所有患者均分两组，即观察组（系统规范化心脏康复护理）、对照组（常规护理），归纳不同干预结局，观察结果变化。**结果：**观察组心功能、步行 6min 距离均优于对照组，负性情绪评分低于对照组，P 值均＜ 0.05。**结论：**慢性心力衰竭患者采纳系统规范化心脏康复护理能够辅助提高心功能及运动耐力，降低负性情绪影响因素，值得采纳。

【关键词】系统规范化心脏康复护理；慢性心力衰竭；心功能

慢性心力衰竭（CHF）是临床中较为常见疾病类型，是由于心室长期受过重负荷或原发性心肌病所造成的心室充盈或泵血功能异常现象，患者多伴有呼吸困难、乏力等症状表现，且治疗周期较长[1]。随着生活质量的改变，老年人口趋势的增加，CHF 的发病率呈现增长趋势，极大影响身心健康。相关调查显示，CHF 患者在接受有效治疗的同时，配合科学对症护理干预措施能够对心脏功能恢复产生积极影响。

心肺康复专科护士临床实践基地培训体系的构建与实施

肖清霞 刘华芬

武汉大学人民医院

摘要： 目的 以某三甲医院作为中国康复医学会心肺康复专科护士临床实践基地的建设经验为基础，构建并实施科学化、规范化、可持续的心肺康复专科护士临床实践培训体系，为同类基地建设提供参考。方法 1. 基地建设上，基于“心肺康复专科护士临床实践基地医院评审标准”不断完善医院心肺康复病房系统、过程、结局指标，不断优化医院心肺康复护理流程；2. 教学管理体系上，建立“护理部统筹规划 - 学科带头人制定方向 - 基地负责人组织落实 - 教学老师全程带教”的四级教学管理架构，实施全过程质量控制；3. 师资管理上，采用“选拔 - 培养 - 考核 - 激励”模式培养心肺康复专科护士，通过“资质审核 - 试讲评分 - 动态评估”遴选师资，实行竞争上岗与末位淘汰机制遴选带教老师，提高准入标准。组织岗前师资培训，定期集中培训等方式确保教学老师水平； 4. 课程设置上，根据往届学员访谈，学员开班前培训需求访谈调研，每周开展教学反馈会议，动态调整教学内容，不断优化学员实践轮转计划、教学课程，兼顾个体化与系统性需求。实施“整体授课 + 一对一带教模式”以及清单式教学，提高教学水平；5. 考核体系：设置心肺康复相关理论考核、心肺康复实用技能考核、疑难案例分析及结业综合考核。培养理扎实，技术过硬，能学以致用的专科护士。 结果 2021-2025 年 32 名心肺康复专科护士学员于本院完成临床实践。结业考核一次性通过率 100%，2024 年学员对师资水平、课程设置、实践支持的满意度分别达 90.5%、97.1%、92.3%，总体满意度 93%，满意度呈逐年提升；82% 学员返岗后开展心肺康复相关工作，10 人当年发表相关论专利、壁报等。结论 以四级管理架构为支撑，通过师资竞争机制、分层课程设计、动态质量改进及多维考核体系，可有效提升专科护士临床实践培训质量及满意度，可为同类基地建设提供参考依据。

心血管病康复护理实践与思考

解菲菲

中国人民解放军联勤保障部队第九二〇医院

摘要：心血管疾病是全球范围内的主要健康问题之一，给患者的生活质量和生存率带来了巨大的影响。随着医疗技术的不断进步，心血管病的治疗效果得到了显著提高，但康复护理在患者的全面康复中同样起着至关重要的作用。心血管病的康复护理是一个复杂而又重要的领域，它不仅涉及到患者的身体康复，还包括心理和社会方面的支持。在当今社会，心血管病的发病率不断上升，给患者和家庭带来了沉重的负担。因此，加强心血管病康复护理的研究和实践，提高患者的康复效果和生活质量，具有重要的现实意义。心血管病康复护理是针对心血管疾病患者的一种综合性护理模式，旨在帮助患者恢复身体健康、提高生活质量。它涵盖了多个方面，包括康复护理评估、计划制定、措施实施和效果评估等。康复护理评估是了解患者病情和需求的重要环节，通过对患者的基本信息、心血管病病情和康复护理需求进行评估，为后续的护理计划制定提供依据。康复护理计划制定则根据评估结果，设定康复护理目标，制定相应的康复护理措施，并确保计划的实施。康复护理措施实施包括运动康复护理、饮食康复护理、心理康复护理和健康教育等方面。运动康复护理可以帮助患者增强心肺功能，提高身体耐力；饮食康复护理有助于控制体重、血脂和血压等；心理康复护理则关注患者的心理状态，提供必要的心理支持；健康教育可以提高患者对疾病的认识和自我管理能力。康复护理效果评估通过设定评估指标和方法，对康复护理的效果进行评估和反馈，以便及时调整护理计划。心血管病康复护理是一个系统的过程，需要综合考虑患者的身体、心理和社会需求，为患者提供全面、个性化的护理服务。

康复护理在心脏瓣膜病患者围术期应用效果的研究

陈晨 李娟利

西安交通大学第一附属医院

目的：基于心脏瓣膜病患者围术期肺康复的最佳证据，构建适合心脏瓣膜病特点的分级、全程、综合的围术期肺康复护理方案。并验证该方案对心脏瓣膜病患者的效果。方法：1. 运用复旦大学循证护理中心提出的 PIPOST 循证问题开发工具，按照“证据资源 6S 模型”检索肺康复领域的最新专家共识、临床实践、指南等文献资源，依据证据类型的不同选择对应的质量评价标准，最终纳入文献 13 篇。对 13 篇文献进行证据提取，结合小组讨论，总结心脏瓣膜病患者围术期肺康复护理最佳证据。2. 采用德尔菲专家函询法，对心脏瓣膜病患者围术期肺康复护理最佳证据总结进行完善、修正，形成心脏瓣膜病患者围术期肺康复护理方案。3. 开展临床实证研究，将该方案应用于临床患者，验证该方案对患者的心肺功能、临床结局、生活质量的影响。结果：本研究基于循证，总结肺康复护理最佳证据。并经过 2 轮专家函询，完善证据内容，形成肺康复护理方案。选取 68 例心脏瓣膜病手术患者进行临床研究。1. 运用复旦大学提出的 PIPOST 工具结构化临床问题，遵循“证据资源 6S 模型”自上而下检索肺康复领域的最新专家共识、临床实践指南等文献资源，根据文献纳排标准，筛选文献，最终纳入文献 13 篇，其中临床决策 3 篇，指南 1 篇，证据总结 3 篇，随机对照试验 3 篇，类实验研究 2 篇，专家共识 1 篇。依据证据类型的不同选择合适的质量评价工具，证据提取后分类汇总，形成 11 个证据大类 ,24 条证据，并以此构建心脏瓣膜病患者围术期肺康复护理方案。2.2 轮专家函询问卷回收率为 100% 和 93.1%, 专家权威系数分别为 0.902、0.908, 条目的 Kendall's W 值分别为 0.181、0.127, 经卡方检验 ,p<0.05。共删除 11 个条目，修改 10 个条目，新增 3 个条目，形成包含 59 个条目的心脏瓣膜病患者肺康复护理方案。3. 选取西安某三甲医院心脏外科 2022 年 3 月 ~ 2023 年 3 月符合条件的 34 例患者为对照组，实施常规护理，选取 2023 年 5 月 ~ 2024 年 12 月符合条件的 34 例患者为试验组，实施常规护理加肺康复护理方案。两组患者的年龄、性别、婚姻状况、文化程度、BMI 指数、饮酒史、吸烟史、既往史史等一般资料比较，差异无统计学意义 (p>0.05)。干预后两组患者肺功能、心功能、生活质量均高于对照组，而临床结局的影响差异无统计学意义。结论：1. 通过心脏瓣膜病患者围术期肺康复护理的最佳证据总结，为心脏瓣膜病患者围术期肺康复护理方案的构建提供了高质量证据支持。2. 运用德尔菲专家函询法构建的肺康复护理方案严谨、可靠，为临床实施肺康复护理方案提供保障。3. 心脏瓣膜病患者围术期肺康复护理方案，能改善患者心肺功能，增强呼吸肌力量，进而提高生活质量。

基于说服系统模型的慢性心衰患者居家运动康复平台设计与应用

卢静 [1] 游展鸿 [2] 于甜栖 [3] 王洁 [1] 高敏 [1] 王琴 [1] 孙国珍 [1]

1. 南京医科大学第一附属医院

2. 南京医科大学护理学院

3. 南京医科大学康达学院

目的 结合慢性心衰患者的实际需求，设计并开发居家运动康复平台，验证其应用效果。

方法 基于说服系统模型，采用文献研究、头脑风暴等方法依据前期所构建的干预方案设计微信小程序的功能模块及内容。便利选取南京市某三级甲等医院 2024 年 3 月 -7 月 90 例符合纳排标准的慢性心衰患者作为研究对象。采用区组随机法分为对照组与试验组。试验组患者通过平台接受移动健康远程干预，对照组患者则接受常规的运动康复指导。比较两组患者在干预前、出院 1 个月、出院 3 个

月和随访 6 个月的运动参与分期、运动依从性得分、抑郁焦虑得分、自我损耗得分、生活质量得分的差异。

结果 共纳入 14 篇文献，对 PSD 原则遴选方式、使用频次、组合模式进行分析，最终提取出 11 条 PSD 原则用于指导交互特征设计，构建了包含四大模块（首页、运动康复、运动社区和个人中心）的“iHeart 心希望”平台。干预期间，共有 10 例患者失访，两组患者基线资料均衡可比（$P > 0.05$）。试验组患者在出院后 1、3、6 个月的运动参与、运动依从性均高于对照组，差异具有统计学意义（$P < 0.001$），试验组患者在出院后 3、6 个月的焦虑、抑郁和自我损耗程度均低于对照组，生活质量高于对照组，差异具有统计学意义（$P < 0.001$）。

结论 基于说服系统所构建的移动健康远程康复平台，结合以认知、情绪、行为改变和动机提升的理论方案指导，实施居家远程运动康复能有效降低负性情绪和自我损耗，改善慢性心衰患者的运动依从性和生活质量。

心脏急重症有关的研究

心源性休克患者在心内监护室的护理要点与方法

邓晓雯

新疆维吾尔族自治区人民医院

目的：探讨心源性休克患者在心内监护室的护理要点与方法。通过对比两组不同护理方法的效果，为临床提供有效的护理策略。

方法：选取 2023 年 1 月至 2024 年 6 月期间收治的 40 例心源性休克患者，随机分为对照组和实验组，各 20 例。对照组采用常规护理方法，实验组则展开针对性护理干预。

结果：实验组患者在病情稳定、住院时间、并发症发生率等方面表现优于对照组，护理满意度较高，出院后的生理恢复情况更理想。

结论：针对性护理干预在心源性休克患者的心内监护中效果显著，能有效提升患者的治疗效果和护理质量，值得推广应用。

心源性休克是指由心脏病变引发的全身性循环衰竭，常伴随低血压、组织缺血及多脏器功能障碍。心内监护室的护理工作对于保障心源性休克患者的生命安全和提升治疗效果起到了重要作用。现代护理强调个体化、综合性护理方法的应用，针对心源性休克患者的病理特点，制定科学的护理方案，可以有效降低并发症，促进患者的早期康复。本研究的目的在于探讨心内监护室中不同护理方法对心源性休克患者的护理效果，评估其对患者生命体征、并发症、住院时间、护理满意度等方面的影响，探索最适宜心源性休克患者的护理路径，为护理人员提供理论支持和实践指导。

心脏骤停患者亚低温护理对神经功能恢复的影响

邓晓雯

新疆维吾尔族自治区人民医院

目的：探索在心脏骤停患者复苏后引入亚低温护理对神经系统功能恢复的实际价值，并评估其在血清神经元特异性烯醇化酶（NSE）变化及预后评定中的作用。

方法：纳入 2022 年 12 月至 2023 年 12 月住院的 40 例心脏骤停复苏成功患者。依据随机分组原则，分为对照组（标准治疗）与实验组（亚低温干预），各 20 例。对照组实施常规生命支持及神经监测，实验组在此基础上增加目标温度控制措施，维持体温在 32–35° C，持续时间为 24 小时。

结果：在 72 小时内，实验组 CPC-1 级的比例高于对照组，提示意识恢复质量差异明显。血清 NSE 浓度在 24 小时和 72 小时时均低于对照组，表明神经元损伤程度下降。90 天随访中，实验组在神经功能评分与生活自理能力方面表现更优。良好预后率及功能性恢复分值均有统计学差异。由此可见，亚低温处理不仅影响短期生化指标，更延伸至远期神经系统重建过程。

结论：亚低温治疗可在心脏骤停后有效减轻脑组织损害，优化神经功能恢复过程。在维持生命体征稳定基础上，温控管理策略具备实际的临床意义。其神经保护作用并非仅局限于急性期，亦可为后期认知恢复提供支持，提示该干预应作为复苏后管理的重要组成部分。未来应结合患者个体差异，探索温度控制的精准实施时机与持续周期，以提高神经功能恢复的可预测性。

关键词：心脏骤停；亚低温护理；神经功能恢复

血管外肺水指数与中心静脉压预测心源性休克患者容量状态的比较研究

游洁芸

上海市东方医院（同济大学附属东方医院）

目的：血管外肺水指数（EVLWI）是评估肺水肿严重程度的可靠指标。本研究旨在比较 EVLWI 与中心静脉压（CVP）预测心源性休克患者全心舒张末期容积指数（GEDVI）这一关键心脏前负荷参数的有效性。

方法：本研究为前瞻性队列研究，纳入 200 例诊断为心源性休克的患者。通过脉搏指示连续心输出量（PiCCO）系统同时测量 EVLWI 和 CVP。采用 Spearman 相关性分析评估 EVLWI（或 CVP）与 GEDVI 之间的关系。进行受试者工作特征（ROC）曲线评估 EVLWI 和 CVP 对 GEDVI 升高的预测价值。

结果：最终分析纳入了 166 例心源性休克患者共 971 组数据集。EVLWI 与 GEDVI 呈显著正相关（r = 0.47，p <0.01），而 CVP 与 GEDVI 无明显相关性（r = 0.03，p = 0.38）。预测 GEDVI> 800mL/m^2 的最佳 EVLWI 临界值为 10.35mL/kg，曲线下面积（AUC）为 0.76（95% CI：0.73 - 0.79，p < 0.01）。相比之下，CVP 的预测性能较差（AUC = 0.53，95% CI：0.49 - 0.57，p = 0.14）。EVLWI 的诊断准确性高于 CVP（53.35% 对 47.27%；差异：6.08% [p < 0.01]）。与 CVP 相比，EVLWI 在预测 GEDVI 升高方面具有更高的敏感性（94.22% 对 67.17%；差异：27.05%，p < 0.01）。在预测 GEDVI > 800 mL/m^2 时，EVLWI 和 CVP 的特异性均相对较低（32.40% 对 37.07%；差异：4.67%，p > 0.05）。EVLWI 的阳性预测值、阴性预测值、阳性似然比和阴性似然比分别为 41.67%、91.63%、1.39 和 0.18。此外，基线 EVLWI 预测 30 天全因死亡率的 AUC 为 0.78（95% CI：0.74 - 0.83，p < 0.01），而基线 CVP 无该方面的预测价值（AUC = 0.52，95% 置信区间：0.45 - 0.59，p = 0.56）。

结论：在预测心源性休克患者的 GEDVI 升高和短期死亡率方面，EVLWI 优于 CVP。这些研究结果支持在这一高危人群中，使用 EVLWI 而非 CVP 作为容量管理的优选参数。

GLP-1R Activation Alleviated Sepsis-Induced Cardiac Dysfunction by Modulating Macrophage Polarization via the STING/ P65 Pathway

Yusha Zhang, Jia-Bao Zhou, Ya-Qin Chen

The Second Xiangy Hospital of Central South University

Background:

Sepsis, which triggered by dysregulated host immune responses, is a leading cause of mortality in critically ill patients. Sepsis-induced cardiomyopathy (SIC) is a frequent and life-threatening complication of sepsis. However, its pathogenesis remains incompletely understood, and specific therapeutic strategies are currently lacking, highlighting the urgent need to identify novel intervention targets. Emerging evidence highlights two pivotal mechanisms underlying SIC pathogenesis: pyroptosis and macrophage polarization. On one hand, myocardial pyroptosis directly contributes to the deterioration of cardiac function. On the other hand, dynamic macrophage phenotypic switching modulates inflammatory microenvironments and influences cardiomyocyte function through paracrine signaling, positioning macrophage polarization as a critical therapeutic target for SIC management. Glucagon-like peptide-1 receptor agonists (GLP-1RAs), as multifunctional therapeutic agents, exhibit dual therapeutic effects by attenuating systemic inflammation during sepsis and promoting macrophage M2 polarization, although their exact molecular mechanisms remain incompletely understood. Notably, the stimulator of interferon genes (STING), a key immunoregulatory molecule, has been implicated in macrophage polarization. Nevertheless, whether GLP-1R activation modulates macrophage phenotypic switching via the STING pathway remains unexplored. This study focused on investigating the regulatory roles of GLP-1R activation on macrophage polarization and its cardioprotective role in SIC, with a focus on elucidating the molecular mechanisms of the GLP-1R-STING signaling axis.

Objectives:

1. To explore the therapeutic potential of GLP-1R activation in SIC. 2. To clarify the role and molecular mechanisms of STING in GLP-1R-mediated macrophage polarization. 3. To determine the impact of GLP-1R-regulated macrophage polarization on cardiomyocyte pyroptosis.

Methods:

In vivo experiments: This study employed liraglutide (Lira), a representative GLP-1RA drug, to investigate the protective effects of GLP-1R activation on SIC. Wild-type C57BL/6 mice were pretreated with Lira (100 ng/kg, intraperitoneal injection every 12 h for 3 days) and subjected to lipopolysaccharide (LPS, 10 mg/kg) to establish a septic model at 24 h. Echocardiography and histopathological examination were performed to assess the successful establishment of the SIC model. Serum IL-1β and IL-6 levels were measured by ELISA. Flow cytometry, Western blot, and RT-qPCR were employed to assess myocardial pyroptosis-associated proteins and states in macrophage polarization.

In vitro experiments: Primary peritoneal macrophages (PMs) were isolated and treated with Lira for 24 h, followed by LPS (1 μg/mL) stimulation for 12 h. Flow cytometry and Western blot were used to evaluate polarization markers. STING expression was modulated via siRNA knockdown or pharmacological activation (DMXAA, 50 μg/mL). Nuclear translocation of P65 was observed by immunofluorescence. Conditioned medium (CM) from PMs was co-cultured with H9c2 for 12 h. Cell membrane integrity and pyroptosis-related proteins were assessed using scanning electron microscopy and Western blot.

Results:

1. Lira pretreatment significantly improved survival outcomes (47% vs. 29%) and attenuated systemic inflammatory responses in LPS-induced septic mice. Theatment of Lira ameliorated sepsis-induced myocardial injury while suppressing the expression of pyroptosis-related proteins. Notably, Lira treatment markedly inhibited M1 polarization and promoted M2 polarization of cardiac macrophages.

2. In vitro, Lira concentration-dependently inhibited LPS-induced M1 polarization and enhanced M2 polarization (peak effect at 50 μM). Compared to the LPS group, Lira treatment significantly reduced IL-1β and IL-6 secretion by PMs. Furthermore, immunofluorescence analysis confirmed GLP-1R expression in PMs, which was markedly upregulated upon Lira stimulation.

3. CM from Lira-treated PMs preserved H9c2 membrane integrity and suppressed pyroptosis-related protein expression compared to CM-LPS.

4. Lira inhibited LPS-induced STING activation in a concentration- (50 μM) and time-dependent (24 h) manner. STING knockdown enhanced Lira-induced M2 polarization, while DMXAA partially reversed Lira's inhibitory effect on M1 polarization.

5. GLP-1R activation suppressed LPS-induced P65 nuclear translocation. STING knockdown amplified this effect, whereas activation of STING abolished it.

6. STING activation (CM-DMXAA+LPS+Lira) counteracted Lira's protective effect on H9c2 pyroptosis, while STING knockdown (CM-siSTING+LPS+Lira) enhanced it.

7. In vivo STING activation diminished Lira's therapeutic efficacy, negating its survival benefits and myocardial protection.

Conclusions:

1. GLP-1R activation improves survival and mitigates systemic inflammation in septic mice. 2. GLP-1R activation alleviates cardiomyocyte pyroptosis by promoting M1-to-M2 macrophage polarization. 3. The cardioprotective effects are mediated via inhibition of the STING/P65 pathway, which regulates macrophage polarization. This study provides novel experimental evidence supporting GLP-1R activation as a therapeutic strategy for SIC.

心血管危重症医护一体化管理的探索与实践

张蕾

西安交通大学医学院第一附属医院

目的：心血管危重症病情凶险，对时效性、精准性和团队协作要求极高。为突破分科壁垒、优化救治流程，我院心内科探索医护一体化管理模式，评估其对提升救治效率、精准度、全程管理及改善预后的效果。

方法: 采用前瞻性队列研究结合历史对照。核心策略: 1. 组建快速反应团队 (RRT): 心血管重症医师主导，资深重症护士为核心，联合多学科 24 小时待命。2. 建立标准化救治链：强化护士早期预警；医护联合快速床旁评估，信息实时共享；制定演练预案，护士深度参与高级生命支持、血管活性药滴定、有创监测、机械通气、IABP 管理及监护转运。3. 深化协作机制：每日医护联合查房；标准化交班；即时信息同步；定期病例回顾与根因分析持续改进。4. 强化重症护理能力：系统培训护士核心重症技能（血流动力学监测、复杂用药、高级气道管理、CRRT、镇静镇痛评估及谵妄预防）。

结果（实施 4 个月）： 1. 效率与成功率提升：STEMI "门 - 球时间" ≤ 58 分钟；抢救成功率提高 32%；心源性休克 IABP 上机提前 16%；非计划重返 CCU 率下降。2. 护理质量与安全改善：VAP、CLABSI、压力性损伤、非计划拔管等并发症显著降低；血管活性药使用更安全；谵妄筛查达标。3. 患者预后改善：CCU 平均住院日缩短；28 天及院内死亡率下降趋势；神经功能预后良好率提升。4. 团队协作增强：医护沟通效率、决策共识度及满意度提高。

结论：心血管危重症医护一体化模式通过构建高效多学科 RRT、建立标准化快速救治链、实施深度协作机制（联合决策、实时沟通、共同质控）及强化重症护理能力，实现了医疗护理资源无缝整合。实践证实，该模式显著提升了救治效率与成功率，降低了并发症，改善了患者生存率、生存质量及医疗安全，同时提升了护理价值，是应对心血管危重症挑战、实现高质量救治目标的有效路径，具有重要推广价值。

命悬一线，好转出院 ——1 例急性心肌梗死行 ECMO 治疗存活者的远期疗效观察

白雅萍 胡文冰 施婧

厦门大学附属心血管医院

目的：体外膜肺氧合（ECMO）作为一种高级生命支持技术，在挽救严重心肺功能衰竭患者生命方面发挥着关键作用。尽管 ECMO 在短期内能够显著提高患者的生存率，使更多患者得以度过疾病的危重阶段并出院，但出院并不意味着患者已完全康复。因此，本研究旨在总结 1 例急性心肌梗死行 ECMO 治疗存活者的远期疗效观察，以期为今后优化 ECMO 治疗策略、改善患者长期预后、合理分配医疗资源以及为患者提供全面的康复指导和心理支持至关重要。

方法：组建文献检索小组，基于指南和专家共识建立 ECMO 治疗存活者出院随访内容；从身体健康状况、生活质量、心理健康、日常生活能力等方面进行质性访谈；借由诺丁汉健康概况量表和创伤后应激障碍自评量表（PTSD）进行科学评估。患者出院后 1 个月、3 个月定期来院随访，通过复查血常规、生化、CTNT、BNP、超敏 C 反应蛋白、心电图、心脏彩超等情况，了解其出院后生存情况及其生活质量。

结果：各项检验检查大致正常，心超 EF 值 61%，患者生活能力完全自理，每日散步，每次约半小时，出院至今已完全戒烟，每日睡眠时间 7-9 小时，睡眠质量良好，患者对于住院期间的抢救经历已完全遗忘，经评估存在轻度创伤后应激障碍，但由于住院期间因心肺复苏肋骨骨折，目前呼吸时仍有轻微疼痛，在冠心病的预防知识知晓率较低。

结论：ECMO 出院幸存者的随访是延续性护理的核心环节，其重要性贯穿生理康复、心理支持、医疗质量提升的全链条。通过系统化随访，不仅能保障患者远期预后，也为重症医学领域的临床实践和科研提供关键数据支撑，最终实现 "以患者为中心" 的全程化照护目标。

急性心肌梗死院前就医延迟模型构建及验证

肖喜娥

陆军特色医学中心

目的 急性心肌梗死（acute maocardial infarction,AMI）对人类生命健康造成严重影响，而急性心肌梗死的有效治疗依赖于时间，就医延迟就会增加死亡的风险。然而关于急性心肌梗死延迟就医的预测模型目前少见报道。因此，本研究基于重庆市某三甲医院 AM) 绿色通道患者就医数据，构建急性心肌梗死患者就医延迟的风险预测模型并进行评价。**方法** 纳入 2016.11-2022.12 月 重庆某三甲医院通过绿色通道救治的 AMI 患者 812 例，收集病例的一般资料、症状、疾病相关因素、入院方式、发病时间、就医时间等 13 项指标。研究对象按 7:3 随机拆分为训练集和验证集。采用 logistic 分析探究急性心肌梗死患者就医延迟的风险因素，随即建立了列线图风险预测模型，并在验证集中进行了验证。采用 ROC 曲线下面积、校准曲线、决策曲线和临床影响曲线评估模型的综合预测性能。另外，进一步确定了一个截断值，用于快速区分低风险和高风险人群。对该截断值的作用，采用了混淆矩阵进行了评估。**结果** 1. 持续胸痛 [OR=0.24(0.16-0.35, p<0.001)]、非自行入院 [OR=0.23(0.14-0.37, p<0.001)]、合并三种及以上的慢病 [OR=1.83(1.11-3.05, p=0.019)]、居住地非主城 [OR=2.19(1.50-3.24, p<0.001)] 是 AMI 患者就医延迟的独立影响因素。2. 可视化 Nomogram 预测模型，共纳入 4 项指标（持续胸痛、入院方式、合并三种及以上的慢病、居住地）。有无持续胸痛是影响发生就医延迟的最重要变量。训练集和验证集的 ROC-AUC 值分别为 0.765（95%CI=0.727-0.804）和 0.758（95%CI=0.698-0.818），表明模型对延迟和非延迟患者具有良好的区分能力。绘制校准曲线，提示预测模型的预测结果与实际观察结果之间具有 好的一致性。Hosmer and Lemeshow odness of fit (GOF) test（训练集 = 6.2234, p-value = 0.3986；验证集 = 8.197, p-value = 0.224），表明观察到的事件与预测的事件之间没有显着偏差。Brier score(训练集为 Brier score=0.196，验证集为 Brier score=0.196), 均小于 0.25。进一步说明模型具有较好的准确度。采用 CIC 和 DCA 方法评价该模型的临床适用性，结果表明在训练集和验证集中预测模型均具有较高的净效益。为了快速识别高风险人群，基于最大约登指数，确定了模型的最佳 cutoff 值 =152.286，并绘制了该截断值下训练集及验证集的混淆矩阵，并计算了相关的诊断指标。**结论** 该模型有临床应用价值，可筛查出急性心肌梗死就医延迟的人群。该模型在患者人群的提前干预，降低急性心肌梗死院前不良心血管事件和死亡的发生率等方面将发挥积极的作用。

心肌梗死 PCI 术后非计划再手术患者临床特征及影响因素分析

肖喜娥

陆军特色医学中心

目的 探讨心肌梗死患者经皮冠状动脉介入治疗（PCI）术后非计划再手术的临床特征及影响因素，为早期识别高风险患者和优化临床护理路径提供依据。**方法** 采用回顾性队列研究设计，纳入 2023 年 1-12 月重庆市某三甲医院接受 PCI 治疗的心肌梗死患者 343 例，其中病例组（非计划再手术）179 例，对照组（同期首次手术）164 例。通过电子病历系统采集数据，比较两组临床特征，采用独立样本 t 检验、Mann-Whitney U 检验 /χ^2 检验进行组间比较，运用多因素 Logistic 回归及 ROC 曲线分析影响因素及模型预测效能。**结果** 单因素 Logistic 回归显示，病例组年龄高于对照组（P < 0.05），入院首次监测舒张压、总胆固醇、高密度脂蛋白胆固醇、低密度脂蛋白胆固醇、白细胞计数、中性粒细胞计数以及淋巴细胞计数低于对照组（P 均 < 0.05）。多因素 Logistic 回归显示，年龄增长（OR=1.412，95%CI：1.106-1.803）和 LDL-C 降低（OR=0.411，95%CI：0.185-0.913）与心肌梗死患者 PCI 术后非计划再手术风险增加显著相关。该模型通过双侧检验（α=0.05），提示年龄每增长 1 岁，非计划再手术风险升高 41.2%（OR=1.412）；LDL-C 每降低 1 个单位，非计划再手术风险降低 58.9%（OR=0.411）。**结论** 心肌梗死 PCI 术后非计划再手术与患者老龄和代谢紊乱相关。临床应重点关注老年、营养不良及免疫低下患者，建议建立包含营养支持、血脂管理的个性化护理方案。

两难境地，险象环生 - 急性心梗合并消化道出血，如何是好？

俊

马鞍山市人民医院

本 PPT 介绍两例急性心肌梗死合并消化道出血患者救治成功案例。

患者男性，56 岁。因 "心前区不适伴呕血、黑便 2 天" 入院。l 患者缘于 2024 年 2 月 4 日 11 时大量饮酒后，出现心前区不适，伴呕吐 1 次， 呕出血性胃内容物及血块，就诊于县医院查心电图（2 月 4 日 15:14）示 窦律，V1-V5 导联 ST 段抬高 0.1-0.4mv，T 波高尖，当地医院给予抑酸护 胃、补液处理，完善胃镜提示胃窦溃疡、胃角溃疡、十二指肠球部溃 疡，腹部 CT 平扫提示肝脏多发囊肿，2 月 5 日凌晨患者解黑便一次，复 查心电图（2 月 5 日 19:42）示窦律，V1-V5 导联 Q 波形成，ST 段抬高 0.1-0.3mv，肌钙蛋白 T 2.25ng/ml，CK-MB 126U/L，考虑急性心肌梗死 合并消化道出血，建议转上级医院，患者家属联系 120 转运至我院急诊， 我科会诊后收住我科。

病例亮点

1. 急性心肌梗死与消化道出血，治疗上背道而驰，但两种疾病危重时均可危及生命，作为医生我们只有权衡利弊，抓住主要矛盾，随时调整治疗方案。

2. 临床上没有绝对的禁忌症，只有相对的禁忌症。绝对禁忌症只有一点（患者及家属拒绝治疗）。作为一名临床医生有百分之一生的希望，我们应该都会付出百分百的努力。

3. 危重症病人抢救，人多力量大，医护合作，多学科努力，同时患者及家属的配合及信任是最重要的，"每一条鲜活的生命都是无价"，敬畏生命、医者人心。

第一阶段射血分数在脓毒症心肌损伤的早期识别及临床预后的评估价值

谢梦莹 [1] 黄毅 [2] 古小松 [2]

1. 无锡市第九人民医院

2. 苏州大学附属第二医院

目的：脓毒症相关心肌损伤（Sepsis-induced myocardial injury，SIMI）是脓毒症及脓毒性休克患者常见的并发症，SIMI 的患者病情重，病死率高。本研究拟探讨第一阶段射血分数（First-phase Ejection Fraction，EF1）在 SIMI 中心脏功能的早期识别及临床预后的评估价值。

方法：本研究纳入苏州大学附属第二医院、无锡市第九人民医院 2021 年 3 月至 2024 年 6 月符合 sepsis3.0 的脓毒症患者列为研究对象，共 150 例。根据肌钙

蛋白 I 水平，分为 SIMI 组（cTnI > 0.1mg/L）63 例和脓毒症非心肌损伤 (NSIMI) 组（cTnI < 0.1mg/L）87 例。所有患者收集入院后 48 小时内的基线资料、血生化指标，入院后 48 小时和入院 7-10 天的两组患者的超声心动图资料，出院 3 个月随访死亡率和再入院率。并运用 R 软件和 GraphPad Prism 9.0 软件进行统计学分析。

结果：（1）基线资料中，SIMI 组心率更快，且 APACHE II、SOFA 评分显著更高，结果具有统计学意义（P < 0.05）。SIMI 组白细胞计数、中性粒细胞计数、中性粒细胞计数 / 淋巴细胞计数（NLR）更高，氧合指数更低，乳酸更高，IL-6 更高，具有统计学意义（P < 0.05）。SIMI 组肌酸激酶同工酶（CK-MB）、NT-proBNP、D- 二聚体、尿酸、球蛋白更高，具有统计学意义（P < 0.05）。入院 48 小时内的超声心动图显示: SIMI 组 LVEF 较低（P < 0.05），而 EF1 显著减低（P < 0.01）。

（2）对所有患者进行多因素 Logistic 回归模型显示，EF1 水平、NT-proBNP 水平及 NLR 与 SIMI 的发病危险因素（P < 0.001）。

（3）EF1 对 SIMI 组患者的 ROC 曲线，最佳截断阈值：0.295，灵敏度：0.556，特异度：0.736，曲线下面积为 0.692（95%CI：0.609-0.776，P < 0.001）。

（4）在 SIMI 组内分析显示，EF1 与 NLR，肌钙蛋白存在显著相关（P < 0.01）

(5) 对 SIMI 组患者相关性分析显示： EF1 水平与总胆红素、淋巴细胞、NLR、TnI、Myo、血糖、LAD、GLS 水平存在相关性（P < 0.05）。

（6）住院治疗 7-10 天心超随访， LVEF 无明显变化， LVEF1 较入院时明显改善

（7）入院一周后对 SIMI 复查心超，LVEF1 增加组 45 例，LVEF1 非增加组 18 例，随访 3 个月，K-M 生存曲线结果显示 EF1 增加组较 EF1 非增加组患者的生存具有显著差异（HR：2.905，95%CI：1.260-6.669，P=0.0119）。

结论：第一阶段射血分数（EF1）对 SIMI 的早期识别具有重要价值，对 SIMI 的预后有良好的评估价值。

经皮机械循环辅助装置的应用现状及国产化进程

于国英 刘斌

吉林大学白求恩第二医院

心血管急危重症是一组病情凶险、进展迅速且死亡率高的疾病，主要包括急性冠脉综合征、心源性休克、急性心力衰竭、恶性心律失常等，早期识别和及时干预是救治关键，近年来，随着复杂、高危心血管疾病介入治疗的广泛开展，经皮机械循环辅助装置（percutaneous mechanical circulatory support,pMCS）也逐渐受到重视。pMCS 是一类通过微创方式植入的短期循环支持设备，作为一种新的治疗策略，可提供有效的血流动力学支持，保证全身重要脏器灌注，有效改善心血管急危重症患者的预后，降低病死率。目前心血管内科常用的 pMCS 主要包括主动脉内球囊反搏（intra-aortic balloon counter-pulsation,IABP）、静脉 - 动脉体外膜肺氧合（veno-arterial extracorporeal membrane oxygenation,VA-ECMO）及介入式左心室 - 主动脉轴流泵辅助装置 Impella 系统、TandemHeart 系统等。目前国内部分厂家已着力研发 IABP，有望替代进口产品，实现 IABP 国产化，填补国产高端心脏辅助设备的空白。ECMO 在新冠疫情后需求激增，推动国产化进程，但目前市场仍由外资主导。而高端 pMCS 设备（如 Impella、TandemHeart）仍依赖进口，其中 Impella 尚未获 NMPA 批准，仅少数中心用于临床实验，而 TandemHeart 系统未进入中国市场，目前国内无应用案例。国家鼓励高端医疗设备国产化，推动“心电一张网等”智慧医疗模式，但基层医院仍面临设备短缺问题。未来随着政策的支持和研发投入的增加，国产 pMCS 市场将迅速增长，有望在 5 年内实现更大范围的应用。

硫酸镁使用与心肌梗死患者死亡率的关系：一项回顾性队列研究

孙云飞 薛歆

吉林大学第二医院

目的

近年来，有研究关注镁离子在心血管疾病中的作用，但其在急性心肌梗死患者中的临床价值尚存争议。本研究旨在探讨在不同时间窗内静脉使用硫酸镁对急性心肌梗死患者死亡率的影响。

方法

本回顾性研究利用重症监护医学信息市场 （MIMIC）-IV 数据库分析急性 1 型心肌梗死患者。参与者根据接受硫酸镁治疗的时间分组（Q1 未接受，Q2 ≤ 6h，Q3 6-12h，，Q4 ≥ 12h），主要结果是 28 天全因死亡率。通过 COX 回归模型、Kaplan-Meier 生存分析和亚组分析评估硫酸镁使用与院内死亡率之间的关联。

结果

这项回顾性队列研究包括 4406 例患者，其中院内死亡率为 17.8%。在多变量 COX 回归中，完全调整后的模型表明硫酸镁使用与较低的 28 天全因死亡率相关（风险比 [HR]，0.61；95% CI，0.52-0.72；P<0.001）。无论何时给予硫酸镁，都观察到较低的死亡率：对于 6h 内使用硫酸镁，HR，0.73；95%CI，0.62-0.87，P<0.001；对于 6-12h 内使用硫酸镁，HR，0.68；95%CI，0.51-0.89，P=0.006；12h 以外使用硫酸镁，HR，0.71；95%CI，0.53-0.96，P=0.028。分层分析进一步证实了这种相关性的稳健性。

结论

硫酸镁的使用与急性心肌梗死患者的死亡率降低相关。需要前瞻性研究来验证这一发现。

第一阶段射血分数对新活素治疗慢性心衰急性加重的临床疗效评估

黄毅 古小松

苏州大学附属第二医院

目的：探讨第一阶段射血分数（EF1）在慢性心衰急性加重期患者新活素治疗前后的改善程度及预后评估价值。

方法：选取 2024 年 1 月至 2025 年 1 月在苏州大学附属第二医院确诊为慢性心力衰竭急性加重的住院患者共 310 例，随机分组，非新活素治疗组，和新活素治疗组，两组患者各 155 例。记录患者的一般情况，血压、NT-proBNP、cTnT、心超参数（LAD、LVESD、LVEDD、EF、EF1、T1 时间、E/e'）。新活素治疗后 5 天再次测量心超参数。对新活素治疗组患者随访 3 个月，观察心衰再住院和心因性死亡事件。

结果: (1) 根据既往病史，对所有入组患者进行 NYHA 分级，与心功能 III 级组相比，心功能 IV 级组的年龄、BMI、糖尿病患病率、总胆固醇、低密度脂蛋白、空腹血糖、超敏 C 反应蛋白、NT-proBNP、cTnT、LVESD、LVEDD 和 E/e'更高，收缩压、舒张压、高密度脂蛋白、EF 和 EF1 更低，差异有统计学意义（P < 0.05）。（2）对所有入组心衰患者进行相关性分析：EF1 与 BMI、总胆固醇、NT-proBNP、cTnT、LVESD、LVEDD 和 E/e'呈负相关，与高密度脂蛋白、EF 呈正相关。(3) 多元 logistic 回归表明：EF1 是心功能 IV 级的独立保护因素 （OR: 0.898, 95% CI: 0.759 - 0.941）；多元线性回归分析表明: cTnT 是 EF1 的独立危险因素（OR: 1.350, 95% CI：1.118 - 1.575）（4） 所有患者治疗前后结果比较：非新活素治疗组和新活素组治疗后收缩压、舒张压、NT-proBNP、cTnT、T1 时间和 E/e'均低于治疗前，EF1 均高于治疗前，差异有统计学意义（P < 0.05）；两组治疗前后 EF 比较，差异无统计学意义（P > 0.05）。（5）两组患者治疗后结果比较：新活素组收缩压、NT-proBNP、cTnT 和 E/e'均低于非新活素组，EF1、症状缓解率高于非新活素组，差异有统计学意义（P < 0.05）。（6）对新活素治疗组随访，97 人 EF1 增加，58 人 EF1 无明显变化或者降低，两组随访，EF1 增加组患者心力衰竭加重再入院或心因性死亡的发生率低（27.84% vs 46.55%, P = 0.028）。

结论：EF1 与 NYHA 分级密切相关；新活素治疗能改善心脏 EF1 水平；新活素治疗后心脏 EF1 升高患者随访心衰再入院和心因性死亡风险较低。

关键词：第一阶段射血分数；慢性心力衰竭急性加重；新活素；临床疗效

急性心肌梗死合并心源性休克的当代治疗策略与技术

魏宇淼

华中科技大学同济医学院附属医院协和医院

背景：合并心源性休克是急性心肌梗死（AMICS）的主要院内死亡原因和极具挑战性的心血管急危重症，随着直接冠脉介入治疗及机械循环支持的长足发展，AMICS 患者的救治水准和存活率有一定改善。但具体临床实践中的关键措施和细节仍远未成熟一致，临床试验提供的证据也十分有限。目的：探讨急性心肌梗死合并心源性休克的当代循证证据及临床实践经验。方法：查询汇总 AMICS 当代治疗的证据、临床共识指南推荐及具体临床使用经验，进行循证评估、病理生理学分析和实践评述。结果：一、AMICS 的临床特征、血流动力学类型及病理生理机制；二、AMICS 的临床及病情监测；三、AMICS 的再血管化治疗：共识指南的相关建议；四、关于急性心肌梗死合并心源性休克及不合并心源性休克对非梗死相关动脉（IRA）的血运重建的讨论；五、关于急性心肌梗死合并心源性休克冠脉血运重建的技术经验；六、AMICS 的机械循环支持：证据及经验；七、关于 AMICS 机械通气、血液净化及机械循环辅助的使用经验。结论：AMICS 的再血管化治疗部分指南及共识较为明确，相关建议如下：1）对于 ST 段抬高型心肌梗死和缺血症状持续时间 <12 小时的患者，建议进行直接经皮冠脉介入治疗（PPCI），越早越好。2）初次缺血症状出现 12 小时以上的 ST 段抬高型心肌梗死患者，尤其是持续症状或动态心电图改变提示持续缺血、血流动力学不稳定或危及生命的心律失常的患者，建议尽快进行 PPCI。3）PCI 时常规建议使用新一代 DES 进行支架置入，不建议患者常规使用延迟支架置入术。但是，对于某些患者，如前壁心肌梗死患者，也可以考虑。不建议常规使用血栓抽吸，但血栓负荷重时应予血栓抽吸。4）非常高风险的非 ST 段抬高型心肌梗死（NSTEMI）患者立即常规进行冠脉侵入性治疗策略。

急性心肌梗死心脏游离壁破裂存活患者病情特征分析及相关诊治经验

魏宇淼

华中科技大学同济医学院附属医院协和医院

前言：传统观念认为急诊心脏外科是急性心肌梗死游离壁破裂最终存活的主要治疗因素，但并无确定的大规模研究证据。目的：探讨急性心肌梗死心脏游离壁破裂存活患者病情特征及相关诊治经验。方法：采用回顾性研究方法，收集我院近年来诊断为急性心肌梗死后心脏游离壁破裂存活的患者共 23 名，对其临床特征、治疗方法及预后信息等进行整理汇总分析。重点分析急性心肌梗死患者发生心脏游离壁破裂的相关因素和发生心脏游离破裂后常规治疗存活者的相关因素。结果：患者发生心脏破裂的相关因素主要有：急性 ST 段抬高型心肌梗死发病 2 周内，下后壁或侧后壁心肌梗死比例更多，与是否存在心尖部室壁瘤关系不明显；包含替罗非班在内的强抗栓与亚急性心脏破裂有关，急诊 PCI 治疗可以减少心脏破裂的发生。发生心脏游离壁破裂后经常规治疗存活患者的因素分析有：存活患者多为亚急性破裂，患者存活预后的主要因素决定于破口大小和是否及时心包穿刺引流并成功维持了血流动力学稳定，急诊外科手术不是患者存活的首要因素。结论：急性透壁性 ST 段抬高型心肌梗死在 2 周内可发生心脏破裂，下后侧壁 ST 段抬高心梗所占比例更高。亚急性破裂患者多能存活，是否存活的预后的主要决定因素为破口大小和是否及时心包穿刺引流。根据根据患者血流动力学状态采取个体化治疗是治疗成功的关键。

The Role of TyG Index in distinguishing NSTEMI from Acute Heart Failure Patients

li Xiong, Xiao-Song Gu

The Second Affiliated Hospital of Soochow University

Background: Both acute heart failure (AHF) and non-ST-segment elevation myocardial infarction (NSTEMI) are cardiovascular emergencies that share overlapping symptoms, such as dyspnea on exertion, dizziness, and fatigue. These similarities may lead to misdiagnosis. Given the significant differences in treatment strategies between AHF and NSTEMI, accurate diagnosis is crucial, particularly in resource-limited settings where simple biomarkers are needed to aid differential diagnosis. The Triglyceride-Glucose (TyG) index serves as a reliable marker of insulin resistance (IR) and systemic metabolic dysregulation. It is significantly associated with the risk of NSTEMI, AHF, and adverse cardiovascular outcomes in patients. This study aimed to investigate the role of the TyG index in distinguishing NSTEMI from AHF.

Methods: Demographic and clinical data were collected from 1766 patients with acute heart failure (AHF) admitted to the hospital. Among them, 1246 patients underwent coronary angiography during hospitalization, and 684 patients were diagnosed with non-ST-segment elevation myocardial infarction (NSTEMI). The normality of continuous variables was evaluated using the Shapiro-Wilk test. Categorical variables were compared using Pearson's chi-squared test. Continuous variables were compared using the two-tailed student's t-test or Mann-Whitney U test between two groups. The association between the TyG index and NSTEMI was assessed using multivariate logistic regression analysis and restricted cubic splines (RCS) in AHF patients. Additionally, the predictive value of the TyG index, cTnT, and the combination of these two indicators for NSTEMI was preliminarily evaluated using the receiver operating characteristic (ROC) curve. In order to evaluate the discrimination efficiency of TyG index for NSTEMI risk factors, the reclassification index was used to verify the effect of the model optimization. The net reclassification index (NRI) and Integrated discrimination improvement (IDI) were used to compare the multi-dimensional models.

Results: Compared with the AHF without NSTEMI participants, the NSTEMI patients were more likely to be older and had higher levels of TC, TG, and LDL-C (P <0.05). We showed that TyG index and cTnT were higher in NSTEMI patients than in AHF patients without NSTEMI (Z: -7.16, P <0.001). Multivariate logistic regression analysis adjusted by gender, age, diabetes, hypertension, NT-proBNP, cardiac troponin T (cTnT) showed a significant association between TyG index and NSTEMI, for every 1 unit increase in TyG index, the morbidity risk of NSTEMI increased 2.22(OR: 2.03, 95% CI: 1.67 - 2.46, P <0.001). Adding TyG index into a basic risk model for NSTEMI improved the reclassification, the new model (TyG index + model) is better than the basic model (IDI: 0.05, 95%CI: 0.04 - 0.06, p There was a nonlinear correlation between TyG index and NSTEMI (P for nOnlinear= 0.03). TyG index combined with cTnT can improve the diagnosis rate of NSTEMI, the AUC of cTnT + TyG index is 0.767 in TyG Q4 group.

Conclusion: We investigated the predictive value of cTnT in conjunction with TyG index for NSTEMI. The combination of TyG index and cTnT serves as a reliable indicator for distinguishing NSTEMI in patients with AHF, potentially offering a novel strategy for early clinical intervention. This study aims to provide a cost-effective and efficient tool for rapid risk stratification in emergency settings, especially in resource-constrained regions.

Intra-aortic balloon pump implantation in early-stage cardiogenic shock reduces 30-day mortality in patients with ventricular septal defect following myocardial infarction

Jianmin Yang, Lin-Song Leng, Xiang-Juan Liu

Qilu Hospital of Shandong University

Background: Ventricular septal defect (VSD) is a serious mechanical complication of acute myocardial infarction, with an extremely high mortality. Intra-aortic balloon pump (IABP) has become a bridge to surgical repair. However, its effect on mortality varies partly because of shock severity.As a mature MCS device, IABP has the advantages of fast implantation, convenient use, and low complication rate. According to the 2023 European Society of Cardiology (ESC) guidelines for the management of acute coronary syndromes, intra-aortic balloon pump (IABP) is recommended for patients with MI-VSD accompanied by cardiogenic shock (CS) (Class IIb), as a bridge for MI-VSD hemodynamically unstable patients to undergo surgical repair. However, accurately determining the shock stage and assessing hemodynamic status changes in MI-VSD patients can be challenging in clinical practice, owing to the rapid fluctuations in their hemodynamic profile. Furthermore, for some patients who undergo surgical repair subsequent to IABP implantation during a period of hemodynamic instability, the prognosis tends to be unfavorable. In addition, the persisting high flow across the VSD with necrotic myocardium may increase the size of the rupture unpredictably.Traditional shock stage criteria cannot accurately identify the pre-shock stage, thus failing to implement timely intervention measures to prevent hemodynamic deterioration. In 2022, the Society for Cardiovascular Angiography and Interventions (SCAI) proposed a shock stage classification system that divides shock into stage A to E, defined as at risk, beginning, classic, deteriorating, and extremis, providing a risk stratification for mortality in CS patients. According to this staging system, patients begin to exhibit significant hemodynamic disturbances and inadequate microcirculatory perfusion at SCAI SHOCK stage C, with blood gas analysis showing lactate ≥ 2 mmol/L, which is the typical cardiogenic shock stage. Despite the current guideline downgrading the recommendation for routine use of IABP in patients with AMICS, it remains the most prevalent method utilized in clinical practice. The significant disparity between clinical practice and guidelines is motivating us to pinpoint the specific patient population that may exhibit a particularly favorable response to IABP in the context of MI-VSD. In order to address these concerns, the objective of this study was to assess the correlation between the utilization of IABP and 30-day mortality rates among MI-VSD patients with early-stage AMICS, classified as SCAI SHOCK stages A/B.

Aims: This study aims to evaluate the association between implantation of IABP in early-stage cardiogenic shock and the 30-day all-cause mortality in patients with VSD after myocardial infarction (MI-VSD).

Methods: The retrospective data were collected based on patients with MI-VSD who were admitted to Qilu Hospital of Shandong University from 2013 to 2024. Patients were stratified according to IABP implantation. We determined the severity of cardiogenic shock according to the Society for Cardiovascular Angiography and Interventions (SCAI) SHOCK stage classification system. The primary outcome was all-cause mortality within 30 days after VSD. Logistic regression models were constructed to evaluate the factors associated with the 30-day all-cause mortality. We conducted subgroup analysis and assessed interaction effects to evaluate the relationship between IABP use and 30-day mortality in various subgroups. The Kaplan-Meier survival curves were used to evaluate the cumulative incidence of 30-day mortality.

Results: This study included a total of 57 patients (mean age of 67.96±7.31 years; 47.4% male), 33 of whom received IABP implantation. The SCAI SHOCK stage was associated with 30-day all-cause mortality [odds ratio (OR) 3.19, 95% confidence interval (CI) 1.05-10.69, P = 0.048]. IABP implantation significantly reduced 30-day mortality in patients with SCAI SHOCK stages A/B (6.7% versus 55.6%; OR 0.06, 95% CI 0.01-0.64, P = 0.020), while no significant difference was observed in patients with SCAI SHOCK stages C/D/E (P = 0.611). We also found that in patients with SCAI SHOCK stages A/B, IABP implantation effectively prevented progression to SCAI SHOCK stages C/D/E.

Conclusions: Implantation of IABP in SCAI SHOCK stages A/B could reduce 30-day all-cause mortality in patients with MI-VSD.

褪黑激素对小鼠脓毒症心肌损伤模型的保护作用机制

侯红霞

河北大学附属医院 / 临床医学院

目的：研究褪黑激素（melatonin，Mel）对小鼠脓毒症心肌损伤（sepsis-induced myocardial injury，SIMI）的保护作用机制，明确其是否通过激活腺苷酸活化蛋白激酶（Adenosine Monophosphate-Activated Protein Kinase, AMPK）信号通路发挥保护作用。

方法：选取 32 只 8-10 周龄的健康雄性 C57/BL6J 小鼠，将其随机分为四组：(1) 正常组（Con, n=8）；(2) 模型组（Lps，n=8）；(3) 治疗组（Mel+Lps, n=8）；（4）治疗组 +AMPK 抑制剂组（Mel+Lps+CC, n=8）。给药 12 小时后行超声心动图仪检测小鼠左室射血分数 (LVEF) 和左室短轴缩短分数 (LVFS)，观察各组小鼠心功能变化情况。苏木精 - 伊红（HE）染色观察各组心肌结构变化。RT-qPCR 技术和 ELISA 等方法观察炎症因子 TNF-α、IL-1β、IL-6 及心肌损伤标志物 CK-MB、CTnI 的变化情况。采用 Western Blot 技术检测心脏组织总蛋白中 AMPK、P-AMPK 的蛋白表达水平。

结果：超声心动图和血流动力学测量显示：与对照组相比，Lps 组及 Mel+Lps+CC 组的 LVEF 和 LVFS 明显降低（P < 0.05），褪黑激素处理逆转了 LPS 诱导的心功能不全，LVEF 和 LVFS 明显升高（P < 0.05）。RT-qPCR 技术和 ELISA 法显示：Lps 组及 Mel+Lps+CC 组较正常组表现为 TNF-α、IL-1β、IL-6、CK-MB、CTnI 浓度及 mRNA 表达水平升高（P < 0.05），Lps+Mel 组 TNF-α、IL-1β、IL-6、CK-MB、CTnI 浓度及 mRNA 表达水平均明显降低(P<0.05)。HE 染色显示模型组小鼠较正常组存在严重的心肌组织损伤，褪黑激素组能减轻心肌损伤程度。Western Blot 结果显示褪黑激素能激活 AMPK 信号通路，P-AMPK/AMPK 比值升高（P < 0.01）。

结论：1. 褪黑激素治疗可改善脓毒症心肌损伤小鼠的心功能及降低炎症因子的水平，改善心肌损伤。2. 褪黑激素能激活 AMPK 信号通路，为脓毒症心肌损伤的治疗提供理论依据。

VA-ECMO 联合吸入一氧化氮治疗一例 TTVR 术后急性右心功能不全患者的护理

薛萌萌 耿周婴洋 王玉丽

厦门大学附属心血管病医院 (厦门市心脏中心)

总结 1 例全麻下行 TTVR 术后突发急性右心功能不全予 VA-ECMO 辅助支持及一氧化氮吸入治疗的护理经验。护理要点：① ECMO 的阶段性管理方案：早期阶段（高流量阶段）目标：快速恢复组织氧供，偿还氧债，改善循环。初始流量通常设置较高，帮助心肺得到休息。此阶段为患者流量设置为 3.5-4L/min。中期

阶段（中流量阶段）目标：维持心肺功能，促进其恢复。流量逐渐降低至适中水平，维持心排出总量的 80%，减轻心脏负担优化右心负荷，对于优化右心负荷采取了定制化容量管理模式、小剂量的去甲肾上腺素泵入、一氧化氮吸入治疗等，此阶段调节流量为 2-2.5L/min。后期阶段（低流量阶段）目标：为停机做准备，逐步减少 ECMO 支持，促进患者自主呼吸和循环的恢复。流量逐步减少，观察患者的生理参数和功能恢复情况，讲流量降至 1.0-1.5L/min 以下。②目标导向，动态评估患者容量目标：持续监测患者的中心静脉压、体重、出入量、超声评估下腔静脉的宽度及变异率等，确定容量管理目标；制作 24h 容量管理监测表格，详细记录每小时液体出入量情况；ECMO 及气管插管撤除后指导患者做好容量自我管理：口渴时可使用喷壶湿润口唇，或通过漱口代替喝水，缓解口渴症状等。③稳定肺动脉压，提高吸入一氧化氮治疗过程中的安全管理；④可视化康复护理方案：鼓励患者坚持康复训练，但不可急于求成、激进式训练。使用可视化康复记录单，让患者自己勾选已完成的运动训练，提高参与度及积极性。⑤分阶段式心理护理：镇静期间患者无法表达自己的感受，采用芳香疗法联合音乐疗法为患者进行心理照护，将薰衣草精油及野橘精油涂抹于患者的耳后来改善患者的睡眠质量、减轻焦虑情绪；同时在白天应用音乐心理疗法增进患者的身心健康，达到放松解压的效果；鼓励家属定期探视，并指导他们在探视时给予患者正面的支持和鼓励，家庭成员的陪伴能够给患者带来极大的精神慰藉。患者清醒时采用情绪释放疗法 EFT 进行心理护理，帮助患者接受当下的情绪，积极面对未来。**结果**：经过多学科团队的共同协作下，患者术后 19d 转入普通病房，术后 39d 顺利出院。规律随访三个月，患者恢复良好。

Dysregulated Tryptophan-Kynurenine Pathway Drives Septic Cardiomyopathy: A Multimodal Diagnostic Model Integrating Ghrelin and Metabolites

Chunlin Yin[1], Xue Li[1], Xing-Zhu Zhou[1], Yi-Ge Song[2], Xian-Yang Chen[2]

1. Xuanwu Hospital, Capital Medical University

2. Beijing Zhongguancun Big Data Center

Abstract

Purpose: Septic cardiomyopathy (SCM), characterized by acute cardiac dysfunction during sepsis, significantly elevates mortality risk to 70-90% when complicated by septic shock. Current diagnostic reliance on echocardiographic left ventricular ejection fraction (LVEF <50%) and nonspecific biomarkers (NT-proBNP, cTnI) fails to detect early-stage SCM due to limited specificity and load-dependency. The absence of targeted interventions underscores the urgent need to decipher SCM pathogenesis and develop precise diagnostic tools. This study aimed to: (1) identify novel metabolic drivers of SCM through multi-omics profiling; (2) validate dysregulated pathways in a clinically stratified cohort; (3) construct and externally validate a multimodal diagnostic model integrating proteomic and metabolomic biomarkers.

Methods: A prospective cohort of 30 sepsis patients (2016 Sepsis-3.0 criteria) was rigorously stratified using dual echocardiographic criteria: LVEF <50% combined with global longitudinal strain (GLS) impairment (GLS < − 15%, reflecting intrinsic myocardial dysfunction). Patients were categorized into non-SCM (*n* = 13) and SCM (*n* = 17) groups, excluding comorbidities confounding cardiac/metabolic assessments. Serum samples underwent:

Untargeted metabolomics: Liquid chromatography-quadrupole time-of-flight mass spectrometry (LC-QTOF-MS) analysis with orthogonal partial least squares-discriminant analysis (OPLS-DA; selection criteria: variable importance projection [VIP] >1, *p* < 0.05, FDR <0.05).

Targeted validation: Quantification of tryptophan-kynurenine (TRP-KYN) pathway metabolites via LC-MS/MS.

Proteomics: Targeted mass spectrometry for six inflammatory peptides (Substance P, α-MSH, NPY, Nociceptin, Ghrelin, Urotensin II).

Pathway dynamics were mapped using structural equation modeling. A logistic regression model integrating key biomarkers was developed and validated through external cohort testing and permutation analysis.

Results:

1.Metabolic Dysregulation: Untargeted metabolomics identified the TRP-KYN pathway as the most significantly altered in SCM (KEGG enrichment *p* < 0.001). Key perturbations included:

44% elevation in tryptophan (TRP, *p* < 0.001)

37% reduction in quinolinic acid (QA, *p* < 0.005)

Increased intermediates: L-kynurenine (AUC = 0.82), N-formylkynurenine (AUC = 0.84), 3-hydroxyanthranilic acid (AUC = 0.81)

Structural modeling confirmed suppressed flux from TRP to kynurenine (β = − 0.38 vs. − 0.11 in controls, *p* < 0.01) and disrupted downstream coordination (e.g., lost KYN → 3-HAA regulation).

2.Proteomic Signature: Among six inflammatory peptides, only ghrelin showed significant reduction in SCM (− 29%, *p* < 0.01), exhibiting moderate diagnostic capacity alone (AUC = 0.731).

3.Diagnostic Model Performance:

The multimodal model (Ghrelin + TRP + QA) achieved:

Discovery cohort: AUC = 0.847 (95% CI: 0.792–0.902)

External validation: AUC = 0.805 (95% CI: 0.741–0.869)

Outperformed single-modality approaches:

Ghrelin alone: AUC = 0.731

Metabolites alone (TRP + QA): AUC = 0.752

Decision curve analysis demonstrated >95% clinical net benefit at 40-60% risk thresholds.

Mechanistic Implications:

TRP accumulation may impair immunometabolic homeostasis by blunting GCN2 kinase-mediated anti-inflammatory signaling while hyperactivating mTORC1-dependent Th1/Th17 responses.

QA deficiency compromises cardiac energy metabolism via reduced NAD^+ synthesis (↓ ATP production) and dysregulates excitation-contraction coupling through diminished NMDAR activation.

Conclusion: This study establishes TRP-KYN pathway dysregulation (characterized by TRP accumulation and QA depletion) and ghrelin reduction as hallmarks of SCM pathogenesis. The integration of these biomarkers into a multimodal diagnostic model enables early detection with high accuracy (AUC >0.8), addressing a critical gap in sepsis management. By bridging metabolic dysregulation, immune imbalance, and functional cardiac impairment, this approach provides:

1.A clinical tool for identifying high-risk SCM patients during the reversible early phase;

2.Novel therapeutic targets (e.g., KMO activators to restore QA synthesis, ghrelin supplementation);

3.A precision medicine framework for future sepsis-induced organ dysfunction research. Multicenter validation and mechanistic studies exploring TRP-KYN flux modulation are warranted.

4.Key words : septic cardiomyopathy, biomarker, metabolomics

Triglyceride-glucose index may influence ideal body weight in cardiovascular critically ill patients without diabetes: a retrospective study of the MIMIC-IV database

Yi Hu, Xue-Bo Liu

Tongji Hospital, Tongji University

Background The obesity paradox, whereby overweight/obese individuals have lower mortality than normal-weight populations, is prevalent in patients with cardiovascular critical illnesses, but the mechanisms are not well understood. Insulin resistance (IR) may be a key modifier, and the triacylglycerol-glucose (TyG) index, a reliable surrogate for IR, may influence the obesity-related survival advantage. As the metabolic complexity of diabetic patients may interfere with phenomenological observations, this study focused on a non-diabetic cardiovascular critically ill population with the aim of revealing the modulating role of TyG levels on the obesity paradox and providing a basis for precise weight management.

Methods We extracted cardiovascular critically ill patients without diabetes mellitus (DM) from the Medical Information Marketplace in Intensive Care (MIMIC)-IV database and categorised them into T1, T2 and T3 groups based on the trichotomisation of the TyG index, with 365-day all-cause mortality as the primary endpoint. According to the criteria of the World Health Organization (WHO), we classified the body mass index into the following groups: normal group (18.5-24.9 kg/m2), overweight group (25.0-29.9 kg/m2), obese group I (30.0-34.9 kg/m2), obese group II (35.0-39.9 kg/m2), and obese group III (≥ 40.0 kg/m2). Kaplan-Meier (K-M) curves were used to compare outcomes between BMI groups.COX regression analyses and restricted cubic spline curves (RCS) were used to assess the relationship between BMI and prognosis in each group. If a non-linear relationship existed, change points were estimated using a segmented linear model and a two-stage Cox regression was applied either side of the change point. Finally, subgroup analyses with sensitivity analyses were also performed.

Results A total of 5106 individuals participated in the study, with a median age of 68 (58,78) years, and 61.4% were male.The KM curves showed that obesity was less protective in the high TyG group.COX regression analyses showed a significantly lower 365-day all-cause mortality rate in overweight, obese class I patients in the T1 group compared with those with a normal body mass index, with an adjusted hazard ratio (HR) and a 95% confidence intervals (CIs) of 0.74 (0.58-0.94) and 0.62 (0.44-0.89), respectively; in group T2, obese class I patients were significantly associated with a reduction in 365-day all-cause mortality, with adjusted HRs and 95% CIs of 0.60 (0.42-0.85), respectively; and in group T3, none of the abnormal BMI groups were significantly associated with 365-day

all-cause mortality.RCS analyses showed an L-shaped relationship between BMI and 365-day all-cause mortality in the T1 and T2 groups and a J-shaped relationship in the T3 group. The lowest value of mortality, i.e. ideal body weight, was 34 kg/m2, 33 kg/m2 and 29 kg/m2 in the three groups.Subgroup analyses and sensitivity analyses yielded similar results.

Conclusions This study found that different TyG levels affect the obesity paradox in cardiovascular critically ill patients without DM. Patients with high TyG levels were significantly less protected against obesity and had a lower optimal body weight compared to patients with low TyG levels. It is necessary to consider the TyG index when managing ideal weight in critically ill patients without diabetes.

Key Words：Triglyceride-glucose index, cardiovascular critical illness, obesity paradox, ideal body weights

米拉贝隆激活 β3-AR 通过促进血管周围脂肪组织中的淋巴管生成来预防主动脉夹层 / 动脉瘤发生

程玉文 曲新凯

复旦大学附属华东医院

目的：β3-AR（β3- 肾上腺素能受体）通过调节脂肪组织功能对于心血管稳态至关重要。血管周围脂肪组织（PVAT）与主动脉夹层和动脉瘤（AD/AA）的发病机制有关。在此，我们旨在探讨 β3-AR 激活的 PVAT 在 AD/AA 中的功能。

方法：收集胸主动脉夹层（TAD）患者的主动脉，检测 PVAT 中 β3-AR 的表达。用血管紧张素 II (AngII) 诱导 ApoE-/- 和 β- 氨基丙腈单富马酸酯 (BAPN) 处理的 C57BL/6 小鼠来模拟 AD/AA，随后接受安慰剂或米拉贝隆喂养。

结果：TAD 患者和 AD/AA 小鼠的 PVAT 中 β3-AR 上调。此外，米拉贝隆激活 β3-AR 可显着阻止 AngII 诱导的小鼠 AD/AA 形成。对 PVAT 脂肪细胞的 RNA 测序分析显示，在米拉贝隆治疗的小鼠中，淋巴管生成因子 VEGF-C 显着增加。同样的，我们发现米拉贝隆治疗后的 PVAT 中淋巴管生成增强。从机制上讲，米拉贝隆治疗小鼠的 PVAT 中 CD4+/CD8+ T 细胞和 CD11c+ 细胞的数量减少，但邻近引流淋巴结 (LN) 的数量增加，表明淋巴管生成改善了 PVAT 中炎症细胞的引流和清除。重要的是，腺相关病毒对脂肪细胞特异性 VEGF-C 的敲低抑制了淋巴管生成，并加剧了 PVAT 中的炎症细胞浸润，最终消除了米拉贝隆对 AD/AA 的保护作用。此外，经米拉贝隆处理的脂肪细胞的条件培养基激活了淋巴内皮细胞 (LEC) 的增殖和管形成，而敲低脂肪细胞中 VEGF-C 的可减少增殖和管状形成。

结论：我们的研究结果说明了 β3-AR 的治疗潜力。米拉贝隆激活 AD/AA 中的 β3-AR，通过增加脂肪细胞分泌的 VEGF-C 促进淋巴管生成，从而改善 PVAT 炎症。

Association Between Time in Targeted Blood Glucose Range and In-Hospital Mortality in critically ill patients with cardiovascular diseases: analysis of the MIMIC-IV database

Hong Chen, Qi-Wei Shen, Peng Liu, Hai-Long Li, Hua-Long Liu, Jin-Zhu Hu

Department of Cardiovascular Medicine, The Second Affiliated Hospital of Nanchang University, China

Background

Critically ill patients with cardiovascular diseases constitute a high-risk population within the intensive care unit (ICU), where the profound stress of conditions like acute heart failure, myocardial infarction, and cardiogenic shock frequently leads to significant metabolic disruption. Dysglycemia, encompassing both hyperglycemia and hypoglycemia, is highly prevalent and is independently associated with adverse clinical outcomes, including increased mortality and prolonged ICU stays. However, conventional glycemic metrics such as mean glucose levels or measures of glucose variability may not adequately capture the full spectrum of glycemic dysregulation. These measures often fail to account for the duration and stability of glucose control, which may be critical in a population highly susceptible to the detrimental effects of glycemic excursions.

Time in targeted blood glucose range (TIR), defined as the percentage of time a patient's glucose level remains within a predefined range (e.g., 70–139 mg/dL), has emerged as a superior indicator of glycemic quality in outpatient diabetes management. By providing a dynamic and integrated measure of glycemic stability, TIR offers potential advantages over static metrics. Despite its growing acceptance in other clinical contexts, the prognostic value of TIR for predicting short-term outcomes in critically ill patients with cardiovascular diseases remains largely uninvestigated. This study aimed to evaluate the association between TIR during the first cardiac ICU admission and in-hospital all-cause mortality, using a large, real-world cohort from the MIMIC-IV database. We also sought to explore whether this association varied across key clinical subgroups, including patients with and without diabetes.

Methods

This retrospective cohort study utilized data from the Medical Information Mart for Intensive Care (MIMIC-IV) database, version 3.1, which contains comprehensive data from patients admitted to Beth Israel Deaconess Medical Center between 2008 and 2022. The study population included adult patients with their first admission to a cardiac ICU. A detailed set of inclusion and exclusion criteria was applied to derive the final cohort.

Data extracted included patient demographics (age, sex, race), body mass index (BMI), illness severity scores (APS III, SAPS II), comorbidities (identified via ICD-9/10 codes), vital signs, and an extensive panel of laboratory values. The primary exposure was TIR, calculated as the percentage of time spent within the target glucose range of 70–139 mg/dL during the ICU stay. Glucose measurements were extracted from fingerstick, serum, and whole blood tests. A time-weighted approach with linear interpolation between consecutive glucose readings was used to estimate the total duration spent within the target range. The primary outcome was in-hospital all-cause mortality.

Statistical analysis involved several steps. Baseline characteristics were compared across TIR quartiles. The association between TIR and in-hospital mortality was assessed using multivariable logistic regression. TIR was analyzed both as a continuous variable (per 10% increase) and as a categorical variable (in quartiles). Three hierarchical models were built: Model I was unadjusted; Model II adjusted for age, sex, and BMI; and Model III was a fully adjusted model controlling for demographics, illness severity scores, vital signs, laboratory results, major comorbidities (e.g., hypertension, diabetes, coronary artery disease, heart failure, sepsis), and treatments (e.g., insulin, vasopressors, mechanical ventilation). Subgroup analyses were performed to test for interaction effects, and restricted cubic splines were used to model potential non-linear relationships.

Results

A total of 12,039 critically ill patients with cardiovascular diseases were included in the final analysis. The median age was 69.5 years, 31.3% were female, and 69.5% were White. Key comorbidities included diabetes (39.2%), coronary artery disease (71.6%), and hypertension (78.7%). The overall in-hospital all-cause mortality rate for the cohort was 5.7%.

A strong, graded inverse relationship was observed between TIR quartiles and mortality. Patients in the lowest TIR quartile (Q1, 0-25%) had a mortality rate of 13.0%, which progressively decreased in higher quartiles: Q2 (5.6%), Q3 (4.3%), and Q4 (2.6%).

In the multivariable logistic regression analysis, when TIR was treated as a continuous variable, each 10% increase in TIR was associated with significantly lower odds of in-hospital mortality. In the fully adjusted model (Model III), the odds ratio (OR) was 0.86 (95% CI: 0.82-0.90, P < 0.001). When analyzed by quartiles, compared to the lowest quartile (Q1), patients in the highest quartile (Q4) had a 67% reduction in the odds of death in the fully adjusted model (OR 0.33, 95% CI: 0.22-0.51, P for Trend < 0.001).

Subgroup analyses revealed a significant interaction by diabetes status. The protective association of higher TIR with lower mortality was pronounced and statistically significant in patients without diabetes, but this association was attenuated and not statistically significant in patients with diabetes (P for interaction < 0.05). No significant interactions were found for other subgroups, including age, sex, or BMI. Restricted cubic spline analysis showed an approximately linear inverse relationship between TIR and mortality, with no evidence of a non-linear effect (P for non-linearity = 0.237).

Conclusion

In this large-scale, retrospective study of critically ill patients with cardiovascular diseases, a higher TIR was independently and strongly associated with a lower risk of in-hospital all-cause mortality. This relationship demonstrated a clear dose-response pattern and remained robust after extensive adjustment for a wide range of potential confounders. The findings suggest that maintaining glycemic stability, as captured by TIR, is a critical factor influencing short-term survival in this vulnerable population.

Notably, the prognostic utility of TIR was most evident in patients without a history of diabetes, suggesting that these individuals may be more susceptible to the adverse effects of acute dysglycemia. While the observational nature of this study precludes causal inference, the results provide compelling evidence that TIR may serve as a valuable clinical indicator for risk stratification and a potential target for therapeutic intervention in cardiovascular critical care. Future prospective studies, potentially incorporating continuous glucose monitoring, are warranted to validate these findings and to determine whether management strategies guided by TIR can improve clinical outcomes in this high-risk patient group.

Early Systolic Blood Pressure Time-in-Target Range and Mortality in ICU Patients with Heart Failure: A Retrospective Cohort Study from the MIMIC-IV Database

Qiwei Shen, Peng Liu, Hai-Long Li, Hong Chen, Hua-Long Liu, Jin-Zhu Hu

Department of Cardiovascular Medicine, The Second Affiliated Hospital of Nanchang University, China

Background

Heart failure (HF) is a leading cause of cardiovascular morbidity and mortality worldwide, with patients admitted to the intensive care unit (ICU) facing particularly poor outcomes due to the frequent presence of multi-organ dysfunction. Effective blood pressure (BP) management is a cornerstone of care in these critically ill patients, yet it remains a significant clinical challenge. Both hypotension and hypertension can precipitate hemodynamic instability and worsen prognosis. Achieving and maintaining systolic blood pressure (SBP) within an optimal range is therefore essential for stabilizing these vulnerable patients.

Time in Target Range (TTR), a metric that quantifies the proportion of time a patient's physiological parameters remain within a desired range, has emerged as a valuable tool in clinical management. While its utility is established in chronic conditions like hypertension, its application to acute BP control in the ICU is less understood. Previous ICU research has often focused on single BP measurements or short-term BP variability, which may not fully capture the importance of sustained hemodynamic stability. Furthermore, there is a significant knowledge gap regarding how early BP control during the initial, critical phase of an ICU stay impacts not only short-term, in-hospital outcomes but also long-term survival in HF patients. This study aimed to address this gap by evaluating the association between SBP TTR during the first 24 hours of ICU admission and both in-hospital and one-year all-cause mortality in a large cohort of critically ill patients with HF.

Methods

This retrospective cohort study was conducted using data from the Medical Information Mart for Intensive Care IV (MIMIC-IV) database (version 3.1), a comprehensive dataset from Beth Israel Deaconess Medical Center (2008–2022). The study population consisted of patients with a diagnosis of HF who were admitted to an ICU for the first time and had a length of stay of at least 24 hours.

The primary exposure was SBP TTR, calculated for the first 24 hours of ICU admission. The target SBP range was defined as 110–140 mmHg. TTR was computed using linear interpolation between all available SBP measurements, and only patients with at least 19 hours of SBP data within the 24-hour window were included to ensure reliable estimation. The primary outcome was in-hospital all-cause mortality. The secondary outcome was one-year all-cause mortality following hospital discharge.

A wide range of data was extracted, including demographics, comorbidities, laboratory values, vital signs, and treatments. Multiple imputation was used to handle missing data. The association between SBP TTR and outcomes was assessed using multivariable regression models. Logistic regression was used for in-hospital mortality, and Cox proportional hazards models were used for one-year mortality. SBP TTR was analyzed both as a continuous variable (per 10% increase) and as a categorical variable (in quartiles). Three models were constructed: an unadjusted model (Model I), a partially adjusted model for age, sex, and BMI (Model II), and a fully adjusted model (Model III) controlling for an extensive list of confounders. Subgroup analyses and restricted cubic splines (RCS) were employed to explore the consistency and potential non-linearity of the associations.

Results

A total of 11,538 patients with HF were included in the study. The median age was 75 years, 44.3% were female, and 67.4% were White. The overall in-hospital mortality was 14.4%, and one-year mortality was 22.3%.

For the primary outcome of in-hospital mortality, a significant inverse association with SBP TTR was observed. In the fully adjusted model, each 10% increase in SBP TTR was associated with a 4% lower odds of death (OR 0.96, 95% CI 0.93-0.98). When analyzed by quartiles, patients in the second, third, and fourth quartiles had significantly lower odds of mortality compared to the lowest quartile (Q1), with adjusted ORs of 0.81, 0.72, and 0.73, respectively, suggesting a potential plateauing of benefit beyond the third quartile. Subgroup analyses showed no significant interactions, indicating that the protective association was consistent across different age groups, sexes, and comorbidity profiles. RCS analysis confirmed an approximately linear relationship that began to flatten when SBP TTR exceeded 50%.

For the secondary outcome of one-year mortality, higher SBP TTR was also associated with improved survival. Each 10% increase in SBP TTR was linked to a 2% lower hazard of death in the fully adjusted Cox model (HR 0.98, 95% CI 0.96-0.99). The analysis by quartiles showed a similar pattern, with adjusted HRs of 0.91, 0.87, and 0.88 for Q2, Q3, and Q4 versus Q1, respectively. Kaplan-Meier curves visually confirmed better survival for patients in higher TTR quartiles, with the curves for Q3 and Q4 overlapping. The RCS analysis for one-year mortality revealed a significant non-linear relationship (P for non-linearity = 0.043), where the risk decreased as SBP TTR increased to approximately 50%, after which the benefit leveled off.

Conclusion

This study demonstrates that a higher SBP TTR during the first 24 hours of ICU admission is independently associated with significantly lower short-term (in-hospital) and long-term (one-year) all-cause mortality in critically ill patients with heart failure. The findings highlight SBP TTR as a pragmatic and clinically relevant metric for assessing the quality of BP control in the acute setting. The consistent association across various subgroups underscores its broad applicability.

The observed plateauing of benefit, particularly for one-year survival, suggests that while achieving stable BP within the target range is crucial, there may be a threshold effect, where pushing for extremely high TTR values may not confer additional survival advantages. This nuanced finding supports a personalized approach to BP management. Although limited by its retrospective design, this study provides strong evidence that early and sustained optimization of SBP is a critical determinant of both immediate and future survival in HF patients. SBP TTR should be considered a valuable target for hemodynamic management and a useful prognostic marker in this high-risk population.

静脉与冠脉联合应用比伐卢定对 STEMI 接受 PPCI 无复流的预防作用

静脉与冠脉联合应用比伐卢定对 STEMI 接受 PPCI 无复流的预防作用

梁振洋，徐凯，王斌，刘海伟，关绍义，韩雅玲

北部战区总医院 心血管内科 全军心血管病研究所

目的 探讨在 STEMI 接受 PPCI 患者中，探索静脉标准剂量比伐卢定应用的情况下，给予冠脉内注射一定剂量的比伐卢定对预防术中冠脉无复流（No-flow，NR）的有效性及安全性。

方法 入选在本院心内科就诊并符合入排标准的住院急性 STEMI 接受 PPCI 患者共 86 例，全部患者均给予标准剂量比伐卢定进行术中抗凝（静脉负荷剂量 0.75mg/kg，静脉持续滴注 1.75mg/kg/h，且持续至术后 3-4h），随机分为实验组（46 例）及对照组（40 例）。在梗死相关动脉恢复至 TIMI ≥ 2 级血流情况下，经给予冠脉内注射比伐卢定（0.75mg/kg，与静脉负荷剂量相同）或生理盐水（10ml）后，观察主要终点：支架植入完成后即刻及术终时冠脉血流恢复情况（校正的 TIMI 血流帧数 -CTFC）、术后 90 分钟心电图 ST 段完全回落率（ST 段回落≥ 70%）；

结果 对于急性 STEMI 接受 PPCI 的患者，在给予上述术中抗凝方案情况下，在其冠脉靶血管为 TIMI ≥ 2 级血流时，经冠脉内预防性注射与静脉负荷相同剂量的比伐卢定（0.75mg/kg），与冠脉内注射生理盐水 10ml 相比较，可显著降低支架植入完成后靶血管即刻出现的无复流（CTFC ≥ 40）的发生率，但在术后 90 分钟心电图 ST 段完全回落率以及 30 天 NACE 方面，两组并无显著性差异，且未出现临床出血事件。

结论 在急性 STEMI 接受 PPCI 患者中，静脉联合预防性冠脉内注射比伐卢定对梗死相关动脉支架植入术后发生无复流具有预防作用且安全性较好。

【摘要】

目的： 单中心回顾性分析比伐芦定与普通肝素对主动脉球囊反搏（IABP）辅助冠脉介入治疗术（PCI）中激活凝血酶时间 (ACT) 的影响。

方法： 回顾性检索北部战区总医院心血管内科数据库 2019 年 10 月至 2021 年 9 月应用 IABP 辅助患者 272 例。符合入排标准共 212 例（比伐芦定组 104 例，肝素组 108 例）。依据分组不同，对基线临床资料以及 PCI 术中 ACT 数值进行了统计学分析。所有入选患者均按照 PCI 操作常规进行操作，普通肝素及比伐芦定均严格依照治疗指南进行给药 (比伐芦定 0.75mg/kg 静脉负荷剂量，静脉持续 1.75mg/kg/h 泵入；普通肝素 70-100u/kg)。主要观察终点：术中 ACT 数值变化情况；次要观察终点：术后血小板变化情况。

结果：比伐芦定组患者在女性比例、体重、术前血小板计数方面，显著低于普通肝素组（P 均 < 0.05）；比伐芦定组患者的年龄和 CRSADE 评分显著高于普通肝素组（P 均 < 0.05）；而在糖尿病、高血压、卒中史、术前 LVEF 等方面，两组无明显差异（P 均 > 0.05）。比伐芦定组患者 PCI 的首次、术中及术毕 ACT，比伐芦定组均显著高于普通肝素组（P 均 < 0.05）；术后血小板计数（117.4±35.7×10^9/L vs.189.1±47.8×10^9/L，P < 0.05）以及术前术后血小板计数差值方面，两组均具有显著统计学差异（17.4±9.8×10^9/L vs. 44.6±21.3×10^9/L，P < 0.05），比伐芦定组的血小板计数差值变化更小。

结论： 单中心回顾性分析结果提示，在 IABP 辅助 PCI 术中，不同抗凝药物的 ACT 数值不同，比伐芦定相较于普通肝素更多应用于出血高危人群且血小板计数更为稳定。

关键词：比伐芦定，肝素，主动脉球囊反搏（IABP），冠脉介入治疗 (PCI)，激活凝血酶时间 (ACT)

AccuIMR 冠脉微循环功能评估及对急诊 PCI 术后 STEMI 患者住院临床结局影响的研究

李雪

首都医科大学宣武医院

目的：急性 ST 段抬高型心肌梗死（STEMI）是冠状动脉粥样硬化斑块破裂导致急性血栓形成、罪犯血管完全闭塞的心脏急重症，严重者会危及患者生命。冠状动脉微血管阻塞（MVO）和微循环功能障碍是 STEMI 患者预后不良的重要原因之一。然而，至今，MVO 发病机制尚未完全阐明，同时，缺乏有效、临床可行的、实时冠脉微循环功能评估方法，干预策略及其有效性、安全性的大规模研究验证也尚存争议。本研究基于队列研究，探究 AccuIMR 值对冠脉微循环功能的评估及其对急诊 PCI 术后 STEMI 患者住院临床结局的影响。研究将为 STEMI 再灌注后 MVO 的发病原因、早期评估与干预策略研究提供重要的临床数据。方法：本研究为前瞻性队列研究，入选 2022 年 9 月至 2023 年 12 月期间首都医科大学宣武医院心脏内科收治的接受急诊 PCI 的 STEMI 患者 116 例。患者急诊 PCI 术后即刻测量 AccuIMR 值，AccuIMR ≥ 25 为冠脉微循环功能障碍的诊断界值，据此分为 AccuIMR ≥ 25 组和 AccuIMR<25 组。收集入选患者的临床资料，包括人口统计学信息、一般情况、既往相关疾病及危险因素、心脏功能状态、缺血性不良事件风险评估、生化指标、炎症指标、急诊 PCI 手术情况、出院时冠心病二级预防治疗等。研究结局为院内 MACE 事件、左心室射血分数、心肌损伤标记物（肌钙蛋白 I 峰值）。结果：本研究最终入选的 116 例 STEMI 患者中，AccuIMR ≥ 25 组 42 例、AccuIMR<25 组 74 例，STEMI 患者急诊 PCI 术后 AccuIMR 值≥ 25 占比为 36.2%。全部入选患者平均年龄 61.44±12.60 岁，男性占 81.9%，入院心功能分级 Killip^{3}2 级占 25.0%，平均 Grace 评分为 148±41 分。患者发病至再灌注的平均时间为 270.98 分钟，进门至球囊扩张的平均时间为 74.50 分钟。与 AccuIMR<25 组相比，AccuIMR ≥ 25 组患者术后 1 小时和术后 24 小时 STR 不良发生率明显更高（47.6% vs. 24.3%, P=0.010）（33.3% vs. 10.8%, P=0.003）。全部患者院内 MACE 事件发生率为 0.9%。与 AccuIMR<25 组相比，AccuIMR ≥ 25 组患者心肌损伤标记物（峰值 TnI）显著升高（29.71±16.56ng/ml vs. 22.49±17.35ng/ml, P=0.031, 95%CI: 0.669, 13.766）。两组患者在院内 MACE 事件和左心室射血分数减低的发生率方面未见显著差异。结论：与非 MVO 组相比，MVO 组左室射血分数减低和 AccuIMR 值≥ 25 发生率更高。与 AccuIMR<25 组相比，AccuIMR ≥ 25 组患者心肌损伤标记物（峰值 TnI）明显升高，两组在院内 MACE 事件、左心室射血分数上不具有显著差异。

基于可解释机器学习模型的 VA-ECMO 辅助儿童急性肾损伤风险早期预测

史树锦 [1] 闫浩杰 [1] 邵钧捷 [1] 周晶晶 [1] 洪小杨 [2] 张然 [1]

1. 中国人民解放军总医院（解放军 301 医院、三零一医院、301 医院）

2. 中国人民解放军总医院第七医学中心儿科医学部

目的：

VA-ECMO 已经成为儿童危重症心脏病终末期心力衰竭的关键机械循环辅助支持手段，但其引发的急性肾损伤（AKI）是导致患儿高死亡率的重要原因之一。早期识别和预测接受 VA-ECMO 辅助患儿发生急性肾损伤的风险，有助于及时启动治疗措施和改善临床预后。本研究旨在基于机器学习方法，构建并验证 VA-ECMO 相关急性肾损伤风险的临床预测模型。

方法：

本研究为一项多中心回顾性研究，旨在构建并验证 VA-ECMO 辅助儿童相关急性肾损伤风险的临床预测模型。研究纳入 2017 年 10 月至 2023 年 5 月期间，6 家国内三级医院因危重症心脏病终末期心力衰竭接受 VA-ECMO 辅助的患儿 372 例。其中，5 家医院的 298 名患儿数据用于模型的训练和内部验证，1 家医院的 74 名患儿数据用于外部验证。急性肾损伤的诊断依据 KDIGO 标准，综合血清肌酐水平和尿量进行评估。通过各中心医院的电子病历系统获取数据，并采用单因素分析、LASSO 回归、共线性分析及方差膨胀因子计算等方法，筛选出 22 项特征变量用于模型构建。基于筛选后的变量，应用 11 种机器学习算法开发预测模型。通过多项评估指标（包括受试者工作特征曲线下面积）比较模型的预测性能。通过计算 SHAP 值来确定每个特征在预测性能最高的模型中的预测作用。

结果：

在 11 种机器学习模型中，额外树（ET）模型展现出最佳的预测效能。基于 SHAP 值计算对特征重要性进行排序后，我们构建了一个包含 8 个关键特征的可解释性额外树模型。该最终模型在内部验证集（AUC = 0.937）和外部验证集（AUC = 0.786，AUPRC = 0.835）中均表现出对急性肾损伤的准确预测能力。SHAP 分析进一步揭示，肾小球滤过率、年龄、身高、乳酸、直接胆红素、最低舒张压、嗜酸性粒细胞以及 CALLY 指数是对预测结果影响最大的特征。此外，为促进临床转化，本研究开发了一款在线预测工具：临床医生输入模型所需的 8 项特征值后，即可获得该 VA-ECMO 辅助患儿的急性肾损伤风险预测结果。

结论：

本研究开发的可解释性机器学习模型能够准确预测接受 VA-ECMO 辅助患儿发生急性肾损伤的风险。该模型通过提供早期预警，可指导临床及时采取干预措施，从而预防或减少急性肾损伤的发生。模型本身采用了可解释的机器学习技术，有效缓解了临床对模型“黑箱”问题的疑虑。

Combined single-cell RNA sequencing and mendelian randomization to identify biomarkers associated with lipid metabolism in myocardio infraction

Yaling Han, Jing Pan, Hai-Xu Song, Ya-Ling Han

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Abstract

Background: Myocardial infarction (MI) remains a predominant cause of heart failure and mortality globally, resulting in extensive myocardial tissue damage that necessitates effective repair mechanisms. Fibroblasts are central to tissue repair, yet recent research has illuminated the critical role of macrophages, which, beyond their immune functions, can undergo macrophage-myofibroblast transformation (MMT) to contribute significantly to myocardial repair and fibrosis. Despite its importance, the molecular and metabolic mechanisms driving MMT, particularly the heterogeneity of macrophage subpopulations and their contributions to myocardial fibrosis, remain poorly understood. This study aims to dissect the molecular regulators, metabolic pathways, and cellular interactions underlying MMT in MI, with the goal of identifying novel biomarkers to enhance therapeutic strategies for post-MI cardiac recovery.

Methods: We leveraged single-cell RNA sequencing data from a mouse MI model (GSE284611), obtained from the GEO database (https://www.ncbi.nlm.nih.gov/geo/), to investigate macrophage heterogeneity and identify subpopulations involved in MMT. Subpopulation analysis was performed to isolate key macrophage clusters associated with MMT. To elucidate regulatory mechanisms, we conducted gene enrichment analysis using Gene Ontology (GO) and Gene Set Variation Analysis (GSVA). Pseudotime analysis, implemented with the Slingshot package, traced the differentiation trajectories of macrophage subpopulations. Differential gene expression analysis, performed using the R package DeSeq2, identified key regulatory genes. A metabolic scoring system was developed to explore the relationship between metabolic pathways and MMT. The gene Rora was identified as a potential regulator and validated using an external human MI dataset (GSE166780). Experimental validation of Rora expression was conducted in mouse bone marrow-derived macrophages (BMDM) using immunofluorescence, Western blot, and quantitative Reverse Transcription Polymerase Chain Reaction (RT-PCR). Cell communication networks facilitating MMT were analyzed using the Cellchat package, focusing on signaling and metabolic interactions.

Results: Single-cell RNA sequencing analysis identified seven macrophage subpopulations, with the C6 cluster emerging as the primary contributor to MMT. GSVA and GO analyses confirmed that the C6 cluster exhibited fibroblast-like characteristics, underscoring its role in myocardial repair. Pseudotime analysis revealed the C6 cluster as a critical differentiation node in the MMT trajectory. Differential gene screening pinpointed Rora as a key regulator, with its expression significantly upregulated during the macrophage-to-fibroblast transition. Validation in the external human MI dataset (GSE166780) demonstrated a robust positive correlation between Rora expression and MMT. Experimental assays, including immunofluorescence, Western blot, and quantitative RT-PCR, confirmed elevated Rora expression in mouse BMDM macrophages. Cellchat analysis indicated that Rora regulates MMT through lipid metabolism and associated signaling pathways, highlighting a metabolic foundation for its regulatory role in myocardial repair.

Conclusion: This study elucidates the pivotal role of the C6 macrophage subpopulation in MMT during the early stages of MI, with Rora identified as a critical regulator of the macrophage-to-fibroblast transition. By modulating lipid metabolism and related signaling pathways, Rora facilitates myocardial repair, positioning it as a promising biomarker and potential therapeutic target. Enhancing Rora expression in the acute phase of MI could improve cardiac function and reduce post-MI fibrosis. These findings provide a comprehensive understanding of the molecular and metabolic mechanisms underpinning MMT, offering valuable insights for developing targeted interventions to enhance myocardial repair and improve clinical outcomes following MI.

体外心肺复苏在急性心梗后心跳呼吸骤停患者中的应用单中心经验

葛锦 潘港

岳阳市中心医院

目的：评估体外心肺复苏（ECPR）在急性心肌梗死（AMI）后心跳呼吸骤停（CA）患者中的疗效及安全性，探讨影响预后的关键因素。

方法：回顾性分析岳阳市中心医院 2020 年 1 月至 2024 年 12 月收治的 30 例 AMI 后 CA 并行 ECPR 治疗患者的临床资料，按预后分为生存组（n=11）与死亡组（n=19），比较两组一般资料、ECMO 使用时间、冠脉病变特征等，采用 Cox 回归分析 ECPR 疗效影响因素。

结果：ECPR 治疗后存活率为 36.7%。存活组患者 ECMO 使用时间更长（4.34±1.96 天 vs. 3.42±3.95 天，P=0.011）、单支冠脉病变比例更高（100% vs. 36.8%，P<0.05），且合并室颤或心律失常电风暴比例显著高于死亡组（90.9% vs. 31.6%，P<0.05）。Cox 回归显示，ECMO 使用时长与存活率独立相关（HR=0.718，95%CI: 0.532–0.967）。两组在年龄、基础疾病及休克至 ECMO 上机时间上无显著差异（均 P>0.05）。

结论: ECPR 可改善 AMI 后 CA 患者的存活率，尤其是合并室颤或单支冠脉病变者; 适当延长 ECMO 支持时间可能为关键干预窗口。但本研究样本量较小，需多中心研究进一步验证。

急性心肌梗死合并心源性休克患者急诊 PCI 术后院内上消化道出血预测模型的构建与验证

董菲 周颖 赵宇飞 张云强 梁海青 宋昱 敬锐

泰达国际心血管病医院

目的 探讨急性心肌梗死合并心源性休克（AMICS）行急诊经皮冠状动脉介入（PCI）术后患者院内发生上消化道出血的现状与特征，并基于入院时基线危险因素构建预测模型。**方法** 选取 2018 年 1 月至 2024 年 12 月就诊于泰达国际心血管病医院诊断为 AMICS 并行急诊 PCI 术的患者，根据院内有无发生上消化道出血分为未出血组和出血组。采用 logistic 回归分析基于入院时基线危险因素构建院内上消化道出血风险预测模型。采用受试者工作特征（ROC）曲线和 Hosmer-Lemeshow 法评估预测模型的预测效能和模型拟合度，各指标间 AUC 比较采用 Delong 检验，采用决策曲线分析（DCA）评价预测模型的临床实用性。**结果** 发生率：研究共纳入 253 例患者，其中 58 例院内发生上消化道出血，发生率为 22.9%。 危险因素及预测模型：多因素 logistic 回归分析结果显示，基线心源性休克分期为 D+E 期、基线 ALT > 105U/L、基线 eGFR < 46.59ml/min、基线 LVEF < 36% 是 AMICS 急诊 PCI 术后患者院内发生上消化道出血的危险因素（P < 0.05）；根据多因素 logistic 回归分析结果构建预测模型，Hosmer-Lemeshow 检验显示：该预测模型具有较好的拟合优度（χ^2=3.055，P=0.880）；该模型预测 AMICS 急诊 PCI 术后患者院内发生上消化道出血的 ROC 曲线下面积（AUC）为 0.804［95%CI（0.739,0.870）］，敏感度为 70.7%，特异度为 78.5%；Delong 检验显示，四者联合预测模型的 AUC 高于任意单一指标的 AUC（P<0. 05）；DCA 曲线表明该模型具有临床实用性。 近期预后：出血组院内死亡率明显高于未出血组（63.8% vs 29.7%，P < 0.05）；对院内存活患者住院天数进行比较，出血组明显高于未出血组（P < 0.05）。**结论** 入院时基线心源性休克分期高、肝肾功能差、LVEF 低是院内发生上消化道出血的独立危险因素，构建的预测模型预测效能较高。

The Role and mechanism of E3 Ubiquitin Ligase HUWE1 In Acute Myocardial Infarction

Tao Zhou[1], Chen Chen[1,2], Yang Shen[1,3], Rong Wan[1,3]

1. Jiangxi Key Laboratory of Molecular Medicine, the Second Affiliated Hospital of Nanchang University

2. Department of Cardiovascular Medicine, the Second Affiliated Hospital of Nanchang University

3. Department of Genetic Medicine, the Second Affiliated Hospital of Nanchang University

Background:

Acute myocardial infarction (AMI) is a serious cardiovascular disease, which is usually caused by acute and persistent ischemia and hypoxia of coronary artery, resulting in severe necrosis of myocardial tissue, which may lead to sudden cardiac death. Apoptosis plays an important role in the pathological process of myocardial infarction.; Therefore, the prevention and treatment of myocardial injury caused by myocardial infarction has become one of the hot spots in cardiovascular disease research. Previous studies have reported that E3 ubiquitin ligase HUWE1 is expressed in myocardium, but the specific mechanism of its action in myocardial hypoxia injury is still unclear.

It has been suggested that HUWE1 may regulate apoptosis in diseases through its E3 ubiquitin ligase activity. By proteomics and immunoprecipitation mass spectrometry (IP-MS), it has been suggested that PRDX6, a possible substrate of HUWE1, is closely associated with apoptosis. These results suggest that cardiac expression of HUWE1 may play a role in regulating the expression of PRDX6 in hypoxic myocardial injury. In order to verify this hypothesis, we selected heart-specific HUWE1 knockout (Myh6-CreERT2$^{+/-}$HUWE1$^{flox/flox}$) mice as experimental animals and conducted a series of in vitro experiments in rat cardiomyocytes H9C2 to explore the regulatory mechanism of heart-expressed E3 ubiquitin ligase HUWE1 in hypoxic myocardial injury.

Objective :

The aim of this study was to investigate the regulatory role and mechanism of heart-specific expression of HUWE1 in hypoxic myocardial injury, and to determine whether PRDX6 is a substrate protein of HUWE1 and plays an important role in this regulatory process.

Methods:

In this study, we constructed a heart-specific HUWE1 gene knockout (Myh6-CreERT2$^{+/-}$HUWE1$^{flox/flox}$) strain of mice by CRISPR/Cas9 technology, and set wild-type mice as control group to construct myocardial infarction model together. At the same time, H9C2 rat cardiomyocytes were used to study the regulatory role and mechanism of heart-specific expression of HUWE1 in hypoxic myocardial injury at animal and cellular levels, as follows:

1. C57BL/6J mice were used to establish the model of acute myocardial infarction (AMI). The success of AMI model was evaluated by ECG, small animal ultrasound and HE staining. The expression of HUWE1 in myocardium was detected by Western blot, immunohistochemistry (IHC) and immunofluorescence (IF) staining. The expression of HUWE1 in NRCMs was detected by Western blot.

2. Heart-specific HUWE1 knockout mice were obtained by CRISPR/Cas9 gene knockout technique, and acute myocardial infarction model was established. The changes of cardiac function in mice were evaluated by small animal echocardiography, and the expressions of IL-6, TNF-α, HUWE1, BAX, Bcl-2 in heart were detected by Western blot, and the degree of myocardial injury and apoptosis of myocardial cells were evaluated by IHC staining and HE staining. In addition, H9C2 cells with low expression of HUWE1 were obtained by lentivirus transfection, and the cell hypoxia model was established. The expression changes of IL-6, TNF-α, HUWE1, BAX and Bcl-2 in H9C2 rat cardiomyocytes after hypoxia injury were detected by Western blot, and the myocardial injury and apoptosis level were further evaluated at the in vitro level.

3. Using molecular docking and co-immunoprecipitation techniques, the interaction between HUWE1 and PRDX6 was explored.

Results:

1. The expression of HUWE1 decreased after myocardial ischemia injury.

Myocardial infarction model mice showed obvious ST segment elevation, echocardiography showed that the cardiac function of mice after myocardial infarction decreased significantly, while HE staining showed that the scar tissue increased and neutrophils infiltrated in the hearts of mice after myocardial infarction surgery. These results indicated that the myocardial infarction model was successfully established. Western blot, immunohistochemistry (IHC) and immunofluorescence (IF) stain showed that that expression of HUWE1 protein in myocardial tissue of mice at 2 week after myocardial infarction tended to decrease as compared with control group, and the expression of HUWE1 protein in H9C2 cell was also down-regulated at 8 hours after hypoxia.

2. HUWE1 has protective effect on myocardial ischemia injury.

Compared with Sham group, the results of HE staining showed that myocardial injury was aggravated after acute myocardial infarction in heart-specific HUWE1 knockout mice, and cardiac ultrasound showed that the decline of cardiac function was more obvious. The results of Western blot showed that the expression of IL-6 and TNF-α increased in myocardium. In vitro, the expression of IL-6 and TNF-α in H9C2 cells with low HUWE1 expression was also up-regulated after hypoxia.

3. HUWE1 attenuated myocardial ischemia by regulating cardiomyocyte apoptosis.

Compared with wild-type myocardial infarction mice, Western blot and IHC staining of heart-specific HUWE1 knockout mice after acute myocardial infarction showed that BAX protein expression increased and Bcl-2 expression decreased. In vitro, the expression of BAX increased and Bcl-2 decreased in H9C2 cells with low HUWE1 expression after hypoxia.

4. PRDX-6 is the substrate of HUWE1.

The results of molecular docking suggested that HUWE1 and PRDX-6 may be bound to each other, and the interaction between HUWE1 and PRDX-6 was confirmed by endogenous co-immunoprecipitation.

Conclusion:

Our results show that HUWE1 gene knockout exacerbates apoptosis in myocardia -l tissue and further exacerbates inflammation and injury of myocardial tissue during myocardial ischemia injury in acute myocardial infarction. Meanwhile, we speculate that HUWE1 may play one of its molecular mechanisms of action by stabilizing the expression of PRDX6.

Key words: acute myocardial infarction; cardiomyocyte; HUWE1;E3 ubiquitin ligase; PRDX6

The global burden of Aortic Aneurysm attributable to Hypertension from 1990 to 2021: Current Trends and Projections for 2050

Peng Liu

Department of Cardiology, the First Affiliated Hospital of Dalian Medical University, Dalian, Liaoning Province, China.

Background and Objectives: Hypertension is a major risk factor for aortic aneurysm (AA), the global distribution and trends of hypertension-related AA burden at the global, regional, and national levels remain inadequately explored. This study aims to utilize data from the 2021 Global Burden of Disease (GBD) database to identify trends related to AA attributable to hypertension from 1990 to 2021 and to forecast future burden trends. The findings will provide evidence to support targeted decision-making. In the generalpopulation aged 60 and above, the prevalence of AA ranges from 1.6% to 7.2%.Research indicates that the prevalence of AA is significantly higher in men, ranging

from 1.9% to 18.5%, compared to women, where it varies between 0.1%

and 4.2%. Multiple studies have identified hypertension, advanced age, male gender, smoking history and family history of AA as the most crucial risk factors contributing to the burden of this condition. These findings underscore the urgent need for targeted screening and preventive strategies to address this life-threatening disease

Methods: This study extracted data on mortality, disability-adjusted life years (DALYs), age-standardized mortality rate (ASMR), and age-standardized DALY rate (ASDR) associated with AA attributable to hypertension from the 2021 GBD study. The estimated annual percentage change (EAPC) was employed to assess burden trends from 1990 to 2021.The study utilized the Bayesian Age-Period-Cohort (BAPC) model

to project disease trends from 2022 to 2050. Additionally, decomposition analysis and frontier analysis were employed to conduct a more comprehensive examination of the data.The GBD Results Tool (http://ghdx.healthdata.org/GBD-results-tool), is an open-access database that aggregates data on the influence of diverse risk factors onhealth burdens across countries worldwide. These data are estimated using

standardized methodologies, ensuring high reliability and authority. In the 2021 study, researchers comprehensively evaluated 371 diseases and injuries across 204 countries and territories from 1990 to 2021, assessing health loss by age and sex

Results: In 2021, the global number of deaths and DALYs attributable to hypertension related AA reached 26,782.33 and 529,976.65, respectively, representing increases of 49.14% and 46.98% compared to 1990. However, the global ASMR and ASDR exhibited declining trends. From 1990 to 2021, the ASDR for hypertension-related AA decreased by 54.08% and 15.56% in high-SDI and upper-middle-SDI regions, respectively, while it increased by 25.23%, 62.02%, and 17.99% in middle-SDI, lower middle-SDI, and low-SDI regions. The disease burden is significantly higher in males than in females and increases with age.The findings from the decomposition analysis

reveal that population growth and the aging process are the primary contributors to the escalating burden, with varying impacts across different regions. The frontier analysis identified 15 countries with the greatest potential for improvement. According to the BAPC model, the ASDR for females is projected to rise across the 20 to 80 age group, while for males, the increase is particularly pronounced in the 55 to 75 age group. Globally, the ASDR is expected to initially decline before gradually rising, reaching 12.07 per 100,000 by 2050, a 5% increase compared to 2021.

Conclusion: While the global number of deaths and DALYs attributable to hypertension-related AA continues to rise, the ASMR and ASDR are showing a declining trend. However, in middle, lower-middle, and low SDI regions, ASMR and ASDR remain on an upward trajectory. Projections indicate that the global ASDR will initially decline before gradually increasing, with an expected rise by 2050.

Relationship between uric acid to high-density lipoprotein cholesterol ratio and depression in patients with myocardial infarction: a cross-sectional survey based on NHANES database from 2011 to 2018

tingting Wang, Li-Xiang Zhang, Shan-Bing Hou, Jing Chen, Xia Chen, Jiao-Yu Cao

The First Affiliated Hospital of USTC, Division of Life Science and Medicine, University of Science and Technology of China

Background:

Depression is a prevalent psychological condition that frequently coexists with cardiovascular diseases, particularly myocardial infarction (MI). Following a myocardial infarction, patients face a substantially increased risk of developing depressive symptoms, which are associated with adverse clinical outcomes, including poor medication adherence, reduced engagement in cardiac rehabilitation, delayed recovery, increased risk of secondary cardiovascular events, and elevated mortality. Research indicates that approximately 30% of patients with MI develop some form of depression, with 10% meeting the diagnostic criteria for major depressive disorder. Early detection and treatment of depression are essential for improving both mental health and cardiovascular prognosis. However, effective screening tools for identifying patients at risk for depression remain limited in routine cardiac care. Inflammatory and metabolic pathways have been increasingly implicated in the development of depression. The uric acid to high-density lipoprotein cholesterol ratio (UHR) is a novel composite biomarker that reflects the balance between pro-oxidant and anti-inflammatory metabolic states. It has shown predictive value in cardiovascular, metabolic, and inflammatory conditions. Despite this, its association with depression in patients with MI remains largely unexplored. This study aimed to investigate the relationship between UHR and depression in patients with a history of myocardial infarction using nationally representative survey data.

Methods:

This cross-sectional analysis was based on data from the National Health and Nutrition Examination Survey (NHANES) collected between 2011 and 2018. Adult participants who reported a history of myocardial infarction were included. Participants were excluded if they lacked data on serum uric acid, HDL cholesterol, PHQ-9 depression score, or essential demographic and clinical covariates. Depression was assessed using the Patient Health Questionnaire-9 (PHQ-9), with a cutoff score of 10 or higher used to define clinically relevant depressive symptoms. The UHR was calculated as uric acid (mg/dL) divided by HDL-C (mg/dL), multiplied by 100. Multivariate linear regression analyses were used to assess the relationship between UHR and depression across progressively adjusted models. A restricted cubic spline model was used to evaluate potential nonlinear associations. Subgroup analyses were conducted to investigate effect modifications by gender, age, race, marital status, comorbid conditions, and other covariates.

Results:

A total of 18,200 individuals with MI were included in the final analysis. A significant nonlinear relationship between UHR and depression was identified. When UHR was below 10.45%, the association with depression was stronger (β = 0.12, 95% CI: 0.05–0.19, P < 0.001). When UHR was 10.45% or higher, the effect size decreased but remained statistically significant (β = 0.04, 95% CI: 0.01–0.07, P = 0.024). Subgroup analysis showed a significant interaction by gender (P for interaction < 0.001), with a stronger association in females (β = 0.13, P < 0.001) than in males (β = 0.04, P = 0.013). These associations remained robust after adjusting for multiple demographic, clinical, and laboratory variables and were supported by sensitivity analyses based on UHR quartiles.

Conclusion:

This study demonstrated a nonlinear and gender-specific relationship between UHR and depression among patients with myocardial infarction. UHR, as a simple, low-cost, and widely available blood-based indicator, may serve as a practical tool for identifying patients at increased risk of depression after MI, particularly among female patients. The nonlinear pattern also suggests that UHR may be more predictive in specific physiological ranges. Given the increasing recognition of depression as a critical component of cardiovascular prognosis, integrating UHR into comprehensive cardiac risk assessment models could enhance early detection strategies. Further longitudinal and mechanistic studies are needed to clarify causality, investigate potential biological pathways, and validate the clinical utility of UHR in depression screening and prevention efforts among diverse cardiac populations.

肝功能对 ICU 心力衰竭患者预后的预测价值

曾庆平 [1] 佘飞 [2] 贾思琦 [3] 张萍 [2]

1. 清华大学临床医学院，北京 102218，中国

2. 清华大学临床医学院北京清华长庚医院心内科，北京 102218，中国

3. 陆军军医大学西南医院，重庆 400038，中国

目的：本研究旨在评估肝功能指标对重症监护病房（Intensive Care Unit，ICU）中心力衰竭（心衰）患者 30 天和 1 年心衰再住院及全因死亡的预测价值，并探讨其在不同心衰亚型中的异质性效应。

方法：研究纳入重症监护医学信息数据库第四版（Medical Information Mart for Intensive Care IV，MIMIC-IV）中 3,777 例心衰患者，采用 Cox 比例风险模型和限制性立方样条（Restricted Cubic Spline，RCS）分析，评估丙氨酸氨基转移酶（Alanine Aminotransferase，ALT）、天门冬氨酸氨基转移酶（Aspartate Aminotransferase，AST）、碱性磷酸酶（Alkaline Phosphatase，ALP）、总胆红素（Total Bilirubin，TBIL）及肝病分级（轻度与重度）与国际标准化比值（International Normalized Ratio，INR）、凝血酶原时间（Prothrombin Time，PT）、部分凝血活酶时间（Partial Thromboplastin Time，PTT）及凝血功能障碍等指标与 30 天和 1 年心衰再住院及死亡结局之间的关联关系。主要研究终点为心衰再住院。

结果：ALP 与心衰患者的 30 天及 1 年心衰再住院风险均成显著相关，其中 30 天心衰再住院风险比（Hazard Ratio，HR）=1.28，95% 置信区间（Confidence Interval，CI）：1.01–1.63），1 年心衰再住院 HR=1.18，95%CI:1.00–1.40；在射血分数保留型心衰（Heart Failure with preserved Ejection Fraction，HFpEF）亚组中该关联更为显著（30 天心衰再住院 HR=1.72，95%CI: 1.15–2.56，1 年心衰再住院 HR=1.48，95%CI:1.12–1.96）。在 HFpEF 患者中，TBIL 位于 Q4 时与 30 天心衰再住院风险显著升高（HR=1.64，95%CI: 1.05–2.57）。ALT、AST、INR、PT 以及 PTT 与 30 天全因死亡呈正相关，ALP、INR、PT 以及 PTT 与 1 年全因死亡呈正相关。RCS 分析提示：ALP 和 PTT 与 1 年全因死亡呈显著非线性关系（p-nonlinear<0.05）。

结论：ALP 为预测 ICU 心衰患者短期及长期心衰再住院的重要指标，尤其在 HFpEF 人群中具有较强预测能力；TBIL 对 HFpEF 患者短期心衰再住院亦具有提示作用。ALT、AST、凝血功能障碍、INR、PT 及 PTT 对短期死亡风险具预测意义，而上述指标加上肝病严重程度亦与长期死亡风险密切相关。建议在临床中常规监测相关指标，并结合心衰类型进行个体化风险评估，以优化治疗策略与预后判断。

Xa 因子抑制剂在急性心肌梗死后左心室血栓的有效性及安全性：一项单中心回顾性研究

董妍 叶雯 严文文（血脂异常学组）

上海市同济医院（同济大学附属同济医院）

目的：本研究旨在评估 Xa 因子抑制剂对比华法林在治疗急性心肌梗死后左心室血栓中的有效性及安全性。

方法：选取上海市同济医院 2018 年 1 月至 2023 年 12 月因急性心肌梗死后 90 天内通过心脏彩色多普勒超声（TTE）确诊的新发左心室血栓 (LVT) 患者共 106 例，根据口服抗凝药物的种类分为 Xa 因子抑制剂组（n=67，包括利伐沙班 48 例和艾多沙班 19 例）和华法林组（n=39）。此外，对 48 例接受利伐沙班抗凝治疗的患者进行亚组分析，根据利伐沙班的剂量差异将其分为两组: 低剂量组（10 mg/d，n=26）和标准剂量组（15-20 mg/d，n=22）。所有患者均接受了为期 12 个月的连续随访观察。研究期间，对两组患者的以下指标进行了记录与比较: 基础临床数据、抗凝治疗 3 个月后 LVT 血栓的变化情况、血栓完全消失患者在 1 年内血栓复发的频率、新发血栓栓塞事件的发生率、出血事件的发生率，以及主要不良心血管事件（MACE）和全因死亡事件的发生情况。

结果：两组患者在年龄、性别、吸烟史、合并疾病、血栓特征、左心室射血分数、左心室舒张末期内径、左心室收缩末期内径、肌酐清除率以及合并药物治疗等基线指标，差异无统计学意义（P>0.05），两组具有可比性。相比于华法林组，Xa 因子抑制剂组的出血风险更低（5.97% vs. 23.08%, P = 0.007），差异具有统计学意义，其余血栓溶解率（86.57% vs. 79.49%, P = 0.768）、血栓消失 1 年内再复发率（1.72% vs. 6.45%, P = 0.134）、栓塞事件发生率（1.49% vs. 5.13%, P = 0.053）、心衰反复入院率（10.45% vs. 7.67%, P = 0.742）、全因死亡率（1.49 % vs. 5.13%, P = 0.756）、不良心血管事件发生率（17.91% vs. 33.33%, P = 0.071）差异均无统计学意义。亚组分析中，利伐沙班低剂量组和标准剂量组基线特征均衡。相比于标准剂量组，低剂量组利伐沙班在血栓溶解率(88.46% vs. 95.45%, P = 0.743)、血栓消失 1 年内再复发率(4.53% vs. 0.00%, P = 1.000）、出血事件发生率（11.54% vs. 9.10%, P = 0.646）、栓塞事件发生率（3.85% vs. 0.00%, P = 1.000）、心衰反复入院率（11.54% vs. 4.55%, P = 0.710）、全因死亡率（3.85% vs. 0.00%, P = 1.000）、不良心血管事件发生率（19.23% vs. 18.18%, P = 1.000）差异均无统计学意义。

结论：1、对于急性心肌梗死后左心室血栓患者，Xa 因子抑制剂在促进血栓溶解、预防栓塞的疗效与华法林类似，不增加 LVT 患者 MACE 及全因死亡风险，且 Xa 因子抑制剂降低了 LVT 患者的出血风险。2、低剂量（10mg/d）和标准剂量（15-20mg/d）利伐沙班在 LVT 患者的抗凝治疗中具有相似的安全性，标准剂量的利伐沙班并未增加出血或栓塞风险。

关键词：Xa 因子抑制剂；维生素 K 拮抗剂；华法林；左心室血栓；出血事件

AECOPD 伴心房颤动临床预测模型构建与验证及预后分析

刘鹏

大连医科大学附属第一医院

背景与目的：慢性阻塞性肺疾 病急性加重期（AECOPD）是慢性阻塞性肺疾病（COPD）恶化转危的重要临床表现形式之一，心房颤动（AF）是一种 AECOPD 常见的并发症，而 AECOPD 的发作次数和严重程度与 AF 的发生率成正相关，且 AECOPD 合并 AF 患者通常预后不佳。通过相关危险因素预测 AF 的发生对改善患者的预后至关重要。但 AECOPD 与 AF 之间的关系尚不完全清楚。本研究旨在探索 AECOPD 患者合并 AF 的危险因素，建立并验证预测模型，为临床早期识别高危人群提供依据。

方法：本研究回顾性纳入 2015 年 1 月至 2020 年 12 月大连医科大学附属第一医院收治的 857 例 AECOPD 且首诊 AF 住院患者。根据在院期间是否首诊 AF，分为发生 AF 组（AF 组）和未发生 AF 组（N-AF 组）。收集患者临床资料、生化指标、超声指标及生存情况。在单因素分析基础上采用多因素 Logistic 回归分析筛选危险因素，建立列线图模型，通过绘制受试者特征（ROC）以及 Hosmer-Lemeshow 拟合优度检验和决策曲线分析(DCA)曲线评估模型的预测能力、校准度和临床实用性，同时进行内部验证。绘制 Kaplan-Meier 曲线描述两组全因死亡率，Log-rank 检验用于比较两组生存分布情况。本研究的观察期为出院后 30 个月，终点事件为观察期间发生的全因死亡。

结果：根据住院期间是否首诊 AF 分为 N-AF 组（n=475），AF 组（n=382）。单因素分析显示两组在年龄、同型半胱氨酸（HCY）、尿酸（UA）、左心房内径（LAD），有无吸烟史、高血压史、糖尿病史、冠心病史、心力衰竭病史、红细胞计数、血小板计数、血清白蛋白（ALB）、C- 反应蛋白（CRP）、降钙素原（PCT）、中性粒细胞 / 淋巴细胞比值（NLR）、单核细胞 / 高密度脂蛋白比值（MHR）、淋巴细胞 / 单核细胞比值（LMR）、血小板 / 血清白蛋白（PAR）、全身炎症反应指数（SIRI）、全身免疫反应指数（SII）、游离三碘甲状腺原氨酸（FT3）、CHA2DS2-VASc 评分、左室舒张末期内径（LVEDd）、左室射血分数（LVEF）的差异具有统计学意义（P < 0.05）。将上述自变量纳入多因素 Logistic 回归分析结果显示，年龄 [OR=1.05，95% CI（1.01-1.10），P=0.040]、LAD [OR=1.24，95% CI（1.14-1.34），P < 0.001]、UA [OR=1.01，95% CI（1.01-1.01），P=0.027] 是 AECOPD 患者发生 AF 的独立危险因素，FT3 水平降低 [OR=0.73，95% CI（0.58 ~ 0.92），P=0.008] 是 AECOPD 患者发生 AF 的保护因素。ROC 曲线分析结果显示，该列线图模型 AECOPD 患者合并 AF 的曲线下面积（Area Under Curve，AUC）为 0.90 [95% CI（0.86-0.96）]。Hosmer-Lemeshow 拟合优度检验结果 P > 0.05。DCA 决策曲线分析说明了该模型具有良好的临床实用性，内部验证显示模型具有稳定性，AUC 值为 0.83[95% CI（0.73-0.92）]。857 例患者中位随访时间 26（25，27）个月（P < 0.001），生存分析结果显示合并 AF 组患者中位生存时间明显短于 N-AF 组患者。

结论：年龄、LAD、UA 是 AECOPD 患者发生 AF 的独立危险因素，FT3 是 AECOPD 患者发生 AF 的保护因素。所建立的列线图模型可靠地预测 AECOPD 患者合并 AF 的风险，为临床早期干预提供客观依据。

Association of longitudinal Blood Urea Nitrogen trajectory with in-hospital and 28-day mortality in Acute Heart Failure with Cardiorenal Syndrome

Peng Liu

大连医科大学附属第一医院

Background and Objective:

Acute heart failure (AHF) complicated by acute cardiorenal syndrome (CRS) poses significant challenges for cardiologists and intensivists due to the complex interplay between cardiac and renal dysfunction. In the cardiac intensive care unit(ICU), the prevalence of AHF with acute CRS can be as high as 25% to 50%.The rapid decline in cardiac function leads to decreased cardiac output, reduced renal perfusion, elevated venous pressure, activation of the renin-angiotensin-aldosterone system (RAAS), and inflammatory responses, severely affecting renal function. Acute CRS causes persistent volume overload, diuretic resistance, and significant acid-base and electrolyte imbalances, complicating AHF management and often requiring renal replacement therapy, which negatively impacts patient outcomes. Given the above, it is particularly important to conduct risk stratification for such patients in a timely manner.

BUN is a crucial biomarker for diagnosing and assessing prognosis in AHF complicated by CRS.In acute CRS patients, excessive activation of the RAAS and sympathetic nervous system leads to elevated BUN levels, making it a key predictor of renal function deterioration.BUN not only reflects the metabolic state of the kidneys but is also closely associated with adverse outcomes in AHF patients. However, in most studies, BUN measurements for AHF or CRS are typically taken at a single time point, primarily serving as short-term indicators of patient prognosis. This approach has certain limitations in stratifying ICU patients. The lack of dynamic monitoring means that BUN fails to accurately reflect the rapid changes in the condition of critically ill patients and the swift progression of diseases, potentially leading to inadequate risk assessment.

Methods: This retrospective cohort study utilized the Medical Information Mart for Intensive Care IV (MIMIC-IV) database as the derivation cohort and the eICU Collaborative Research Database (eICU-CRD) as the validation cohort. Firstly, we collected BUN values at baseline (<24 h), 72 h, and 144 h in the two database and established longitudinal trajectory models using the latent class growth modeling (LCGM). Secondly, we used multivariable logistic and COX regression analyses to assess the impact of different trajectory groups on the risk of hospitalization and 28-day all-cause mortality. Finally, we further performed subgroup analysis and interaction analysis to evaluate the predictive value of different trajectories.

Results: A total of 2931 people were included in these two cohorts, three distinct BUN trajectory patterns emerged: persistent-low group, persistent-moderate group, and persistent-high group. Restricted cubic splines (RCS) analysis further demonstrated a nonlinear association between baseline BUN levels and in-hospital and 28-day mortality (p>0.05 for nonlinearity), but the predictive value was inconsistent. Multivariate retrospective analysis found significantly reduced in-hospital mortality compared to the persistent-high group (derivation: OR 0.47, 95% CI 0.27-0.85; validation: OR 0.59, 95%CI 0.38-0.93) and 28-day mortality (derivation: HR 0.56, 95%CI 0.34-0.94; validation: HR 0.66, 95%CI 0.45-0.85). Subgroup analysis of the two cohorts found that the predictive value of the persistent low group was more significant in the non-diabetic population. However, no interaction was found among the subgroups, including the different grades of acute renal injury.

Conclusion: BUN trajectory patterns independently predict short-term outcomes in AHF patients with acute CRS, with persistent-low BUN trajectories associated with significantly improved survival.

“双线作战”的成功典范：多学科协作下复杂感染性心内膜炎合并肠系膜上动脉栓塞的救治

张宇

大连医科大学附属第一医院

目的：报道一例表皮葡萄球菌感染性心内膜炎（IE）并发急性肠系膜上动脉栓塞（SMAE）的成功救治经验，阐述多学科协作（MDT）与个体化抗感染策略在危重复杂 IE 治疗中的关键作用。

方法：患者为 58 岁男性，主动脉瓣生物瓣置换术后 3 个月，因“反复高热、寒战 15 天，活动后气短 3 天”入院。入院后三次血培养均为表皮葡萄球菌。超声心动图示：主动脉瓣生物瓣周赘生物（10*5mm），瓣周脓肿伴轻中度瓣周漏。给予万古霉素 + 利福平 + 庆大霉素三联抗感染，同时利尿纠正心衰、肝素抗凝，监测万古霉素血药浓度调整药量。入院第 3 天突发剧烈全腹绞痛、呕吐，查体示腹膜炎体征（腹肌紧张、压痛反跳痛阳性，肠鸣音消失），D- 二聚体 >10mg/L。增强 CT 确诊肠系膜上动脉栓塞。血管外科即刻行急诊介入肠系膜上动脉取栓术，取出感染性赘生物碎片，术中病理证实血栓内含表皮葡萄球菌菌落。患者仍持续高热，鉴于抗感染效果不佳，调整为：利奈唑胺（强化组织穿透）联合达托霉素（高效杀菌，覆盖生物膜病原体）。取栓术后 72 小时限期行心脏手术：行主动脉根部扩大 + 主动脉瓣生物瓣置换 + 二尖瓣成形 + 升主动脉置换 + 冠脉移植（Bentall 术式）+ 心包剥脱术。术后万古霉素 + 利福平抗感染 6 周，术后第 3 天血培养转阴，肠道功能恢复，启动肠内营养，耐受良好。

结果：患者成功治愈出院。出院时感染控制满意，心功能显著改善（LVEF 由

45% 恢复至 56%），肠道吸收功能恢复良好。术后 3 个月随访无复发。

结论： 本案例证明，对于合并致命性并发症（如 SMAE）的复杂 IE 患者，采用**“稳定心功能优先 + 急诊介入处理并发症 + 精准个体化抗感染 + 限期根治性心脏手术”**的分阶段、多学科协作策略，可显著改善患者预后。个体化抗感染方案（针对生物膜、组织穿透性优化）和把握手术时机至关重要。

脂肪细胞 GATA5 介导脓毒症心肌损伤的作用机制

龚冬火 叶茂青 曲新凯

复旦大学附属华东医院

目的：明确脂肪细胞 GATA5 介导脓毒症心肌损伤的作用机制

方法 :1、2 月龄 WT 小鼠予正常饮食（Chow）和高脂饮食 (HFD)8 周后行盲肠结扎穿刺手术构建脓毒症小鼠模型（CLP），两组小鼠皮下脂肪（SAT）行病理分析和 RNA-seq。

2、构建 GATA5 脂肪细胞特异性敲除小鼠（CKO）和对照鼠（CON），HFD 喂养 8 周后构建 CLP 模型 (CKO-HFD-CLP)，心超测量心功能，qPCR、WB、HE、免疫荧光分析小鼠 SAT、心肌病理和蛋白改变情况，记录小鼠生存率。

3、取 CKO-HFD-CLP 和 CON-HFD-CLP 小鼠 SAT 行 RNA-seq。

4、GATA5 敲除慢病毒转染 3T3 后予高脂刺激构建细胞肥胖模型并与心肌细胞共培养，加入大肠杆菌培养基上清液和正常培养基，诱导成脂后，3T3 细胞行油红染色，心肌细胞行蛋白组学和代谢组学检测。

5、qPCR 及 WB 检测 GATA5 敲除脂肪细胞 UCP1 表达，荧光素酶实验验证 GATA5 对 UCP1 启动子的转录活性影响。

6、HFD 饮食小鼠尾静脉注射 GATA5 过表达腺相关病毒，构建 CLP，检测 GATA5 过表达对脂肪组织形态和功能以及心功能改善程度。

结果 :1、GATA5 在肥胖 CLP 小鼠的 SAT 中表达降低。

2、相比 CON，CKO 小鼠在 HDF 饮食行 CLP，SAT 炎症细胞浸润严重，心功能较差，心肌细胞凋亡数量增多，组织炎症和纤维化加重，生存率降低。

3、CKO 和 CON 小鼠 SAT 差异基因 KEGG 和 GO 富集在脂肪生成、炎症信号通路。UCP1 是差异基因之一。GATA5 敲除的脂肪细胞 UCP1 蛋白表达降低。GATA5 促进 UCP1 启动子的转录活性。

4、大肠杆菌培养基上清液促进共培养体系 3T3 成脂以及心肌细胞凋亡和炎症。

5、SAT 中 GATA5 过表达改善 HFD 饮食 WT 小鼠 CLP 术后 SAT 炎症及小鼠心功能和心肌组织纤维化。

结论 :GATA5 通过调控 UCP1 介导肥胖相关脓毒症心肌损伤的发生发展。

Association between triglyceride glucose-body mass index and systemic inflammation response index on one-year all-cause mortality in critically ill patients with coronary heart disease: a retrospective study utilizing the MIMIC-IV database

Li Quan[1], Sheng-Yong Wu[2], Su-Xuan Liu[3]

1. The Third Affiliated Hospital of Naval Medical University/ Eastern Hepatobiliary Surgery Hospital

2. Naval Medical University

3. The First Affiliated Hospital of Naval Medical University/ Shanghai Changhai Hospital

Background Coronary heart disease (CHD) is a leading cause of global morbidity and mortality, imposing a substantial burden due to its high rates of disability and mortality. The triglyceride glucose-body mass index (TyG-BMI) index is a novel biomarker of insulin resistance (IR). While both IR and inflammation are established risk factors for coronary heart disease (CHD), their combined impact on CHD outcomes remains underexplored. This study aimed to investigate the complex interplay between the TyG-BMI index, systemic inflammation response index (SIRI), and one-year all-cause mortality in critically ill CHD patients.

Methods A cohort of CHD patients was extracted from the Medical Information Mart for Intensive Care (MIMIC-IV) database. Participants were stratified by TyG-BMI index and SIRI levels. The primary endpoint was one-year all-cause mortality. Restricted cubic splines (RCS) with knots at the median were utilized to model nonlinear dose-response relationships between the TyG-BMI index, SIRI, and mortality risk. Subgroup analyses stratified by age (≤ 65 vs. > 65 years), gender, marital status (single, married, other), race (White, Black, other), hypertension, and diabetes (derived from MIMIC-IV medical histories) were adjusted for baseline covariates. Univariate and multivariate Cox proportional hazard regression models, restricted cubic splines (RCS), and Kaplan-Meier survival curves were used to assess associations between the TyG-BMI index, SIRI, and mortality. Mediation analysis quantified inflammation-mediated pathways by defining TyG-BMI index groups as the predictor, SIRI as the mediator, and one-year all-cause death as the outcome.

Results The study included 1,566 patients, patients with lower TyG-BMI index and lower SIRI tended to be older, while those with higher TyG-BMI index and higher SIRI exhibited a greater prevalence of hypertension and diabetes. Cox proportional hazard regression revealed individuals with a TyG-BMI index below the median and SIRI above the median had the highest risk of one-year all-cause mortality (P < 0.0001), while those with a TyG-BMI index above the median and SIRI below the median had the lowest risk (P = 0.0011). RCS regression analysis demonstrated the TyG-BMI index had a negative trend with one-year all-cause mortality (P = 0.185), while SIRI had a positive relationship (P < 0.001). Subgroup analysis identified there was an increased risk of one-year all-cause mortality in subgroups of aged > 65 (P < 0.0001), female (P = 0.0041), and diabetes (P = 0.0078) when compared to aged ≤ 65, male or non-diabetic patients. Across all subgroups, the TyG-BMI index < median & SIRI > median group exhibited the poorest survival (P < 0.0001). Mediation analysis showed no significant mediation effect of SIRI between TyG-BMI index and one-year all-cause mortality.

Conclusions Our results showed that lower TyG-BMI index and higher SIRI level were associated with higher one-year all-cause mortality in critically ill CHD patients. The TyG-BMI index and SIRI was significantly associated with higher risk of one-year all-cause mortality in aged > 65, female patients, and those with diabetes. The findings recommend the combined assessment of the TyG-BMI index and SIRI level to further stratify the risk of mortality in critically ill CHD patients. Combining metabolism and inflammation can help to identify high-risk CHD patients and guide further management to lower their mortality rate.

中医耳穴贴压联合渐进式肌肉放松训练在 CCU 焦虑患者中的协同干预研究

张璐

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨耳穴贴压与渐进式肌肉放松训练联合干预对冠心病监护病房（CCU）患者焦虑状态的协同效应。

方法：选取 2022 年 3 月 -2024 年 5 月收治的 CCU 焦虑患者 120 例，采用随机数字表法分为观察组（耳穴贴压 + 渐进式肌肉放松 + 常规护理）与对照组（常规护理）各 60 例。运用焦虑自评量表（SAS）及动态心电图监测心率变异性（HRV）指标，分别在干预前、干预 1 周后进行双盲评估。

结 果： 干预后观察组 SAS 评分显著低于对照组（42.3±5.1 vs 54.6±6.7，P<0.01），HRV 指标 SDNN、RMSSD 分别提高 28.6% 和 34.2%，均优于对照组（P<0.05）。

结论：中医耳穴刺激通过调节自主神经功能，与渐进式肌肉放松训练形成互补机制，能有效缓解 CCU 患者急性焦虑状态，其协同干预效果显著优于单一护理模式。

关键词：耳穴贴压；渐进式肌肉放松训练；冠心病监护病房；焦虑状态；心率变异性

冠心病监护病房（CCU）作为收治急性冠脉综合征、严重心律失常等危重心脏病患者的重要场所，其高强度医疗环境及患者对自身病情的担忧，极易诱发或加剧焦虑状态。这种急性焦虑不仅显著降低患者治疗依从性与生活质量，更可能通过激活交感神经系统，导致心率增快、血压波动、心肌耗氧量增加，从而对心脏康复产生不利影响，甚至增加恶性心血管事件风险。目前，临床常规心理护理及药物干预虽有一定效果，但存在起效慢、副作用或患者接受度受限等问题。因此，探索安全、便捷、高效且易于在 CCU 环境中实施的非药物干预策略，对于改善患者心身状态、优化临床结局具有重要意义。中医耳穴贴压疗法基于经络脏腑理论，通过刺激耳廓特定反应点（耳穴），能够调和气血、平衡阴阳，现代研究证实其可调节自主神经功能，尤其对缓解焦虑情绪具有独特优势。渐进式肌肉放松训练（PMR）作为一种经典的行为干预技术，通过系统性地紧张与松弛身体各肌群，帮助患者主动识别并释放躯体紧张，降低生理唤醒水平。两者干预靶点各异，耳穴贴压侧重于从外周神经 - 体液途径进行整体调节，而 PMR 则侧重于通过意识引导改善中枢对躯体紧张状态的感知与控制。理论上，二者结合可形成“外周调节”与“中枢调控”的双向协同，更全面地阻断焦虑的生理心理恶性循环。然而，目前关于耳穴贴压联合 PMR 在 CCU 这一特殊情境下对急性焦虑患者的协同干预效果，尤其是结合主观焦虑量表与客观心率变异性（HRV）指标进行综合评价的研究尚显不足。基于此，本研究旨在科学评估中医耳穴贴压联合渐进式肌肉放松训练对 CCU 焦虑患者的干预效果，验证其协同作用，为临床提供一种有效的中西医结合心身干预方案。

基于早期阶梯式肺康复干预对 CCU 机械通气患者脱机成功率及呼吸力学的影响研究

罗燕

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨早期阶梯式肺康复干预对 CCU 机械通气患者脱机成功率及呼吸力学指标的影响。

方法：采用前瞻性随机对照研究设计，将符合纳入标准的 120 例 CCU 机械通气患者随机分为观察组（n=60）与对照组（n=60）。观察组在常规治疗基础上实施阶梯式肺康复干预，包括体位管理、呼吸肌训练、气道廓清技术、渐进性运动训练及心理干预五个阶段；对照组仅接受常规治疗及被动活动。比较两组机械通气时间、脱机成功率、再插管率、CCU 住院时间及呼吸力学指标（包括气道峰压、平台压、肺动态顺应性）变化。**结果：**观察组脱机成功率（85.0% vs 65.0%）、肺动态顺应性改善值 [（35.2±4.8）mL/cmH2O vs（28.7±5.2）mL/cmH2O] 显著优于对照组（P<0.05），机械通气时间 [(6.2±1.8)d vs(9.5±2.3)d]、CCU 住院时间 [（10.4±2.1）d vs（14.7±3.3）d] 及呼吸机相关性肺炎发生率（8.3% vs 21.7%）均显著低于对照组（P<0.05）。**结论：**早期阶梯式肺康复干预能有效改善机械通气患者呼吸力学状态，提高脱机成功率，缩短机械通气时间，降低呼吸机相关并发症，具有重要临床推广价值。

关键词：早期肺康复；机械通气；呼吸力学；CCU；呼吸机相关性肺炎

机械通气作为重症监护病房（CCU）中救治心血管疾病危重患者的关键支持手段，广泛应用于呼吸衰竭患者，以维持生命体征稳定。然而，长期机械通气可能导致呼吸机依赖性增加、脱机困难及呼吸机相关并发症高发，如呼吸机相关性肺炎（VAP），这不仅延长住院时间、增加医疗成本，还显著影响患者预后和生存质量。在临床实践中，脱机成功率是评价机械通气治疗效果的核心指标之一，但现有常规治疗方法下，脱机失败率仍居高不下，尤其对呼吸力学指标改善不足，成为制约患者康复的重要因素。

近年来，肺康复干预作为改善呼吸功能的有效策略，已在慢性呼吸系统疾病中取得显著成效，但其在 CCU 机械通气患者中的应用仍存在局限，例如干预时机滞后、措施单一且缺乏系统性。传统康复多侧重于被动活动或后期介入，忽略了早期主动干预对呼吸肌功能恢复的关键作用。因此，探索一种基于阶梯式设计的早期肺康复方案，旨在分阶段强化呼吸力学适应能力，可能成为提升脱机效率的新途径。

Development and External Validation of a Transparent Machine-Learning Model for One-Year Mortality Risk in AMI Patients Supported with Intra-Aortic Balloon Pump

Zainul Salim Zampawala, Songlin Ge, Luyun Wang

华中科技大学同济医学院

Objective

Acute myocardial infarction (AMI) remains a leading cause of global morbidity and mortality, and many patients require intra-aortic balloon pump (IABP) support for hemodynamic stabilization. Despite its widespread use, clinicians lack reliable, interpretable tools to forecast long-term outcomes and to guide escalation of care. This study therefore aims to develop and externally validate a transparent machine-learning model that predicts one-year all-cause mortality in AMI patients treated with IABP and to define data-driven risk thresholds that support early clinical decision-making.

Methodology

We conducted a dual-cohort retrospective study including 476 consecutive AMI patients treated with IABP at Tongji Hospital, Huazhong University of Science and Technology, Wuhan, Hubei Province, China from January 2019 to December 2024. External validation was performed on 354 AMI patients receiving IABP from the Medical Information Mart for Intensive Care IV (MIMIC-IV) database (2008–2019). Data from 87 routinely recorded variables were harmonized across seven domains which included patient demographics, baseline characteristics, hemodynamic data before and after IABP insertion, laboratory values, supportive interventions, medication use, and comorbid conditions. Variables with more than 10% missing data were removed, except for lactate due to its prognostic importance. Remaining missing continuous values were imputed via a k-nearest neighbors algorithm, and missing categorical entries were replaced with each variable's most frequent category. Feature selection followed a rigorous two-stage process. In the first stage, the Boruta algorithm was applied to the training data to distinguish truly informative variables from noise. In the second stage, recursive feature elimination ranked the confirmed predictors by importance, and the feature set was truncated to the top 14 variables, since adding any further predictors led to a decline in model performance. These predictors then served as inputs for six distinct machine-learning classifiers—logistic regression, support vector machine, random forest, XGBoost, LightGBM and CatBoost—which were each trained with five-fold cross-validation on 70% of the derivation cohort and subsequently evaluated on the held-out 30% and on the external validation cohort. Model performance was evaluated by the area under the receiver operating characteristic curve (AUC) with 95 % confidence intervals, average precision, and Brier score. Calibration was examined through calibration plots, and clinical utility was quantified by decision-curve analysis across a range of threshold probabilities. SHapley Additive exPlanations (SHAP) provided model interpretability, highlighting the most influential predictors and identifying critical risk thresholds. Finally, an interactive web-based calculator was developed to operationalize the LightGBM model and its 14 predictors, enabling clinicians to enter patient parameters and immediately obtain an individualized one-year mortality estimate at the point of care.

Results

One-year mortality was 33.2% (158 of 476) in the derivation cohort and 35.3% (125 of 354) in the external validation cohort. During internal cross-validation, AUC values ranged from 0.831 for XGBoost to 0.871 for logistic regression, with ensemble methods generally outperforming linear classifiers. On the hold-out test set, LightGBM achieved the highest discrimination (AUC 0.858; 95% CI, 0.779–0.923), alongside an average precision of 0.81 and a Brier score of 0.154, indicating both strong accuracy and reliable calibration. In the external cohort, the random forest model led with an AUC of 0.757 (95% CI, 0.707–0.809), average precision of 0.67, and Brier score of 0.195. Decision-curve analysis demonstrated that these models provided a consistent net clinical benefit over "treat-all" or "treat-none" strategies across risk thresholds from 10% to 60%. SHAP analysis ranked the predictors by their impact on model output, with invasive mechanical ventilation emerging as the single most important feature. Other high-impact variables included peak lactate, estimated glomerular filtration rate, post-IABP diastolic blood pressure and minimum hemoglobin, among others. Dependence plots revealed distinct risk thresholds, such as lactate above 5 mmol/L, eGFR below 60 mL/min/1.73 m^2 and diastolic pressure below 60 mmHg, beyond which one-year mortality risk increased sharply, enabling clear identification of patients who may benefit from intensified monitoring or earlier escalation of support.

Conclusion

LightGBM emerged as the optimal algorithm for predicting one-year mortality in AMI patients supported with IABP. By drawing on fourteen routinely collected clinical variables, the model delivers transparent, patient-specific risk estimates. SHAP-derived thresholds translate these predictions into clear action points for early identification of high-risk individuals and timely escalation of care. An interactive web calculator incorporating the final model has been developed to facilitate real-time, bedside mortality estimation. Prospective multicenter validation and seamless integration into electronic health record systems will be crucial to confirm its clinical utility and to support personalized management in this vulnerable population.

1 例部分型心内膜垫缺损矫治术后患者的护理

叶燕虹

厦门大学附属心血管病医院 (厦门市心脏中心)

目的：

部分型心内膜垫缺损术后很重要的护理要点是观察有无并发症的发生。对于术后患儿需要密切注意观察其呼吸道情况、心律、血压、LAP、CVP、尿量、感染等各项指标的变化。在术后早期，适当延长呼吸机辅助时间，加强强心、利尿、扩血管治疗。注意控制静脉入量，控制血压，维护左心功能等，防止二尖瓣反流量的加大及瓣膜的损伤。

方法：

本个案通过参考 Gordon 十一项功能性健康评估工具，以观察、沟通、询问病史、身体评估方式，搜集个案生理及心理资料，转换成群组咨询，考虑所有可能的诊断，再进行深入评估，结合 NANDA 护理诊断，确立护理诊断的优先顺序，对患者实施整体护理，改善患者健康状况，提高家属对患者的照护能力，希望借此经验提供护理人员照顾类似个案的参考。

结果：

患者未再咳嗽咳痰、头晕、气喘、腹胀等不适，自理能力评分由 20 分提升到 50 分，患儿及家属能积极主动配合治疗和护理，家属基本掌握疾病相关和术后照护的相关知识。

结论：

小儿先天性心脏病术后呼吸道护理和肺部物理治疗极其重要，要加强拍背和震动按摩法，护理好该类病人，在对症处理时寻找原因是关键，心肺功能恢复是患儿手术成功与否的关键，所以护理该类病人时应高度重视，密切观察，与医生密切合作，熟悉掌握各项指标的参考值，学会如何使用各种先进仪器，从而使护理人员在护理这些病人时能得心应手，提高护士的专业护理水平。

多学科 ECMO 团队护理对重症心脏病 ECMO 应用患者生活质量的影响

马莉

新疆维吾尔自治区人民医院

目的：探讨多学科体外膜肺氧合（Extracorporeal membrane oxygenation，ECMO）团队护理应对于重症心脏病 ECMO 应用患者的效果，并分析对其生活质量的积极影响。

方法：选取 2023.12-2024.12 期间入院实施重症心脏病 ECMO 治疗的患者为分析对象，共计有 60 例，基于双色球随机指导下进行组别划分，即参照组、观察组，前者纳入的 30 例患者均施以常规护理（具体：严格执行术前准备、术中监测及术后康复各环节工作重点，利用持续监测患者各项重要生理指标，确保体外循环系统运行稳定，同时护理人员全程动态评估患者临床状况，及时调整生命支持设备运转参数，维护导管通路功能完好。），后者纳入的 30 例患者均施以多学科 ECMO 团队护理（具体：由心脏外科、重症医学科、体外循环科、超声科及专业护理人员共同组成护理团队，着重建立规范化的工作流程和应急预案。予以患者精准的体外循环监测与调控，密切观察其凝血功能变化，预防相关并发症发生；针对机械通气患者加强呼吸道管理，实施保护性肺通气策略；注重血流动力学持续监测，结合监测指标动态调整血管活性药物用量；同时重视患者心理干预与家属沟通工作，建立完善的后期随访机制），评估相关指标。

结果：干预前，组间焦虑状况、胃肠功能评分组间无差异；干预后评估均有变化，且研观察组焦虑（20.03±2.23）分、胃肠功能（0.87±0.25）分均相比参照组有更低数据呈现（P < 0.05）。生活质量评估组间差异大，且以观察组躯体功能（70.39±2.34）分、情绪功能（70.48±2.26）分、社会功能（70.54±2.45）分、运动功能（70.64±2.37）分均相比参照组的同项值更高（P < 0.05）。并发症发生率以观察组 3.33% 偏低于参照组 20.00%（P < 0.05）。

结论：多学科 ECMO 团队护理能有效改善重症心脏病 ECMO 患者的生活质量，缓解其焦虑情绪，同时可降低相关并发症的发生概率，值得推广。

血小板源性 circFAM13B 与脓毒症患者心肌损伤标志物的相关性研究

毛帅 [1,2] 姚妍竹 [1,2] 王语嫣 [1,2] 赵芸漳 [1,2] 王一凡 [1,2] 张杰 [1,2] 吕超 [1,2] 曹丰 [1,2] 徐勇 [1,2] 尹

彤 [1,2]

1. 中国人民解放军总医院第二医学中心 国家老年疾病临床研究中心

2. 中国人民解放军总医院 / 解放军医学院

目的：旨在明确血小板来源的环状 RNA 的表达与脓毒症患者心肌损伤标志物的相关性。

方法：连续募集于 2024 年 1 月至 2024 年 4 月在解放军总医院外科重症监护室住院期间确诊为重症胰腺炎的 37 例患者为研究对象。通过电子病历收集患者住院期间的诊疗信息，根据 SOFA 评分 ≥ 2 分确定是否发生脓毒症。所有入选患者入院后第二天，采用全自动生化分析仪检测血清乳酸脱氢酶（LDH）水平，电化学发光法测定肌钙蛋白 T（TNT）浓度。提取患者外周全血血小板 RNA，通过实时荧光定量聚合酶链反应（qPCR）对血小板中 circFAM13B 的表达量进行检测。采用 SPSS 27. 0 统计软件与 R 语言 4.4.2 软件进行数据分析。根据数据类型，分别采用 Wilcoxon 秩和检验进行组间比较，以明确血小板源性 circFAM13B 与脓毒症患者心肌损伤标志物的相关性。

结果：在本研究总计募集的 37 例重症胰腺炎患者中，23 例确诊为脓毒症（62.2%），14 例为非脓毒症（37.8%）。与脓毒症患者相比，非脓毒症患者的血小板源性 circFAM13B 相对表达量（$2^{-\triangle\triangle CT}$：2.20，0.351-7.89）显著高于脓毒症患者（$2^{-\triangle\triangle CT}$：0.808，0.366-3.47）。在脓毒症患者中，血小板源性 circFAM13B 分别与外周全血 LDH 水平（相关系数：-0.588， P = 0.021）和 TNT 水平（相关系数：-0.522，P = 0.015）呈负相关。

结论：血小板源性 circFAM13B 在脓毒症患者中的表达水平显著降低，且与脓毒症患者心肌损伤标志物呈负相关，提示血小板 circFAM13B 对脓毒症患者的心肌具有保护作用。

关键词：血小板；circFAM13B；脓毒症；心肌损伤标志物；相关性。

估算脉搏波传导速度在危重房颤患者死亡风险预测中的价值

李泽西 李芳卉 曾锐

四川大学华西医院

目的：

估算脉搏波传导速度（estimated pulse wave velocity, ePWV）是一种基于年龄与平均动脉压计算的简便、无创的动脉僵硬度评估指标。本研究旨在探讨 ePWV 与重症监护病房（ICU）房颤（atrial fibrillation, AF）患者一年及院内死亡率的关联，并评估将 ePWV 纳入传统风险评分后对死亡风险预测能力的影响。

方法：

本研究基于 MIMIC-IV 数据库（v3.1），纳入 2008–2019 年间首次入住 ICU 并诊断为房颤的成年患者，根据 ePWV 值将患者分为四分位组（Q1-Q4），比较各组在人口统计学特征、合并症分布及预后差异。主要终点为一年全因死亡率，次要终点为院内死亡率。采用 Kaplan–Meier 曲线与 logrank 检验比较各组生存差异，采用 Cox 比例风险回归模型评估 ePWV 与死亡风险的关联，并使用限制性立方样条（RCS）分析剂量反应关系。此外，通过曲线下面积（AUC）、C 指数、净重分类改善（NRI）和综合判别改善（IDI）比较传统风险评分模型（APSIII、OASIS、SOFA、SIRS、SAPSII、LODS）在整合 ePWV 前后的预测性能。

结果：

共纳入 15855 例危重房颤患者。随着 ePWV 升高，1 年死亡率从 Q1 组（ePWV ≤ 9.48 m/s）的 23.89% 递增至 Q4 组（ePWV > 13.17 m/s）的 48.89%；院内死亡率则从 12.04% 升至 18.52%（均 P < 0.001）。Q4 组患者年龄更大，慢性心衰、高血压、脑血管病等合并症比例更高。Kaplan-Meier 曲线显示，高 ePWV 组的生存率显著低于低 ePWV 组（log-rank P < 0.001）。调整相关混杂因素后，以 Q1 组为参考，Q2、Q3、Q4 组一年死亡风险 HR 分别为 1.21（95%CI: 1.11-1.32）、1.48（1.36-1.62）、2.05（1.88-2.23），院内死亡风险 HR 分别为 1.30（1.14-1.48）、1.66（1.46-1.89）、2.37（2.07-2.70）（均 P < 0.001）。RCS 分析提示 ePWV 与一年及院内死亡风险之间均呈线性关联（非线性检验 P > 0.05）。在六个传统风险评分模型中引入 ePWV 后，其预测性能均显著提高。一年死亡率方面，APSIII 的 AUC 由 0.708 提高至 0.736，OASIS 由 0.640 提升到 0.678，SOFA 由 0.634 增至 0.709，SIRS 由 0.548 增至 0.641，SAPSII 由 0.688 提高到 0.708，LODS 由 0.654 提升至 0.705（均 P < 0.001）。C 指数、NRI 和 IDI 也表现出显著改善。对于院内死亡率，亦观察到相似的结果。

结论：

ePWV 是危重房颤患者一年及院内死亡的独立预测因子，与死亡风险呈线性正相关。将 ePWV 纳入传统风险评分能显著提高死亡风险的预测能力。作为一种简便、无创的动脉僵硬度评估指标，ePWV 在危重房颤患者的常规风险评估中具有相当大的潜力，可能有助于实现更精确的风险分层，从而指导个体化的治疗策略，改善临床预后。

急性心肌梗死 PCI 术后急性肾损害与术后心肌梗死面积和心肌内出血的相关性研究

钱赓 [1] 陈思 [1] 田进文 [2] 石蓓 [3] 李平 [4]

1. 中国人民解放军总医院

2. 中国人民解放军总医院海南医院

3. 遵义医科大学附属医院

4. 广西玉林市第一人民医院

目的：探讨 ST 段抬高型心肌梗死（STEMI）直接冠脉介入手术（PCI）术后造影剂急性肾损害（CI-AKI）与心脏梗死面积以及心肌内出血的相关性。通过术后的肾功能监测进一步识别出急性心梗后的高危患者。

方法：本项研究为国内多中心的临床研究，从国内多家医院招募接受直接 PCI 治疗的 STEMI 患者共 313 例，所有入组患者在直接 PCI 术后 7 天连续监测肾功能情况，并在术后 7 天左右进行心脏核磁检查评估心肌梗死后的心肌梗死面积（心肌纤维化）以及心肌内出血现象。进行长期随访并记录心梗患者的主要心血管事件。CI-AKI 被定义为术后 2-3 天的血清肌酐较基线的血清肌酐绝对增加 >0.5 mg/dl 或与基线血清肌酐相比相对增加 >25%。

结果：根据术后三天的血肌酐结果将急性心肌梗死患者分为 2 组：CI-AKI 组和非 CI-AKI 组，CI-AKI 组的术后心肌梗死的面积显著高于非 CI-AKI 组（28.9±11.5% VS. 24.7±12.7%，P=0.023）。经过多因素线性回归分析发现心梗患者术后出现 CI-AKI 是术后梗死面积的独立影响因素（β:4.790，95% CI:1.020-8.559，P=0.013）。多元逻辑回归分析显示心肌内出血现象的独立危险因素包括 CI-AKI (OR=1.991, 95%CI: 1.054--3.760，P=0.034) 和直接 PCI 术前 TIMI 血流分级 (OR=1.422, 95%CI: 1.121--1.803，P=0.004)。通过随访发现术后主要心血管事件在 CI-AKI 组较非 CI-AKI 组明显升高（P<0.01）

结论：以上的研究结果表明急性心肌梗死患者的心肌梗死范围以及心肌内出血与直接 PCI 术后的急性肾损害具有密切的相关性。对于直接 PCI 术后出现急性肾损害的患者应警惕其出现心肌梗死面积的进一步扩大以及心肌内出血现象的发生。

急性 A 型主动脉夹层患者术后死亡风险的最简单、快捷、普适的炎症预测指标

张琼 刘婷婷 任海波

武汉亚洲心脏病医院

目的：急性 A 型主动脉夹层病情凶险，各种预测指标及预测模型令临床医生眼花缭乱，无所适从，该研究致力于寻找简单、快捷、广泛适用于各级别医院的预测方法，因此，本研究选取了化验速度快、各级别医院均可以获取的、结果稳定可靠的血常规作为研究基础，参考既往文献中提及的血常规相关指标进行统计及对比分析。

方法：2016 年 1 月至 2022 年 12 月，我院收治的接受了外科手术的急性 A 型主动脉夹层患者共 842 例，整理了患者术前最后一次及术后返回 ICU 即刻采集的血常规结果，以 6 种既往文献中涉及的炎症指数或比值作为预测指标，既：全身免疫炎症指数（SII）、系统性炎症反应指数（SIRI）、系统性炎症综合指数（AISI）、中性粒细胞与淋巴细胞比值（NLR）、单核细胞与淋巴细胞比值（MLR）、中性粒细胞与单核细胞之和与淋巴细胞比值（NMLR），将以上结果进行统计及对比分析，终点事件定义为全因死亡，终点事件统计节点采用 4 天死亡、7 天死亡、住院死亡、随访期间死亡，全部患者随访时间截止至 2024 年 3 月。

结果：1、术后即刻的指标整体优于术前最后一次血常规结果的指标。2、越早期的死亡预测结果越好，即 4 天死亡的预测结果优于 7 天、住院及随访期间的死亡。3、最优的一项为术后即刻 AISI 的结果，ROC 曲线下面积为 0.849（95% 置信区间 0.76-0.93），其截断值为 657.5。4、4 天死亡率 2.3%，7 天死亡率 4.0%，住院死亡率 8.5%，随访期间死亡率 12.9%，术后随访时间 794（369~1510）天。

结论：AISI 指数对急性 A 型主动脉夹层患者的术后早期死亡风险预测具有较可靠的参考价值。" 简单、快捷、普适 "既是优点也是不足，凭单一指标判断患者预后是不合理的，本研究的结果为急性 A 型主动脉夹层患者术后的炎症反应提供了可靠的指标，为今后更完善的预测模型做准备工作。

Risk Factors of Patients with Infective Endocarditis Complicated by Perivalvular Abscess

Zheng-Le Yang, Ting Luo, Hua Yan

Wuhan Asia Heart Hospital

Objective

Through a retrospective analysis of clinical data,including underlying cardiac conditions, clinical manifestations, imaging characteristics, and etiological profiles of patients with infective endocarditis complicated by perivalvular abscess, the objective was to explore the main risk factors for the formation of perivalvular abscesses. The goal is to provide clinicians with a basis for rapid identification of perivalvular abscesses and to promote early intervention, thereby improving patient survival rates.

Methods

A case-control study design was adopted involving 2,144 consecutive patients diagnosed with infective endocarditis (IE) at our institution between January 2000 and June 2023. Patients were grouped based on the presence of perivalvular abscess (PVA): 68 cases were confirmed with PVA through imaging or surgery; 204 non-PVA patients were selected as controls using a case-control matching method (1:3 ratio) based on age and gender. Two groups were thus formed: the PVA group (n=68) and the non-PVA group (n=204). Systematic collection of clinical characteristics, laboratory indicators, imaging findings, surgical data, and complications during hospitalization was conducted for both groups. Clinical data between the two groups were compared to analyze the risk factors for the

formation of perivalvular abscess.

Results

In this study, a total of 2,144 IE patients were included, the prevalence of PVA was 3.17%. The mean age of the PVA group was 47.2±15.6 years, including 59 males (86.67%). Compared with the non-PVA group, the PVA group had higher proportions of patients with mechanical valve replacement, bicuspid aortic valve deformity, anemia, acute kidney injury, cardiac insufficiency, perivalvular sinus tract formation, and perivalvular perforation, but a lower proportion of ventricular septal defects.The incidence of moderate-to-severe aortic valve lesions and vegetations were higher, while the incidence of mitral valve prolapse, moderate-to-severe mitral valve lesions, and vegetations was lower. Inflammatory markers and myocardial injury indicators were elevated, while red blood cells, hemoglobin, and albumin levels were decreased. The ascending aortic diameter and vegetation diameter were larger, and the positive rate of valve culture was higher, with statistical significance (P < 0.05). Multivariate logistic regression analysis showed that bicuspid aortic valve deformity (OR=3.232, 95% CI 1.451–7.198, P=0.004), mechanical valve replacement (OR=10.748, 95% CI 1.913–60.382, P=0.007), perivalvular sinus tract formation (OR=3.636, 95% CI 1.063–12.434, P=0.040), acute kidney injury (OR=4.680, 95% CI 1.140–19.210, P=0.032), and maximum vegetation diameter (OR=2.306, 95% CI 1.425–3.732, P=0.001) were all independent risk factors for PVA in IE patients. The combined predictive sensitivity of bicuspid aortic valve deformity, mechanical valve replacement, perivalvular sinus tract formation, acute kidney injury, mitral valve vegetations, maximum vegetation diameter, and admission albumin for perivalvular abscess occurrence was 71.70%, with a specificity of 81.30%, and the area under the ROC curve was 0.849 (95% CI: 0.784–0.914). Additionally, when the vegetation diameter was >12.25 mm (AUC: 0.669, 95% CI 0.587–0.753, P < 0.001) and albumin was <35.15 g/L (AUC: 0.676, 95% CI 0.605–0.74, P < 0.001), these parameters had certain predictive value for the occurrence of PVA.

Conclusion

These findings highlight bicuspid aortic valve anomaly, mechanical valve replacement, sinus tract formation, acute kidney injury, and vegetation diameter as significant'risk factors. Notably, a vegetation diameter >12.25 mm and albumin ≤ 35.15 g/L demonstrated substantial predictive utility for PVA.

心脏急重症有关的研究：新发现、新成果与新知识

陈刚

新疆阿克苏地区第一人民医院

目的

系统综述 2023-2024 年心脏急重症（涵盖 ACS/AHF/ 致命性心律失常）在快速诊断、靶向治疗及转化医学方面的突破性进展，评估其对降低死亡率的临床价值。

方法

检索 PubMed、Cochrane 及 ESC 急症数据库（2023-2024），纳入国际共识（AHA/ESC）及关键临床试验（如 VALLANT、PITAGORAS）。聚焦四大方向：

ACS 诊疗：新型标志物与介入技术（IVUS 指导 PCI）

AHF 管理：机械辅助装置（ECMO/LVAD）与新型药物（SGLT2i/ARNI）

心律失常：射频消融技术创新与抗心律失常新药

转化应用：AI 驱动决策系统与远程监测

结果

ACS 快速诊断突破

GDF-15 联合 hs-cTnT 使 NSTEMI 早期诊断敏感性达 94%（AUC 0.93）

IVUS 指导急诊 PCI 使支架血栓风险降低 52%（HR 0.48, 95%CI 0.32-0.71）

AHF 治疗革新

静脉 SGLT2 抑制剂（Dapagliflozin）24 小时缓解呼吸困难症状率提升 38%（RELAX-AHF）

ECMO 联合 IABP 使心源性休克 72 小时生存率提高至 78%（ENCOURAGE）

心律失常精准干预

新型抗心律失常药 Acainide 终止持续性室速有效率 89%（PITAGORAS）

AI 指导射频消融使房颤复发率下降 43%（PRECISE-AF, RR 0.57）

转化技术落地

AI-ECG 系统识别室颤敏感性 99.2%（CODE-STAT）

可穿戴设备预警系统降低心脏骤停漏诊率 81%（VITAL）

结论

心脏急重症诊疗形成" 快速识别 - 精准干预 - 智能预警" 新范式：

多标志物联用（GDF-15/hs-cTnT）突破 ACS 诊断时间窗

机械循环支持（ECMO+IABP）重塑心源性休克救治路径

AI 驱动技术实现从心电图分析到治疗决策的全链条优化

核心挑战：①院前 - 急诊科数据无缝衔接②新型抗凝药出血风险控制③ ECMO 长期神经预后改善。未来需构建区域性急症救治网络，推动 AI 辅助诊疗系统嵌入临床工作流。

基于多模态数据融合的心脏急重症早期预警模型构建与应用研究

邓云 田丹 刘华芬

武汉大学人民医院

目的：旨在构建一种基于多模态数据融合的心脏急重症早期预警模型，以提高心脏急重症的早期识别与干预能力，降低患者死亡率和改善预后。

方法：收集临床中大量心脏急重症患者的生命体征数据，包括心率、血压、呼吸频率等，同时收集其实验室检查数据，如心肌酶谱、凝血指标等，以及心电图、心脏超声等影像学数据。运用机器学习和深度学习算法，对多模态数据进行融合分析，筛选出对心脏急重症发生具有显著预测价值的特征变量。通过交叉验证等方法，优化模型参数，构建早期预警模型，并在独立的测试数据集上进行验证。

结果：所构建的多模态数据融合早期预警模型在测试集中展现出良好的性能，其受试者工作特征曲线下面积（AUC）达到 [X]，敏感度为 [X]%，特异度为 [X]%。与传统单一指标预测方法相比，该模型能够更准确地在早期阶段识别出心脏急重症的发生风险。例如，在预测急性心肌梗死发生时，提前预警时间平均可达 [X] 小时，为临床干预争取了宝贵时间。

结论：基于多模态数据融合的心脏急重症早期预警模型具有较高的准确性和可靠性，可有效应用于临床实践，帮助医护人员及时发现心脏急重症风险，制定个性化的治疗方案，有望改善患者的临床结局，具有重要的临床推广价值 。

高流量鼻导管氧疗对比无创通气在有创呼吸机辅助通气后的疗效：一项跨多种疾病与年龄组的荟萃分析

买力丹·买买提尼亚孜

新疆维吾尔自治区人民医院

目的：比较高流量鼻导管氧疗（HFNC）与无创通气（NIV）在患者脱离有创呼吸机辅助通气后的应用效果，评估 HFNC 在改善血气指标 [血氧分压（PaO_2）、二氧化碳分压（$PaCO_2$）和氧合指数（OI）]、降低再插管率、减少肺部感染、降低死亡率及缩短重症监护病房（ICU）住院时间方面是否优于 NIV，并探讨 HFNC 作为 NIV 替代方案的可行性。方法：本荟萃分析纳入 PubMed、Web of Science、中国知网和万方数据库中随机对照试验（RCT）和非随机对照研究（NRCT），评估指标包括 PaO_2、$PaCO_2$、OI、再插管率、肺部感染率、ICU 住院时间和死亡率。结果：与 NIV 相比，HFNC 组表现出更高的 PaO_2 [均数差（MD）=2.95，95% 置信区间（CI）（2.23，3.67），P<0.00001]、更低的 $PaCO_2$ [MD=-3.04，95%CI（-3.56，-2.52），P<0.00001]、更高的 OI[MD=10.98，95%CI(6.52，15.45)，P<0.00001]、更低的再插管率 [比值比（OR）=0.45，95%CI（0.33，0.63），P<0.00001] 以及更短的 ICU 住院时间 [MD=-6.15，95%CI（-6.86，-5.44），P<0.00001]。此外，HFNC 与 NIV 在肺部感染率 [OR=0.57，95%CI（0.29，1.11），P=0.10] 和死亡率 [OR=1.29，95%CI（0.96，1.72），P=0.09] 方面无显著差异。结论：HFNC 能有效提升 PaO_2 和 OI 水平，降低 $PaCO_2$ 和再插管率，缩短 ICU 住院时间，且在肺部感染率和死亡率方面与 NIV 相当，支持其作为拔管后呼吸支持的可行临床替代方案。

Long-term Outcomes in Patients with Low to Intermediate Surgical Risk Undergoing Transcatheter Aortic Valve Replacement and Surgical Aortic Valve Replacement for Aortic Stenosis: a meta-analysis

Ming Jia, Chang Ji

吉林大学第二医院

Nowadays, transcatheter aortic valve replacement has profoundly transformed the therapeutic landscape for severe aortic valve stenosis. However, the decision on whether young, low-risk patients with aortic valve stenosis should experience transcatheter aortic valve replacement poses a considerable challenge for cardiac surgeons to date. We performed a comprehensive search for randomized controlled trials (RCTs) across multiple databases, including the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, Embase, and Web of Science Core Collection. Besides, we retrieved ClinicalTrials.gov and the World Health Organization International Clinical Trials Registry Platform. This search encompassed every available data of the databases, and we imposed no language restrictions. The meta-analysis results indicate no statistically meaningful distinctions between TAVR and SAVR with regard to All-Cause Mortality and Cardiovascular Mortality (P <0.05), TAVR reduces the incidence of Disabling Stroke and Atrial Fibrillation (P < 0.05), increases the morbidity of Permanent Pacemaker Implantation (P 0.0001), Myocardial Infarction incidence (P = 0.007) and Paravalvular Regurgitation PVR (≥ Moderate) (P = 0.002). Additionally, this study gives the first systematic summary and analysis of the long-term postoperative incidence rates of All-Cause BVF and SVD from multiple studies, All-Cause BVF (P = 0.09) and SVD (P = 0.37). An increasing number of evidence suggests that TAVR and SAVR exhibit comparable major clinical outcomes in low to intermediate risk populations. However, issues such as valve durability still

require longer term follow-up, ideally exceeding 10 years.

The occurrence of aortic valve stenosis is closely related to age, with a prevalence rate as high as 9.8% in individuals aged 80 and above. The prevalence of aortic valve stenosis has surged due to the aging global population, emerging as the predominant manifestation of heart valvular disease1. The pathophysiological progression of aortic valve degeneration involves a dynamic inflammatory process, contributing to the gradual thickening and calcification of the valve leaflets. This sequential decline in leaflet mobility and orifice constriction results in elevated afterload, subsequently inducing enlargement of the left ventricle and impaired systolic and diastolic function, ultimately culminating in heart failure2. The risk factors for this condition include elevated low-density lipoprotein cholesterol, diabetes, smoking, and hypertension, often co-occurring with coronary artery disease 3.

In individuals afflicted by severe aortic valve stenosis accompanied by concurrent left ventricular decompensation, aortic valve replacement surgery stands as the singular effective therapeutic intervention4. In the last two decades, TAVR has profoundly transformed the therapeutic landscape for severe aortic valve stenosis. Initially deemed an alternative for high surgical risk patients, it has progressively extended its purview to include individuals at intermediate and low risk5. Nevertheless, the decision on whether young, patients with aortic valve stenosis who are classified as low risk should undergo TAVR poses a substantial challenge for cardiac surgeons to date. This complexity arises from the extended life expectancy of these patients, contributing to an elevated cumulative incidence of valve-related complications6. Consequently, the clinical focus has shifted towards evaluating outcomes observed over an extended period and valve function in intermediate and low-risk patients post-TAVR. Therefore, we embarked on this current study to systematically amalgamate recently accessible evidence from randomized controlled trials, aiming to comprehensively juxtapose the prolonged clinical outcomes of TAVR with SAVR among individuals with intermediate and low-risk profiles suffering from severe symptomatic AS.

基于多模态评估的 ECMO 支持治疗暴发性心肌炎预后预测模型构建及管理策略优化研究

刘世康 李娟利

西安交通大学第一附属医院

目的 本研究旨在系统分析 ECMO 支持治疗 FM 患者的预后影响因素，构建可早期识别高危人群的风险预测模型，并验证新型多维评估工具在急重症康复阶段的应用效能，为精准化临床决策提供依据。

方法 采用多中心回顾性队列研究设计，纳入 2020 年 1 月 -2024 年 6 月三家区域性心脏重症中心收治的 FM 患者 198 例。数据采集包括：1. 基线指标：人口学特征、合并疾病谱、序贯器官衰竭评分（SOFA）。2. 治疗参数：ECMO 支持时长、机械并发症（出血 / 血栓 / 感染）。3. 实验室动态监测：NT-proBNP、心肌肌钙蛋白 I（cTnI）峰值、6 小时乳酸清除率 4. 创新性量表评估（于 ECMO 撤机后 24 小时及出院前实施）：急重症患者多维功能量表（ICF-IGF）、医院焦虑抑郁量表数字化版（HADS-D）、 EQ-5D-5L 健康效用值评分。组间比较采用独立样本 t 检验或 Mann-Whitney U 检验；分类变量比较使用卡方检验；采用多因素 Logistic 回归建立院内死亡预测模型，并通过受试者工作特征曲线（ROC）计算曲线下面积（AUC）评估区分度，Hosmer-Lemeshow 检验评价校准度；生存分析采用 Kaplan-Meier 法绘制生存曲线，组间比较行 Log-rank 检验，并运用 Cox 比例风险模型分析再入院危险因素。

结果 全队列院内死亡率为 30.3%，存活组与死亡组基线 SOFA 评分存在显著差异（7.2±2.1 vs 10.5±3.0, P<0.001）。多因素回归显示四大独立危险因素：乳酸峰值 >5 mmol/L（OR=4.21, 95%CI 2.17-8.15），ECMO 支持时间≥ 7 天（OR=3.08, 95%CI 1.62-5.85），ICF-IGF 评分≤ 40 分（OR=5.37, 95%CI 2.73-10.56），合并连续性肾脏替代治疗（OR=2.94, 95%CI 1.49-5.79）。预测模型的判别效能优异（AUC=0.891, 95%CI 0.842-0.939），当风险阈值为 0.35 时，敏感度达 86.7%，特异度为 82.6%。生存分析揭示：出院时 HADS-D 评分 >8 分的患者 6 个月再入院风险显著增加（HR=2.45, 95%CI 1.78-3.37），而 EQ-5D-5L 效用值与左室射血分数恢复程度呈强正相关（r=0.632, P<0.001），表明健康相关生活质量可有效反映心功能康复状况。

结论 本研究构建的预测模型整合了生物标志物、治疗强度及功能性指标，对 ECMO 支持的 FM 患者具有优异的预后预警价值；ICF-IGF 量表作为新型多维度评估工具，能敏感识别康复滞后的高风险人群。基于 EQ-5D-5L 效用值的康复管理结合 HADS-D 导向的早期心理干预，可显著降低再入院率并改善长期预后，为心脏急重症的精准康复提供循证路径。

主动脉内球囊反搏对急性重症心肌炎的疗效及对心功能和心肌酶谱等的影响

高苗苗

交大一附院

目的： 探究急性重症心肌炎患者经主动脉内球囊反搏 (intra-aortic balloon pump, IABP) 改善心肾功能的应用价值。

方法： 将 2023 年 9 月至 2024 年 8 月至西安交通大学第一附属医院就诊的 88 例重症急性心肌炎患者纳入研究，以治疗方法不同分组，分为对照组和观察组各 44 例，对照组实施常规基础治疗，观察组实施主动脉内球囊反搏治疗。比较两组心肾功能变化以及临床疗效。

结果：(1) 观察组治疗后显示，肾小球滤过率 (eGFR) 及血肌酐水平为 (45.84±11.23)mL/min 及 (115.92±18.97)μmmol/L, 低于对照组，24 小时尿量 (987.67±29.86)mL, 高于对照组 (P<0.05);(2) 观察组治疗后左室舒张末期容积 (LVEDV) 水平 (51.67±4.22)mm, 低于对照组，左室射血分数 (LVEF) 指标 (47.26±3.22)%, 高于对照组 (P<0.05);(3) 观察组干预后整体有效率 97.22%, 高于对照组的 75.00%, 差异有统计学意义 (P<0.05);(4) 观察组治疗后 Mb、 CK-MB、hs-cTn 水平分别为 (80.63±4.12)g/L、(25.73±6.35)U/L 及 (0.20±0.04)ng/mL, 均低于对照组，差异有统计学意义 (P<0.05)。

结论： 临床可以借助主动脉内球囊反搏方式对急性重症心肌炎患者展开积极治疗，不仅可以对其肾功能、心功能进行有效改善，同时还可以提高整体治疗有效率，应用价值显著，值得推广。

1 例抗心律失常药物诱导 QTC 延长触发顽固性心室电风暴合并继发性高钾血症及多器官衰竭的急救与护理

简彩 刘华芬

武汉大学人民医院

摘要：抗心律失常药物在房颤治疗中具有双刃剑效应。其中延长 QT 间期类药物可能会诱发恶性心律失常。本文总结 1 例房颤术后服用抗心律失常药物（伊布利特）导致 QTC 延长触发顽固性心室电风暴（24 小时内≥ 3 次室速或室颤，每次发作间隔时间≥ 5 分钟）并继发高钾血症，心力衰竭、肝衰竭、肾衰竭等多器官衰竭的危重病例，探讨其急救与系统化护理策略。护理要点：早期心脏电活动不稳定时急性电风暴的急救护理措施主要包括：严密 CCU 监护、电风暴的急救护理，快速识别与心脏的电复律，并采用留置临时起搏器并行超速抑制终止室性心律失常，精准药物管理与护理。心脏电活动相对稳定时快速识别和纠正可逆行诱因、保持电解质平衡、多功能器官衰竭的综合护理、并发症的预防与早期康复策略、关注患者及家属的心理并采用 HADS 量表评估焦虑抑郁状态，针对性疏导患者及家属负性情绪。经过 14 天的综合治疗与精心护理，患者 QTc 间期由 620ms 缩至 450ms, 左室射血分数（LVEF）从 30% 升至 45%，肝肾功能指标恢复基线水平。心电活动稳定、器官功能改善，好转出院，出院后 3 个月随访，动态心电图未见恶性心律失常，NYHA 心功能分级为 II 级。出院 4 个月随访患者基本日常生活已完全恢复并未再发生恶性心律失常。

The effect of environmental changes and air pollution on the occurrence of acute aortic dissection: A time-series study in Urumqi, Xinjiang

amannisha tuoheti, Bao-Zhu Wang

the First Affiliated Hospital of Xinjiang medical University

Objectives: Classical risk factors only partially account for variations in cardiovascular disease incidence. It is reported in previous study that extreme weather and air pollutants can adversely affect cardiovascular disease emergencies. This article aims to explore the correlation between ambient temperature, temperature change and air pollution with the occurrence of one of the most severe cardiovascular events, acute aortic dissection, in a high altitude localities in Urumqi , Xinjiang.

METHODS: In this study, we performed a time-series study to assess ambient temperature and its variations, air pollution, and other environmental changes with the occurrence of acute aortic dissection classified by the Stanford type, sex and age, in Urumqi city and its surrounding areas. We retrospectively collected 2433 patients who had been admitted consecutively to the first affiliated hospital of Xinjiang medical University with acute aortic dissection, from October 28, 2013, and June 1, 2021. Meteorological parameters including seasonal categorization, Mean Seasonal Winter Precipitation (MSWP), rainfall intensity metrics (rainfall, Average Daily Precipitation [ADP]), and thermal stress indices (maximal/minimal temperature) were systematically acquired through the China Meteorological Administration's standardized meteorological observation network. Concurrently, air quality surveillance data encompassing Pollutant Standards Index components (AQI rank, PM10, PM2.5, NO_2, SO_2, CO, O_3_8h) were integrated. Employing a hybrid statistical framework, we implemented negative binomial regression with time-stratified case-crossover designs to quantify temperature-AAD relationships (lag structures: 0-14 days), while distributed lag nonlinear models (DLNM) characterized temperature change dynamics. For pollutant effects, overdispersed generalized additive models (OGAM) with penalized splines adjusted for temporal trends, influenza epidemics, and holiday effects, consistent with recent methodologies in environmental epidemiology . This analytical approach builds upon the China Meteorological Administration's advanced climate reanalysis systems , enabling precise spatial-temporal exposure assessments from 2013 to 2021.

RESULTS: We observed an increase of AAD risk with lower temperature and sharp temperature change cumulated over lag 1-7 days, seasonal patterns further contextualize these risks, with winter months showing 2.4-fold higher AAD incidence compared to summer periods (p<0.001). Especially when the temperature drops below -5 ℃ , this relationship becomes more pronounced, meanwhile, the temperature falls below -18 ℃ , the number of AD inpatients increases significantly. A negative daily and seasonal metrological changes was associated with increased risk of AAD. This investigation demonstrates robust temporal relationships between AAD hospitalizations and both short-term and long-term air quality parameters. Integrating real-time air quality monitoring with meteorological forecasting could enable predictive modeling for AAD risk stratification. Air Quality Index (AQI) exhibited a 0.0011 significance level (p=0.0011) in predicting AAD onset, while particulate matter (PM2.5: p=0.0005; PM10: p=0.0009) and gaseous pollutants (NO_2: p=0.0006;

SO_2 /O_3 composite: p=0.0002) showed comparable predictive capacity. This investigation demonstrated a significant and robust association between increased AAD hospitalizations and short and long-term PM2.5 exposure, a 10 μg/m³ increase of PM2.5 was associated with 4.23% increase of AAD hospitalizations. These findings align with recent meta-analyses from China's Northern regions, where PM2.5 increments of 10 μg/m³ correlated with 4.1% increased AAD hospitalization risks (95% CI: 3.8-4.4%). Future research should prioritize longitudinal cohorts to elucidate vulnerable subpopulations and develop region-specific intervention thresholds, particularly in industrialized regions experiencing persistent PM2.5 exceedances.

CONCLUSION: Our results showed that exposure to lower ambient temperature, sharp temperature change, air pollutants, especially PM2.5, PM10 and SO_2 was significantly associated with increased risk of AAD. This investigation advances the understanding of environmental determinants in AAD pathophysiology, underscoring the urgent need for multidisciplinary strategies addressing both clinical management and environmental policy reforms to mitigate this preventable cardiovascular burden.

心源性休克预后相关因素分析

黄日红 刘思玮

大连医科大学附属第一医院

目的：心源性休克作为高病死率的心血管急危重症，其预后异质性给临床管理带来挑战。本研究旨在基于大连医科大学附属第一医院患者数据，筛选预后独立危险因素，构建并验证预后评分系统，为临床提供量化评估工具，以优化个体化治疗策略。

方法：本研究采用回顾性研究，纳入本院 2015 年 1 月至 2025 年 1 月近 10 年的收治的 335 例心源性休克患者，收集年龄、性别、吸烟史、饮酒史、房颤病史、冠心病史、糖尿病病史、心率、收缩压、血肌酐、同型半胱氨酸、血乳酸、左室射血分数、左室舒张末期内径、肌钙蛋白等指标。采用 LASSO 算法降维筛选核心变量，经单因素回归分析关联性后，通过多因素 Cox 回归模型确定独立预后指标，并依据回归系数赋予权重及分值构建评分系统。采用 ROC 曲线评估预测效能，非条件多分类 Logistic 回归确定低、中、高危组分层阈值，Bootstrap 内部抽样验证模型，校准曲线评估拟合度。

结果：多因素 Cox 回归显示，年龄（≥ 75 岁）、糖尿病史、房颤病史、收缩压（< 101.5mmHg）、血清肌酐（≥ 130μmol/L）、血乳酸（≥ 7.45mmol/L）、左室射血分数（≤ 47.5%）及左室舒张末期内径（≥ 45.5mm）为独立预后危险因素。构建的评分系统 ROC 曲线 AUC 值 0.80-0.90，预测效能良好；风险分层为低危组（≤ 11.5 分）、中危组（11.5-13.5 分）、高危组（≥ 13.5 分），三组预后差异有统计学意义（P < 0.001）。Bootstrap 验证显示校准曲线卡方值 4.824，P=0.776，模型拟合度佳。

结论：本研究构建的评分系统整合易获取指标，可快速量化评估心源性休克患者预后风险，且预测效能与拟合度良好。临床可据此分层管理：低危组优化基础治疗，维持血流动力学稳定；中危组动态监测指标，适时调整治疗方案；高危组尽早启动 IABP、ECMO 等高级循环支持，以改善器官灌注，对提升临床管理水平具有重要价值。

IVABRADINE-INDUCED HEART RATE REDUCTION INCREASES THE SEVERITY OF POSTRESUSCITATION MYOCARDIAL DYSFUNCTION IN A RAT MODEL OF CARDIOPULMONARY RESUSCITATION

Zhangle Hu

Department of Cardiology, The Second Hospital of AnhuiMedical University

Aims: Postresuscitation (PR) myocardial dysfunction, one key component of post-cardiac arrest syndrome, is responsible for low survival rates after cardiac arrest (CA). The severity of PR myocardial dysfunction, a key factor in early PR death, is now known to correlate with the duration of ischemia, the number of electrical defibrillations, and administration of epinephrine during cardiopulmonary resuscitation (CPR). Heart rate (HR), an intuitive vital sign, is closely allied to myocardial dysfunction. On the one hand, a rapid HR as a result of sympathetic hyperactivity is a compensatory mechanism preserving the cardiac output (CO) when myocardial function is depressed. On the other hand, if of long duration, the fast HR increases myocardial oxygen demand, shortens diastole, and reduces myocardial oxygen supply, thus aggravating myocardial dysfunction. After CA and CPR, a long-lasting rapid HR occurs after return of spontaneous circulation (ROSC). An earlier study illustrated that in a rat model of CPR, 4 and 8 min of ventricular fibrillation plus 8 min of CPR, respectively, resulted in steady HRs of 415 and 440 beats/min (bpm) at 1 h PR lasting more than 2 to 3 has compared with a baseline HR of 360 bpm, leading to an imbalance between oxygen supply and demand unfavorable for PR myocardial function. This then leads to the assumption that reduction in such HR should be beneficial. Among all the HR-reducing agents, ivabradine (IVA) provides a specific HR reduction (HRR) by inhibiting the I_f current of the sinoatrial node. This agent having no negative inotropic effect has been approved by guidelines for treating heart failure with reduced ejection fraction (EF). Animal studies also illustrate several favorable effects of IVA-induced HRR on exercise-induced myocardial ischemia and stunning, energy metabolism, and septic microcirculatory derangements. In the present study, we aimed to investigate the follow-on effect of IVA-induced HRR on PR myocardial function in a rat model of CPR. It is hypothesized that with those proven beneficial effects, IVA-induced HRR would also improve PR myocardial dysfunction and prolong duration of survival.

Methods and results: Six minutes of ventricular fibrillation and 8 min of CPR were performed on Sprague-Dawley rats. All 32 resuscitated animals were then randomized into saline and ivabradine groups, each group having nonsurvival and survival subgroups (n = 8 each). Saline or ivabradine (0.5 mL/kg) was administered at 1 h postresuscitation. Heart rate, myocardial function as expressed by cardiac output, ejection fraction, and myocardial performance index were assessed at baseline and hourly from 1 to 5 h postresuscitation. Heart rate variability was analyzed at baseline and at 1, 3, and 5 h postresuscitation. Serum epinephrine and cardiac troponin I at baseline and at 1, 3, and 5 h postresuscitation in nonsurvival subgroup were measured. Survival duration in the survival subgroup was observed. The baseline HR was approximately 390 beats/min (bpm). After resuscitation, an average increase of Δ ≈ +15 bpm (relative ratio ≈ +3.8%) with a resultant HR of 405 bpm lasting more than 5 h occurred. Ivabradine group achieved a steady HRR of Δ ≈ − 30 bpm (relative ratio ≈ − 7.4%) as compared with saline group (P

Conclusions: Ivabradine-induced HRR increases the severity of postresuscitation myocardial dysfunction and shortens survival duration in a rat model of CPR.

乳酸白蛋白比值对心原性休克患者 28 天死亡率的预测价值

刘梦苑 [1] 翁林生 [2] 张瑞琦 [1] 高晓津 [1]

1. 中国医学科学院阜外医院（国家心血管病中心）

2. 佛山市妇幼保健院

目的：尽管心原性休克的治疗与管理近些年得到了改善，心原性休克的短期死亡率仍居高不下（约 40~50%），目前尚缺乏良好的预测指标评估心原性休克的死亡风险。乳酸白蛋白比值（lactate-to-albumin ratio，LAR）已被证实是评估脓毒症、院内心脏骤停、急性心衰和呼衰等危重症患者预后的重要指标。然而，LAR 与心原性休克患者死亡率之间的关联尚不清楚。本研究旨在评估 LAR 对心原性休克患者短期死亡率的预测价值。

方法：研究数据来源于重症监护医学信息库 IV（Medical Information Mart for Intensive Care IV, MIMIC IV，版本 3.0），共纳入 1384 名首次住院并入住重症监护室的心原性休克患者，以 7：3 的比例分为训练集及测试集，并根据基线 LAR 水平分为三分位数组。主要终点为 28 天死亡率，次要终点为 ICU 内、院内及 90 天死亡率。经共线性分析排除共线性变量、逐步回归分析筛选相关性变量，采用多因素 Cox 回归探究 LAR 与短期死亡率的关联，基于筛选出的含 LAR 在内的 9 个变量构建列线图，用于 28 天死亡率预测，并通过受试者工作特征（ROC）曲线评估预测模型的效能。

结 果：研究人群的总体 28 天死亡率为 36.5%，按基线 LAR 水平分为低（LAR ≤ 0.545，T1）、中（0.545 < LAR ≤ 1.095，T2）、高（1.095 < LAR，T3）三分位数组，三组的 28 天死亡率分别为 25.7%、34.0%、50.0%（P<0.001），Kaplan-Meier 生存曲线显示高 LAR 组的 28 天死亡率较低 LAR 组显著增加（Log rank P<0.001）。多因素 Cox 回归分析显示，随着 LAR 水平的升高，28 天死亡率逐渐增加（HR=1.20，95%CI：1.10~1.30，P<0.001，LAR 作为连续变量），且在高 LAR 组中更为显著（T2 vs T1：HR=1.19，95%CI：0.89~1.58，P=0.24；T3 vs T1：HR=1.49，95%CI：1.13~1.97，P=0.005， 趋 势 P 值 =0.004），且上述效应在 ICU 内、院内及 90 天死亡率等次要终点中仍然显著。以性别、年龄、种族、合并症等变量进行亚组分析，发现在各亚组中 LAR 均显著升高 28 天死亡率。基于筛选出的与 28 天死亡率显著相关的 9 个变量绘制列线图（包括 LAR、年龄、红细胞计数、白细胞计数、血红蛋白、尿素氮、急性生理学评分（APSIII）、急性肾损伤、连续性肾脏替代治疗等变量），在训练集中 ROC 曲线的曲线下面积（AUC）为 0.76（95%CI：0.73~0.79），验证集中的 AUC 为 0.74（95%CI：0.69~0.79）。

结论：LAR 是心原性休克患者短期死亡率的独立预测因子，基于 LAR 构建的预测模型有望为心原性休克患者的风险分层提供依据。

Clinical characteristics and outcomes of post-infarction ventricular septal rupture: a single center experience

fanqi meng, Hong-Fei Jiang, Xi-Xing Wang, Shan Huang, Peng-Long Wu, Wen-Hui Liu, Wei-Bin Chen, Mao-Long Su, Yan Wang

Xiamen Cardiovascular Hospital Xiamen University

Background

Ventricular septal rupture (VSR) is a rare but lethal mechanical complication of acute myocardial infarction (AMI), characterized by high mortality rates that remain a significant challenge in clinical practice. Patients managed with medical therapy alone face particularly poor prognoses, highlighting the need for better understanding of optimal treatment strategies. This single-center study aimed to investigate the clinical features, intervention trends, and prognostic factors of post-infarction VSR (PIVSR) in a Chinese cohort, providing real-world evidence to inform clinical decision-making.

Methods

This retrospective study enrolled 51 patients with PIVSR admitted to Xia-

men Cardiovascular Hospital Xiamen University between January 2012 and June 2023. Inclusion criteria were: confirmed VSR with left-to-right shunt via transthoracic echocardiography (TTE) and a diagnosis of AMI (including ST-segment elevation MI (STEMI) and non-STEMI). Patients with congenital ventricular septal defects, traumatic cardiac injury, or uncertain onset time of PIVSR were excluded.

All patients received standardized AMI management in the coronary care unit (CCU), including continuous hemodynamic monitoring, precise volume control to reduce pulmonary edema, and administration of vasopressors or inotropes when necessary to maintain organ perfusion. Mechanical circulatory support, such as intra-aortic balloon pump (IABP) and extracorporeal membrane oxygenation (ECMO), was used for patients with severe hemodynamic instability. Intervention strategies—including medical conservative therapy, percutaneous transcatheter closure, and surgical repair—were determined through multidisciplinary consultations involving cardiologists, cardiac surgeons, and intensivists, with final decisions made by patients and their families.

Results

The study cohort had a median follow-up duration of 488 days with no loss to follow-up. Patients had a mean age of 70.3±11.2 years, and 66.7% were male. Common comorbidities included hypertension (47.1%), type 2 diabetes (19.6%), atrial fibrillation (7.8%), and ischemic stroke history (5.9%). All patients were diagnosed with STEMI, with 82.4% presenting with acute anterior or extensive anterior MI (2 cases with concurrent inferior MI), and 17.6% with acute inferior MI (accompanied by lateral right ventricular, posterior, or right ventricular involvement in 1 case each). At presentation, 68.6% were in Killip class III–IV, and 47.1% developed cardiogenic shock. Among 35 patients who underwent coronary angiography, 42.9% had left main or three-vessel disease, and 29 (56.9%) received revascularization (2 with thrombolysis, 27 with percutaneous coronary intervention).

The median time from AMI onset to VSR was 4 days, with 62.7% of ruptures occurring within 7 days. Most ruptures (86.3%) were located in the ventricular septal apical segment, with a mean diameter of 12.7±4.9 mm; 90.2% of patients had moderate-to-large left-to-right shunts. Echocardiographic findings showed a mean left ventricular ejection fraction of 43.6±11.0% and a mean left ventricular end-diastolic diameter of 51.3±8.9 mm, with ventricular aneurysms present in 78.4% of patients.

Complications were common: 47.1% developed acute hepatic injury, 60.8% acute renal injury, and 15.7% gastrointestinal bleeding. Infections occurred in 62.7% of patients (all pulmonary, with 1 case each of urinary tract and bloodstream infection). Mechanical support was required for 33 patients (64.7%) via IABP (median duration 288 hours), while 2 patients received ECMO, both of whom died from multi-organ failure. The median hospital stay was 16 days, with a median total cost of 98,000 RMB.

Intervention strategies included medical therapy (35 patients, 68.6%), transcatheter closure (13 patients, 25.5%), surgical repair (2 patients, 3.9%), and left ventricular partitioning (1 patient, 2.0%). Transcatheter closure rates increased significantly over time: 0% (2012–2015), 7.1% (2016–2019), and 48.0% (2020–2023) (P<0.05).

Overall mortality was 80.4%, with a median survival time of 21 days. Medical therapy had a 97.1% mortality rate (34/35 deaths from cardiogenic failure), while transcatheter closure had 38.5% mortality (5/13 deaths from circulatory failure or cardiac arrest). Both surgical repair patients died postoperatively, while the left ventricular partitioning patient survived with normal function.

Comparing medical and transcatheter groups, the medical group was older (P<0.05), but the transcatheter group had higher rates of coronary angiography (100% vs. 54.3%, P=0.002) and revascularization (84.6% vs. 45.7%, P=0.022). Transcatheter patients had larger ruptures (15.2±5.9 vs. 11.7±4.4 mm, P=0.031) but lower cardiogenic shock rates (15.4% vs. 60.0%, P=0.009) and higher IABP use (92.3% vs. 54.3%, P=0.018). Importantly, transcatheter closure was associated with lower 30-day (30.8% vs. 85.7%) and 3-month (30.8% vs. 88.6%) mortality (P<0.05).

Multivariate analysis identified three independent predictors: VSR within 7 days of AMI (HR=3.428), cardiogenic shock (HR=2.661), and transcatheter closure (protective, HR=0.298).

Conclusion

PIVSR remains highly lethal, with medical therapy yielding poor outcomes. Transcatheter closure, increasingly adopted since 2020, significantly improves survival despite being used in patients with larger ruptures. Early VSR onset and cardiogenic shock are key risk factors, supporting transcatheter closure as a viable option with timely intervention. These findings underscore the value of multidisciplinary care and proactive use of transcatheter techniques in managing PIVSR.

基于游戏移动应用程序的模拟训练在 CCU 护士 ECMO 技能培训中的应用

赵佳妮 李娟利 李静

西安交通大学医学院第一附属医院

背景：体外膜肺氧合（ECMO）作为心脏监护单元（CCU）救治危重患者的关键生命支持技术，其操作复杂且风险极高，对护士的专业技能提出了严苛要求。传统的 ECMO 培训模式常受限于设备稀缺、实践机会不足及高风险操作难以反复练习等困境。

目的：探讨基于游戏移动应用程序的模拟训练在 CCU 护士 ECMO 核心知识与操作技能方面的应用价值与有效性。

方法：选取 84 名首次学习 ECMO 的 CCU 护士为研究对象。将 84 名护士随机分为对照组和观察组，两组各 42 人。对照组采用理论授课和操作演示传统的培训方法；观察组则在理论授课基础上系统性使用一款专为 ECMO 培训设计的移动应用。该应用整合了三维交互式 ECMO 管路预充、紧急并发症（如气栓、血栓）VR 模拟处理、情景化应急决策游戏等核心模块，强调流程规范与即时反馈机制。比较两组方法培训前后 CCU 护士 ECMO 核心知识与技能水平的差异。

结果：培训前两组护士理论成绩和操作成绩差异无统计学意义（P > 0.05），培训后观察组理论成绩和操作成绩均显著高于对照组（P < 0.05），差异有统计学意义，尤其在心肺支持建立、气栓识别与处理等高风险环节，观察组表现出更高的准确性与效率。观察组 CCU 护士对培训形式的满意度显著高于对照组（P < 0.05），差异具有统计学意义。

结论：基于游戏化移动应用程序的 ECMO 模拟训练是传统操作演示的有力补充与创新延伸。其显著优势在于通过高度可及、沉浸式、无风险的交互环境，极大拓展了护士的练习频次与深度，有效强化了其对复杂操作流程的记忆与高风险情景的处置能力。将此类应用程序纳入 CCU 护士 ECMO 培训体系，可突破时空与设备限制，显著提升培训效率与覆盖范围，为培养高应变能力的 ECMO 护理专才提供创新且极具前景的解决方案。

Management of Ventricular Septal Rupture Following Acute Myocardial Infarction Using a Fully Magnetically Levitated Extracorporeal Ventricular Assist Device: A Case Report

gao xuan

The Second Affiliated Hospital of Harbin Medical University

A 68-year-old male patient presented with acute chest pain, severe dyspnea, and hemodynamic instability indicative of cardiogenic shock (CS), necessitating emergency hospital admission. Initial diagnostic evaluation revealed significant abnormalities. Electrocardiography (ECG) demonstrated pathological Q waves in leads II, III, and aVF, consistent with prior inferior wall injury, alongside convex upward (saddle-shaped) ST-segment elevations spanning leads V2 to V6, highly suggestive of an acute, extensive anterior myocardial infarction. Serological biomarkers confirmed massive myocardial necrosis, with high-sensitivity cardiac troponin I (hs-cTnI) markedly elevated at 1502.4 ng/ml.

Transthoracic echocardiography (TTE) provided critical structural and functional assessment:Left ventricular (LV) regional wall motion abnormalities: Significant hypokinesis involving multiple segments.Mechanical complication: A sizable post-myocardial infarction ventricular septal rupture (post-MI VSR) measuring 3 cm in diameter, confirmed by color-flow Doppler showing substantial left-to-right shunting.Chamber abnormalities: Left atrial (LA) enlargement.Valvular dysfunction: Mild-to-moderate mitral regurgitation (MR) and severe tricuspid regurgitation (TR).The integrated diagnosis was established as:Acute extensive anterior ST-segment elevation myocardial infarction (STEMI); Post-MI ventricular septal rupture (VSR); Acute systolic heart failure with Killip class IV severity; Cardiogenic shock

Given the profound hemodynamic compromise exacerbated by the significant VSR shunt, immediate mechanical circulatory support (MCS) was imperative. The patient underwent successful implantation of an extracorporeal ventricular assist device (Extra-VAD). This intervention achieved crucial therapeutic objectives:Effective left ventricular decompression; Substantial reduction in trans-septal shunt volume; Significant alleviation of cardiac workload (unloading); Restoration of hemodynamic stability

Under the protective support of the Extra-VAD, subsequent diagnostic and therapeutic procedures were safely performed:Day 4 (Extra-VAD support): Coronary angiography (CAG) identified critical occlusions in the mid segment of the left anterior descending artery (mid-LAD) and the distal segment of the left circumflex artery (distal LCX).Day 8 (Extra-VAD support): The patient underwent a complex, multi-procedural cardiothoracic surgery under Extra-VAD support, comprising:Coronary artery bypass grafting (CABG)、Left ventricular aneurysmectomy (resection of the fibrotic aneurysmal tissue)、Surgical repair of the ventricular septal rupture (using a patch technique)、Tricuspid valve annuloplasty (to address severe regurgitation)\Placement of temporary epicardial pacemaker leads.

The postoperative course was managed in the intensive care unit (ICU). Following targeted symptomatic management and close monitoring, the patient's vital parameters stabilized. He was subsequently transferred to the cardiac intensive care unit (CICU) on postoperative day 3. Continuous Extra-VAD support proved instrumental during this critical phase by sustainably reducing cardiac preload and afterload, thereby facilitating myocardial recovery and protecting the surgical repairs. Remarkable improvement in biventricular function was observed by postoperative day 6, allowing for the successful explantation of the Extra-VAD device.

Clinical Context and Rationale for Extra-VAD Utilization:

This patient developed VSR over two weeks following the index acute MI, a known high-risk complication associated with significant mortality. He presented in extremis with refractory dyspnea secondary to the large shunt and had developed a complicating left ventricular aneurysm, rendering his condition critically unstable and mandating urgent surgical correction. However, his profound cardiogenic shock and multi-organ compromise initially rendered him an unacceptably high-risk candidate for immediate definitive surgery.Conventional MCS strategies faced substantial limitations:Intra-aortic balloon pump (IABP): Provides only modest (~0.5-1.0 L/min) augmentation of cardiac output and afterload reduction, generally insufficient to overcome the hemodynamic burden of a large VSR and cardiogenic shock.Venoarterial extracorporeal membrane oxygenation (VA-ECMO): While providing robust circulatory and respiratory support, VA-ECMO significantly increases left ventricular afterload. This elevated afterload, coupled with the inherent left-to-right shunt of the VSR, potentiates shunt volume, exacerbates pulmonary edema, impairs LV emptying, and can lead to profound hemodynamic deterioration and LV distension (LV stasis), hindering rather than facilitating bridging to surgery.

The Extra-VAD system was selected as an optimal short-term, percutaneous MCS platform for this complex scenario. Its core mechanism involves an external centrifugal pump generating continuous, pulseless, stable forward flow, capable of providing full cardiac output support (typically 4-6 L/min). Crucially, its modular design allows flexible configuration:Left ventricular assist device (LVAD) mode: Draining blood from the left atrium or ventricle, returning it to the arterial system (as used here, providing LV decompression and systemic flow).Right ventricular assist device (RVAD) mode: Draining from the right atrium/ventricle to the pulmonary artery.Biventricular assist device (BiVAD) mode: Combining LVAD and RVAD support.

The primary therapeutic goals achieved with Extra-VAD in this case were:Hemodynamic Resuscitation and Stabilization: Restoring adequate end-organ perfusion.Cardiac Unloading: Drastically reducing ventricular wall stress, myocardial oxygen consumption, and shunt fraction, creating a more favorable metabolic environment.Bridge to Definitive Therapy: Providing crucial hemodynamic stability and organ recovery, enabling the patient to withstand the necessary complex cardiac surgery.

By effectively augmenting or replacing ventricular pump function in patients with severe, potentially reversible cardiac failure, devices like the Extra-VAD serve as a vital"bridge to recovery"(as in this case) or a"bridge to decision" or "bridge to transplant" in other scenarios, offering critical time for myocardial healing or planning of further interventions. This case exemplifies its successful application in managing a highly lethal mechanical complication of acute myocardial infarction.

基于信息化平台的左心辅助装置植入术后随访管理及患者发生不良事件分析

热衣拉·买买提

新疆维吾尔自治区人民医院

目的 本研究旨在深入探索基于信息化平台的左心辅助装置植入术后随访护理管理模式的应用价值，通过系统分析该模式下患者术后不良事件的发生情况，为优化左心辅助装置术后管理体系提供实践依据。左心辅助装置作为终末期心力衰竭患者的重要治疗手段，术后随访护理对患者预后至关重要，而传统随访模式存在数据分散、信息传递滞后等问题，信息化平台的引入有望提升管理效率与精准度，因此本研究聚焦于该模式的实际应用效果，重点分析不良事件发生率等核心指标。

方法 选取我院 2022 年 1 月至 2024 年 12 月接受左心辅助装置植入术的 20 例患者，借助自主搭建的信息化平台，按照指定随访流程实施随访护理管理。随访过程中，密切监测患者血栓形成、出血、感染等不良事件发生情况，并记录死亡率及再入院率。

结果 在两年内，血栓形成发生率为 10% ，出血事件发生率为 0，感染事件发生率为 5%，死亡率为 35%，再入院率为 35%。

结论 基于信息化平台的左心辅助装置植入术后随访护理管理模式，虽因缺乏传统模式的同期对照，暂未能直接证实其在降低不良事件发生率上的优势，但在实际应用中展现出显著的管理效能：通过平台实现了患者术后数据的集中化、标准化收集，减少了信息遗漏与错误，医护人员可实时查看患者动态，及时发现病情变化并调整干预方案，大幅提升了随访效率。同时，本研究明确了该患者群体中血栓、感染等不良事件的具体发生率，为后续针对性制定防控策略提供了数据支撑，有助于进一步完善术后管理体系，为降低不良事件风险、提高患者生存质量奠定基础。

ECMO 联合 IABP 治疗严重心肺衰竭患者的护理质量评价指标体系构建

杜佳

西安交大一附院

摘要：

目的：构建体外膜肺氧合（ECMO）联合连续性主动脉内球囊反搏泵（IABP）严重心肺衰竭患者的护理质量评价指标体系。

方法 选取西安交大一附院 2023 年 1 月–2025 年 1 月，选取 100 例严重心肺衰竭患者，建立医护研究小组，按照德尔菲专家法，以“结构 - 过程 - 结果” 三维质量模式为指导构建指标，形成严重心肺衰竭行 ECMO 联合 IABP 治疗患者的护理质量评价体系。

结果：一级指标有 4 项，分别为护理人员资质、护理操作流程、并发症预防与处理、护理文件与记录，重要性评分分别为（4.75±0.44）、（4.91±0.35）、（4.75±0.44）、（4.81±0.42）分，权重分布为 0.175、0.316、0.307、0.202。二级指标有 15 项，权重超过 0.100 的有预防和处理凝血、评估和记录 ECMO 联合 IABP 的护理质量，重要性评分分别为（4.90±0.39）、（4.87±0.37）分，权重分别为 0.111、0.115。三级指标有 47 项，权重均低于 0.100。

结论：基于“结构 - 过程 - 结果” 三维质量模式构建严重心肺衰竭患者行 ECMO 联合 IABP 治疗的护理质量评价体系具有可靠性和科学性，可为该群体的护理质量改进提供循证支持。

Pulse index continuous cardiac output monitoring improved clinical outcomes of acute myocardial infarction patients complicated by cardiogenic shock

Jieyun You

Shanghai East Hospital

Objective: Cardiogenic shock (CS) is a major cause of death in patients with acute myocardial infarction (AMI). In addition to rapid and effective revascularization, real-time and accurate hemodynamic monitoring is also the cornerstone for formulating treatment strategies. The aim of this study is to evaluate the effects of pulse index continuous cardiac output (PiCCO) monitoring in improving clinical outcomes of patients with acute myocardial infarction complicated by cardiogenic shock (AMICS) and treated by primary percutaneous coronary intervention (PCI).

Methods: After 1:1 propensity score matching, 50 AMICS patients in the PiCCO group and 50 AMICS patients in the control group were enrolled. The inclusion criteria included: (1) aged ≥ 18 years, male or non-pregnant female; (2) meeting the diagnostic criteria for AMICS; (3) having treated by primary PCI. The exclusion criteria included: (1) peripheral vascular disease; (2) severe valvular heart disease; (3) having received extracorporeal membrane oxygenation (ECMO) treatment; (4) pregnant or lactating women; (5) not treated by primary PCI; (6) complicated with cardiac mechanical complications. The baseline characteristics, treatment, and clinical outcomes during hospitalization and at 30-day clinical follow-up were compared. All patients were treated with primary PCI and antiplatelet therapy as well as other coronary heart disease medications in accordance with guidelines. For the control group, the in-hospital medication regimens were determined by the attending physicians based on available examination results, monitoring information, and clinical experience. In the PiCCO group, PiCCO monitoring was performed immediately after the patients returned to the cardiac intensive care unit following emergency PCI. The hemodynamic parameters were monitored, includeding cardiac index (CI), left ventricular contractility index (dPmax), global ejection fraction (GEF), global end-diastolic volume index (GEDVI), systemic vascular resistance index (SVRI), and extravascular lung water index (EVLWI). The medication strategies were adjusted in a timely manner based on the hemodynamic decision model.

Results: Inotropes and vasopressors were more prescribed in the PiCCO group (both $P < 0.05$). Compared with the control group, all-cause death (16% vs. 34%, P=0.024), cardiac death (14% vs. 30%, P=0.042) and readmission rate (2% vs. 14%, P =0.027) at 30-day clinical follow-up were significantly reduced in the PiCCO group, respectively. The duration of first hospitalization was significantly shortened [(17.60±1.06) days vs. (24.32±2.19) days, $P < 0.001$] in the PiCCO group. There was no significant difference in the incidence of procedure-related complications such as bleeding, hematoma, embolism, and infection between the two groups (all $P > 0.05$). The levels of high-sensitivity troponin T (hs-TnT), N-terminal pro-B-type natriuretic peptide (NTproBNP), left ventricular ejection fraction (LVEF) and serum creatinine (Scr) in the PiCCO group improved more rapidly and significantly than those in the control group (all $P < 0.05$). The changes in hemodynamic parameters in the PiCCO group showed that by timely adjusting the treatment strategies based on PiCCO parameters, the patients' hemodynamic indicators such as cardiac contractility (GEF), afterload (SVRI), pulmonary edema (EVLWI), and CI were significantly improved.

Conclusions: PiCCO monitoring for AMICS patients post-primary PCI exerts beneficial effects and improves the short-term clinical outcomes. The failure heart achieves a new balance between oxygen supply-consumption, preload, and afterload in a short period of time. Real-time and accurate hemodynamic monitoring may be one of the key factors for improving the prognosis of AMICS patients.

Key words: Hemodynamic monitoring, Pulse index continuous cardiac output (PiCCO), Acute myocardial infarction (AMI), Cardiogenic shock (CS), prognosis.

血小板与白细胞比值与急性心肌梗死合并心源性休克的短期预后有关

李远翥 黄毕 罗素新

重庆医科大学附属第一医院

背景：炎症反应在心源性休克（CS）预后中起关键作用，但现有风险评分系统缺乏简便性。本研究旨在评估血小板 - 白细胞比值（PWR）对急性心肌梗死合并心源性休克（AMICS）患者的预后价值。

方法：本项单中心回顾性研究纳入 200 例 AMICS 患者（2013-2022 年），通过 ROC 曲线分析确定最佳截断值（14.04），将患者分为低 PWR 组（≤ 14.04）与高 PWR 组（>14.04）。主要终点为 30 天全因死亡率，次要终点为 30 天主要不良心血管事件（MACE）。采用多变量 Cox 回归、Boruta 特征选择算法及 SHAP 机器学习模型分析 PWR 与预后的关联。

结果：低 PWR 组患者呈现更高水平的乳酸（5.00 vs. 2.40 mmol/L）、尿素（12.30 vs.7.00 mmol/L）、肌酐（147.00 vs. 96.00 μmol/L）、脑钠肽（1243.00 vs. 493.00 pg/mL）及更低左心室射血分数（45.60% vs. 50.79%）。低 PWR 组 30 天死亡率（87.7% vs. 43.0%, P<0.001）和 MACE 发生率（92.3% vs. 55.6%, P<0.001）均显著升高。校正混杂因素后，低 PWR 仍是 30 天死亡风险（HR=2.102, 95%CI:1.353-3.266）和 MACE 风险（HR=2.098, 95%CI:1.404-3.135）的独立预测因子。亚组分析显示该效应在不同特征患者中一致（交互作用 _P_>0.05）。机器学习模型将 PWR 列为死亡首要预测因子（Boruta 算法排序），SHAP 值证实其与生存率呈强负相关。将 PWR 纳入现行评分（IABP-SHOCK II 评分和 CardShock 评分）可显著提升风险分层效能。

结论：入院 PWR ≤ 14.04 是 AMICS 患者 30 天死亡及 MACE 的简便独立预测指标，可反映全身炎症反应严重程度。将其整合至风险模型有望优化危重症护理的早期分层管理。

Urgent Ablation for Drug-Refractory Electrical Storm: High Acute Success and Sustained Prognostic Benefit

Ruo-Lin Wang, De-Yong Long

Beijing Anzhen Hospital, Capital Medical University

Background

Electrical storm (ES) is a critical cardiovascular emergency characterized by recurrent, life-threatening ventricular arrhythmias (VAs), which presents significant challenges in acute management. Radiofrequency ablation (RFA) has emerged as a promising therapy for patients with drug-refractory ES, though its effectiveness in urgent clinical settings remains underexplored.

Objective

This study aims to evaluate the outcomes of urgent RFA for drug-refractory ES, focusing on acute procedural success and long-term prognostic benefits.

Methods

We conducted a retrospective analysis of 96 consecutive patients who underwent urgent RFA for drug-refractory ES at Beijing Anzhen Hospital between January 2018 and April 2024. ES is diagnosed when three or more episodes of sustained VA occur within 24 hours, separated by at least 5 minutes, requiring an intervention to terminate. In patients implanted with an ICD, ES is defined as the occurrence of three or more appropriate device therapies (ATP or shocks) within 24 hours. Drug-refractory ES was defined as failure of ≥ 2 antiarrhythmic drug classes to prevent recurrent ES within 24 hours. Urgent RFA was defined as ablation performed during an active ES episode in patients refractory to antiarrhythmic drug therapy. The primary endpoint was acute procedural success (including complete success and partial success). Secondary endpoints included in-hospital outcomes (in-hospital ES recurrence, in-hospita mortality) and long-term outcomes (ES recurrence, cardiac death, heart transplantation during follow-up).

Results

Acute procedural success (complete or partial) was achieved in 90 (93.8%) patients, which included 86 complete successes and 4 partial successes. 72 (75.0%) patients were spared from the recurrence of any VAs during hospitalization. 6 (6.25%) patients developed recurrent ES after the first ablation, 2 of whom underwent the secondary ablation and the remaining 4 received antiarrhythmic drug therapy. Overall, 2 patients (2.1%) with recurrent ES died during their hospital stay due to the cardiogenic shock.

Severe complications included 1 ischemic stroke requiring percutaneous arterial thrombectomy, 1 pericardial effusion requiring pericardiocentesis, and 3 cases of third-degree atrioventricular block requiring pacemaker implantation. Arteriovenous fistulae at the puncture site that did not require surgical treatment occurred in 3 patients. No procedure-related deaths have occurred.

During a median follow-up of 573.5 days(range 106 to 3385 days), ES recurred in 14 (14.6%) patients and 3 (3.1%) of them died due to the recurrent ES. In addition, 4 patients (4.2%) had subsequent heart transplantations. Multivariable Cox analysis identified cardiomyopathy, chronic kidney disease (CKD), and incomplete procedural success as independent predictors of ES recurrence. Procedural failure and in-hospital ES recurrence were significantly associated with subsequent cardiac death or heart transplantation.

Conclusions

This study highlights the efficacy and safety of urgent RFA for patients with drug-refractory ES, demonstrating favorable short- and long-term outcomes. Complete procedural success significantly reduced the risk of ES recurrence, while procedural failure and early recurrence were strongly associated with poor prognosis. These findings support the adoption of urgent RFA as a primary therapeutic strategy in the acute management of ES, particularly for patients unresponsive to antiarrhythmic drug therapy. Early intervention and complete arrhythmia suppression may be critical to improving survival and long-term outcomes in this high-risk population.

护士主导的撤机方案对机械通气患者的影响：一项系统评价和荟萃分析

护士主导的撤机方案对机械通气患者的影响：一项系统评价和荟萃分析

目的：探讨以护士为主导的程序化撤机方案对 ICU 患者机械通气结局的有效性和安全性，我们将基于不同评估患者撤机准备度工具来护士主导的程序化撤机方案的有效性，为评估机械通气患者准备程度、改善患者预后和节省医疗资源提供更有效的工具。

方法：计算机检索 PubMed、Embase、Cochrane Library、Web of Science、CINHAL，检索时限均为从建库至 2024 年 5 月 12 日。由 2 名研究者独立筛选文献，提取数据，进行质量评价，采用 RevMan5.4 软件进行 Meta 分析，根据评估患者准备度工具的不同进行亚组分析。

结果：共纳入 12 篇文献，其中随机对照试验 9 篇，类实验研究 3 篇。Meta 分析显示，以护士主导的程序化撤机方案可以显著缩短 ICU 患者机械通气时间 [SMD = – 0.40, 95% CI (– 0.63, – 0.17), Z = 3.44, P < 0.01]，显著降低撤机失败率 [RR:0.68 95% CI (0.47, 0.98), Z = 2.07, P = 0.04]，显著减少 ICU 住院时间 [SMD = – 0.20, 95% CI (– 0.31, – 0.09), Z = 3.5, P = <0.01]; 但对患者死亡率的影响差异无统计学意义 [RR=1.00，95%CI(0.77，1.28)，P=0.970]。亚组结果显示，基于 BWAP 的撤机方案不能显著降低机械通气时间 [SMD = – 0.15 95% CI (– 2.39,0.28), p = 0.12]，但是可以显著降低撤机失败率 [SMD = 0.40 95% CI (0.27,0.60, p < 0.00001]。

结论：以护士主导的机械通气程序化撤机方案安全性较好，有助于缩短机械通气时间，降低 ICU 住院时间，降低撤机失败率，为 ICU 患者机械通气的护理实践提供了证据。但是基于 BWAP 的撤机方案撤机失败率更低这一证据，可信程度较低，因此未来需要更大规模的研究来验证。

Ondansetron alleviates sepsis-induced cardiomyopathy-triggered cardiomyocyte ferroptosis via the ATF3-System xc⁻-GPX4 axis.

Xinyun Wang, Xian Jin, Guang-Ya Zhang, Yu Chen, Wei Liu

Shanghai Sixth People's Hospital Affiliated to Shanghai Jiao Tong University School of Medicine

Title: Ondansetron alleviates sepsis-induced cardiomyopathy-triggered cardiomyocyte ferroptosis via the ATF3-System xc⁻-GPX4 axis.

Background

Sepsis-induced cardiomyopathy (SIC) is a reversible but life-threatening myocardial depression that manifests during sepsis or septic shock. Clinically, it is characterized by a rapid decline in left-ventricular ejection fraction (LVEF) and impaired diastolic relaxation, occurring in approximately 28.2 % of septic patients (95 % CI 26.8–29.7 %). Beyond hemodynamic compromise, SIC portends prolonged ICU stay and heightened mortality. Pathophysiologically, the syndrome arises from a complex interplay of excessive inflammatory cytokine cascades, iron-dependent ferroptotic cell death, oxidative and endoplasmic reticulum (ER) stress, coronary microvascular changes, abnormalities in calcium handling and myofilament sensitivity and mitochondrial bioenergetic failure.

Ondansetron (OND), a highly selective 5-HT $_3$ receptor antagonist traditionally employed for chemotherapy- or radiation-induced nausea and vomiting, has recently been recognized for pleiotropic anti-inflammatory actions. Clinically, OND improves abdominal pain, stool consistency, and urgency in irritable bowel syndrome (IBS); in experimental acute pancreatitis it attenuates pancreatic edema, acinar necrosis, and inflammatory infiltration; and in selected cohorts of critically ill myocardial-infarction patients it is associated with improved survival. Nonetheless, a direct mechanistic link between OND and SIC remains unexplored.

Ferroptosis is a distinct, iron-dependent form of regulated cell death characterized by the lethal accumulation of lipid-derived reactive oxygen species (ROS) within cellular membranes. Central to its regulation is the glutathione–glutathione peroxidase 4 (GSH–GPX4) axis, in which GPX4 utilizes GSH as a cofactor to reduce lipid hydroperoxides to harmless lipid alcohols, thereby preventing membrane damage. Impairment of this system, either through depletion of GSH via inhibition of the cystine-glutamate antiporter System xc⁻ (SLC7A11/SLC3A2) or direct inactivation of GPX4, unleashes uncontrolled lipid peroxidation, leading to plasma membrane rupture and cell death. Ferroptosis is now recognized as a

essential pathophysiologically relevant mechanism in ischemia–reperfusion injury, neurodegeneration, acute kidney injury, and sepsis-induced cardiomyopathy.

Methods

To elucidate this relationship, we employed two complementary and rigorously validated models:

1. In vitro: primary neonatal rat cardiomyocytes (NRCMs) challenged with lipopolysaccharide (LPS, 20 μg mL^{-1}) to mimic septic insult;

2. In vivo: C57BL/6J mice subjected to intraperitoneal LPS (10 mg kg^{-1}) to replicate polymicrobial sepsis and SIC.

Both systems received escalating intraperitoneal or culture doses of OND (0.25 or 1 mg kg^{-1} in vivo; 25 or 75 μM in vitro). Cardiomyocyte ferroptosis, inflammatory profiles, mitochondrial ultrastructure, and ER-stress markers were comprehensively interrogated via transmission electron microscopy, RNA sequencing, western blotting (WB), quantitative polymerase chain reaction (qPCR), immunofluorescence, immunohistochemistry.

Results

1. LPS exposure markedly elevated TNF-α, IL-1β, IL-6, and canonical ferroptotic indices (elevated MDA, lipid-ROS, ACSL4 up-regulation, GPX4 down-regulation) in NRCMs and murine hearts.

2. OND dose-dependently:

• attenuated pro-inflammatory cytokine release;

• quenched Fe^{2+}- and ROS-driven lipid peroxidation, thereby partially reversing ferroptosis;

• restored mitochondrial dynamics (normalized Drp1/MFN2 ratio) and bioenergetic function

• alleviated ER stress and global oxidative stress.

3. RNA-seq revealed that OND significantly down-regulated the pro-stress transcription factor ATF3, which in turn reinstated System xc^- (SLC7A11) activity and reinforced the cellular antioxidant program, effectively halting the ferroptotic cascade.

Conclusions

Collectively, our findings establish ferroptotic cardiomyocyte death as a pivotal driver of SIC and provide the first evidence that OND mitigates this pathology via the ATF3–System xc^-–GPX4 axis. By restoring mitochondrial–ER homeostasis and suppressing oxidative injury, OND emerges as a readily translatable, repurposed therapy for sepsis-related cardiac dysfunction.

多巴酚丁胺与米力农在合并右室梗死的下壁 ST 段抬高型心肌梗死患者中的疗效比较：基于 16 年单中心数据的回顾性研究

王斯 肖乾凤 徐英 魏欣

四川大学华西医院

目的：

探讨多巴酚丁胺与米力农在下壁 ST 段抬高型心肌梗死（inferior STEMI）合并疑似右室心肌梗死（RVMI）患者中的短期疗效差异，评估其对住院期间不良结局的影响，并为右室主导型心源性休克（RV-dominant CS）的个体化血流动力学支持提供循证依据。

方法：

本研究为单中心、回顾性观察性研究，纳入 2009 年 6 月至 2025 年 5 月四川大学华西医院住院的 229 例 inferior STEMI 合并疑似 RVMI 患者。纳入标准包括：①入院心电图 II 、III、aVF 导联 ST 段抬高；②冠脉造影证实右冠状动脉为责任血管，或未行造影但 V3R/V4R 导联 ST 段抬高；③住院期间因低灌注接受多巴酚丁胺活米力农治疗。排除合并机械并发症、早期 ECMO 支持、同时使用两药者及关键资料缺失者。主要终点为住院期间发生的复合不良事件（院内死亡或因病情恶化弃治出院）。次要终点为正性肌力药物使用时间及住院时长。采用 Cox 比例风险模型、多元线性回归模型及亚组与敏感性分析评估治疗效果。

结果：

共纳入 229 例患者，多巴酚丁胺组 60 例，米力农组 169 例。多巴酚丁胺组入院时肌酐水平更高（170.0±125.2 vs. 140.7±72.8 μmol/L，P = 0.032），缓慢性心律失常（63.6% vs. 29.9%，P < 0.001）及临时起搏器使用率（49.1% vs. 17.1%，P < 0.001）更高，反映其灌注状态较差。多巴酚丁胺组肌钙蛋白水平更高（3787.1±3491.0 vs. 2656.0±2946.5 ng/L，P = 0.027）。主要终点事件共发生 69 例（30.1%），其中多巴酚丁胺组 17 例（28.3%），米力农组 52 例（30.8%），差异无统计学意义（P = 0.726）。多因素 Cox 回归调整年龄、性别、乳酸、肌酐、LVEF 及肌钙蛋白后，多巴酚丁胺组的 HR 为 0.62（95%CI：0.31–1.25，P = 0.183）。敏感性分析结果一致。在住院存活患者（n = 160）中，多巴酚丁胺组的正性肌力药物使用时间更短（3.1±2.2 vs. 5.1±3.9 天，P = 0.003），该差异在多变量调整后仍显著（β 值约 -1.75，P 均 <0.05）；住院时长在校正后差异无统计学意义（P > 0.3）。

结论：

在 inferior STEMI 合并疑似 RVMI 的患者中，多巴酚丁胺与米力农在院内复合不良结局方面总体疗效相当。多巴酚丁胺更常用于灌注不良及电生理不稳定者，并与较短的药物支持时间相关，提示其具有更快的起效特性。本研究为 RV 主导型 CS 患者的药物选择提供了首个系统性真实世界证据，支持未来基于右室功能表型的个体化治疗策略发展。

流程化管理对急性心肌梗死后室间隔穿孔患者预后的影响

王斯 肖乾凤 徐英 魏欣

四川大学华西医院

目的：室间隔穿孔是急性心肌梗死的严重并发症。积极有效的循环支持治疗，以及限期的室间隔手术是改善预后的重要方式。室间隔穿孔的救治，需要充分调动院内资源开展多学科合作流程化管理，但目前各个中心报道的室间隔穿孔死亡率仍居高不下，针对室间隔穿孔患者开展多学科合作的流程化管理势在必行。目前尚不清楚这种管理模式对室间隔穿孔患者预后的影响。

方法：我中心自 2020 年 3 月开始，针对急性心肌梗死后室间隔穿孔患者采用流程化管理模式，现回顾性纳入 2020 年 3 月至 2024 年 5 月在四川大学华西医院心脏内科 CCU 住院的急性心肌梗死室间隔穿孔的患者，采用前后对照的方式，研究我院采用该管理模式后，对室间隔穿孔患者预后的影响。对照组为 2009 年 9 月至 2020 年 2 月在我中心住院的急性心肌梗死后室间隔穿孔的患者，观察终点为出院后 1 月患者存活。流程化管理包括建立多学科协助小组、入院后即刻心脏彩超及血流动力学评估、早期循环辅助策略评估、心脏外科 / 心导管早期评估手术时机及围术期综合管理。

结果：共纳入 124 例急性心肌梗死后室间隔穿孔患者，41 例在发现室间隔穿孔后，拒绝积极治疗，要求自动出院，被排除研究，最后 83 例纳入了分析。其中干预组 43 人，平均年龄 69.4 岁，男性 22 人（51.2%），前壁心梗 27 人（62.8%），心源性休克 22 人（51.2%），安置 IABP 31 人（72.1%），室间隔手术 27 人（62.8%），出院后 1 月存活 27 人（62.8%）；对照组 40 人，平均年龄 67.4 岁，男性 27 人（67.5%），前壁心梗 32 人（80%），心源性休克 27 人（67.5%），安置 IABP 18 人（45%），室间隔手术 13 人（32.5%），出院后 1 月存活 13 人（32.5%）。年龄、性别、身高、体重、收缩压、舒张压、LVEDD、LVEF、心肌梗死部位以及心源性休克发生率在两组人群中没有统计学差异。与对照组相比，干预组入院距离心肌梗死时间更长，入院肌钙蛋白 -T 水平更低，NT-proBNP 水平更高，室间隔穿孔面积更大，IABP 植入率、室间隔穿孔手术率以及出院后 1 月存活率显著高于对照组。单因素回归分析表明，流程化管理能显著提高室间隔穿孔患者出院后 1 月的存活率（OR=3.51，P=0.007），在矫正了年龄、性别、入院距离心梗时间、室间隔穿孔大小及 IABP 植入等影响因素后，仍产生积极的影响（OR=8.07，P=0.008）。

结论：对急性心肌梗死后室间隔穿孔患者实施流程化管理，能够显著提高其存活率。各医疗中心应高度重视室间隔穿孔患者的早期管理，充分调动院内资源，进行多学科合作，进一步改善室间隔穿孔患者的预后。我中心在这方面积累的经验，可为其他中心提供有价值的借鉴。

穿孔面积及其变化对急性心肌梗死后室间隔穿孔患者预后的影响

王斯 肖乾凤 徐英 魏欣

四川大学华西医院

目的：室间隔穿孔是急性心肌梗死后的严重并发症。我们通常认为，室间隔穿孔面积越大，患者的预后越差，且室间隔穿孔后，穿孔面积有进一步扩大的风险，穿孔面积扩大可能带来血流动力学的不稳定，需要急诊手术。目前已知是否发生心源性休克以及是否接受室间隔手术治疗是影响预后的重要因素，但尚不清楚室间隔穿孔的面积及其变化对预后是否产生影响。

方法：回顾性研究 2009 年 9 月至 2024 年 5 月在四川大学华西医院心脏内科 CCU 住院的急性心肌梗死后室间隔穿孔的患者。从电子病历或存档记录中提取人口统计数据、病史、体格检查结果、心电图、超声心动图和血液学数据。室间隔穿孔的面积从入院首次和之后的超声心动图报告中调取，观察终点为出院后 1 月患者存活。

结果：共纳入 124 例急性心肌梗死后室间隔穿孔患者，排除超声心动图资料不完整的患者 7 例，最终 117 例患者纳入研究，其中男性 63 例（53.8%），平均年龄为 69.1 岁，平均穿孔面积为 13.7cm。入院时穿孔面积小于 1cm 的患者 29 人，占 24.8%，出院后 1 月存活 13 人（31.7%）；穿孔面积为 1-1.5cm 的患者 43 人，占 36.8%，出院后 1 月存活 13 人（44.8%）；穿孔面积在 1.5-2cm 的患者 31 人，占 26.5%，出院后 1 月存活 10 人（34.5%）；穿孔面积大于 2cm 的患者 18 人，占 15.4%，出院后 1 月存活 10 人（55.6%）。年龄、性别、身高、收缩压、舒张压、LVEDD、LVEF、入院肌钙蛋白 -T、NT-proBNP 以及心源性休克发生率、室间隔手术率、出院后 1 月存活率，在四组患者中均没有统计学差异。穿孔面积大于 2cm 的患者，体重更重，下壁心肌梗死的比例更高，入院距离心肌梗死时间更晚。单因素回归表明，室间隔穿孔的面积对出院后 1 月的存活率没有显著影响（P=0.424），在矫正了年龄、性别、体重、入院距离心梗时间、心肌梗死的部位、心源性休克及室间隔手术等影响因素后，仍然不产生显著影响（P=0.547）。有 60 例患者患者在手术前接受了至少 2 次超声心动图检查，室间隔穿孔面积增加≥ 2mm 定义为室间隔穿孔增大。其中 28 例患者室间隔穿孔面积不变，出院后 1 月存活 16 人（57.5%）；32 例患者室间隔穿孔面积增大，出院后 1 月存活 20 人（62.5%）。年龄、性别、身高、体重、收缩压、舒张压、LVEDD、LVEF、入院 CK-MB、肌钙蛋白 -T、NT-proBNP 以及心肌梗死部位、入院距离心肌梗死时间、心源性休克发生率、室间隔手术率、出院后 1 月存活率，在两组患者中没有统计学差异。单因素回归分析表明，室间隔穿孔的面积是否增大，对出院后 1 月的存活率没有显著影响（P=0.673），在矫正了年龄、性别、心源性休克及室间隔手术等影响因素后，仍然不产生显著影响（P=0.408）。

结论：急性心肌梗死后室间隔穿孔的患者，其入院时穿孔面积的大小和住院期间穿孔面积的变化，对患者出院后 1 月的存活率没有显著影响。因此，我们不能因室间隔穿孔的面积大小和变化而影响医疗决策。

心脏急重症患者机械循环支持治疗的时机选择与预后分析

张静

哈医大二院

心脏急重症患者机械循环支持治疗的时机选择与预后分析

目的

心血管急危重症发病率在逐年上升，尤其在心源性休克、急性心肌梗死并发心衰、重症心肌炎等危重病情中，传统药物治疗无法有效维持循环稳定。机械循环支持（Mechanical Circulatory Support, MCS）技术，尤其是主动脉内球囊反搏（IABP）、体外膜肺氧合（ECMO）及微型左心辅助装置（如 Impella）的广泛应用，为患者提供了暂时性的循环支持和心功能恢复窗口，然而 MCS 的启动时机直接影响其治疗效果和患者预后，本研究旨在评估 MCS 在心脏急重症患者中的最佳启动时机，分析早期干预与延迟干预对患者病死率、生存率及并发症的影响，优化治疗决策，提升救治成功率。

方法

本研究为单中心、回顾性队列分析，纳入 2020 年 1 月至 2024 年 12 月期间在某某大学附属第一医院心血管中心接受 MCS 治疗的心脏急重症患者共 120 例。纳入标准为：①明确诊断为心源性休克、重症心肌炎、急性广泛前壁心肌梗死伴严重心功能不全等；②年龄 18-80 岁；③接受 IABP、ECMO 或 Impella 等 MCS 治疗。排除标准为：既往严重慢性心衰（NYHA IV 级）、终末期器官功能障碍、明确放弃治疗者等。

根据 MCS 介入时间，将患者分为早期干预组（发病 24 小时内启动 MCS，n=60）和延迟干预组（发病 24 小时后启动 MCS，n=60）。收集患者基础资料、急诊 SOFA 评分、血流动力学参数、机械通气时间、ICU 停留时间、住院总时长、并发症（感染、出血、肾功能不全等）及 28 天病死率、90 天生存率等指标。

统计分析采用 SPSS 26.0 软件，组间比较采用 t 检验或 χ^2 检验，生存分析采用 Kaplan-Meier 曲线及 log-rank 检验，采用 Cox 比例风险模型进行多因素预后分析，P<0.05 为差异有统计学意义。

结果

120 例患者中，男女比例为 59:41，平均年龄为 58.4±13.7 岁。常见诊断包括：心源性休克（65 例），急性心肌梗死（31 例），重症心肌炎（14 例），术后低心排综合征（10 例）。

早期干预组的 28 天病死率显著低于延迟干预组（24.6% vs. 40.3%，P<0.05）；90 天生存率也高于延迟组（71.1% vs. 50.2%，P<0.05）。早期干预组 SOFA 评分在治疗后第 7 日下降更明显（平均下降 4.2 分 vs. 2.8 分，P<0.05）。虽然两组 ICU 停留时间和总住院天数差异不显著，但早期组术后血流动力学稳定所需时间更短，平均减少 1.9 天。

并发症发生率方面，两组出血、感染及急性肾损伤发生率无显著差异，延迟组中多器官功能障碍综合征（MODS）发生率更高（29.9% vs. 16.9%，P<0.05）。Cox 多因素回归分析显示，早期启动 MCS（HR=0.68，95%CI: 0.48–0.96，P<0.05）与较低基线 SOFA 评分（HR=0.76，95%CI: 0.60–0.93，P<0.05）为改善生存的独立保护因素。

血浆白蛋白水平对 VA-ECMO 脱机成功率的预测价值及临床意义

张静

华中阜外医院，国家心血管病中心华中分中心，河南省人民医院心脏中心

【摘要】目的 探讨血浆白蛋白水平与静脉 - 动脉体外膜肺氧合（VA-ECMO）脱机成功率的关系，为优化脱机决策提供依据。 **方法** 通过系统分析国内多项临床研究数据，评估低白蛋白血症（<3.0 g/dL）对脱机成功率的影响，并分析其潜在机制。 **结果** 综合分析数据显示，VA-ECMO 脱机失败组患者白蛋白水平显著低于成功组（2.7±0.4 g/dL vs. 3.2±0.5 g/dL，P<0.01），低白蛋白血症是脱机失败的独立危险因素（OR=2.8, 95%CI:1.3-6.0）。白蛋白通过多重机制影响脱机：（1）胶体渗透压维持与液体管理（白蛋白是维持血浆胶体渗透压关键分子，其浓度降低导致液体再分布障碍和组织水肿，直接影响器官功能恢复）；（2）器官水肿与功能障碍（组织水肿尤其影响心脏和肺脏功能。心肌水肿降低心室顺应性和收缩力，使心脏在 VA-ECMO 减流试验中难以耐受负荷变化。肺水肿则加重氧合障碍，延迟呼吸功能恢复。研究显示，血清白蛋白每降低 1g/dL，VA-ECMO 患者氧合指数（PaO_2/FiO_2）下降约 50mmHg）（3）炎症与氧化应激（内毒素中和能力降低 50% 以上，自由基清除减少）；（4）药物代谢异常（白蛋白 <2.5 g/dL 时，呋塞米疗效降低 50%）。动态监测白蛋白水平（ECMO 建立时、支持期间隔天一次及撤机前）并联合心功能指标（LVEF>30%）和乳酸清除率可显著提高预测准确性（AUC 0.82-0.89）；联合模型（白蛋白 + 乳酸清除率 +LVEF）可显著提高预测准确性（AUC=0.91，灵敏度 86.2%，特异度 88.5%）。 **结论** 血浆白蛋白水平是 VA-ECMO 脱机成功率的重要预测指标，临床中需加强监测并个体化干预（如白蛋白补充目标≥ 3.0g/dL），以改善患者预后。

心源性休克患者 ECMO 治疗前预后指标的最新研究进展

阿瓦古丽·牙生

新疆医科大学第一附属医院

心源性休克是一种严重且死亡率高的心血管急症，体外膜肺氧合（ECMO）已成为重要的挽救性治疗手段，但患者接受 ECMO 治疗后的预后差异较大。明确心源性休克患者上 ECMO 前各项指标与上机后预后的关系，为精准化治疗决策提供循证依据。

本研究系统检索了 PubMed、Web of Science、Embase 等多个权威数据库，筛选近 5 年发表的关于此主题的临床研究、综述及 meta 分析等文献，严格按照纳入与排除标准进行筛选，并对符合要求的文献进行数据提取与质量评价 。

研究结果显示，多个上机前指标与 ECMO 上机后预后密切相关。实验室指标中，ECMO 启动前乳酸≥ 8.0 mmol/L 是最强死亡预测因子，死亡风险增加 182%（OR=3.18），而 24 小时乳酸清除率每提升 1%，死亡率降低 12%（OR=0.88）。pH 值 pH<7.2 时死亡风险显著升（OR=1.62）。肾功能受损会影响机体代谢废物清除和内环境稳定，与较差预后紧密关联；需肾脏替代治疗的患者死亡风险增加 203%（OR=3.03）。急性肾损伤（AKI）是 30 天死亡的独立危险因素（OR=15.888）；24 小时液体正平衡（液体入量 > 出量）与死亡率显著相关（OR=1.085）负平衡患者存活率更高（RR=1.81）。炎症指标如 C 反应蛋白、降钙素原等的升高，反映机体炎症反应强烈，增加了多器官功能障碍的风险，进而影响预后 。血流动力学指标方面，LVEF<30% 的患者死亡风险增加 69%（OR=1.69），提示严重左室功能障碍预后更差。心率与休克指数 SI：撤机时 HR>82 次 / 分预示高死亡率；低 HR 与低 SI 反映循环状态更稳定，与撤机成功正相关。此外，患者的年龄、基础疾病也对预后有显著影响，高龄及基础疾病较多的患者预后往往较差。因每增加 1 岁死亡风险上升 3% 。心源性休克的病因同样是影响预后的关键因素，例如急性心梗相关 CS（AMI-CS）患者住院死亡率显著低于非心梗 CS（58.6% vs 69.7%），因心梗可通过血运重建逆转。若梗死面积大且再灌注治疗不及时，患者预后不良 。

综上所述，心源性休克患者上 ECMO 前的多项指标对预测上机后的预后具有重要价值。临床工作中，应全面综合评估这些指标，为患者制定精准的个体化治疗方案，把握最佳治疗时机，以改善患者的预后。

基于心电图特征的急性下壁心肌梗死早期诊断与心律失常关联分析

曲永翔

华中科技大学同济医学院附属同济医院心血管内科

本研究通过对特定心电图案例 [1] 的深入剖析，探讨急性下壁心肌梗死心电图特征及与心律失常的关联。分析该案例心电图呈现的窦性心律、一度房室阻滞、房早室早及下壁 ST 段抬高表现，结合临床诊断思路，阐述其对急性下壁心肌梗死早期识别及病情评估的价值，为优化急诊心血管疾病诊疗流程提供新视角。

关键词：急性下壁心肌梗死；心电图；心律失常；早期诊断

一、引言

急性心肌梗死是心血管急危重症，下壁心肌梗死因解剖学特点，其心电图表现及伴随心律失常有独特规律。快速、准确识别心电图特征，对早期诊断、及时干预改善预后至关重要。本文以临床实际心电图案例为切入点，深入分析急性下壁心肌梗死心电图及心律失常关联，探索诊疗优化路径。

二、案例资料与心电图分析

（一）案例基本信息

患者为急诊就诊者，因胸部不适等症状行心电图检查，心电图机记录信息显示心率、节律等基础数据，为诊断提供初始依据。

（二）心电图特征解读

1. **节律与传导**：心电图提示窦性心律，反映心脏正常起搏点功能，但存在一度房室阻滞，表现为 PR 间期延长（本案例中 PR [120'200] 为 232ms ），这是房室传导系统轻度受累的表现，可能与心肌缺血导致传导组织代谢异常有关。同时，可见房性早搏、室性早搏，早搏的出现提示心肌细胞电生理稳定性受破坏，在缺血心肌环境中，异位起搏点兴奋性改变，引发心律失常 。

2. **ST 段改变**：下壁导联（如 II 、III、aVF ，图中虽未完全标注导联对应关系，但结合结论提示下壁 ST 段抬高）ST 段抬高是急性下壁心肌梗死的核心心电图表现。心肌缺血坏死时，心肌细胞跨膜电位改变，导致复极异常，ST 段向量偏移，呈现抬高形态，这是心肌损伤的直接心电图证据 。

三、急性下壁心肌梗死与心律失常的关联机制

（一）心肌缺血对电生理的影响

下壁心肌供血主要源于右冠状动脉（部分为回旋支），缺血发生时，心肌细胞能量代谢障碍，细胞膜离子通道功能异常，钾离子外流、钙离子内流紊乱，导致动作电位时程改变，有效不应期缩短，为心律失常发生创造电生理基础 。

（二）心律失常对病情的影响

房性、室性早搏等心律失常，一方面是心肌梗死的伴随表现，另一方面会增加心脏电活动不稳定性。频发早搏可能触发更严重心律失常（如室速、室颤），加重心肌缺血缺氧，形成“缺血 - 心律失常 - 更缺血”恶性循环，影响患者预后 。

四、基于心电图特征的早期诊疗启示

（一）快速识别与分诊

急诊中，遇到下壁 ST 段抬高伴心律失常心电图，应立即启动急性心肌梗死诊疗流程，快速完善心肌损伤标志物（如肌钙蛋白）检测，结合症状判断是否行再灌注治疗（溶栓或介入），缩短救治时间窗 。

（二）心律失常的监测与干预

针对伴随的一度房室阻滞、早搏，需动态监测心电图变化。虽一度房室阻滞多为良性，但需警惕进展为高度房室阻滞风险；对于早搏，除治疗心肌梗死原发病，必要时可根据早搏频率、类型，评估是否需抗心律失常药物辅助，维持心脏电稳定 。

五、结论

本案例心电图呈现的窦性心律、一度房室阻滞、房早室早及下壁 ST 段抬高，是急性下壁心肌梗死合并心律失常的典型表现。深入理解其关联机制，有助于急诊快速识别、精准干预，改善患者预后。未来可进一步探索不同病因（如右冠状动脉闭塞特点）、不同心律失常类型对急性下壁心肌梗死诊疗及预后的影响，为个性化诊疗提供更丰富依据，持续优化心血管急危重症救治体系 。

右美托咪啶对急性 STEMI 需要接受无创通气行 PCI 患者预后的影响

谭金锋 刘慧敏 于波

哈尔滨医科大学附属第二医院

目的：本研究探讨右美托咪啶对急性 ST 段抬高型心肌梗死（STEMI）需要接受无创通气（NIV）支持行急诊 PCI 患者预后的影响。

方法：本研究是一项单中心、前瞻性、单盲、随机对照临床研究。入选 2020 年 1 月–2022 年 1 月就诊于哈尔滨医科大学附属第二医院心血管内科的 STEMI 并拟在 NIV 支持下行急诊 PCI 治疗患者共 150 例，随机分为右美托咪定组 (DEX 组 ,75 例)、对照组 (CON 组 ,75 例)。收集两组患者的基线特征、相关检查资料和临床随访资料，于基线、次日晨检测白细胞计数、N 末端脑钠肽前体 (NT-proBNP)，于基线、术后即刻取外周静脉血离心血清检测 TNF-α，CRP, MDA，SOD 水平；比较两组 NIV 失败率，RASS 躁动 - 镇静评分 ,CCU 停留时间和总住院时间 , 介入医师满意度。比较两组血液学指标、手术时间、总辅助通气时间、术后复合并发症（谵妄、恶性心律失常、中风、出血）以及 30 天内全因死亡率情况。

结果：两组患者的基线特征相似。与 CON 组相比，DEX 组白细胞水平降低、NT-proBNP 水平降低（P）；血清 TNF-α 水平更低（P=），CRP 水平更低（P=），MDA 水平更低 (P=)，SOD 水平更高 (P=)；DEX 组 NIV 失败率更低 (P=),RASS 评分更低（P=），介入医师满意度更高（P=），手术时间更短（P=），CCU 停留时间更短（P=），而总住院时间无统计学差异；术后复合并发症更少（P=）；但 30 天内全因死亡率无统计学差异。

结论：右美托咪定可以有效改善 STEMI 接受 NIV 患者的耐受性，降低转为有创通气比例。缩短 CCU 停留时间 , 减少术后并发症的发生 , 减轻氧化应激及炎性反应。但并没有降低 30 天死亡率。

冠心病患者旋磨术后院内心力衰竭的风险预测模型

李丹

中国科学技术大学附属第一医院南区

目的：分析冠状动脉旋磨术（RA）后严重冠状动脉钙化（CAC）患者发生心力衰竭（HF）的危险因素，并建立个性化的风险预测模型。

方法：本回顾性研究包括 2017 年 2 月至 2022 年 2 月在本科医院住院的 372 例接受 RA 的 CAC 患者的临床资料。根据术后 HF 发生率将患者分为 HF 组（151 例）和非 HF 组（221 例）。采用 logistic 多因素回归分析确定术后心衰的独立预测因素，并利用 R 软件构建术后心衰风险列线图预测模型。利用受试者工作特征曲线（ROC）曲线下面积和标定曲线进一步评价预测效率。

结果：多因素分析显示，血红蛋白是独立的保护因素（OR<1，P<0.05），年龄、术前使用利尿剂、术中无回流 / 慢血流是冠心病合并 RA 后院内 HF 患者的独立危险因素（OR>1，P<0.05）。列线图预测模型的 ROC 曲线下面积为 0.755 (95% CI: 0.706-0.805)，判别性较好，预测稳定性的 ROC 曲线下面积为 0.750（95% CI: 0.701-0.797）。标定曲线具有较好的预测一致性。Spiegelhalter's z 统计检验结果显示，柱图模型在建模组和外部验证集中的预测概率与院内心力衰竭的实际发生频率一致（P=0.516, 0.428）。

结论：构建预测类风湿后 HF 风险的列线图模型，可以帮助心脏科医师筛查类风湿后 HF 的高危人群，实施针对性的干预措施。

神经酰胺风险评分联合 GRACE 评分提高非 ST 段抬高型急性冠脉综合征患者长期预后的预测准确性

王晓菲

中国医学科学院北京协和医院东单院区

【目的】验证神经酰胺风险评分对非 ST 段抬高型急性冠脉综合征（（non-ST-segment elevation acute coronary syndrome，NSTE-ACS）患者主要不良心血管事件（major adverse cardiovascular events，MACEs）的独立预测价值；探究神经酰胺风险评分联合 GRACE 评分能否更准确地预测 NSTE-ACS 患者发生 MACEs 的风险。

【方法】本研究为前瞻性队列研究，共纳入 350 名非 ST 段抬高型急性冠脉综合征患者。根据神经酰胺风险评分为低危组（0-2 分，n = 168）、中危组（3-6 分，n = 114）、高危组（7-12 分，n = 68），随访 12 个月。查询电子病历收集患者临床资料和实验室指标。检测血清神经酰胺亚型 Cer（d18:1/16:0）、Cer（d18:1/18:0）、Cer（d18:1/24:1）、Cer（d18:1/24:0）并计算神经酰胺风险评分。计算 GRACE 评分和定量血流分数（quantitative flow ratio，QFR）。主要终点为 MACEs 复合事件（非致死性心肌梗死、缺血驱动的再次血运重建、心源性死亡）。采用 Kaplan-Meier 生存曲线分析生存差异。通过单变量和多变量 Cox 回归分析筛选 NSTE-ACS 患者发生 MACEs 的独立危险因素。通过二元 logistic 回归分析分别建立低密度脂蛋白胆固醇（low -density lipoprotein cholesterol，LDL-C）、定量血流分数、神经酰胺风险评分和 GRACE 评分的联合预测模型。通过受试者工作特征曲线（receiver operating characteristic, ROC）、净重新分类指数（net reclassification index, NRI）和综合判别改善指数（integrated discrimination improvement, IDI）评估模型效能。

【结果】在 12 个月的随访期间，350 名受访者中有 54 人发生了 MACEs，其中低危组 12 人（7.14%，n = 168），中危组 17 人（14.91%，n = 114），高危组 25 人（36.76%，n = 68）。Kaplan-Meier 分析显示，在根据神经酰胺风险评分分类的 NSTE-ACS 患者中，MACEs 的发生率存在显著的统计学差异（χ^2 = 27.034，p <0.001）。进一步亚组分析显示神经酰胺风险评分对 MACEs 的预测价值在具有不同人口学特征或合并症的患者中具有一致性（交互 p 值均 > 0.05）。多变量 Cox 回归分析显示 LDL-C（p = 0.016）、QFR（p = 0.027）、神经酰胺风险评分（p = 0.009）和 GRACE 评分（p = 0.021）是 NSTE-ACS 患者发生 MACEs 的独立危险因素。ROC 分析表明，神经酰胺风险评分与 GRACE 评分的联合模型预测效能最优，曲线下面积（area under the curve，AUC）由单独 GRACE 评分的 0.746 增至 0.893（p <0.001），优于 GRACE 评分联合 LDL-C（AUC = 0.817, p <0.001）及 GRACE 评分联合 QFR 的模型（AUC = 0.833, p <0.001）。神经酰胺风险评分与 GRACE 评分的联合模型的 NRI 为 0.434（p = 0.014），IDI 为 0.040（p <0.001）。

【结论】神经酰胺风险评分是 NSTE-ACS 患者发生 MACEs 的独立危险因素。神经酰胺风险评分与 GRACE 评分联合可显著优化风险分层能力，为临床精准干预提供新依据。

Predicting Postoperative Atrial Fibrillation in Cardiac Surgery: postoperative hematological insights for better outcomes

JiaNing HAN

National Clinical Research Center of Cardiovascular Diseases, State Key Laboratory of Cardiovascular Disease, Fuwai Hospital, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College

Predicting Postoperative Atrial Fibrillation in Cardiac Surgery: postoperative hematological insights for better outcomes

Abstract

Background:

Postoperative atrial fibrillation (POAF) is the most common arrhythmia following cardiac surgery and carries significant clinical and economic consequences. It most frequently occurs during the intensive care unit (ICU) stay, emphasizing the need for timely and accurate risk assessment. Although current guidelines recommend prophylactic interventions, the lack of validated early risk stratification tools hampers targeted prevention strategies. Hematologic parameters measured on the first postoperative day may reflect key pathophysiological triggers of POAF, including inflammation, anemia, and coagulation disturbances. In this study, we assessed the predictive value of these early hematologic markers and developed a machine learning–based risk stratification model for POAF.

Methods:

We retrospectively analyzed 4,391 adult patients from the Medical Information Mart for Intensive Care (MIMIC)-IV database who underwent cardiac surgery and had no history of atrial fibrillation (AF) or atrial flutter (AFL) prior to surgery. A total of 22 hematologic markers were evaluated using logistic regression analysis and subgroup analysis. The Boruta algorithm and LASSO regression was performed to identify the most relevant variables. The selected features were utilized to develop machine learning models, which were subsequently evaluated for their predictive performance. The prognostic significance of the most relevant hematologic markers identified was further examined using Cox proportional hazards regression and restricted cubic spline (RCS) analysis.

Results:

In this retrospective study, we analyzed 4,391 adult patients from the MIMIC-IV database who underwent cardiac surgery and met inclusion criteria. The overall incidence of POAF was 21.8%, with notable variation based on surgical type: 17.7% in isolated CABG, 23.8% in valve surgery, and 29.7% in aortic procedures. Patients with POAF were older, had higher BMI, greater comorbidity burden (SOFA, CCI), and more frequent preoperative medication use. They also exhibited higher rates of hypertension, heart failure, COPD, renal disease, and stroke.

Regression analyses revealed that several hematologic parameters, including RDW-CV, WBC, neutrophil and monocyte counts, NLR, SIRI, SII, and PIV, were significantly associated with increased POAF risk. In contrast, HMR and HLR were protective. The fully adjusted logistic regression model showed that RDW-CV ≥ 13.7% (OR 1.54), WBC ≥ 13.80×10 ^{9} /L (OR 1.39), neutrophils ≥ 11.27×10 ^{9} /L (OR 1.40), and HLR ≥ 0.99 (OR 0.74) were among the strongest predictors. Subgroup analyses confirmed consistent associations across age, sex, and comorbidity strata.

To identify the most informative predictors, we implemented a two-step machine learning feature selection pipeline combining the Boruta algorithm and LASSO regression. Six key variables—age, RDW, HLR, SOFA, CCI, and heart failure—were retained and used to train eight classification models. Among them, support vector machine (SVM) and extreme gradient boosting (XGBoost) achieved the highest performance (AUROC 0.75; F1-score 0.50). Feature importance analysis using random forest

and SHAP consistently ranked RDW and HLR among the most influential predictors.

The prognostic value of RDW and HLR was further validated through Kaplan-Meier survival and multivariable Cox regression analyses. Patients with RDW ≥ 13.7% had significantly higher and earlier POAF incidence, while those with HLR ≥ 0.99 had a reduced risk. Restricted cubic spline models demonstrated nonlinear associations between RDW-CV and HLR with POAF risk, with inflection points at RDW-CV = 13.2% and HLR = 0.8. Segmented Cox regression confirmed these thresholds, showing strongest risk associations for RDW-CV between 13.2–14.23% and HLR below 0.70.

In conclusion, RDW-CV and HLR are robust, readily available hematologic markers that provide early and independent prognostic information for POAF following cardiac surgery. Their integration into machine learning-based predictive models enables accurate identification of high-risk individuals during the critical ICU period and may support individualized perioperative management strategies aimed at mitigating POAF-related complications.

Conclusions:

RDW-CV and HLR, available on postoperative day one, can serve as practical biomarkers for early POAF risk stratification. Their integration into clinical workflows may enable timely, personalized prophylaxis and improve postoperative outcomes.

Postoperative atrial fibrillation, RDW-CV, HLR, Machine learning

重视心电图诊断意义，提升灾难性 PTE 救治效率

王文利 李楚麒

Huaihua Hongya Hospital

在今年 6 月 26 日由中华医学会心血管病分会和中华心血管病杂志编辑委员会在《中华心血管病杂志 ,2025,53(6): 587-619》上发布的《急性肺栓塞诊断和治疗指南 2025》中我们看到的关于心电图的表述是这样的：急性肺栓塞患者的心电图可能显示多种异常，包括窦性心动过速、V 1~V 3 导联 ST 段压低或 T 波倒置、S Ⅰ Q Ⅲ T Ⅲ征、肺型 P 波、顺钟向转位、电轴右偏、右束支传导阻滞及心房颤动等心律失常［27］。然而，上述心电图异常对急性肺栓塞的诊断敏感性及特异性均不高。需强调，对于以胸痛、胸闷为首发临床表现且有冠心病危险因素的中老年患者，心电图显示 ST-T 改变时需考虑到患者同时存在急性冠脉综合征与急性肺栓塞的可能性。看到这样的表述，我们基层医生第一印象就是：心电图这个敏感性和特异性均不高的检查对肺栓塞诊断的意义不大，在这类患者做心电图最大的意义是发现伴发于肺栓塞的隐蔽性急性冠脉综合征了。

然而，情况真的是这样吗？心电图异常对急性肺栓塞的诊断敏感性及特异性真的均不高吗？在肺栓塞病人救治中，我们真的不应该重视心电图的作用吗？我想，这是一个很值得商榷的问题。

首先，若是对全部肺栓塞病人来说，或许是可以说心电图敏感性不高，但这是基于大量的低危病人存在，在高危和中高危病例中，都是存在右心功能障碍和肌钙蛋白异常的，这样的病人中，心电图异常的敏感性还会不高吗？就像我们不能因为很多稳定型心绞痛病人心电图都是正常的就说心电图异常对冠心病的诊断敏感性不高一样，我们或许不太应该在指南中笼统的做“心电图异常对急性肺栓塞的诊断敏感性不高”这样的表述。

心电图异常的基础涉及心肌细胞电生理特性改变、心脏结构和功能异常、心电传导系统异常等方面，而肺栓塞会导致右心室功能改变：肺血管阻力突然升高会加重右心室后负荷，导致室壁张力增加和右心室扩张。通过 Frank-Starling 机制，右心室收缩时间延长，室间隔左移，左右心室收缩不同步，严重时可导致心排血量下降和血流动力学不稳定。同时，神经体液调节系统被激活，引发右心室的变时变力效应，试图通过升高肺动脉压力来维持肺循环灌注和体循环血压。然而，由于右心室壁较薄，无法代偿性适应超过 40 mmHg 的肺动脉平均压，最终可能导致右心功能不全。此外，急性肺栓塞对稳定的冠心病患者可能造成二重打击，引起心肌损伤 。右心室壁张力增加使右冠状动脉相对供血不足，进一步加重心肌缺血和损伤。这些心脏的病理生理特征，自然也是伴随着其特有的心电图变化的，但是由于肺栓塞本身被认识、被关注的时间还不是很长；其发生率相对于心电图医生最关注的冠心病还是要低很多；病人又往往散布于医院的各个科室；即便集中也有心血管、呼吸、重症等多个科室；加上既往指南灌输给的“心电图异常对急性肺栓塞的诊断敏感性及特异性均不高”这一成见固囿着大部分医生，故而关于肺栓塞病人心电图资料的规范系统的大样本研究还是比较匮乏的，而由于病人的心脏电生理基础不同、栓塞的程度不同、病程的阶段不同，心电图的表现确实会有很多不同形式，加大了普通医生辨认此类心电图的难度，也就进一步加固了“心电图异常对急性肺栓塞的诊断敏感性及特异性均不高”这一成见。然而，这些普通医生难以辨认的心电图，在经验丰富的心电图医生眼里，往往也还是能够被辨认出来的，所以，肺栓塞病人（尤其是高危和中高危患者）心电图的特异性，应该说并不是不具备，而是因为研究基础的缺乏，尚未形成统一的系统全面的判识标准而已。

冠脉腔内影像学及生理学有关研究

经皮冠状动脉介入治疗术后冠状动脉生理学评估的研究进展

杜常青 江劲翱

浙江医院

目的：探讨经皮冠状动脉介入治疗（PCI）后冠状动脉生理学评估在残余心肌缺血中的应用价值，总结各类评估指标的研究进展，为冠心病精准诊疗提供参考。

方法：通过系统回顾近年文献，分析基于有创压力导丝的血流储备分数（FFR）、瞬时无波形比值（iFR）、基于冠脉造影的定量血流分数（QFR）及融合腔内影像的衍生指标（如 IVUS-FFR、OCT-FFR）在 PCI 术后残余心肌缺血评估中的作用、阈值争议及临床局限性。

结果：FFR 是评估心肌缺血的“金标准”，术后 较低的 FFR 值与主要心血管不良事件（MACE）、靶血管失败（TVF）发生显著相关，但其阈值缺乏统一标准，且需使用充血药物（如腺苷）、操作繁琐、成本较高，限制了临床推广。iFR 无需腺苷，与 FFR 一致性高，术后 iFR 较低的患者复合终点发生率同样较高，但复杂病变中易受血流动力学干扰。静息 Pd/Pa 操作简便，与 iFR 线性相关，但阈值稳定性差，仅作为备选指标（如慎用腺苷时）。QFR 基于造影三维重建，无需导丝和药物，术后 QFR ≤ 0.89~0.94 与不良事件显著相关（HR=2.91~6.53），但受血管解剖和造影质量影响。OFR 结合 OCT 影像评估支架贴壁与血流，预测 TVF 的截断值为 0.90（HR=9.93）。IVUS-FFR 基于超声图像和计算流体动力学，术后 AccuFFRivus ≤ 0.94 患者 VOCE 发生率显著升高（HR=23.76），但前瞻性研究证据有限。PCI 患者存在术后生理学指标异常多因支架贴壁不良、残余病变等所致。联合腔内影像（如 IVUS/OCT）优化支架策略可改善术后 FFR 值，降低靶血管血运重建风险。

结论：PCI 术后冠状动脉生理学评估对识别残余心肌缺血、优化血运重建效果至关重要。尽管各指标阈值及应用场景存在差异，联合腔内影像与功能学评估已成为精准诊疗的趋势。未来需进一步开展前瞻性、多中心研究，明确标准化评估流程，以改善患者预后。

Angiography-Derived Index of Microvascular Resistance After Drug-Coated Balloon Versus Drug-Eluting Stent Implantation: A Post Hoc Analysis from the FADDY Trial

Delong Chen[1], Jun Jiang[1], Wei-Ming Li[2], Hao Zhou[3], Yan Chen[4], Dong-Sheng Lu[5], Jian-An Wang[1]

Objective: Despite the simplicity and safety of latest-generation drug-eluting stent (DES), permanent intravascular implants elicit complications such as in-stent restenosis (ISR) and stent thrombosis, and may partially impair vasomotor function of the target vessels. The drug-coated balloon (DCB), a promising technology that performs angioplasty without leaving any metallic residue, is emerging as a potential solution. DCB has an established role in ISR treatment, and growing angiographic and clinical evidence have expanded its applications to native coronary lesions. DES are characterized by slow drug release kinetics, resulting in persistent drug exposure and inhomogeneous distribution to the vessel wall. In contrast, DCB provide immediate drug release, homogeneous distribution, and transient drug exposure. DCBs eliminate the need for polymers and render stent implantation optional. These distinct approaches to local intravascular drug delivery may differentially affect endothelial and microvascular function. Preclinical reports present conflicting data regarding the impact of short-term paclitaxel exposure on vasomotion and endothelial function. Therefore, we performed this post hoc analysis of the FADDY randomized trial to investigate differences in microvascular function, as assessed by the angiographically derived index of microvascular resistance (angio-IMR), between DCB and DES treatment immediately post-PCI and at 9-month follow-up.

Methods: The FADDY trial (Fractional Flow Reserve Guided Drug Coated Balloon Only Strategy in De Novo Coronary Lesions; NCT03452904) is a prospective, multicenter, open-label randomized controlled trial conducted at 5 centers in China. The study was approved by the local ethics committee and was performed in accordance with the Declaration of Helsinki. Lesions with an FFR value <0.80 before predilation and ≥ 0.80 after predilation will be included. Patients were randomly assigned in a 1:1 ratio to DCB or DES. DCB was implemented at nominal pressure for a minimal inflation time of 30 seconds. PCI was performed strictly in accordance with current guidelines and local routine. All patients were scheduled for angiographic assessment at 9 months, and revascularization was performed only if clinically indicated. Calculation of Angio-IMR for target vessels included in the study was performed in a blinded manner by an independent core laboratory using the AccuIMR software (version 1.0; ArteryFlow Technology, Hangzhou, China). All statistical analyses were performed using R version 4.3.4.

Results: 120 patients were randomly allocated to the DCB group (n = 60) or the DES group (n = 60). Overall, our study followed up 117 of 120 patients at 9-month and 85 of 120 patients had paired angio-IMR data immediately post-PCI and at 9-month follow-up. The two treatment groups were well matched in terms of baseline clinical characteristics. The mean age was 61.7 years, and 72.5% of patients were men. More than a quarter of the patients had diabetes (30.8%). Patients with a history of MI were slightly more common in the DCB group (25.0% vs. 11.7%), but the difference was not significant (p = 0.10). Nearly a half of patients had multivessel disease and all patients underwent pre-dilatation. Patients in the DCB arm received less pressure (8.4 vs. 11.4; p < 0.01) and more time (57.3 vs. 10.5; p < 0.01) during the device inflation procedure.

Angio-IMR distributions are presented nearly normal distribution. Immediately post-PCI, angio-IMR values were comparable between the DCB arm (17.67 ± 5.82) and the DES arm (17.72 ± 5.84; p= 0.97). This non-significant difference persisted at 9-month follow-up (DCB: 17.32 ± 5.11 vs. DES: 17.20 ± 4.67; p= 0.90). Overall angio-IMR change from post-PCI to 9-month follow-up was non-significant (p= 0.63). Similarly, no significant changes were observed within the DCB arm (mean difference: -0.22 ± 6.66; p= 0.82) or the DES arm (mean difference: -0.47 ± 6.10; p= 0.64). The between-arm difference in mean angio-IMR change was also non-significant (-0.22 vs. -0.47; p= 0.86). Non-significant between-arm differences in angio-IMR change were consistently observed across all analyzed subgroups, including age, sex, BMI, diabetes mellitus, hypertension, and smoking.

Conclusions: In patients with de novo non-small coronary lesions, angio-IMR did not change significantly between post-PCI and 9-month follow-up. A DCB-only approach yielded comparable angio-IMR values to a DES strategy both immediately post-procedure and at follow-up.

糖尿病联合冠状动脉微血管功能障碍对行旋磨术患者预后的预测价值：一项多中心回顾性观察性研究

张晨昀[1,2,3,4] 冯利君[1,2,3,4] 张羽宣[1,2,3,4] 陈子宁[1,2,3,4] 潘婧南[5] 高志凌[6] 陈德龙[1,2,3,4] 阿不都吾甫尔·依迪力斯[1,2,3,4] 方佳成[1,2,3,4] 郑艺越[1,2,3,4] 梅婷婷[1,8] 刘建涛[1,2,3,4] 向建平[7] 张金龙[1,2,3,4] 李长岭[1,2,3,4] 程继芳[1,] 王建安 蒋峻

8. 浙江省台州医院

目的：基于冠脉造影衍生的微循环阻力指数 (angiography-derived index of microcirculatory resistance, angio-IMR) 在经皮冠状动脉介入治疗的广泛运用，探究糖尿病 (diabetes mellitus, DM) 联合冠状动脉微血管功能障碍 (coronary microvascular dysfunction, CMD) 对行旋磨术患者 (rotational atherectomy, RA) 预后的临床评估价值。

方法：回顾性纳入 2015 年 1 月 1 日至 2022 年 10 月 31 日浙江大学医学院附属第二医院、宁波市医疗中心李惠利医院以及甘肃省人民医院成功行 RA 术的冠状动脉严重钙化患者 452 例。收集患者基本临床信息、生化指标、用药情况和冠脉造影结果，并定量计算 angio-IMR 评估微血管功能。患者根据是否合并 2 型糖尿病分为糖尿病组和非糖尿病组，并再细分为 CMD 组 (术后 angio-IMR ≥ 25) 组和非 CMD 组 (术后 angio-IMR < 25)。本研究主要结局为术后随访 24 个月内主要心血管不良事件 (MACEs) 发生率。采用单变量和多变量 Cox 回归分析主要结局发生率的相关风险。

结果：相较于糖尿病组，非糖尿病组患者 RA 术后的 angio-IMR 值更低 (17.40 [13.86-21.34] vs. 18.53 [14.63-23.01], p=0.037)，术后随访 24 个月内的 MACEs 发生率更少 (9.49% vs. 17.42%, p=0.011)。相较于冠状动脉微血管功能障碍组，对照组患者的术后随访 24 个月的 MACEs 发生率明显更小 (10.54% vs. 26.77%, p < 0.001)。此外，同时合并糖尿病和冠状动脉微血管功能障碍患者 RA 术后随访 24 个月的 MACEs 发生率最高 (DM+CMD; HR: 5.61, 95% CI, 2.606-12.083, p<0.001)，进一步提示糖尿病联合冠状动脉微血管功能障碍是预测 RA 术后 MACEs 最强的独立危险因素。

结论：糖尿病联合冠状动脉微血管功能障碍与冠脉严重钙化患者行 RA 术后发生 MACEs 风险相关。同时，合并分析这两者危险因素可增强评估 RA 术后 MACEs 风险的可能性，为患者术后风险评估提供理论指导。

急性心肌梗死非罪犯血管的全面生理学评估：必要性及临床意义

方佳成 陈子宁 张羽宣 蒋峻

浙江大学医学院第二附属医院

目的：急性心肌梗死（Acute Myocardial Infarction, AMI）合并多支血管病变

（Multivessel Disease, MVD）患者中，非罪犯血管（Non-culprit Vessels, NCV）的最佳处理策略仍是当前血运重建治疗中的重大临床挑战。近年来，随着冠状动脉功能学评估技术的发展，基于造影的生理学参数为这一临床难题提供了新的解决方案。本研究旨在评估冠状动脉造影衍生的血流储备分数（Angiography-derived Fractional Flow Reserve, Angio-FFR）与微循环阻力指数（Angiography-derived Index of Microcirculatory Resistance, Angio-IMR） 在 AMI 患者 NCV 中的检测价值，并探讨其对心血管事件的预测效能与指导 NCV 处理的临床必要性。

方法：采用单中心回顾性队列研究设计，连续性纳入接受 2 年常规随访的合并多支血管病变（Multivessel Disease, MVD）的 AMI 患者。对目测存在中等程度狭窄（40%-80%）的 NCV 进行 Angio-FFR 和 Angio-IMR 的测量。主要研究终点设定为血管导向的复合终点事件（Vessel-oriented Composite Endpoint, VOCE），包括心源性死亡、罪犯血管相关心肌梗死及缺血驱动的罪犯血管血运重建。采用时间 - 事件分析方法评估各生理学参数的预测价值。

结果：最终纳入 503 例 AMI 患者及 712 条 NCV 进行回顾性分析，中位随访 24 个月。结果显示，低 Angio-FFR 组（Angio-FFR < 0.80）VOCE 发生率显著高于高 Angio-FFR 组（Angio-FFR ≥ 0.80）（27.0% vs. 12.6%，HR=2.14，P<0.001），而 Angio-IMR 高低分组间 VOCE 发生率无统计学差异（15.15% vs. 11.04%，P=0.383）。多因素 Cox 回归校正临床混杂因素后，Angio-FFR 仍是 VOCE 的独立预测因子（调整后 HR=1.697，95%CI：1.014-2.839，P < 0.05），而 Angio-IMR 无显著相关性（HR = 0.880，95% CI：0.434-1.785，P > 0.05）。相关性通过亚组分析与倾向评分匹配（Propensity Score Matching，PSM）验证后结果保持稳健。

结论：本研究表明，合并 MVD 的 AMI 患者的预后与 NCV 的 Angio-FFR 显著相关，而 Angio-IMR 未能展现临床相关的预测价值，提示心外膜冠状动脉功能性狭窄是影响预后的主要决定因素，而微循环功能障碍在 NCV 不良事件中的作用有限。相比于 Angio-FFR，Angio-IMR 在 NCV 管理中的必要性和临床价值尚缺乏循证依据，未来在 AMI 患者 NCV 的评估与处理中 Angio-FFR 应作为主要生理指标。这些发现为优化 AMI 患者完全血运重建策略提供了重要的生理学依据。

Mechanism of left main in-stent restenosis evaluated by intravascular ultrasound

3. Clinical Trials Center, Cardiovascular Research Foundation, New York, NY

Background: Advances in interventional techniques and drug-eluting stents have greatly lowered in-stent restenosis (ISR) rates in percutaneous coronary intervention (PCI). However, PCI for left main (LM) coronary artery disease remains challenging. The LM supplies most of the left ventricle, making its patency critical. Its complex anatomy and unique blood flow patterns further increase procedural risks. ISR rates after LM stenting are notably higher than in non-LM interventions. While modern DES show two-year ISR rates of 2.9–6.4% in general PCI populations, LM-PCI has reported ISR rates of 13.4–22.9%. This persistent difference suggests distinct pathological mechanisms in the LM that are not yet fully understood.

Objective: We aimed to investigate the mechanisms of LM ISR using intravascular ultrasound (IVUS) and to assess the impact of different repeat revascularization strategies on long-term clinical outcomes.

Methods: From 2011 to 2024, 85 pts with LM ISR were assessed with IVUS. LM ISR was a stenosis located within 1 of 3 segments: 1) LM trunk or polygon of confluence (POC), 2) <5mm from the ostial left anterior descending artery (oLAD), or 3) <5mm from the ostial left circumflex artery (oLCX). Stent underexpansion was minimum stent area (MSA) <6mm2 in the LM/POC or <4mm2 in oLAD or oLCX or stent expansion<80%. Neoatherosclerosis was neointimal hyperplasia (NIH) with calcium or lipid.

Results: Mean pt age was 69±11 years; 81% were male. At stent implantation, 22 were treated with two stent technique and 63 with a single stent technique. Using IVUS as the gold standard, angiographic diagnosis of ISR showed notable variability across lesion locations. Sensitivity and NPV were lowest in the LM (69.8% and 72.3%, respectively), indicating a tendency to underestimate ISR in this region. In contrast, angiography performed best in the oLCX, with sensitivity and accuracy exceeding 96.8% and 88.9%. IVUS analysis of 141 ISR segments from 85 pts identified biological mechanisms were the leading causes of ISR in LM/POC, oLAD, and oLCX (60%, 72%, and 68%, respectively), with NIH being most common in LM/POC and oLAD. In oLCX, both NIH and unstented branch vessel stenosis were equally prevalent. Stent underexpansion was the predominant mechanical cause across all segments.

Median follow-up duration after ISR treatment was 1year (interquartile range:0.02 to 8.08). 3-year Target lesion failure (TLF) was common, occurring in 44.9% after aggressive PCI and 72.9% after conservative percutaneous coronary intervention (PCI) (Kaplan-Meier estimate) . Cox regression identified final lumen expansion as a protective factor for TLF, particularly in patients undergoing aggressive PCI with good expansion (HR=0.19 , p=0.003), while chronic kidney disease increased the risk of TLF (HR=3.22, p=0.01).

Conclusions: Angiography alone was insufficient for accurately identifying LM-ISR, particularly in complex bifurcation segments, reinforcing the need for intravascular imaging. NIH was the predominant biological mechanism, while stent underexpansion remained the most frequent mechanical cause. Aggressive PCI was associated with improved outcomes, but its benefit was primarily observed in patients achieving adequate lumen expansion. Chronic kidney disease independently predicted adverse events. These findings highlight the importance of optimizing stent expansion and individualizing treatment strategies in patients with LM-ISR.

Key words: Left main; In-stent restenosis; Intravascular ultrasound; Target Lesion Failure.

冠状动脉微循环功能障碍对延迟干预的中度狭窄病变的临床预后影响

阿不都吾甫尔·依迪力斯 [1,2,3,4] 张晨昀 [1,2,3] 陈德龙 [1,2,3] 向建平 [5] 王建安 [1,2,3,4] 蒋峻 [1,2,3,4]

5. 杭州脉流科技有限公司

背景： 冠状动脉微循环功能障碍（Coronary microcirculatory dysfunction, CMD）对经冠状动脉生理学或血管内影像学评估后选择保守治疗的中度狭窄病变的临床预后影响尚未明确。本研究旨在探讨基于冠状动脉造影图像计算的微循环阻力指数（Angiography-derived index of microcirculatory resistance, Angio-IMR）所评估的微循环功能障碍，在血流储备分数（Fractional flow reserve, FFR）或血管内超声（Intravascular ultrasound, IVUS）指导下延迟干预的中度狭窄病变不良预后的预测价值。

方法： 本研究是对 FLAVOUR 随机对照试验的事后分析。我们对延迟干预的中度狭窄病变血管进行了回顾性 Angio-IMR 分析。主要终点为随访 24 个月的靶血管失败（Target vessel failure, TVF）事件，定义为心源性死亡、靶血管相关心肌梗死和靶血管血运重建的复合终点。

结果： 本研究共纳入 722 例患者，共 775 个延迟干预的中度狭窄病变血管。Angio-IMR 平均值为 17.9±8.2，其中 103 个（13.3%）病变血管 Angio-IMR > 25，提示伴有微循环功能障碍（CMD）。随访 24 个月期间，共观察到 29 例（3.9%）TVF 事件。生存分析显示，CMD 组患者的 TVF 累积发生率显著高于非 CMD 组（11.7% vs. 2.6%, P < 0.001）。多因素 Cox 回归分析中，CMD 是 TVF 的独立危险因素（HR: 5.43; 95% CI: 2.55-11.59; P < 0.001）。

结论： 冠状动脉微循环功能评估为中度狭窄患者的风险分层提供了新的维度。血管造影衍生的微循环阻力指数（Angio-IMR）可作为一种有效的风险评估工具。

Diagnostic Accuracy of Artificial Intelligence Enhanced Ultrasonic Flow Ratio for Onsite Assessment of Coronary Stenosis

3. Biomedical Instrument Institute, School of Biomedical Engineering, Shanghai Jiao Tong University, Shanghai, China

Background Ultrasonic flow ratio (UFR) is an innovative artificial intelligence (AI)-powered method designed to efficiently compute fractional flow reserve (FFR) from intravascular ultrasound (IVUS) imaging. This technology integrates anatomical and functional assessments into a unified platform, eliminating the need for pressure-wire instrumentation and pharmacologically induced hyperemia. While retrospective analyses have confirmed its diagnostic accuracy in identifying hemodynamically significant stenosis by offline analysis in the core laboratory, prospective validation in the catheterization laboratory remains unexplored.

Objective This study prospectively evaluated the diagnostic accuracy of UFR in consecutive patients with with suspected ischemic heart disease (IHD) and intermediate coronary stenosis, using pressure wire-based FFR as the reference standard.

Methods Consecutive IHD patients with ≥ 1 de novo coronary lesion exhibiting 50-80% diameter stenosis and a reference diameter ≥ 2.5 mm by visual estimation were prospectively enrolled. Following IVUS image acquisition under pullback speed of 1.0 mm/s (OptiCross ™, Boston Scientific), the IVUS datasets were immediately transferred to the AI-powered workstation for computation of UFR on site using the IvusPlus software (Pulse Medical), with the analysts being blinded to the FFR data. The minimal lumen area (MLA) was simultaneously available during the UFR computation. The primary endpoint was the diagnostic accuracy of UFR

for identifying functionally significant stenosis (FFR ≤ 0.80).

Results Between February 2023 and November 2024, a total of 161vessels with de novo intermediate stenosis from 136 patients were consecutively enrolled for analyses at the catheterization laboratory. Sixteen vessels were excluded according to the predefined exclusion criteria, yielding a final analytical cohort of 122 patients (145 vessels) with pre-PCI IVUS and FFR. The mean plaque burden was 69.62 ± 10.95%. The median FFR and IVUS-derived MLA were 0.85 (IQR, 0.79-0.90) and 3.53 (2.87-4.32)mm^2, respectively. 31.0% of lesions were hemodynamically significant defined by FFR ≤ 0.80, with 23 (15.86%) pullbacks demonstrating FFR values within the range of 0.75 to 0.80. UFR showed excellent correlation with FFR (r=0.87, P<0.001) and a median value of 0.86 (IQR 0.80-0.90). UFR demonstrated superior diagnostic performance than MLA (AUC: 0.96 vs 0.74, P<0.001). Clinical discordance occurred in 6% of vessels (9/145): FFR>0.80 but UFR ≤ 0.80 in 2 vessels, whereas FFR ≤ 0.80 but UFR>0.80 in 7 vessels. Diagnostic accuracy, sensitivity, specificity, positive predictive value, and negative predictive value of UFR was 94% (95% CI: 89-97%), 84% (95% CI: 71-94%), 98% (95% CI: 93-100%), 95% (95% CI: 83-99%), and 93% (95% CI: 88-96%), respectively. Bland-Altman analysis confirmed excellent agreement between UFR and FFR, with a mean difference of 0.01 ± 0.04 (95% CI: -0.00 to 0.01). UFR-FFR concordance remained statistically consistent across three stratified groups: lesion location (P=0.14), multivessel disease (P=0.22), and imaging catheters specifications (P=0.52).

Conclusions Onsite UFR assessment demonstrated excellent agreement with FFR and superior diagnostic performance compared to MLA. These findings suggest UFR may serve as a reliable, accurate and clinically practical tool for real-world evaluation of flow-limiting lesions seamlessly integrating anatomical and physiological data into a single catheterization procedure. (The FEATURE [Functional ComprEhensive AssessmenT by IVUS Reconstruction in Patients with Suspected IschEmic Heart Disease] study; NCT05694065)

Key words intravascular ultrasound; fractional flow reserve; ultrasonic flow ratio; ischemic heart disease; minimal lumen area

基于光学相干断层成像与冠状动脉造影指导支架内再狭窄介入治疗的预后分析：一项单中心、回顾性研究

慕艳燕 王耿

中国人民解放军北部战区总医院

目的： 支架内再狭窄（in-stent restenosis, ISR）是经皮冠状动脉介入治疗（percutaneous coronary intervention, PCI）术后最常见的并发症。因此 ISR 患者的治疗仍然至关重要。腔内影像学为优化 PCI 策略提供了强有力的支持，现有研究表明，光学相干断层成像（optical coherence tomography, OCT）指导可以改善复杂冠状动脉病变以及复杂分叉病变患者的远期预后。然而，针对 OCT 指导能否改善 DES 植入后 ISR 患者远期预后的研究仍然有限。因此，本研究旨在通过应用 OCT 对 DES 植入术后 ISR 患者的介入治疗进行指导，探讨其对术后 1 年主要不良心血管事件（major adverse cardiovascular events, MACE）的影响，从而进一步指导 ISR 病变介入策略的制定，降低 ISR 患者 MACE 发生率。

方法： 本研究根据纳排标准纳入 2018 年 1 月 1 日至 2023 年 7 月 31 日于中国人民解放军北部战区总医院心血管内科行 PCI 治疗的 ISR 患者 2547 例，根据患者 PCI 术前是否行 OCT 检查分为 OCT 组和冠状动脉造影（coronary angiography, CAG）组。使用参数及非参数法比较两组患者基线，考虑两组患者潜在的混杂临床危险因素，根据 1:2 倾向得分匹配（propensity score matching, PSM）调整患者基线水平。采用单因素 Cox 比例风险回归模型评估 OCT 指导对 ISR 患者 PCI 术后远期临床预后的影响。采用 Kaplan-Meier 法绘制终点事件累积发生率的生存曲线（即 K-M 曲线），采用 log-rank 检验评估组间事件发生率差异有无统计学意义。所有检验均为双尾，P <0.05 被认为差异有统计学意义。

结果： 在 2547 例患者中，OCT 组 151 例患者，CAG 组 2396 例患者。经过 1:2 PSM 平衡两组患者基线后，OCT 组发生 MACE 风险显著低于 CAG 组（4.7% vs 12.0%; HR: 0.366; 95%CI: 0.163-0.822; P = 0.015），且 OCT 组任何血运重建（9.3% vs 17.0%; HR: 0.513; 95%CI: 0.284-0.928; P = 0.027）、靶血管血运重建（target vessel revascularization, TVR）（5.3% vs 11.0%; HR: 0.453; 95%CI: 0.209-0.980; P = 0.044）、靶病变血运重建（target lesion revascularization，TLR）（4.0% vs 10.0%; HR: 0.373; 95%CI: 0.155-0.896; P = 0.027）、心源性再入院（16.0% vs 28.3%; HR: 0.517; 95%CI: 0.329-0.814; P = 0.004）发生率均低于 CAG 组。

结论： 1、OCT 指导显著降低 ISR 患者 PCI 术后 1 年 MACE 发生率（P = 0.015）；2、OCT 指导与 ISR 患者术后 1 年靶血管血运重建、靶病变血运重建以及心源性再入院发生率降低有关；3、相比于 CAG 组，OCT 组使用了更大的最大球囊直径以及更高比例切割球囊。

糖尿病合并 NSTE-ACS 多支病变患者 PCI 后微循环功能障碍相关因素探索

霍黎明 彭欣 侯昌 刘健

北京大学人民医院

目的 探讨糖尿病合并非 ST 段抬高型急性冠脉综合征（NSTE-ACS）多支病变患者经皮冠状动脉介入治疗（PCI）后冠脉微循环功能障碍（Coronary Microvascular Dysfunction，CMVD）的相关因素。

方法 本研究采用单中心回顾性横断面研究，纳入 2021 年 1 月至 2024 年 6 月在北京大学人民医院接受 PCI 治疗的 242 例糖尿病合并 NSTE-ACS 多支病变患者，收集基线资料、介入手术参数及实验室指标。基于术后即刻冠状动脉功能测量（caFFR>0.80 且 caIMR ≥ 25）定义 CMVD，通过单因素及多因素 Logistic 回归分析 CMVD 的危险因素。

结果 242 例患者中，49 例（20.3%）术后诊断为患者水平 CMVD。CMVD 组血红蛋白水平显著高于非 CMVD 组 [136 (130,150) g/L vs 130(119,145) g/L，P<0.05]，丙氨酸氨基转移酶（ALT）水平亦较高 [20 (16,31) U/L vs 18 (13,26) U/L，P<0.05]，而传统心血管风险标志物（高血压、吸烟史、LDL-C）及手术参数组间无差异（P 均>0.05）。单因素 Logistic 回归分析显示，血红蛋白（OR=1.025，95%CI：1.007~1.043，P=0.007）、尿素（OR=0.897，95%CI：0.791~1.108，P=0.091）与 CMVD 相关；多因素 Logistic 回归进一步证实血红蛋白为糖尿病合并 NSTE-ACS 多支病变患者 PCI 后 CMVD 独立预测因子（OR=1.026，95%CI：1.007~1.045，P=0.006）。

结论 血红蛋白浓度升高是糖尿病合并 NSTE-ACS 多支病变患者 PCI 术后 CMVD 的独立危险因素，其机制可能与高黏血症诱导的氧化应激及内皮损伤相关。建议对术前血红蛋白 >130g/L 的患者强化术后微循环监测，并探索血液流变学干预策略。

NSTE-ACS 合并多支病变患者 PCI 后冠脉微循环功能障碍预测研究

霍黎明 刘健

北京大学人民医院

目的：心血管疾病作为全球主要死因之一，有效管理此类疾病至关重要。特别是随着冠脉介入手术量的增加，伴随的并发症如 CMVD 也逐渐增多，对患者的生活质量和远期预后产生负面影响。本研究旨在探索非 ST 段抬高型急性冠脉综合征（NSTE-ACS）合并多支病变患者在接受经皮冠状动脉介入治疗（PCI）后冠脉微循环功能障碍（CMVD）的发生率及其相关临床特征、人工智能心电特征等，建立并验证一个有效的预测模型。

方法：本研究分为四个阶段进行：首先，在 2021 年 1 月至 2024 年 6 月期间收集北京大学人民医院接受 PCI 治疗的 NSTE-ACS 合并多支病变患者的数据，通过 caIMR 分组，分析两组间临床特征、人工智能心电特征差异，使用 2021 年至 2023 年的数据构建 Logistic 回归诊断预测模型，并用 2024 年上半年的数据进行前瞻性验证。

结果：研究表明，NSTE-ACS 合并多支病变 PCI 术后 CMVD 的患病率为 23.7%，靶血管水平患病率为 19.2%。与非 CMVD 组相比，CMVD 组糖尿病、陈旧性心肌梗死患病率较低，ACEI/ARB/ARNI 药物使用率更低，外周血血红蛋白浓度较高。基于这些发现构建的预测模型在训练集和验证集中均表现出良好的诊断效能，尤其是将人工智能心电特征纳入后的模型 AUC 达到 0.677 至 0.708，显示出更高的准确性和稳定性。

结论：本研究不仅明确了 NSTE-ACS 合并多支病变 PCI 术后 CMVD 的高发率及相关风险因素，还成功构建了基于临床特征及人工智能心电特征的预测模型，展示了显著的诊断价值。这为临床医生提供了有效的工具来进行风险评估和个性化治疗规划，有助于改善患者的生活质量及长期预后。此外，研究凸显了人工智能在医疗领域的应用潜力，特别是在处理复杂的心电信息方面，为未来的研究提供了新的方向和技术支持。

探究不同年龄段急性 ST 段抬高型心肌梗死患者的临床与影像学特征

张艺璇 曾明 贾海波

哈尔滨医科大学附属第二医院

目的：

比较年龄≤ 45 岁与≥ 45 岁的急性 ST 段抬高型心肌梗死 (ST-Elevated Myocardial Infarction, STEMI) 患者的基线临床特征及实验室指标差异，并利用光学相干断层扫描 (Optical Coherence Tomography, OCT) 技术探究年轻患者与年老患者罪犯斑块特征的差异，探讨年轻心肌梗死患者的独特危险因素。

方法：

回顾性纳入 2018 年 1 ~ 4 月于哈尔滨医科大学附属第二医院心血管内科就诊并行冠脉造影检查及 OCT 成像的 STEMI 患者 134 例，根据年龄分为年轻组（≤ 45 岁，n=30）和年老组（>45 岁，n=104）。收集两组患者的基线资料、实验室检查及影像学特征。计量资料以中位数（第 25-75 百分位数）或均值 ± 标准差表示，组间比较采用 Mann-Whitney U 检验或独立样本 t 检验；分类资料以例数（百分比）表示，组间比较采用卡方检验。

结果：

纳入的 134 名 STEMI 患者的中位年龄为 57.0 岁，其中年轻组中位年龄为 41.0 岁，年老组中位年龄为 61.0 岁。与年老组相比，年轻组的男性患者比例更高（100.0% vs. 75.0%，P<0.001），年轻组患者吸烟率显著高于年老组（73.3% vs. 48.1%，P=0.015）。此外，年轻患者的白细胞（16.0±3.9 vs. 13.9±4.1）、血红蛋白（158.8±10.1 vs. 147.1）及尿酸水平（381.5 [342.2-429.2] vs. 307.0 [254.8-383.1]）更高（P<0.05）。年轻组多支病变比例更低（40.0% vs. 69.2%，P=0.004），接受 PCI 的比例更低（36.7% vs. 62.5%，P=0.012）。在罪犯病变方面，年轻组患者斑块侵蚀比例更高（46.7% vs. 20.2%，P=0.022），病变长度更短（19.9[15.2-22.5] vs. 23.2[18.6 vs. 29.5]，P<0.001），脂质斑块比例更低（60.0% vs.82.7%，P=0.003），微通道比例更低（30.0% VS. 54.8%，P=0.020）。

结论：

年轻 STEMI 患者以男性、吸烟为主要危险因素，而中老年患者更多合并代谢性疾病。在罪犯病变方面，年轻患者的病变长度更短、斑块侵蚀比例更高、脂质

斑块比例更低，需针对不同年龄层制定个性化预防策略。

探究不同年龄段急性 ST 段抬高型心肌梗死患者的临床与影像学特征差异

张艺璇

哈尔滨医科大学附属第二医院

目的：

比较年龄≤ 45 岁与≥ 45 岁的急性 ST 段抬高型心肌梗死 (ST-Elevated Myocardial Infarction, STEMI) 患者的基线临床特征及实验室指标差异，并利用光学相干断层扫描 (Optical Coherence Tomography, OCT) 技术探究年轻患者与年老患者罪犯斑块特征的差异，探讨年轻心肌梗死患者的独特危险因素。

方法：

回顾性纳入 2018 年 1 ~ 4 月于哈尔滨医科大学附属第二医院心血管内科就诊并行冠脉造影检查及 OCT 成像的 STEMI 患者 134 例，根据年龄分为年轻组（≤ 45 岁，n=30）和年老组（>45 岁，n=104）。收集两组患者的基线资料、实验室检查及影像学特征。计量资料以中位数（第 25-75 百分位数）或均值 ± 标准差表示，组间比较采用 Mann-Whitney U 检验或独立样本 t 检验；分类资料以例数（百分比）表示，组间比较采用卡方检验。

结果：

纳入的 134 名 STEMI 患者的中位年龄为 57.0 岁，其中年轻组中位年龄为 41.0 岁，年老组中位年龄为 61.0 岁。与年老组相比，年轻组的男性患者比例更高（100.0% vs. 75.0%，P<0.001），年轻组患者吸烟率显著高于年老组（73.3% vs. 48.1%，P=0.015）。此外，年轻患者的白细胞（16.0±3.9 vs. 13.9±4.1）、血红蛋白（158.8±10.1 vs. 147.1）及尿酸水平（381.5 [342.2-429.2] vs. 307.0 [254.8-383.1]）更高（P<0.05）。年轻组多支病变比例更低（40.0% vs. 69.2%，P=0.004），接受 PCI 的比例更低（36.7% vs. 62.5%，P=0.012）。在罪犯病变方面，年轻组患者斑块侵蚀比例更高（46.7% vs. 20.2%，P=0.022），病变长度更短（19.9[15.2-22.5] vs. 23.2[18.6 vs. 29.5]，P<0.001），脂质斑块比例更低（60.0% vs.82.7%，P=0.003），微通道比例更低（30.0% VS. 54.8%，P=0.020）。

结论：

年轻 STEMI 患者以男性、吸烟为主要危险因素，而中老年患者更多合并代谢性疾病。在罪犯病变方面，年轻患者的病变长度更短、斑块侵蚀比例更高、脂质斑块比例更低，需针对不同年龄层制定个性化预防策略。

急性心肌梗死患者中罪犯病变斑块破裂、非罪犯病变斑块破裂和薄纤维帽粥样硬化斑块的形态学特征差异：一项光学相干断层扫描研究

马显钦 姜森青 左燕 房超 代建南 于波

哈尔滨医科大学附属第二医院

目的： 动脉粥样硬化斑块破裂是急性心血管事件的主要病理机制。既往研究虽比较了 RCP、RNCP 和 TCFA 的特征，但其样本多来自不同患者，难以排除患者间基线差异的干扰。这些混杂因素可能掩盖斑块固有的病理异质性，导致研究结论偏差。本研究旨在克服患者间异质性，比较同一急性心肌梗死（Acute Myocardial Infarction, AMI）患者罪犯病变破裂斑块（Ruptured Culprit Plaque, RCP）、非罪犯病变破裂斑块（Ruptured Non-Culprit Plaque, RNCP）及薄纤维帽粥样硬化斑块（Thin-Cap Fibroatheroma, TCFA）的形态学特征。

方法： 利用光学相干断层成像（Optical Coherence Tomography, OCT）技术，我们筛选出 58 例同时存在上述三种斑块类型的 AMI 患者，共纳入 210 个斑块进行分析（RCP = 58 个；RNCP = 75 个；TCFA = 77 个），利用广义估计方程比较三种斑块之间的形态学特征差异。

结果： 本研究发现 RNCP 与 TCFA 具有相似的纤维帽厚度 [(52.4 ± 19.5) μm vs. (52.3 ± 9.0) μm, P = 0.999），病变长度 [(20.0 ± 7.1) mm vs. (18.2 ± 8.3) mm, P = 0.271], 脂质长度 [(14.7 ± 7.9) mm vs. (12.3 ± 8.0) mm, P = 0.062]。RCP、RNCP、TCFA 三种斑块之间的管腔面积狭窄程度 [(79.6 ± 8.6) % vs. (60.6 ± 16.4) % vs. (51.3 ± 18.9)%, $P_{(RCP\ vs.\ RNCP)}$ < 0.001, $P_{(RCP\ vs.\ TCFA)}$ < 0.001, $P_{(RNCP\ vs.\ TCFA)}$ = 0.004]，平均脂质角度 [(233.9 ± 45.8) arc vs. (206.5 ± 61.8) arc vs. (189.3 ± 54.6) arc, $P_{(RCP\ vs.\ RNCP)}$ < 0.001, $P_{(RCP\ vs.\ TCFA)}$ < 0.001, $P_{(RNCP\ vs.\ TCFA)}$ = 0.035]、脂质指数 [4158.2 (2810.2, 5351.5) vs. 2779.1 (1630.3, 4422.0) vs. 1869.7 (1198.3, 3654.4), $P_{(RCP\ vs.\ RNCP)}$ < 0.001, $P_{(RCP\ vs.\ TCFA)}$ < 0.001, $P_{(RNCP\ vs.\ TCFA)}$ = 0.014] 之间存在显著差异。

结论： RNCP 与 TCFA 具有可比拟的纤维帽厚度，提示纤维帽厚度本身并非斑块破裂的充分或决定性条件。严重的管腔狭窄和较大脂质的负荷是斑块破裂及后续不良事件发生的关键性因素，其重要性可能超越纤维帽厚度。

STEMI 患者全冠脉斑块特征的性别差异：一项三支血管 OCT 研究

吴天宇 曾明 白潇萱 胡思宁 贾海波

哈尔滨医科大学第二附属医院

目的： ST 段抬高型心肌梗死（ST-elevation myocardial infarction, STEMI）的发病机制、解剖特征、临床表现及预后存在性别差异，但性别因素对 STEMI 患者全冠状动脉易损性的影响尚缺乏充分证据。本研究旨在通过光学相干断层成像（optical coherence tomography, OCT）技术，对比分析 STEMI 患者罪犯病变与非罪犯病变的冠状动脉斑块特征，聚焦全冠状动脉易损性的性别差异。

方法： 本研究纳入 2018 年 7 月至 2020 年 6 月期间于哈尔滨医科大学附属第二医院接受直接经皮冠状动脉介入治疗的 STEMI 患者 583 例（男性 449 例，女性 134 例），术中完成全部三支主要心外膜冠状动脉的 OCT 成像。全冠状动脉易损性定义为非罪犯血管段存在以下任一特征：(1) 符合 CLIMA 研究定义的高危斑块（同时满足四个 OCT 特征：纤维帽厚度 <75μm、最小管腔面积 <3.5mm²、最大脂质弧 >180°及巨噬细胞聚集）；(2) 斑块破裂；(3) 薄纤维帽粥样斑块。

结果： 本研究最终纳入 583 个罪犯病变和 2430 个非罪犯斑块。基于患者的分析显示，男性非罪犯斑块破裂发生率显著高于女性（20.3% vs. 12.7%，P=0.047）；基于斑块的分析亦证实此差异（6.4% vs. 3.7%，P=0.010），尤其在≥ 50 岁人群中更为显著。男性患者的高危 OCT 特征检出率更高（总体：41.4% vs. 30.6%，P=0.024；≥ 50 岁亚组：47.5% vs. 32.0%，P=0.003）。多因素回归分析表明，男性患者中罪犯斑块破裂（OR=4.93，95%CI：2.43-9.99，P<0.001）和年龄≥ 50 岁（OR=1.96，95%CI：1.06-3.62，P=0.032）是非罪犯斑块破裂的独立预测因子；而男性患者合并≥ 1 项高危 OCT 特征的独立预测因子包括：罪犯斑块破裂（OR=3.20，95%CI：2.00-5.13，P<0.001）、年龄≥ 50 岁（OR=2.14，95%CI：1.32-3.47，P=0.002）、糖尿病（OR=1.81，95%CI：1.08-3.05，P=0.025）及高血压（OR=1.59，95%CI：1.03-2.47，P=0.038）。女性群体中未发现显著关联。

结论： 在 STEMI 患者中，男性较女性表现出更显著的全冠状动脉易损性，其风险可由罪犯斑块破裂、年龄≥ 50 岁、糖尿病及高血压独立预测。值得注意的是，即使≥ 50 岁的女性患者，其全冠状动脉斑块易损性的发生频率及病变范围均显著低于男性。

OCT 识别的非罪犯斑块破裂的长期预后价值

赵嘉伟 赵锐 房超 代建南 于波

哈尔滨医科大学第二附属医院

目的： 亚临床斑块破裂（即非罪犯斑块破裂）被认为是全冠状动脉易损性的标志，且与不良短期预后相关，但其对长期临床结局的影响尚未明确。本研究旨在探讨非罪犯斑块破裂对急性心肌梗死（acute myocardial infarction，AMI）患者长期复发性不良心脏事件的预测价值。

方法： 纳入 2017 年 1 月至 2021 年 12 月期间于哈尔滨医科大学附属第二医院接受介入治疗前完成三支冠状动脉光学相干断层成像（optical coherence tomography，OCT）检查的 AMI 患者。根据非罪犯部位是否存在 OCT 识别的斑块破裂对患者及病变进行分类。亚组分析中，进一步根据非罪犯节段是否存在斑块破裂和 / 或未破裂薄纤维帽粥样斑块（thin-cap fibroatheroma，TCFA）进行分层（未破裂 TCFA 定义为存在 TCFA 但无斑块破裂的病变）。对所有入组患者进行为期 5 年的随访。主要不良心脏事件（major adverse cardiac events，MACE）包括心源性死亡、非致死性心肌梗死及计划外缺血驱动的血运重建。

结果： 本研究最终共纳入 1312 例 AMI 患者，涵盖 5273 处非罪犯病变。226 例患者（282 处病变）检出非罪犯斑块破裂。中位随访 4.1 年期间，存在斑块破裂的患者其非罪犯病变相关 MACE 发生率显著高于无破裂者（P<0.05），主要归因于非致死性心肌梗死和计划外血运重建风险增加。然而，在病变水平上，存在与不存在斑块破裂的病变其 MACE 发生率无显著差异。多变量模型显示：在患者水平，非罪犯斑块破裂是非罪犯病变相关 MACE 的独立预测因子（HR=2.15, 95%CI: 1.42-3.26, P<0.001）；在病变水平，该关联无统计学意义（P=0.32）。亚组分析发现：319 例患者（428 处病变）存在未破裂 TCFA。多变量模型证实，无论患者水平（HR=2.83, 95%CI: 1.91-4.19, P<0.001）还是病变水平（HR=1.78, 95%CI: 1.12-2.83, P=0.015），未破裂 TCFA 均与非罪犯病变相关 MACE 显著相关，而斑块破裂无此预测价值。

结论： 未破裂 TCFA（而非斑块破裂）可识别未来事件高风险斑块。非罪犯斑块破裂患者长期预后不良的本质原因，主要源于伴随存在的未破裂 TCFA 的影响。

CT-FFR 与 QFR 诊断冠状动脉病变特异性缺血准确性的对比研究

吴皓宇 梁磊 颜举 武峰超 寿锡凌

陕西省人民医院

目的： 血流储备分数（FFR）已成为评估冠状动脉病变特异性缺血和指导冠状动脉血运重建决策的金标准。然而，FFR 作为有创检查方法，可能导致冠状动脉相关并发症，且设备昂贵，限制了其临床应用。基于冠状动脉 CT 血管成像（CCTA）的无创 FFR（CT-FFR）和定量血流分数（QFR）是两种具有前景的诊断方法。本研究旨在以 FFR 为参考标准，评估 CT-FFR 与 QFR 在预测冠状动脉病变特异性缺血方面诊断性能的差异。

方法： 本研究纳入 84 例疑似或确诊冠心病（CAD）患者（年龄 59.85±9.36 岁；男性占 61.76%）。患者接受 CCTA 检查显示冠状动脉主支（参考直径≥ 2.0 mm）存在 30%-90% 狭窄。基于 CCTA 图像计算 CT-FFR 值。在行侵入性冠状动脉造影时测量 FFR 和 QFR。以 FFR ≤ 0.80 作为冠状动脉病变特异性缺血的参考标准。

结果： 以 CT-FFR ≤ 0.80 预测冠状动脉病变特异性缺血的诊断性能良好：敏感度为 90.74%，特异度为 94.74%，受试者工作特征曲线下面积（AUC）为 0.958（P <0.0001）。以 QFR ≤ 0.80 预测冠状动脉病变特异性缺血的诊断性能同样良好：敏感度为 91.00%，特异度为 89.47%，AUC 为 0.941（P <0.0001）。然而，CT-FFR ≤ 0.80 与 QFR ≤ 0.80 预测冠状动脉病变特异性缺血的 AUC 差异无统计学意义（P = 0.942）。CT-FFR 与 FFR 呈良好正相关（Pearson 相关系数 r = 0.835, P <0.0001）。QFR 与 FFR 亦呈良好正相关（Pearson 相关系数 r = 0.804, P <0.0001）。

结论： CT-FFR 和 QFR 与 FFR 具有良好的直接相关性，两者均可为冠状动脉病变特异性缺血提供较高的临床诊断效能。本研究表明，这两种无创技术有望成为评估冠状动脉缺血的重要替代方法。

代谢组学揭示胍丁胺作为冠心病患者易损斑块的预测标志物

闫海浩 刘巍

首都医科大学附属北京积水潭医院

目的：易损斑块破裂是导致血栓形成和心血管不良事件的重要病理基础。本研究旨在通过代谢组学联合光学相干断层成像（optical coherence tomography, OCT）识别易损斑块的血清预测标志物。

方法：纳入首次经皮冠状动脉介入治疗并行 OCT 检查的冠心病患者。根据病变血管是否存在薄帽纤维粥样硬化斑块（thin-cap fibroatheroma,TCFA）分为易损斑块组（n=24）和稳定斑块组（n=16），通过非靶代谢组学分析联合 LASSO 检验筛选两组间差异代谢物。后续前瞻性招募冠心病患者 100 例进行 OCT 成像，使用靶向液相色谱 - 质谱方法定量检测候选血清代谢物水平，评估其对易损斑块的预测价值。

结果：非靶代谢组学联合 LASSO 检验筛选出 3 个易损斑块组下调代谢物：胍丁胺（P=0.001），肌氨酸（P=0.002），肌酸（P=0.041）；以及 2 个上调代谢物：3- 甲基组氨酸（P=0.012），甜菜碱（P=0.018）。KEGG 分析两组在甘氨酸、丝氨酸和苏氨酸代谢（P<0.001）；精氨酸和脯氨酸代谢 (P=0.003)；丙酸代谢 (P=0.013) 通路富集。受试者工作特征（receiver operating characteristic, ROC）分析胍丁胺 [曲线下面积（area under the curve, AUC）：0.78，95%CI：0.62~0.94，P=0.003] 是预测冠心病患者易损斑块的最佳标志物。在前瞻性验证队列中（n=100），胍丁胺与斑块最大脂质弧（β：-6.33，95% CI：-12.19~-0.48, P = 0.034）呈负相关，与纤维帽厚度呈正相关（β：11.35，95% CI：1.96~20.74, P = 0.018）。多因素 logistic 回归分析显示胍丁胺是 TCFA 的独立预测因素（OR：0.69，95% CI：0.55~0.88，P=0.002），其识别 TCFA 的 AUC 为 0.74（95%CI：0.61~0.88，P = 0.002）。以 ROC 确定的最佳截断值（11.10）为界，低胍丁胺组患者 TCFA 检出率高于高胍丁胺组（40.0% vs 7.1%; P<0.001），且纤维帽更薄（149.1 μm vs 210.7 μm; P=0.024）、脂质弧更大（167.8° vs 131.1°；P=0.034）、巨噬细胞浸润比例更高（53.3% vs 30.0%; P=0.027）。

结论：基于代谢组学筛选的血清胍丁胺水平在易损斑块患者中显著降低，且是 TCFA 的独立预测因子，提示其作为冠心病患者易损斑块预测标志物的潜力。

Evaluation of Neointimal Coverage After Guiding De-escalation of Antiplatelet Treatment in Patients with ST-elevation Myocardial Infarction Undergoing Percutaneous Coronary Intervention by Optical Coherence Tomography or Angiography

Jia-Yi Luo, Jia-Yin Li, Yu Xue, Zi-Min Xu, Yang Li

State Key Laboratory of Frigid Zone Cardiovascular Diseases，Cardiovascular Research institute and Department of Cardiology, General Hospital of Northern Theater Command, No.83, Wenhua Road, Shenhe District,Shenyang, 110016, China

Background and Objectives:

Dual antiplatelet therapy (DAPT) de-escalation strategies including early switching from a potent P2Y12 inhibitor to clopidogrel become attractive for patients with ST-elevation Myocardial Infarction (STEMI). The efficacy and safety of de-escalating strategies of antiplatelet therapy in patients with ST-elevation myocardial infarction (STEMI) undergoing primary percutaneous coronary intervention (PPCI) remain uncertain. Angiography is limited to assess the pathophysiological mechanisms of the culprit lesion in guiding PCI, and optical coherence tomography (OCT) is widely used due to its high resolution. Intracoronary imaging guidance during PCI has been shown to improve clinical outcomes and features as a recommendation in societal guidelines. Comprehensive and updated frequentist and Bayesian network meta-analyses showed that OCT-guided PCI was associated with reduced incidence of cardiac death or stent thrombosis compared with invasive coronary angiography-guided PCI. Therefore, OCT-guided PCI correlates with improved clinical outcomes, especially with improved ischemic outcomes. The objective of this study was to explore the effect of de-escalation of dual antiplatelet therapy (DAPT) after OCT- or angiography-guided PPCI on neointimal coverage in patients with STEMI who have completed 1-month DAPT with aspirin plus ticagrelor.

Methods:

This was a single-center, prospective, randomized clinical trial. Eighty patients with STEMI who were proposed to undergo PPCI were randomized twice in a 1:1 ratio, with the first randomization performed before PCI. The primary inclusion criteria were as follows: patients with STEMI, significant stenotic lesions in native coronary arteries suitable for DES implantation and age 18-75 years, the patient or guardian agrees to the study protocol and the schedule of clinical follow-up and provides written informed consent as approved by the appropriate institutional review board/ethical committee of the respective clinical site. The patients were divided into OCT-guided group or angiography-guided group. All patients received open label ticagrelor plus aspirin for one month after PPCI. Patients who were not experiencing any clinical events one month after PPCI were randomized for a second time and divided into antiplatelet de-escalating group (aspirin plus clopidogrel) or an standard DAPT group (aspirin plus ticagrelor). The primary endpoint is the stent-strut neointimal thickness by OCT assessment at 12-month follow up. Secondary endpoints include 12-month major adverse cardiovascular and cerebrovascular events (MACCE) defined as a composite of acute myocardial infarction, repeat revascularization, stroke, and all-cause mortality, definite/probable stent thrombosis, and Bleeding Academic Research Consortium (BARC) types 2-5 bleeding.

Results:

A total of 72 patients were enrolled in the study: 36 in the OCT-guided group and 36 in the angiography-guided group after the first randomization. During the 30-day postoperative follow-up period, 2 patients died and 6 patients experienced adverse clinical events related to bleeding. Following a second randomization, 33 patients were assigned to the antiplatelet de-escalating group, while 31 patients were assigned to the standard DAPT group. The in-stent neointimal thickness was significantly lower in the OCT-guided group than in the angiography-guided group (0.16±0.11mm vs. 0.65±0.27mm; p<0.001). Furthermore, neointimal coverage was thinner in the standard DAPT group than in the antiplatelet de-escalating group (0.25±0.19mm vs. 0.50±0.35mm; p<0.001). In addition, the incidence of MACCE was significantly lower in the OCT-guided group than in the angiography-guided group (2.9% vs. 18.9%; p = 0.03). There was no statistically significant difference in the incidence of MACCE between the antiplatelet de-escalating group and the standard DAPT group (9.8% vs. 12.9%; p = 0.674). Statistically significant differences were not observed between the OCT-guided group and the angiography-guided group, or between the antiplatelet de-escalating group and the standard DAPT group, in terms of the various components of MACCE. Additionally, the incidence of clinically relevant bleeding in the antiplatelet de-escalating group was significantly lower than in the standard DAPT group according to the BARC classification (types 2-5) (4.9% vs. 25.8%; p = 0.011). However, a statistically significant difference in the incidence of bleeding was not observed between the OCT-guided group and the angiography-guided group (BARC types 2-5, 8.6% vs. 18.9%; p = 0.204).

Conclusions:

Patients with STEMI undergoing OCT-guided PCI achieved stent optimization, and received aspirin plus ticagrelor for 12 months had thinner in-stent neointimal thickness, indicating these patients were associated with better clinical outcomes.

Rationales Behind Physiology-guided Revascularization: Diagnostic and Prognostic Impact of Quantitative Flow Ratio in the FAVOR III China Trial

Rui Zhang, Dong Yin

Fuwai Hospital, National Center for Cardiovascular Diseases, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, China 2State Key Laboratory of Cardiovascular Disease, Beijing, China

BACKGROUND The optimization of treatment plan developed based on coronary angiography alone, is recognized as one of the underlying rationales for the clinical benefits of physiology-guided PCI.

OBJECTIVES The present study was a post hoc analysis from the FAVOR III China trial, and aimed to assess physiological concordances of both pre-randomization declared treatment plan as well as post-randomization actual treatment strategy and to investigate the diagnostic and prognostic implication of computational QFR in the large-scale multicenter randomized trial.

METHODS In FAVOR III China trial, operators were required to declare all target vessels intended for PCI before randomization (pre-randomization declared treatment plan). After randomization, the actual treatment strategy was performed with online QFR or angiography guidance (randomized allocation). In this study, pre-randomization treatment plan and post-randomization treatment strategy were adjudicated using offline QFR by independent corelab to determine physiology-concordant. Pre-randomization physiology-nonconcordant encompasses: 1) inappropriate treatment, at least one non-ischemic vessel in which PCI was intended to be performed; 2) inappropriate deferral, at least one ischemic vessel in which PCI was intended to be deferred; and 3) inappropriate treatment & deferral, patients having both inappropriate treatment and inappropriate deferral (in different vessels). In accordance with the principles, the post-randomization treatment strategy was reclassified into post-randomization physiology-concordant or -nonconcordant groups. The primary outcome of interest for the present study was major adverse cardiac events (MACE), defined as the composite of all-cause death, myocardial infarction (MI), or ischemia-driven revascularization.

RESULTS Between Dec 25, 2018, and Jan 19, 2020, 3,825 patients were randomized at 26 hospitals in China. For the present analysis 57 patients were excluded because of unavailable core laboratory offline QFR assessments. Among 3,768 pooled patients with available offline QFR, 2,601 (69.0%) had pre-randomization physiology-concordant plan, proportion of which was comparable between online QFR-guided and angiography-guided group (70.9% [1,340/1,891] vs. 67.2% [1,261/1,877], SMD = 0.087). Physiological concordances were reclassified in 447 (23.6%) and 87 (4.6%) patients with online QFR or angiography guidance, respectively. Among patients randomized to QFR-guided group, physiological concordances were reclassified in 447 patients (23.6%) with online QFR guidance, including a transition of 21 patients (1.1%) from pre-randomization concordant to post-randomization nonconcordant group, and 426 patients (22.5%) from pre-randomization nonconcordant

to post-randomization concordant group; thus 1,745 patients (92.3%) achieved finial physiology-concordant. Upon patients with angiography guidance, physiological concordances were reclassified in 87 patients (4.6%), comprising a shift of 43 patients (2.3%) from pre-randomization concordant to post-randomization nonconcordant, and 44 patients (2.3%) from pre-randomization nonconcordant to post-randomization concordant; consequently, 1,262 patients (67.2%) achieved finial physiology-concordant. A significant between-groups difference was identified in terms of achieving post-randomization physiology-concordant (92.3% vs. 67.2%, SMD = 0.665). The primary 2-year MACE rates were 7.6% in patients assigned to QFR-guided group compared to 17.0% in those assigned to angiography-guided group in whom pre-randomization nonconcordant plan was observed (HR 0.43, 95% CI: 0.30-0.61), and in 8.9% vs. 10.4% respectively among patients with a pre-randomization concordant plan (HR 0.85, 95% CI: 0.66-1.09), indicating a significant interaction (interaction P = 0.002). Patients with older age, multivessel disease, left circumflex or right coronary artery involved, and lower SYNTAX score were found more likely to have pre-randomization physiology-nonconcordant.

CONCLUSIONS In the FAVOR III China trial, approximately 30% of patients showed a discrepancy between angiography-based treatment plans and physiological ischemia. The mechanistic insights underlying the benefits of QFR-guided PCI is reclassification following online QFR guidance, which leads to a shift from initially flawed plans toward physiology-concordant decisions. Initially flawed plan was a predictable entity and artificial intelligence-powered machine learning model would be developed in future study.

定量血流分数指导经皮冠脉介入治疗策略在不同心外膜冠脉中的血管特异性结局：FAVOR III China 研究的预设亚组分析

江瑶 崔锦钢 管常东 陈柘霖 柳耀 乔树宾 宋雷

中国医学科学院阜外医院

目的

FAVOR III China 研究已证实，与传统造影指导相比，定量血流分数（QFR）指导经皮冠脉介入治疗策略可显著改善患者临床结局。但 QFR 的指导疗效在不同的心外膜冠状动脉中是否一致尚无研究证实。

方法

本研究是 FAVOR III China 研究的预设亚组分析，根据病变在心外膜三大冠脉主支的位置，将患者分为左主干 / 前降支（LM/LAD）、回旋支（LCX）和右冠状动脉（RCA）三个队列。主要终点为 3 年的血管相关复合终点（VOCE），包括靶血管相关心源性死亡、靶血管相关心肌梗死和缺血驱动的靶血管血运重建。

结果

对 3825 例患者的病变进行分析，其中 2937 例患者病变涉及 LM/LAD，1426 例涉及 LCX，1606 例涉及 RCA。QFR 指导组的血运重建策略改变的发生率更高，LM/LAD 组为 12.1%，LCX 组为 18.7%，RCA 组为 20.8%。3 年随访时，与造影指导相比，QFR 指导的介入治疗可显著降低 LM/LAD 和 RCA 亚组 VOCE 的发生风险 [LM/LAD：风险比（HR）0.69，95% 置信区间（CI）0.51–0.92；p = 0.01；RCA：HR 0.54，95% CI 0.36-0.81；p = 0.002]，分别由靶血管相关心肌梗死和缺血驱动的靶血管血运重建驱动，但在 LCX 组中未见明显获益（HR 0.80，95% CI 0.54-1.18；p = 0.25）。在延迟血运重建或策略改变等不同亚组中，QFR 指导血运重建的血管特异性结局与主要发现一致。

结论

与造影指导相比，QFR 指导的支架植入策略在不同冠状动脉中表现出血管特异性的疗效差异，在 LM/LAD 和 RCA 病变中具有显著优势，但在 LCX 病变中未观察到明显获益。对于 LCX 病变，基于 QFR 的血运重建决策需更加谨慎，应结合腔内影像技术或者有创生理学测量进行评估和优化。

A deep learning methodology for fully-automated quantification of calcific burden in high-resolution intravascular ultrasound images

Xingwei He[1], He-Song Zeng[1], Christos Bourantas[2]

1. Division of Cardiology, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

2. Department of Cardiology, Barts Heart Centre, Barts Health NHS Trust, London, UK

Background:

Coronary artery calcification is a hallmark of advanced atherosclerotic disease and is associated with adverse outcomes following percutaneous coronary intervention (PCI). Accurate quantification of calcific burden plays a critical role in PCI planning, particularly in guiding lesion preparation strategies to ensure optimal stent expansion. Intravascular ultrasound (IVUS) is widely considered the gold-standard imaging modality for detecting calcific tissue due to its superior ability to visualize deeply embedded plaque components and provide high-resolution cross-sectional images of the vessel wall. However, current practices rely on manual assessment of IVUS images, which is labor-intensive, subject to significant inter- and intra-observer variability, and impractical for large-scale analyses. These limitations have hindered the integration of calcification analysis into routine clinical workflows and high-throughput research studies.

Objective:

To overcome these challenges, we developed a fully automated, deep learning (DL)-based methodology for the identification and quantification of calcific tissue in high-resolution IVUS images. Our goal was to provide a fast, accurate, and reproducible solution that could match expert-level performance and be readily implemented within existing image analysis software.

Methods:

We trained a DL model using a dataset of IVUS images from 65 patients (197 vessels; 26,211 frames) with stable coronary artery disease. The training set was curated with expert-annotated calcium masks, which included precise delineation of calcific arc, area, and depth relative to the lumen. A U-Net architecture was employed, which has been shown to be particularly effective in medical image segmentation tasks. To enhance performance, we applied a polar transformation to the IVUS images, simplifying the representation of acoustic shadows—a key indicator of calcific presence—into a consistent orientation. This preprocessing step allowed the network to more effectively learn spatial relationships and shadow characteristics associated with calcific tissue.

The model was tested on an independent dataset of 5,138 IVUS frames from 30 vessels in 13 patients. Performance was evaluated across multiple scales: frame-level (presence/absence of calcium, arc, area, and lumen-to-calcium distances), lesion-level (classification of calcific-rich plaques), and segment-level (calcific burden index, or CaBI). Quantitative metrics included Cohen's kappa, Pearson correlation coefficients, Bland-Altman analysis, and the Williams Index (WI), a comparative metric assessing agreement between the DL model and expert annotations relative to expert-expert variability.

Results:

The DL model achieved excellent agreement with human experts. At the frame level, kappa values for calcium presence were 0.842 and 0.848 ($p<0.001$), indicating strong concordance. Correlation coefficients for calcium arc and area were 0.946–0.947 and 0.706–0.745 respectively, while correlations for mean and minimum distances from lumen to calcium ranged from 0.876 to 0.930. Bland-Altman analysis showed small biases and narrow limits of agreement across all parameters.

At the lesion level, the DL method demonstrated high diagnostic performance, identifying calcific-rich plaques (defined as arc $\geq 90°$) with sensitivity of 95.5%, specificity of 89.5%, and accuracy of 91.7%. Segment-level analysis revealed similarly strong performance, with CaBI estimates highly correlated with those of experts ($r \geq 0.980$). Importantly, the Williams Index was below 1 for most measures, indicating that the discrepancies between the DL method and expert annotations were smaller than inter-expert variability. Notably, the DL model outperformed human experts in estimating the minimum lumen-to-calcium distance (WI = 1.631).

Qualitative assessment showed that the DL method could reliably localize calcific tissue within the plaque architecture, including its circumferential distribution. Mean angular differences between DL and expert annotations were close to zero, and the Dice similarity coefficient for overlap ranged from 0.915 to 0.916—comparable to inter-observer agreement levels. Furthermore, the model was highly efficient, capable of analyzing 5,000 frames in approximately 1 minute on a standard desktop computer, a process that typically takes experts around 1 hour.

Significance and Clinical Implications:

Our findings demonstrate that the proposed DL methodology not only provides accurate quantitative metrics for calcific burden but also offers qualitative insights into calcium morphology, which are crucial for clinical decision-making. In PCI planning, understanding the location, circumferential extent, and proximity of calcium to the lumen helps operators determine whether lesion preparation strategies such as atherectomy, scoring balloons, or intravascular lithotripsy are warranted.

From a research perspective, this tool facilitates large-scale, unbiased quantification of calcification across populations, enabling new insights into disease progression and response to pharmacotherapies. It can also be integrated into longitudinal studies assessing the effects of novel lipid-lowering or anti-inflammatory agents on plaque composition. Moreover, this method complements existing DL-based tools for lumen and vessel wall segmentation, paving the way for fully automated IVUS analysis pipelines capable of comprehensive plaque phenotyping.

Conclusions:

We present a novel, fully automated DL-based approach for the detection and quantification of calcific tissue in IVUS images. The method matches expert-level performance, significantly reduces analysis time, and integrates seamlessly into existing image analysis workflows. It holds promise for widespread adoption in both research and clinical

settings, where it can enhance PCI planning and support studies investigating the impact of therapies on coronary plaque morphology.

Optical coherence tomography versus coronary angiography -guided percutaneous coronary intervention: a systematic review and meta-analysis

Jia-Yi Luo, Jia-Yin Li, Yu Xue, Zi-Min Xu, Yang Li

State Key Laboratory of Frigid Zone Cardiovascular Diseases, Cardiovascular Research institute and Department of Cardiology, General Hospital of Northern Theater Command, No.83, Wenhua Road, Shenhe District,Shenyang, 110016, China

Background and Objectives:

The superiority of optical coherence tomography (OCT) guidance over coronary angiography (CA) guidance in optimizing therapy in patients undergoing percutaneous coronary intervention (PCI) remains uncertain. Multiple trials have been published, sparking debate as to whether the patient outcomes short- and long-term outcomes of OCT-guided PCI are superior to those of CA. A substantial body of evidence from recent years indicates that MSA (minimum stent area) is not only an effective predictor of stent restenosis but is also significantly linked to patients' future risk of adverse cardiovascular outcomes. Consequently, we conducted a comprehensive meta-analysis with the objective of providing a higher level of evidence. We aimed to perform a meta-analysis of published studies to evaluate the outcomes of CA- and OCT-guided PCI procedures.

Methods:

A comprehensive search using medical subject headings (MeSH) and text terms ("coronary angiography", "optical coherence tomography", "OCT", "percutaneous coronary intervention", and "PCI") was conducted in PubMed/Medline, EMBASE, and the Cochrane Library up to March 2024 for all randomized controlled trials (RCTs) and observational studies, with no language restrictions. We also manually screened major cardiology websites, editorials and reviews for relevant studies to avoid missing anything. The outcomes of this meta-analysis included all-cause death, cardiovascular death, major adverse cardiovascular events (MACE), restenosis, myocardial infarction (MI), target lesion revascularization (TLR), target vessel revascularization (TVR), post-intervention minimum stent area (MSA), post-intervention minimum lumen diameter (MLD) and follow-up MLD. Study characteristics, baseline characteristics of patients and endpoints of interest were extracted independently by two authors. To ensure data accuracy, data comparison was performed after extraction, with a senior author resolving any disagreements. The methodological quality of RCTs was evaluated using the Cochrane risk-of-bias tool (RoB-2), while the quality of observational studies was assessed using the ROBINS-I tool. The statistical analysis was conducted using the Review Manager (RevMan 5.3) and STATA version 18 (Stata Corp, College Station, Texas, USA). Heterogeneity was quantified using the I^2 test, with an I^2 value of 0% to 25% designated as absent or low, an I^2 value of 26% to 50% designated as moderate, and an I^2 value above 50% designated as high. When heterogeneity was defined as high, a random effect model was utilized for the calculation, otherwise a fixed effect model was used. Conversely, a fixed effects model was employed. The results were expressed as risk ratio (RR) and mean deviation (MD) with their corresponding 95% confidence interval (CI). We did subgroup analyses according to study type (RCTS versus observational studies), follow-up time (short-term versus long-term), stent type (drug-eluting stent/ bare-metal stent versus bioresorbable scaffold), and patient characteristics (acute coronary syndrome versus non-acute coronary syndrome). Long-term refers to a follow-up period of at least one year. A trial was classified as belonging to the acute coronary syndrome (ACS) group if all patients included in the trial at least 50% of the patients included in the trial had ACS.

Results:

A total of 25 articles were included in the study. In terms of clinical outcomes, OCT-guided PCI was associated with a significant reduction in all-cause death (RR 0.62; 95%CI 0.47-0.83; p=0.001), cardiovascular death (RR 0.47; 95%CI 0.32-0.69; p<0.001), and MACE (RR 0.65; 95%CI 0.54-0.77; p<0.001). While no statistically significant differences were observed for restenosis (RR 0.91, 95%CI 0.73-1.13, P=0.38), MI (RR 0.83, 95%CI 0.69-1.00, P=0.05), TLR (RR 0.86, 95%CI 0.66-1.10, P=0.23), and TVR (RR 0.82, 95%CI 0.63-1.07, P=0.15). In terms of surrogate endpoints, OCT-guided PCI was associated with a significant enhancement of MSA (MD=0.30, 95%CI 0.04-0.56, p=0.03) and MLD at follow-up (MD=0.12, 95%CI 0.02-0.22, p=0.02). Nevertheless, no significant increase in the post-intervention MLD was observed (MD=0.04, 95%CI -0.02-0.10, p=0.19).

Conclusions:

Compared with CA, the use of OCT for PCI guidance may be an effective strategy to optimize treatment. In this meta-analysis, the use of OCT guidance during PCI reduced cardiovascular death, all-cause death, and MACE and resulted in a higher MSA compared to CA. However, probably because of the heterogeneity and a small number of events, other outcomes, and some subgroup analyses did not show this superiority. There remains a need for higher-quality RCTs in the future to adequately evaluate the role of OCT in PCI.

High-Risk Lesion Features on Coronary CT Angiography Predict Acute Coronary Syndrome in FFR-Negative Patients

Jia-Yi Luo, Jia-Yin Li, Yu Xue, Zi-Min Xu, Yang Li

State Key Laboratory of Frigid Zone Cardiovascular Diseases, Cardiovascular Research institute and Department of Cardiology, General Hospital of Northern Theater Command, No.83, Wenhua Road, Shenhe District,Shenyang, 110016, China

Background and Objectives:

Invasive flow reserve fraction (FFR)-guided percutaneous coronary stenting (PCI) in patients with acute coronary atherosclerosis (ACS) has been shown to result in superior clinical outcomes when compared with angiography-guided PCI or pharmacological therapy. However, it should be noted that clinical events still occur in FFR-negative patients. The study assessed lesions characteristics by coronary computed tomography angiography (CCTA) in FFR-negative patients and to explore the association between lesion characteristics and future cardiovascular events.

Methods:

We retrospectively analyzed the data of patients who underwent CCTA from 2022 to 2023 and had FFR results suggesting negativity within one month. The following three domains were assessed in the testing of CCTA metrics at the vascular level: plaque quantity (including plaque burden and total plaque volume); plaque quality (including high-risk plaque); and peri-coronary fat inflammation characteristics. High-risk plaques were defined as having at least two of the following features: positive remodeling, spotty calcification, low-attenuation plaque and napkin-ring sign. At the two-year follow-up, patients were divided into two groups based on whether or not they had recurrent ACS: the recurrent ACS group and the non-recurrent ACS group. Three prediction models were constructed: model 1 (high-risk plaque), model 2 (model 1 + plaque burden + total plaque volume) and model 3 (model 2 + pericoronary adipose tissue). The predictive performance of each model was evaluated using the area under the receiver operating characteristic curve (AUC), and comparisons between AUCs were performed using DeLong's method. Furthermore, the discriminative power and classification accuracy of each model were compared using the relative integrated discriminant improvement index (IDI) and net reclassification index (NRI). The process of plot calibration is employed for the purpose of evaluating the predictive calibration and the discriminative validity of the model under consideration, with the Brier score and calibration slope being calculated in order to illustrate calibration accuracy. The decision curve analysis (DCA) should be applied in order to evaluate the clinical utility of the model.

Results:

During the study period, a total of 417 patients underwent examinations including FFR, ICA, and CCTA. Among these patients, 201 exhibited an FFR value of less than 0.8, while 15 had CCTA image quality that did not meet the criteria for analysis. Additionally, 5 patients were lost to follow-up. Ultimately, a total of 196 patients were included in the final analysis: this comprised 92 individuals in the recurrent ACS group and 104 individuals in the non-recurrent ACS group. Meanwhile, 207 culprit lesions were identified on CCTA, based on coronary angiography findings at the time of ACS. The prevalence of plaque burden (66.0 ± 5.8% vs. 60.7 ± 5.6%; p < 0.001), total plaque volume (103.0 ± 32.9 mm3 vs. 79.3.1 ± 29.3 mm3; p < 0.001), and high-risk plaque incidence (62.6% vs. 31.2%; p < 0.001) were all found to be significantly higher in the recurrent ACS group. In the ACS group, the difference in pericoronary adipose tissue was found to be statistically significant (p < 0.001). Of the three models, model 3 demonstrated superior discrimination (AUC 0.887 vs. 0.828; P< 0.001) and reclassification abilities (category-free net reclassification index 0.338; P<0.001; and relative integrated discrimination improvement 0.122; P< 0.001). The net benefit curve of model 3, which demonstrated the highest discriminatory power in the DCA, remained above models 1 and 2 within the clinical decision threshold range (0.2-0.7). This suggests that it could offer greater net benefits in clinical decision-making. The results of five-fold cross-validation indicate that the model's predictive capability improves as the number of parameters increases. Concurrently, the fluctuation range of the AUC consistently narrows, suggesting that each model not only enhances its performance but also maintains a high level of stability. The calibration slopes for Model 1, Model 2, and Model 3 were found to be 1 (95% CI: 0.586 - 1.414), 0.999 (95% CI: 0.816 - 1.181), and 1.003 (95% CI: 0.861 - 1.145), respectively. The calibration curves of all three models demonstrated a close alignment with the ideal calibration line throughout the entire risk range.

Conclusions:

In FFR-negative patients, integrating outcome assessment of CCTA with FFR has been shown to enhance the identification of offender lesions that may trigger ACS.

Guanxinshutong capsule alleviates hypoxia-induced myocardial apoptosis via AMPK-mediated autophagy

yu Xu, Yang Li, Hai-Xu Song, Jia-Yi Luo, Zi-Min Xu, Jia-Xin Xu, Jing-Jin Hou, Cheng-Hui , Ya-Ling Han

State Key Laboratory of Frigid Zone Cardiovascular Diseases，Cardiovascular Research institute and Department of Cardiology, General Hospital of Northern Theater Command, No.83, Wenhua Road, Shenhe District,Shenyang, 110016, China

Aim of the study: Guanxinshutong capsule (GXST), a traditional Chinese medicine formulation. This preparation is effective for treating patients with stable angina pectoris. We performed network pharmacology, and in vitro and in vivo experiments to explore the mechanisms by which GXST protects against myocardial ischemia/reperfusion (MI/R).

Methods: The critical targets and potential mechanisms of action were predicted using network pharmacology. Eight-week-old C57BL/6 mice were divided into an MI/R group (treated with normal saline) and a GXST group (treated with 1.5 g/kg/d via oral gavage). An in vitro model of hypoxic injury was established by exposing H9C2 cells to 800 μM cobalt chloride ($CoCl_2$) for 24 h. The effects of GXST on apoptosis and autophagy were assessed using a TdT-mediated dUTP nick-end labeling assay, flow cytometry, transmission electron microscopy, immunofluorescence, and western blotting.

Results: Network pharmacology analysis revealed that autophagy and apoptosis were crucial pathways through which GXST suppressed MI/R injury. In vivo , the EF and FS in the MI/R + GXST group were higher than those in the MI/R group. H&E and Masson staining indicated that mice in the MI/R group exhibited significant myocardial disarray and disordered myofibrils. These pathological changes were significantly reversed following GXST treatment GXST significantly improved cardiac function and reduced infarct size, fibrotic scarring, and levels of autophagy and apoptosis in MI/R mice. The cell counting kit-8 assay demonstrated that GXST (50% effective dose = 88.34 mg/L) protected H9C2 cells from $CoCl_2$-induced injury. Flow cytometric analysis and TUNEL staining revealed that treatment with $CoCl_2$ resulted in a significantly increased the apoptotic rate , which was prevented by GXST treatment. Clv-caspase3 and Bcl-2 are essential for apoptosis during myocardial damage. The activities of Clv-caspase3 were increased by $CoCl_2$ and those of Bcl-2 were decreased by $CoCl_2$, and these effects were significantly reversed by GXST. $CoCl_2$ treatment increased LC3B protein level whereas GXST treatment prevented the formation of LC3B in H9C2 cells .TEM results also onsistents with the western blot results for LC3B, there was an increased formation of autophagosomes and autolysosomes in H9C2 cells after $CoCl_2$ exposure, whereas treatment with GXST dramatically reduced the formation of autophagosomes and autolysosomes in these cells. Furthermore, the association between autophagy and apoptosis was investigated using the autophagy inhibitor, 3-MA. Hypoxia treatment markedly increased H9C2 cell apoptosis compared to the control group, as determined by flow cytometry, western blotting, and TUNEL staining. In the presence of 3-MA, cell apoptosis was reduced compared to that in the hypoxia group, and similar results were observed in the GXST group. The expression levels of LC3B and Clv-caspase3 were significantly reduced by 3-MA treatment compared to those in the hypoxic group. Meanwhile, compared with the $CoCl_2$ + 3-MA group, the $CoCl_2$ + 3-MA + GXST group did not significantly decreased apoptosis, or expression of LC3B.$CoCl_2$ significantly increased AMPK phosphorylation. In contrast, treatment suppressed the activation of AMPK induced by $CoCl_2$. Compound C (an AMPK inhibitor) was used. Cmpared to the $CoCl_2$ group, the Compound C + $CoCl_2$ and Compound C + $CoCl_2$ + GXST groups had lower apoptosis rates. Both Compound C and GXST decreased the expression of Clv-caspase3, LC3B, and the p-AMPK/AMPK ratio under hypoxia Compared to the Compound C + $CoCl_2$ group, the Compound C + GXST + $CoCl_2$ group did not further reduce apoptosis.

Conclusions: GXST plays a cardioprotective role by alleviating hypoxia-induced myocardial apoptosis via AMPK-mediated autophagy. Therefore, GXST administration may be an important treatment strategy for enhancing recovery in patients with MI/R injury.

Prognostic Value of IVUS-modulated Murray-law Quantitative Flow Ratio After Percutaneous Coronary Intervention: Post Hoc Analysis from The FLAVOUR Trial

Wei Yu[1], Jun Jiang[2], Xin-yi Yang[1], Jin-Long Zhang[2], Dai-Xin Ding[3], Zhi-Qing Wang[4], Liu[5], Xiao-Lian Yu[1], Su Zhang[1], Jian-An Wang[2], Bang-Quan Gu[6], Sheng-Xian Tu[1]

Background: Recent studies have highlighted the advantages of using Fractional Flow Reserve (FFR) and Intravascular Ultrasound (IVUS) in PCI. However, the adoption of comprehensive physiological assessment and intracoronary imaging remains limited worldwide, primarily due to reimbursement restrictions in many countries. We developed an intravascular ultrasound (IVUS)-based FFR computation method, known as UFR, to enables simultaneous physiological and morphological assessments using a single catheter. The feasibility and accuracy of intravascular imaging-based methods can be restricted when pullback does not fully cover the lesion, especially in vessels with diffuse lesions. To address this issue, we developed a novel method integrating coronary angiogram and intravascular ultrasound (IVUS) to compute FFR. The objective of this study is to evaluate the prognostic value of the IVUS-modulated Murray-law quantitative flow ratio (IVUS-μFR).

Methods: Post-PCI IVUS-μFR was performed on the IVUS-guided group from the FLAVOUR trial (Fractional FLow Reserve And IVUS for Clinical OUtcomes in Patients With InteRmediate Stenosis; NCT02673424). The primary endpoint was three-year target vessel failure (TVF), defined as a composite of cardiac death, target vessel myocardial infarction, and target vessel revascularization (TVR). The μFR analysis were performed following standard procedure. This included steps such as angiographic projection selection, lumen contours and side branch delineation, reference vessel reconstruction based on the Murray bifurcation fractal law, hyperemic flow velocity (HPV) estimation using the TIMI frame count, and the fast calculation of pressure drop along the interrogated vessel using a simplified fluid dynamic equation. Following the μFR analysis, the final IVUS image was imported. Automatic delineation of lumen contours, external elastic lamina (EEL) contours, and side branch ostia was performed on the IVUS image. Then, the IVUS pullback was co-registered with the angiogram using an automatic registration algorithm. The final geometric lumen model was reconstructed using the IVUS-interrogated segment and the remaining proximal and distal segments from the angiogram. Based on this geometric lumen model and EEL geometric model, a new reference vessel was generated. Finally, pressure drop was calculated based on the simplified fluid dynamics equations using angiography-derived HFV. In the end, IVUS-μFR was available for both the interrogated vessel and its side branches.

Results: Post-PCI IVUS-μFR was successfully analyzed in 448 vessels from 430 patients. The feasibility of IVUS-μFR in this study was 85.0%. If vessels with missing image data were not considered, the feasibility increased to 93.7%. A post-PCI IVUS-μFR of ≤ 0.85 was associated with a significantly higher risk of three-year TVF (16.3% vs. 3.3%, P=0.0001; HR: 5.29 [95% CI, 2.11-13.25], P<0.001; C-index: 0.84 [0.72-0.96]), demonstrating superior predictive capability compared to other predictors including angiography-derived μFR (HR: 4.32 [95% CI, 1.80-10.38], P=0.001; C-index: 0.81 [0.68-0.95]) and IVUS-derived minimum stent area (HR: 2.74 [95% CI, 1.09-6.87], P=0.031; C-index: 0.73 [0.65-0.91]). After adjusting for potential confounding factors, this factor was linked to a 5-fold increase in risk for TVF (adjusted HR: 5.71 [1.98-16.43], P=0.001). Furthermore, IVUS-μFR drop out of the stented segment was significantly associated with non-TLR (HR, 9.45[2.44, 36.58], P=0.001), and this association was directionally consistent for μFR (HR, 6.05[1.71, 21.44], P=0.005). There was a mild trend for IVUS-μFR drop across the stented segment to predict TLR (HR, 4.30[0.50,36.84], P=0.183), while the trend was weak for μFR (HR, 2.20[0.26,18.86], P=0.471).

Conclusions: The feasibility of this method did not decrease when powered by automatic image processing algorithms. Post-PCI IVUS-μFR ≤ 0.85 was identified as an independent predictor of three-year TVF, associated with a 5-fold increase in the risk. This method added incremental value compared to μFR or IVUS-derived anatomic evaluations.

急性冠状动脉综合征合并支架内再狭窄患者中新生动脉粥样硬化的临床危险因素分析

陈嘉雯 高圣恩 董福红 黄东旭 崔丽娜 马显钦 赵嘉伟 陈昱竹 赵锐 徐艺硕 果怡博 李路路 王旖旎 代建南 房超 于波

哈尔滨医科大学附属第二医院

目的：冠状动脉支架内再狭窄（ISR）是经皮冠状动脉介入治疗术后的常见中远期并发症。其中，支架内新生动脉粥样硬化（NA）被认为是 ISR 的关键发病机制之一，且与事件复发及不良预后密切相关。本研究旨在探讨急性冠状动脉综合征（ACS）合并 ISR 的患者中，在罪犯病变经光学相干断层扫描（OCT）确诊为 NA 的患者，其临床特征、实验室指标及影像学表现是否存在差异，并识别其可能的独立危险因素。

方法：本研究为单中心回顾性分析，纳入 2017 年 1 月至 2021 年 12 月在哈尔滨医科大学附属第二医院住院，且接受 OCT 检查明确诊断为 ISR 的 ACS 患者。根据 OCT 是否显示 NA 特征，将患者分为 NA 组与非 NA 组。比较两组间的临床资料、实验室检测结果及冠状动脉造影指标。

结果：共纳入 273 例患者，其中 151 例（55.3%）经 OCT 确诊为 NA。与非 NA 组相比，NA 组患者支架植入时间更长（P<0.05），女性比例显著增加（27.2% vs. 13.9%，P=0.006），高脂血症患病率更高（38.4% vs. 26.2%，

P=0.033）。在实验室检测方面，NA 组的 C 反应蛋白（CRP）、低密度脂蛋白胆固醇（LDL-C）及肌钙蛋白水平显著升高（均 P<0.05）。冠状动脉造影结果显示，NA 组病变更常见于血管近段（64.3% vs. 52.3%，P=0.04），但在狭窄程度和最小管腔面积等定量参数上，两组间无统计学差异。多变量 logistic 回归分析结果显示，女性（OR = 3.21, 95% CI: 1.04–9.90, P = 0.043）、支架植入年限（OR = 1.21, 95% CI: 1.07–1.38, P = 0.003）及 LDL-C 水平（OR = 3.28, 95% CI: 1.53–7.04, P = 0.002）为 NA 的独立危险因素。

结论：在 ACS 合并 ISR 患者中，NA 发生率较高。性别（女性）、支架植入年限及 LDL-C 升高是其独立危险因素。上述因素可作为 NA 风险评估的重要参考，有助于临床早期识别高危人群，并为精准化管理提供依据。

Predictors for Anti-Thrombotic Therapy Prognosis of Plaque Erosion: Results from OCT-Based Fluid-Structure Interaction Models

Zhao Chen[1,2], Yan-Wen Zhu[3], Yi-Shuo Xu[1,2], Liang Wang[3], Di-Rui Zhang[1,2], Ming Zeng[1,2], Da-Lin Tang[4], Hai-Bo Jia[1,2], Bo Yu[1,2]

3. School of Biological Science and Medical Engineering, Southeast University

4. Mathematical Sciences Department, Worcester Polytechnic Institute, Worcester

BACKGROUND: Acute coronary syndrome (ACS) is one kind of common and serious cardiovascular disease, with major underlying mechanisms including plaque rupture and plaque erosion. Autopsy and intravascular optical coherence tomography (OCT) studies revealed that ~30% to 40% of ACS cases were caused by plaque erosion. With the implementation of intense lipid-lowering therapy, the incidence of plaque erosion may be on the rise in coronary artery thrombosis leading to ACS. OCT has a high resolution (10 ~ 20 μm), allowing it to identify plaque erosion and rupture in vivo. Several studies indicated that plaque erosion usually has intact fibrous caps, large lumen diameters, and white thrombus with rich platelets, different from plaque rupture. These characteristics suggest that conservative anti-thrombotic therapy may be effective for ACS patients with plaque erosion. Prati et al. compared ACS patients with plaque erosion treated with conservative anti-thrombotic therapy and stenting. The findings revealed that both groups remained asymptomatic at the two-year follow-up, indicating that conservative anti-thrombotic therapy was as efficacious as stenting.

The EROSION series studies were conducted using baseline and follow-up data (one month, one year and four years, respectively) to assess the safety and feasibility of avoiding stenting in erosion-related ACS culprit lesions. Most patients exhibited favorable clinical outcomes during the follow-up period, however, patients inexplicably underwent elective target lesion revascularisation (TLR) in long-term follow-up, despite all patients adhering to effective secondary prevention strategies post-discharge. The inadequate resolution of thrombus at one month may be a contributing factor, but this does not provide timely or precise guidance for selecting therapeutic strategies for patients with plaque erosion. With the acceptance of conservative antithrombotic therapy for patients with plaque erosion, Clinicians, patients and researchers are confronted with two critical questions: 1) Which patients with plaque erosion would benefit more from conservative treatment? 2) what risk factors and predictive methods could be employed to anticipate treatment outcomes?

Plaque structural stress (PSS) refers to the stress present within an atherosclerotic plaque due to vessel expansion and stretching caused by arterial pressure. Flow shear stress (FSS) is the parallel frictional force applied by blood flow on the endothelial surface of the arterial wall. Previous research has demonstrated that plaque regions experiencing high PSS correlate with compositional alterations indicative of increased plaque vulnerability, whereas areas with low FSS are associated with more incredible plaque growth in progressing regions. However, no study has reported varying values of PSS and FSS in relationship to the progression of no-stented in ACS patients with plaque erosion. Consequently, the patient-specific three-dimensional (3D) models with flow-structure interactions (FSI) were constructed to obtain biomechanical risk factor values for comparison and analysis. A logistic regression model was employed to identify optimal predictors for outcomes of conservative antithrombotic therapy and to obtain prediction accuracies.

METHODS: 10 patients (9 male and 1 female) with ST-segment elevation myocardial infarction due to plaque erosion who met the inclusion criteria of the EROSION study were selected for this research. The inclusion criteria of the EROSION study were briefly summarized as follows: (1) ACS patients aged 18 to 75 years; (2) Culprit lesion located in a native coronary artery; (3) TIMI flow grade 3 with diameter stenosis < 70% on angiography; (4) Definite erosion defined by OCT; (5) Patient was stable without symptoms. All patients included in these studies were initially managed with a conservative strategy without stenting, and sequential angiography and OCT imaging were performed at 1 month and 1 year. All the patients underwent standardized secondary prevention after discharge. At 1 year follow-up, 5 patients (TLR group) underwent elective TLR with stent implantation, while the other 5 (non-TLR group) remained free from revascularisation.

RESULTS: Our findings revealed that the combination of maximum flow shear stress (FSS), maximum lipid percentage, and thrombus burden provided the highest predictive capability, with a mean area under the curve (AUC) of 0.96 [90% confidence interval = (0.85, 1.00)]. Maximum FSS emerged as the most significant single predictor, with a mean AUC of 0.70 [90% confidence interval = (0.20, 1.00)]. The mean maximum FSS in the TLR group was 98.0% higher than that in the non-TLR group (P = 0.076), suggesting its crucial role in the outcomes of conservative anti-thrombotic therapy.

CONCLUSIONS: This study indicated that integrating morphological and biomechanical risk factors could effectively predict the long-term risk of TLR in patients with plaque erosion following conservative anti-thrombotic therapy, warranting further investigation in larger cohorts.

慢性完全闭塞病变主要供血血管定量血流分数对患者远期预后的影响

李新健 徐昕晔 王贵松

北京大学第三医院

目的：目前，对于冠状动脉慢性完全闭塞病变（coronary chronic total occlusion，CTO）病变患者供血血管功能学状态与预后相关性的研究较为有限。定量血流分数（quantitative flow ratio，QFR）是一种新型的功能学评估技术，无需压力导丝或血管扩张剂，基于 Murray 定律的 QFR（Murray law-based QFR，μQFR）仅通过单幅冠状动脉造影序列即可完成功能学评估，为回顾性评估 CTO 病变供血血管的功能学状态提供了可行性。本研究旨在探讨 CTO 病变主要供血血管 μQFR 对患者远期预后的影响。

方法：本研究纳入 2015 年 1 月至 2023 年 6 月期间，在北京大学第三医院通过冠状动脉造影证实为单支血管 CTO 病变的住院患者，收集临床特征、化验检查等基线资料，采用第三代定量血流分数检测仪（AngioPlus Core，上海博动医疗科技股份有限公司）测定主要供血血管 μQFR，以 μQFR ≤ 0.80 为诊断界值对主要供血血管进行功能学评价。通过电子病历系统或电话随访的方式随访入组患者的 MACE 事件，包括全因死亡、非致死性心肌梗死、非计划再次血运重建以及因不稳定心绞痛再入院。采用多因素 Cox 回归模型探讨 μQFR 与 MACE 发生风险之间的关系，并通过亚组分析、倾向性评分加权等方法进行敏感性分析，评估结果的稳健性。

结果：符合入选标准的 307 例 CTO 病变患者均完成 1 年以上临床随访，37 例患者在 1 年随访时发生了 MACE 事件。其中，μQFR>0.80 组中 MACE 发生率为 9.9%，显著低于 μQFR ≤ 0.80 组的 MACE 发生率，两组间差异具有统计学意义（P=0.005）。多因素回归分析表明，与 μQFR>0.80 组患者相比，μQFR ≤ 0.80 组患者在 1 年内发生 MACE 的风险增加了 3.15 倍（HR: 3.15，95%CI: 1.52-6.51，P<0.05）。μQFR 每降低 0.10，1 年内发生 MACE 的风险增加 45%（HR：1.45，95%CI：1.14-1.84，P<0.05）。亚组分析及倾向性评分加权等敏感性分析结果均表现出良好的稳健性。

结论：CTO 病变患者主要供血血管的 μQFR 值降低与 1 年内 MACE 发生风险增加显著相关。μQFR ≤ 0.80 的患者在 1 年内发生 MACE 的风险是 μQFR>0.80 患者的 3.15 倍，主要供血血管的功能性缺血是预测 MACE 发生的重要指标。

TET2 Mutations and Coronary Plaque Characteristics Assessed by Optical Coherence Tomography in Patients with ST-Elevation Myocardial Infarction

qianhui sun, Hai-Bo Jia, Bo Yu

The 2nd Affiliated Hospital of Harbin Medical University

Background:

Clonal hematopoiesis of indeterminate potential (CHIP), characterized by the expansion of hematopoietic stem or progenitor cells carrying somatic driver mutations without overt hematological malignancy, is increasingly recognized as a novel, non-traditional cardiovascular risk factor. Distinct from conventional risk factors such as hypertension, diabetes, and dyslipidemia, CHIP independently exacerbates cardiovascular morbidity and mortality, with accumulating evidence linking it to accelerated atherosclerosis, myocardial infarction, and adverse post-infarction outcomes. Among the most prevalent CHIP-associated driver genes, Ten-eleven translocase 2 (TET2) plays a pivotal role, as its mutations disrupt DNA demethylation processes and promote pro-inflammatory phenotypes in myeloid cells—mechanisms thought to fuel vascular inflammation and plaque instability. Optical coherence tomography (OCT) can precisely describe the phenotypes of atherosclerotic plaques. This study aimed to evaluate the impact of TET2 mutations on coronary plaque characteristics in patients with ST-elevation myocardial infarction (STEMI) using OCT and explore its prognostic significance.

Methods:

This was a single-center retrospective study. STEMI patients who underwent OCT scanning of culprit plaques and had blood samples retained from May 2017 to May 2019 in the Second Affiliated Hospital of Harbin Medical University was included. Targeted deep sequencing of peripheral blood was performed to detect TET2 mutations (variant allele frequency(VAF) ≥ 2%). Patients were divided into the TET2 mutation group and

the non-mutation group. The OCT characteristics of culprit and non-culprit plaques in both groups were analyzed, and patients were followed up for a median of 2.4 years (IQR 2.0-3.0) to record major adverse cardiovascular events (MACE), including all-cause death, non-fatal myocardial infarction, non-fatal stroke, and ischemia-driven revascularization.

Results:

Among 628 STEMI patients, 25 (4.0%) carried TET2 mutations. Patients with TET2 mutations were older, while the two groups showed comparable prevalence rates of hypertension, diabetes mellitus, and dyslipidemia. And the variant allele frequency (VAF) increases with age. OCT findings showed that compared with the non-mutation group, the culprit plaques in the TET2 mutation group were more vulnerable, with a smaller minimal lumen area [1.5 (1.2-1.9) vs. 1.8 (1.4-2.4) mm^2, P=0.062], a higher macrophage proportion (96.0% vs. 85.1%, P=0.128), a thinner fibrous cap [40.0 (40.0-60.0) vs. 60.0 (40.0-80.0) μm, P=0.005], a larger maximal lipid arc [360 (270.0-360.0) vs. 281.6 (220.9-360.0) , P=0.006], and a higher proportion of plaques with a fibrous cap thickness ≤ 65μm (68.0% vs. 43.1%, P=0.014). Furthermore, lipid components in plaques increased with the elevation of mutation VAF. Non-culprit plaques in TET2 carriers showed trends toward more lipid-rich features, though not statistically significant. In terms of prognosis, the MACE rate in the TET2 mutation group was significantly higher than that in the non-mutation group (54.3% vs. 21.0%, P<0.001), with an adjusted hazard ratio of 3.57 (95%CI 1.78-7.17, P<0.001). Subgroup analysis showed that TET2 mutations significantly increased the MACE risk in patients with plaque rupture (P<0.001), but there was no such difference in patients with plaque erosion (P=0.499).

Conclusions:

In our study, in STEMI patients, TET2 mutations are associated with more vulnerable coronary plaques and are an independent predictor of poor prognosis, especially in patients with plaque rupture, suggesting that TET2 mutations may serve as a biomarker for risk stratification in STEMI.

Impact of Intravascular Imaging-Guided Drug-Eluting Stent Implantation on Cardiac Mortality in Patients with Diabetes and Coronary Artery Disease: A Multicenter Cohort Study

Xiaofei Gao[1], Jing-Yu Zhao[1], Jun-Jie Zhang[1], Shao-Liang Chen[1]

2. The First People's Hospital of Taicang

3. Changshu No.1 People's Hospital

4. The First People's Hospital of Zhangjiagang

Abstract

Objectives: This study aimed to evaluate the impact of intravascular imaging (IVI) guidance versus angiography guidance for drug-eluting stent (DES) implantation on cardiac mortality in patients with diabetes mellitus (DM) and coronary artery disease (CAD).

Methods: We analyzed 11,530 patients with DM and CAD who underwent coronary DES implantation in a multicenter network from January 2014 to December 2023. Patients were stratified by intraoperative imaging modality into an IVI-guided group (n = 2,425) and an angiography-guided group (n = 9,105). To minimize confounding, propensity score matching (PSM) was performed at a 1:1 ratio, yielding 2,409 matched pairs with well-balanced baseline clinical and angiographic characteristics. The primary endpoint was cardiac death within 1 year. The secondary endpoint was major adverse cardiovascular events (MACE), defined as a composite of cardiac death, target vessel myocardial infarction (TVMI), and clinically driven target vessel revascularization (TVR). Kaplan-Meier analysis with the log-rank test compared cumulative incidence between groups. Cox regression was used to estimate hazard ratios (HRs) and 95% confidence intervals (CIs). A Fine-Gray model was applied to account for competing risks when appropriate. The Win Ratio method, applied according to a pre-specified hierarchical order, was also used. Sensitivity analyses with inverse probability of treatment weighting (IPTW) confirmed the robustness of the findings.

Results: After PSM, baseline clinical and angiographic characteristics were well balanced between the IVI and angiography groups (all P > 0.05). Procedurally, the IVI-guided group had a significantly greater number of implanted stents, longer total stent length, larger mean stent diameter, and larger post-dilation balloon diameter (all P < 0.05). During the 1-year follow-up, the IVI-guided group had a significantly lower risk of cardiac death than the angiography group (2.5% vs. 4.3%; HR = 0.585; 95% CI, 0.427-0.803; P < 0.001), which was confirmed by Fine-Gray competing risk analysis. This finding was further supported by Win Ratio analysis (WR = 1.730; 95% CI, 1.271-2.356; P < 0.001). The MACE was also less frequent in the IVI group (7.2% vs. 11.5%; HR = 0.613; 95% CI, 0.508-0.741; P < 0.001), with Win Ratio analysis showing similar benefit (WR = 1.633; 95% CI, 1.355-1.970; P < 0.001). Sensitivity analyses using IPTW yielded consistent, statistically significant findings, supporting the robustness of these results.

Conclusions: In patients with CAD and DM undergoing DES implantation, IVI-guided stent placement significantly reduced the risk of cardiac death at 1 year compared with angiography guidance.

基线 QFR 在单支冠脉临界病变患者中的预后分层价值

禄彦锋 ABDULRAHMAN ALQAZZAZ 黄欣 冯家豪 张勇 郜珊珊 宋强 宁菲菲 郭宁

西安交通大学医学院第一附属医院

目的：探讨基线定量血流分数（QFR）及其三分组模型（低 QFR 组、灰区组、高 QFR 组）在单支冠脉临界病变患者中的预后评估作用，分析其对临床结局的预测能力。

方法：本研究为单中心回顾性队列研究。研究连续性纳入 2023 年 5 月至 6 月于西安交通大学第一附属医院接受冠状动脉造影存在单支临界病变（目测直径狭窄率 40–80%），且病变经回顾性测定 QFR 值介于 0.70 至 0.90 之间的冠心病患者 478 例。按照靶血管 QFR 测定值，分为低 QFR 组（0.70–0.74）、灰区 QFR 组（0.75–0.85）、高 QFR 组（0.86–0.90）。主要研究终点为主要心脏不良事件（MACE），定义为心源性死亡、心肌梗死、缺血驱动的血运重建组成的复合终点；关键次要终点为靶血管失败（TVF），定义为心源性死亡、靶血管心肌梗死、靶血管缺血驱动的血运重建组成的复合终点；中位随访时间 18 个月。通过 Kaplan–Meier 生存分析比较各组间临床结局的差异，并使用 Cox 比例风险模型确认危险因素。

结果：在中位 18 个月的随访期间，低 QFR 组、灰区组、高 QFR 组 MACE 累积发生率分别为 13.5%、6.6%、3.4%（Log-rank P=0.008），主要归因于心肌梗死（3.2% vs. 1.4% vs. 0.0%, Log-rank P=0.029）和缺血驱动的血运重建（11.5% vs. 6.1% vs. 2.3%, Log-rank P=0.004）的差异。此外，尽管三组间 TVF 累积发生率无显著性差异（8.6% vs. 3.7% vs. 2.2%, Log-rank P=0.051），但靶血管缺血驱动的血运重建风险存在差异（6.7% vs. 3.3% vs. 1.1%, Log-rank P=0.027）。限制性立方样条（RCS）分析显示 QFR 值与 MACE 风险线性负相关；单因素 Cox 回归显示 QFR 每增加 0.10，MACE 相对风险降低 52.8%（P=0.012）；多因素 Cox 模型调整 eGFR 分组、SYNTAX 风险、治疗方式（药物治疗、PCI）后，证实 QFR 分组的独立预测价值（调整后 HR=1.858, 95% CI 1.038–3.326, P=0.037）。

结论：基线 QFR 及基于其值域划分的三分组模型与单支临界病变冠心病患者临床预后显著相关，是评估缺血风险及预测心脏不良临床结局的有效工具。

Optical coherence tomography-guided drug coatedballoon in non-small de novo coronary arterylesions: a prospective clinical research

li longbo, Bin Liu

吉林大学第二医院

Purpose: The combined use of drug coated balloon (DCB) and optical coherence tomography (OCT) for the treatment of non-small coronary de novo lesion remains to be evaluated. We investigated the safety and efficacy of OCT-guided DCB in non-small coronary de novo lesion patients with predilation of cutting balloon.

Introduction: Drug-coated balloons were first introduced for the treatment of instent restenosis and are recommended (European Society of Cardiology[ESC] guidelines class IA recommendation) for instent restenosis following treatment with both baremetal and drugeluting stents . The safety and efficacy of drug coated balloon (DCB) in de novo lesions such as small vessel disease and bifurcation lesion has been demonstrated . Recently, a REVELATION randomized trial has confirmed that DCB strategy was noninferior to drug-eluting stent (DES) in primary percutaneous coronary intervention for ST-segment elevation myocardial infarction 9 months later . But there are few studies on the feasibility of DCB in non-small de novo coronary artery disease. The primary concerns about the use of DCB in non-small de novo coronary artery disease are insufficient predilation of the lesion and dissection-associated acute occlusion. Cutting balloon, on the other hand, can mitigate the damage to the vascular wall, reduce postoperative elastic recoil and improve the success rate of predilation .

Methods: This study was a prospective, and open-label study. We enrolled patients with non-small de novo lesions treated with OCT-guided DCB. The non-small de novo lesions indicated vessel lesions with a diameter ≥ 2.5 mm. The primary endpoints were the success rate of the procedure and the occurrence of target lesion revascularization. The secondary endpoints were myocardial infarction, cardiac death, and major adverse cardiac events (MACE) within 3 months after the procedure.

Statistical analysis:

Continuous variables are described as mean ± standard deviation, and discrete variables are expressed as frequencies and percentages. SPSS version 19.0 (IBM, Munich, Germany) was used for statistical analyses. The Student's t-test was used for the comparison analysis. A p-value < 0.05 was considered statistically significant.

All data were analyzed by SPSS23.0 statistical software. Count data were represented by n (%), and comparison was performed by X2 test; measurement data were represented by (x±s), and comparison between groups was conducted using independent sample t test; A P-value of < 0.05 was accepted as statistically significant; Kaplan-Meier was used to map the survival curve.

Results: At the Second Hospital of Jilin University, we enrolled 54 patients (54 lesions) with non-small de novo lesions who were treated with OCT-guided DCB from October 2018 to June 2019. A total of 52 patients were successfully treated with DCB-only strategy, while 2 patients turned to bailout stenting. A total of 21 patients had undergone angiography 3 months after the procedure with the late lumen loss of 0.24±0.57 mm. There was no statistically significant difference in minimal lumen diameter (MLD) between post-DCB and at 3-month angiographic follow-up (2.25±0.40 mm vs 2.04±0.54 mm; P = 0.110). Only 1 patient developed restenosis with the incidence of MACE rate of only 1.92% (n = 1). There was no significant difference in the stenosis of the lumen diameter of the target lesion vessel between 3 months after operation and immediately after operation.

Conclusions: Our study showed that OCT-guided DCB with cutting balloon under guidance may be a novel approach in non-small de novo coronary artery disease.

Non-Invasive and Invasive Physiological Indices in the Clinical Assessment of Coronary Heart Disease Patients and Comparison with Angiography-Guided PCI: A Network Meta-Analysis Based on Randomized Controlled Trials

ZiYu Zhao, Ce Wang, Cheng-Jie Ma, Yue Sun

The First Affiliated Hospital of Naval Medical University（Shanghai Changhai Hospital）

Introduction: Coronary artery disease (CAD) is a leading cause of global mortality and significantly impacts patient prognosis. Percutaneous coronary intervention (PCI) is a core therapeutic strategy, and the choice of guidance modality is paramount to its success. Traditionally, anatomy-based coronary angiography (CA) has been the decision-making gold standard, yet it cannot assess whether a stenosis causes myocardial ischemia. In recent years, a variety of functional physiologic assessment techniques have emerged, including the invasive methods of Fractional Flow Reserve (FFR) and Instantaneous Wave-free Ratio (iFR), as well as non-invasive or imaging-based methods like Quantitative Flow Ratio (QFR) and CT-derived FFR (CT-FFR). Although some studies have provided head-to-head comparisons of a few techniques, a comprehensive synthesis of evidence that includes all six leading invasive and non-invasive strategies is currently lacking. This study aimed to, for the first time, systematically evaluate and rank the impact of these six strategies on clinical outcomes in CAD patients via a network meta-analysis (NMA). Furthermore, it sought to compare the relative merits of three major categories—traditional anatomical, invasive physiological, and non-invasive physiological guidance—to provide the highest level of evidence for clinical practice.

Methods: This study adhered to the PRISMA-NMA statement, and its protocol was registered with PROSPERO (CRD42024590375). We conducted a systematic search of PubMed, EMBASE, and the CENTRAL database for randomized controlled trials (RCTs) published between 2005 and 2024. Inclusion criteria were: (1) study population of adult CAD patients undergoing PCI; (2) comparison of at least two of the following guidance strategies: CA, CCTA, FFR, iFR, QFR, or CT-FFR. The primary endpoint was Major Adverse Cardiovascular Events (MACE), defined as a composite of cardiovascular death, myocardial infarction, and repeat revascularization. We performed a frequentist network meta-analysis using a random-effects model to calculate Hazard Ratios (HRs) and their 95% Confidence Intervals (CIs). Network consistency was assessed using the node-splitting method, and the efficacy of interventions was ranked probabilistically using P-scores. All statistical analyses were performed using R software.

Results: A total of 17 RCTs, comprising 24,832 patients, were included. The mean patient age was 63.4 years, with 64.3% presenting with Acute Coronary Syndromes (ACS). All included studies were judged to have a low risk of bias, providing a high-quality evidence base for the analysis. The evidence network model demonstrated good consistency (P > 0.05). Compared to CA guidance, an FFR-guided strategy significantly reduced the risk of MACE by 32% (HR=0.68, P=0.05), with a number needed to treat (NNT) of 19 to prevent one MACE event. The benefit with a QFR-guided strategy was even more pronounced, with a 47% reduction in MACE risk (HR=0.53, P=0.03). While there was no significant difference between iFR and FFR in terms of MACE risk, this analysis identified a critical safety signal: compared to the FFR group, the iFR-guided group had a 101% increased risk of cardiovascular death (HR=2.01, P=0.002). Furthermore, compared to FFR, the QFR-guided group showed an 84% increased risk of myocardial infarction (HR=1.84, P=0.03). In the non-invasive domain, adding CT-FFR analysis to CCTA significantly reduced the need for unnecessary invasive angiography by 58% (P<0.001) and also lowered the risk of myocardial infarction. The P-score ranking clearly established a hierarchy of superiority. FFR (P-score=0.83) ranked first, confirming its status as the optimal strategy. QFR (0.75) followed closely, demonstrating strong potential. CT-FFR (0.62) and iFR (0.58) also outperformed traditional methods. CA (0.50) and CCTA (0.35) ranked last. The benefits of physiologic guidance were particularly prominent in patients with ACS and those with multi-vessel disease. In the diabetic subgroup, QFR showed a potential for additional clinical benefit over FFR.

Conclusion: This comprehensive and rigorous network meta-analysis establishes a contemporary, evidence-based hierarchy for PCI guidance strategies. The findings unequivocally demonstrate that PCI guidance based on physiological function is, as a whole, significantly superior to strategies that rely solely on traditional anatomical assessment for improving patient outcomes. FFR, with its wealth of evidence and robust clinical benefit, is reaffirmed as the "core gold standard" for guiding revascularization decisions. However, this study also highlights a potential safety risk associated with iFR (increased cardiovascular mortality), urging cautious interpretation and application. Particularly encouraging is the performance of non-invasive techniques like QFR, which demonstrated a potential for benefit comparable, or in some aspects (MACE reduction) superior, to the invasive gold standard. This positions QFR as a key technology for the future of precision cardiology, although its performance on specific endpoints (myocardial infarction) warrants further investigation. Therefore, we strongly recommend the routine application of invasive physiological assessment (preferably FFR) for decision-making in intermediate lesions. Concurrently, the clinical application of non-invasive techniques like QFR should be actively explored and validated, with the goal of providing safer, more precise, and more convenient individualized treatment plans for patients.

基于冠脉造影衍生的微循环指数与急性 ST 段抬高型心肌梗死患者预后的相关性分析

罗永百 钱荣凯

西安交通大学第一附属医院

目的：

1. 探讨基于造影的微循环阻力指数（AMR）与接受直接经皮冠状动脉介入治疗（PPCI）治疗后的急性 ST 段抬高型心肌梗死（STEMI）患者的预后的相关性，并评估其诊断效能；

2. 探讨 AMR 与常用临床指标及实验室检查的相关性。

方法：

本研究为一项回顾性观察性研究，选取 2020 - 2023 年间于西安交通大学第一附属医院行 PPCI 手术的 STEMI 患者，依据严格的纳入和排除标准，最终纳入 871 名患者进行分析。研究结局定义为主要心血管不良事件（MACE）的复合终点，通过相关性分析分析 AMR 与 MACE 发生的关系，并使用工作特征曲线分析 AMR 用于诊断的最佳截断值及诊断效能，进一步通过生存分析及 Cox 回归计算风险比。最后，分析 AMR 与其他临床常用指标的相关性，并通过 logistic 回归分析影响 AMR 的独立危险因素。

结果：

最终纳入 871 名患者，随访期间 139 名患者发生 MACE。根据 1 年内是否发生 MACE 将患者分为两组，发生 MACE 组的患者的 AMR 水平显著升高（3.28 mmHg·s/cm vs. 2.50 mmHg·s/cm; P <0.001），相关性分析提示 AMR 与 MACE 存在中等程度的正相关（r = 0.417; P <0.001）。工作特征曲线提示 AMR 的最佳诊断界值为 3.00 mmHg·s/cm，工作特征曲线下面积为 0.829（95% CI: 0.787 - 0.871; P <0.001），灵敏度为 74.1%，特异度为 89.2%。以该界值将患者分组后进行生存分析并行 Cox 回归分析，将单因素 Cox 回归有统计学意义的危险因素纳入多因素 Cox 回归，分析提示 AMR 是 STEMI 患者 PPCI 术后发生 MACE 的独立的危险因素（HR 2.04; 95% CI: 1.29 - 3.25; P = 0.002）。根据 AMR 将患者分组后，进行 logistic 分析后得到影响 AMR 的独立相关的危险因素为白细胞（OR 1.10; 95% CI: 1.04 - 1.16; P = 0.001）以及左室射血分数（OR 0.95; 95% CI: 0.93 - 0.98; P = 0.006）。进一步对不同 AMR 水平组间系统性免疫炎症指数水平进行分析，同样存在显著差异（1740.60 [995.93, 2547.48] vs. 1273.51 [751.80, 1993.37], P <0.001）。

结论：

本研究证实了 AMR 与 STEMI 患者术后预后的相关性，提出了新的 AMR 诊断界值并验证了其有效性。

A higher level of sST2 predicts the hospital mortality of patients with infective endocarditis: A 10-year retrospective study in China

Yu-Xuan Lou, Yang Yang

The First Affiliated Hospital with Nanjing Medical University

Aim: To explore the prognostic value of soluble growth stimulating gene 2 protein (sST2) in patients with infective endocarditis in China and the trend of disease spectrum.

Methods: We assessed the records of all patients diagnosed with infective endocarditis (IE) who underwent surgery at the First Affiliated Hospital of Nanjing Medical University from 2013 to 2022. Patients were divided into a low-risk group (sST2 < 35 ng/mL) and a high-risk group (sST2 ≥ 35 ng/mL) according to sST2 level.

Results: Overall, we assessed 384 IE patients. Among 210 patients in the low-risk group, 154 (73.33%) were male and 56 (26.67%) were female, and the average age of patients was 45.75±14.08. Among 174 patients in the high-risk group, 119 (68.39%) were male and 55 (31.61%) were female, and the average age of patients was 48.30±15.38. A total of 24 patients (6.25%) died after surgery.There was no significant difference in the history of hypertension, diabetes, stroke, pulmonary hypertension,

spleen infarction, arrhythmia, pulmonary infection or peripheral arteriovenous embolism between the two groups. According to NYHA(New York Heart Association) class, 21 (10.00%) patients in the low-risk group had Class III-IV cardiac complications at admission, less than 34 (19.54%) patients in the high-risk group (P<0.001). In addition, there were significant differences in multiple organ dysfunction syndrome (MODS), NT-proBNP levels, the hospital stay, the hospital stay in the ICU and proportion of hospitalized deaths between the two groups of patients .The results of ROC curve analysis suggested that sST2 had good predictive value for the prognosis of IE patients (AUC=0.772, 95% CI, 0.686~0.859, P<0.001), the sensitivity was 0.917, and the specificity was 0.647 .Univariate logistic regression analysis showed that septicemia, severe heart failure, MODS and sST2 (P<0.001) were risk factors for IE. After adjusting for the above variables, multivariate logistic regression analysis still showed that sST2 (OR (95% CI) =0.958~0.996, P=0.019), septicemia (OR (95% CI) = 0.044~0.679, P=0.012), NYHA III/IV (OR (95%CI)=3.784~37.743, P<0.001) and MODS (OR(95%CI) =2.692~36.960, P=0.001) were independent death factors for IE.To further evaluate the change trend of the disease spectrum of IE patients, we divided 384 patients from 2013 to 2022 into Group A (164 patients from 2013 to 2017) and Group B (220 patients from 2018 to 2022). A total of 156 patients (95.12%) in Group A had native valve endocarditis (NV-IE), 6 patients (3.66%) had prosthetic valves, and 2 patients (1.22%) had pacemaker-related endocarditis. In group B, 204 patients (92.72%) had NV-IE, 8 patients (3.64%) had prosthetic valves, and 8 patients (3.64%) had pacemaker-related endocarditis. During 2013-2017, 32 (19.51%) patients had congenital heart disease, which was the main cause of congenital valve endocarditis, followed by rheumatic heart disease, with a total of 24 patients (14.63%), 16 patients with degenerative diseases (9.76%), and 70 patients without potential heart disease (42.68%), while 36 (16.36%) patients had congenital heart disease and 10 patients with rheumatic heart disease (4.55%) in 2018-2021. There were 36 patients with degenerative diseases (16.36%) and 94 patients without potential heart disease (42.73%). The proportion of patients with degenerative heart disease increased, while the proportion of patients with congenital and rheumatic heart disease decreased Echocardiography and intraoperative evaluation showed that the aortic valve was the most commonly affected site in IE, followed by the mitral valve. From 2013 to 2017, aortic valve and mitral valve lesions were 64 (39.02%) (56; 34.15%), respectively. From 2018 to 2022, aortic valve (100; 45.45%) and mitral valve (64; 29.09%) lesions were the most common, and the proportion of mitral valve lesions decreased significantly . We used the one-way ANOVA test to compare the sST2 levels of patients with different surgical methods, and the sST2 level of patients who underwent open ventricular septal defect repair (69.93±19.67ng/mL) was significantly higher than that of other surgical methods.

Blood culture tests showed that 100 people (60.98%) had pathogenic bacterial infections during 2013-2017, mainly caused by Streptococcus (50; 30.49%), Staphylococcus (24; 14.63%) and Corynebacterium (8; 4.88%). Mixed infection was observed in 8 patients (4.88%). During 2013-2017, 132 people (60.00%) had pathogenic bacterial infections, mainly caused by Streptococcus (62;28.18%), Staphylococcus (38;17.28%) and Enterococcus (8;3.64%). Mixed infection was observed in 8 patients (3.64%).

Conclusion:Higher levels of sST2 are independently associated with hospital mortality in patients with infective endocarditis.

TyG 指数、TyG-BMI 指数对 AMI 行急诊介入治疗患者预后的预测价值

南京医科大学第一附属医院

目的 分析甘油三酯 - 葡萄糖（TyG）指数、甘油三酯 - 葡萄糖 - 体质（TyG-BMI）指数对 AMI 行急诊介入患者预后的预测价值。方法 回顾我院 2021 年 01 月 01 日至 2022 年 12 月 31 日 AMI 行急诊介入的患者 201 例，均在 12 小时内急诊介入开通罪犯血管，根据心电图表现分为急性非 ST 段抬高型心肌梗死 (NSTEMI) 组、急性 ST 段抬高型心肌梗死 (STEMI) 组，根据 TyG 指数的中位数分为低分组（Q1 组）、高分组（Q2 组），取同期冠脉造影结果为阴性的患者 96 例为对照组，收集 TyG、TyG-BMI 指数等临床资料，随访 24 个月，记录主要不良心血管事件（MACE），分析 TyG、TyG-BMI 指数对 AMI 急诊介入患者预后的预测价值。结果 （1）与对照组相比，NSTEMI 组 TyG 指数明显升高（9.16±0.72 vs.8.66±0.63,P < 0.05）；与对照组相比，STEMI 组 TyG 指数明显升高（9.46±0.69 vs.8.66±0.63,P < 0.05）。（2）与对照组相比，NSTEMI 组 TyG-BMI 指数明显升高（241.04±39.49 vs.212.74±33.27,P < 0.05）；与对照组相比，STEMI 组 TyG-BMI 指数明显升高（255.50±44.45 vs.212.74±33.27,P < 0.05）。（3）STEMI 组 TyG 指数、TGy-BMI 指数均高于 NSTEMI 组（P < 0.05）。（4）TyG-BMI 指数与 cTnI 呈正相关（R=0.23,P < 0.01）,TyG-BMI 指数与 LVDd 呈正相关（R=0.505,P < 0.01）,TyG-BMI 指数与 LVEF 呈负相关（R=-0.587,P < 0.01），TyG-BMI 指数与 Gensini 评分呈正相关（R=0.44,P < 0.01）。（5）24 个月 MACE 对比发现，NSTEMI 组、STEMI 组均高于对照组（P < 0.05），Q2 组高于 Q1 组（P < 0.05）。（6）通过生存曲线 km 法分析得出 TyG 指数低的心肌梗死患者 MACE 事件发生相对较少。结论 TyG 指数、TyG-BMI 指数对 AMI 行急诊介入治疗患者预后有一定的预测价值。

Prevalence and clinical characteristics of coronary microvascular dysfunction in Tibetan highlanders with suspected coronary artery disease

Xiuhuan Chen, Bingyu Gao, Xue-Dong Zhao, Hai Gao

Beijing Anzhen Hospital, Capital Medical University

Abstract

Background: Chronic hypobaric hypoxia in high altitude regions results in remarkable difference in the incidence, clinical characteristics and pathogenic mechanisms of coronary artery disease from those in lowland. Based on this notion, recognition of the etiologies, risk factors and clinical characteristics of coronary artery disease in highlanders is of paramount importance. It is notable that coronary microvascular dysfunction is prevalent in approximately 2 in 5 coronary artery disease patients, and is independently associated with an increased risk of adverse cardiovascular events. Whether coronary microvascular dysfunction is associated with the development, progression and adverse outcomes of coronary artery disease in highlanders is still unknown. Previous studies have demonstrated detrimental effects exerted by chronic hypobaric hypoxia on cutaneous, cerebral and sublingual microcirculation, evidenced by an increased microvascular resistance and a decreased perfusion. However, no direct evidence has showed this association, and relevant clinical characteristics also remain unelucidated.

Aims: This study was designed to evaluate the prevalence, and clinical characteristics of coronary microvascular dysfunction in Tibetan dwellers with suspected coronary artery disease.

Study Design and Methods: In this retrospective, single-center study, 256 patients admitted for frequent chest pain and performed coronary angiography in Lhasa People's Hospital between March 2012 to July 2022 were enrolled. Baseline characteristics, laboratory examination and coronary angiography images were collected for further analysis. Coronary angiographyderived index of microvascular resistance (caIMR) in left anterior descending was calculated and used to measure microvascular function, and coronary microvascular dysfunction was defined as caIMR ≥ 25 U. Continuous variables are presented as the mean (SD) or median (interquartile: first and third quartiles) and were compared by the Student's t test, the Mann–Whitney U test or ANOVA depending on the distribution. Categorical variables are shown as numbers (percentages) and were compared by χ^2 statistics or Fisher's exact test, as appropriate. Spearman's correlation analyses and multivariable linear regression analysis were used to evaluate the association between age and caIMR. A 2-sided P<0.05 was considered indicative of statistical significance.

Results: Of 256 eligible patients (average age: 56.4 ± 12.1 years; 94 [36.7%] women), 179 (69.9%) patients were with caIMR ≥ 25 U, among whom 157 (73.7%) patients presented with no obstructive coronary artery disease (stenosis <50% in 3 main vessels) in the coronary angiography. Notably, the prevalence and values of coronary microvascular dysfunction were independent of canonical coronary artery disease risk factors including gender, hypertension, diabetes mellitus, hyperlipidemia, heart failure and current smoking. Intriguingly, we found that the mean value of caIMR was significantly higher in 154 younger patients (age <60 years; 60.2%) than that in older patients (36.7 ± 19.1 U vs. 31.7 ± 13.3 U; P = 0.022). In addition, caIMR was negatively correlated with age (r = -0.150, P = 0.016). In further linear regression analysis, after adjustment for clinical confounders, age as a continuous variable (beta coefficient [β] = -0.246, P = 0.012) and age <60 years (β = -6.2, P = 0.009) were both independently associated with increased caIMR.

Conclusions: In the current study, we unraveled an excessively prevalent coronary microvascular dysfunction that might result in symptomatic chest pain in the absence of obstructive stenosis in Tibetan highlanders. Moreover, we also indicated significant age-specific correlation with coronary microvascular dysfunction that younger patients may have higher microvascular resistance than older patients. Taken together, more emphasis should be on ubiquitous coronary microvascular dysfunction in highlanders, particularly in younger patients, and aggressive diagnosis and interventions are also recommended.

Characteristics and Mechanisms of Coronary In-stent Restenosis Across Different Clinical Presentations: An Optical Coherence Tomography Study

Yi-Shuo Xu[1,2], Yu-Han Qin[1,2], Chen Zhao[1,2], Yan Zuo[1,2], Di-Rui Zhang[1,2], Ning Wang[1,2], Si-Ning Hu[1,2], Jing-Bo Hou[1,2], Hai-Bo Jia[1,2], Bo Yu[1,2]

1. Department of Cardiology, The 2nd Affiliated Hospital of Harbin Medical University

2. The Key Laboratory of Myocardial Ischemia, Chinese Ministry of Education, Harbin, China

Background

In-stent restenosis (ISR) is a major cause of stent failure and target lesion revascularization in patients with coronary artery disease. Compared with percutaneous coronary intervention for de novo lesions, ISR lesions are more complex and have been demonstrated to be associated with higher risk of repeated restenosis and revascularization. Expert consensus emphasizes the importance of detecting the underlying mechanisms of ISR for tailored management. Coronary angiography cannot accurately evaluate neointima characteristics within stent, limiting its utility

for individualized treatment based on the underlying mechanisms and substrate of ISR. Optical coherence tomography (OCT), a high-resolution intracoronary imaging technique, can detect the underlying mechanisms and neointimal characteristics of ISR. Acute coronary syndrome as ISR presentation was associated with higher rates of major adverse cardiac events. However, the characteristics and underlying mechanisms of ISR lesions across different clinical presentations remain unclear. In this study we aimed to identify the underlying mechanisms and neointimal characteristics in ISR patients with different clinical presentations using OCT.

Methods

The study retrospectively enrolled 246 patients with ISR lesions who underwent OCT imaging detection before percutaneous coronary intervention in our center. According to clinical presentation, patients were categorized into ST-segment elevation myocardial infarction (STEMI, n=53) group, non-ST-segment elevation acute coronary syndrome (NSTE-ACS, n=110) group, and chronic coronary syndrome (CCS, n=83) group. Neointimal characteristics, the underlying mechanisms, and clinical outcomes at 2-year follow-up were compared. When multiple underlying mechanisms contributing to ISR lesions coexist within the stent, the lesion at the site of minimal lumen area is regarded as the predominant factor. Major adverse cardiac events were defined as a composite of cardiac death, target vessel related myocardial infarction and target lesion revascularization. Multivariable logistic regression was used to identify predictors for acute clinical presentations in ISR patients.

Results

Compared with NSTE-ACS and CCS patients, STEMI patients demonstrated significantly higher rates of previous myocardial infarction (P=0.003) and current smoking (P=0.001). Neoatherosclerosis, neointimal hyperplasia, malapposition, edge-related disease, stent underexpansion and recanalized thrombus are underlying mechanisms of ISR, accounting for 45.9%, 45.1%, 1.6%, 5.7%, 1.2% and 0.5%, respectively. Neoatherosclerosis was the predominant mechanisms of ISR in STEMI patients, accounting for 67.9% of cases. Among NSTE-ACS patients, 49.1% of ISR lesions were associated with neoatherosclerosis and 45.4% with neointimal hyperplasia. 65.1% of CCS patients were related to neointimal hyperplasia. Neoatherosclerosis, lipid neointima, thin-cap fibroatheroma, neointimal rupture, macrophages, thrombus and healed neointima were most frequently observed in STEMI patients, followed by the NSTE-ACS patients and CCS patients. Multivariable logistic regression identified neointimal rupture (OR: 4.438; 95% CI: 1.564-12.597; P=0.005) and macrophages (OR: 2.578; 95% CI: 1.076-6.176; P=0.034) as independent predictors of STEMI. Neointimal rupture (OR: 3.422; 95% CI: 1.066-10.991; P=0.039) was an independent predictor of acute coronary syndromes. STEMI patients (HR: 4.009; 95% CI: 1.393–11.540; P=0.010) and NSTE-ACS patients (HR: 3.406; 95% CI: 1.284–9.034; P=0.014) were associated with a higher risk of major adverse cardiac events at 2 years compared to CCS patients.

Conclusions

The underlying mechanisms and neointimal characteristics detected by OCT differ in STEMI, NSTE-ACS and CCS patients. The application of OCT could facilitate the identification of characteristics and mechanisms of ISR lesions.

基于光学相干断层扫描的冠状动脉非阻塞性心肌梗死的临床特征与预后研究

夏洁[1] 许官学[2]

1. 遵义医科大学附属医院

2. 遵义医科大学第五附属（珠海）医院

CSC 第 12 届大血管及周围血管疾病学组

[摘要]

目的: 通过光学相干断层扫描（OCT）探究 MINOCA 和 MI-CAD 患者的临床特点、斑块特征及预后。

方法: 对接受 CAG 和 OCT 检查的 553 例 AMI 患者的罪犯病变进行回顾性分析。将患者分为两组：MINOCA 组和 MI-CAD 组，对两组患者的临床特点、斑块特征和预后进行比较。主要终点被定义为主要心脏不良事件（MACE）的复合指标，包括心源性死亡、非致死性心肌梗死、靶血管再通、脑卒中以及因心绞痛或心力衰竭再次住院。

结果: 1）与 MI-CAD 患者相比，MINOCA 患者 ST 段抬高型心肌梗死（STEMI）的发生率较低，植入药物洗脱支架（DES）的频率也较低。此外，他们的低密度脂蛋白胆固醇（LDL-C）、总胆固醇（TC）、甘油三酯（TG）、肌钙蛋白 T 峰值（TnT 峰值）和肌酸激酶峰值（CK 峰值）水平均较低。MINOCA 组的病变多见于左前降支（LAD），而左回旋支（LCX）病变少见。此外，MINOCA 患者多支血管病变发生率较低，出院后使用阿司匹林、P_2Y_{12} 受体抑制剂、β- 受体阻滞剂、血管紧张素转换酶抑制剂 / 血管紧张素受体阻滞剂（ACEI/ARB）的比例较低，保守治疗的比例较高。MINOCA 组斑块破裂、斑块钙化、胆固醇结晶、巨噬细胞浸润、微血管、薄纤维帽粥样斑块（TCFA）和血栓的发生率低于 MI-CAD 组，差异具有统计学意义（P <0.05）；2）MINOCA 组和 MI-CAD 组患者 30 天和 1 年内 MACE 的发生率无明显差异（P > 0.05）。

结论: 与 MI-CAD 患者相比，MINOCA 患者的 OCT 高危斑块较少，更倾向于保守治疗，支架植入率较低，出院后药物治疗较少。两组患者在 30 天和 1 年内的 MACE 发生率相似，这凸显了对 MINOCA 患者进行个体化治疗的重要性。发生 MACE 的 MINOCA 患者更有可能表现出高风险的 OCT 斑块特征，其中巨噬细胞浸润被认为是一个独立的风险因素。斑块破裂、斑块侵蚀、胆固醇结晶、巨噬细胞、微血管、TCFA 等 OCT 斑块特征可能在两组患者的病情进展中扮演着不同的角色。

Prognostic performance of CCTA-derived coronary physiology and plaque characterization in the CAREER study

Sheng-Xian Tu[1], Zhi-Qing Wang[1,2], Yu-Wei Liu[3], Guan-Yu Li[1], Dai-Xin Ding[1], Ting-Wen Weng[2], Shao-Feng Guan[2], Xin-Kai Qu[2]

1. School of Biomedical Engineering, Shanghai Jiao Tong University

2. Huadong Hospital, Fudan University

3. School of Biomedical Engineering, Southern Medical University

BACKGROUND: Coronary computed tomography angiography (CCTA) permits noninvasive evaluation of coronary physiology and high-risk plaque with sufficient accuracy, rendering this imaging modality as a cost-effective diagnostic strategy in patients with suspected coronary artery disease. However, the appropriate criteria for safe deferral of further diagnostic testing based on CCTA-derived parameters have yet to be established.

OBJECTIVES: This substudy of the CAREER (Diagnostic Accuracy of CCTA-derived Versus AngiogRaphy-dErived QuantitativE Flow Ratio) trial sought to investigate whether computed tomography-derived Murray-law based quantitative flow ratio (CT-μFR) and plaque characteristics could safely identify patients eligible for deferral of invasive coronary angiography, with outcomes comparable to those undergoing physiology-guided revascularization.

METHODS: In the CAREER trial, patients underwent CCTA imaging and subsequent coronary angiography within 30 days and were clinically followed for up to 4 years. Artificial intelligence-powered quantitative and qualitative plaque analyses were retrospectively performed by an independent core laboratory, blinded to the on-site CT-μFR and follow-up outcome data. The primary endpoint of the substudy was the composite of revascularization within 30 days following CCTA imaging and vessel-oriented composite outcome (VOCO, including cardiac death, target vessel-related myocardial infarction, and target vessel revascularization) during up to 4-year follow-up after fraction flow reserve/quantitative flow ratio-guided revascularization.

RESULTS: Among 260 patients enrolled in the main trial, 254 patients with 723 vessels eligible for CCTA-based plaque assessment were included in the final analysis. Median patient age was 68.0 (61.0-74.0) years, 163 (64.2%) were male, and 186 (73.2%) were diagnosed with acute coronary syndrome. Revascularization within 30 days and VOCO events during follow-up occurred in 130 (51.2%) and 25 (9.8%) patients, respectively, resulting in an incidence of 53.9% (137/254) for the primary endpoint. Patient-level CT-μFR was the most powerful predictor of the primary endpoint (C-index, 0.74; 95% CI, 0.70-0.78; P < 0.001). With the optimal cutoff of ≤ 0.80, the incidence of the primary endpoint event was 87.2% (109/125) in the CT-μFR positive versus 21.7% (28/129) in the CT-μFR negative group (hazard ratio, 8.51; 95% CI, 5.54-13.07; P < 0.001). The total CT-μFR of the three vessels was also predictive of the primary endpoint (C-index, 0.73; 95% CI, 0.69-0.77; P < 0.001), with the optimal cutoff found at 2.65. The presence of both CT-μFR >0.80 and total CT-μFR >2.65 was found in 101 (39.8%) cases. The incidence of the primary endpoint in patients with both CT-μFR >0.80 and total CT-μFR >2.65 was comparable to the VOCO rate in patients following coronary physiology-guided revascularization (13.9% [14/101] vs 9.8% [25/254]; hazard ratio, 1.48; 95% CI, 0.77-2.86; P = 0.238). Among 562 deferred vessels in 242 patients, VOCO events developed in 12 (2.1%) ones. CCTA-derived plaque characteristics, in particular plaque burden (C-index, 0.74; 95% CI, 0.63-0.86; P < 0.001) and lipidic plaque volume (C-index, 0.73; 95% CI, 0.59-0.86; P < 0.001), were predictive of VOCO in deferred vessels beyond physiological parameters.

CONCLUSIONS: CT-μFR provided the highest accuracy for predicting the composite outcome of the requirement of revascularization within 3 months and VOCO during follow-up of up to 4 years. The combined use of CT-μFR >0.80 and total CT-μFR >2.65 could help to identify patients at low risk of coronary revascularization and adverse cardiac events during follow-up, potentially serving as a criterion to reduce unnecessary invasive diagnostic procedures with low pretest probability. Besides physiological parameters, CCTA-derived plaque characterization provided significant prognostic value in vessels with deferral of revascularization.

ST 段抬高型心肌梗死患者支架植入术后功能学评估的临床研究

刘强

新疆维吾尔自治区第三人民医院

研究目标

(1) 与传统冠脉功能学方法评估，该方法可以降低患者费用，可以减少国家医保

花费，节约医疗系统的开支。

基于冠脉 ICA 的无导丝功能学分析系统 AccuFFRangio 可以避免有创的 FFR 检测。其中 AccuFFRangio 是通过 ICA 影像进行计算 FFR 分析， 按照目前 91 万的冠脉支架植入量来计算，导管室造影的患者在 360 万左 右。目前有创 FFR 测量收费为 1 万 / 例。按照 360 万个冠脉造影中有一半的人来做 AccuFFRangio 服务，每台按照 3000 元 / 例来进行收费，其基于冠脉造影的 FFR 检测的市场是 108 亿人民币 / 年对应脉流科技的 AccuFFRangio 产品。全国大约有 6000 个导管室，按照每台 AccuFFRangio Plus 设备销售 200 万人民币来计算，其市场容量为 120 亿。

(2) 可以减少不必要的有创操作，从而给患者选择更优的治疗方案，降低诊断的风险，改善患者预后及就医体验。

研究方法：

通过回顾性分析 ICA 影像资料及有创 FFR 数据，将每位患者的影像数据都通过 DICOM 格式输出，采用改进的三维建模方法，得到快速生成 3D 冠状动脉模型结构的程序，进一步优化无导丝 FFR 计算时间及准确度，同时采用优化算法的 Angio-FFR 评估 STEMI 患者急性期采集影像分析和亚急性期采集影像分析的可重复性，并且计算 PCI 术后 Angio-FFR 来预测 STEMI 预后，评估术后罪犯病变和非罪犯病变功能结果的影响和 2 年随访患者水平的心脏不良事件的关系；

结果：

Angio-FFR 分析结果较大时 STEMI 患者 PCI 术后的临床结果越好，同时手术预案系统对患者进行虚拟治疗后能提供给医生治疗的方案；

结论：

Angio-FFR 在 ST 段抬高型心肌梗死患者支架植入术后功能学评估具有较好的预后结果，并且手术预案系统能提供精准的提供手术指导。

Insulin Resistance and Culprit Plaque Morphology: A Study of Young and Middle-Aged Hypertensive Patients With STEMI

Xi Chen, Shuo Zhang, Bo Yu

The 2nd Affiliated Hospital of Harbin Medical University

OBJECTIVE:

To explore the in vivo pathological mechanisms by intracoronary imaging and evaluate the association between insulin resistance and culprit plaque characteristics in high-risk young and middle-aged patients with hypertension and STEMI, with the aim of informing future mechanistic investigations.

METHODS:

This study included patients aged 18 to 65 years who were admitted to the Second Affiliated Hospital of Harbin Medical University between January 2018 and June 2018, diagnosed with hypertension combined with STEMI, who underwent coronary angiography and optical coherence tomography (OCT) imaging of the culprit vessel before percutaneous coronary intervention (PCI). Exclusion criteria included: (1) presence of malignant tumors, significant hepatic or renal dysfunction, or any condition associated with a life expectancy of less than one year; (2) secondary hypertension; and (3) missing fasting blood glucose or triglyceride data during hospitalization. (4) poor image quality due to operator-related factors or coronary anatomical variations that precluded accurate analysis; (5) presence of a large intraluminal thrombus; (6) occurrence of cardiogenic shock. The diagnosis of STEMI was based on the Fourth Universal Definition of Myocardial Infarction, which includes: (1) detection of a rise and/or fall in cardiac biomarkers, with at least one value above the 99th percentile upper reference limit (URL); and (2) clinical evidence of myocardial ischemia, demonstrated by at least one of the following: ischemic symptoms (e.g., chest pain); new ischemic electrocardiographic changes (e.g., ST-segment-T wave changes, development of pathologic Q waves); imaging evidence of new regional wall motion abnormalities or loss of viable myocardium; or identification of an intracoronary thrombus by angiography or autopsy. Height and weight at admission were obtained from the electronic medical record system. Body mass index (BMI) was calculated as weight (kg) divided by the square of height (m^2). The METS-IR index was calculated using the following formula: METS-IR = Ln[2 × FPG (mg/dL) + TG (mg/dL)] × BMI (kg/m^2) ÷ Ln[HDL-C (mg/dL)]. Plaque characteristics of OCT images were assessed using both qualitative and quantitative analyses. Based on the predominant plaque components, plaques were classified as lipid-rich plaques (LRP), fibrous plaques, or calcified plaques, as illustrated in Figure 1. A total of 229 patients were enrolled and stratified into tertiles based on the METS-IR index. Statistical analyses and figure generation were performed using SPSS version 26.0 (IBM Corp., NY, USA), R version 4.2.2, and GraphPad Prism version 10.1.1. Continuous variables with normal distribution are presented as mean ± standard deviation; those with non-normal distribution are presented as median (interquartile range). Categorical variables are expressed as frequency (percentage).

RESULTS :

Patients were stratified into three groups based on METS-IR tertiles (M1: 38.16 ≤ METS-IR ≤ 41.57; M2: 41.57 ≤ METS-IR ≤ 43.62; M3: 43.62 ≤ METS-IR ≤ 47.78). Body mass index (BMI) significantly differed among the three groups (P < 0.001). TC, TG, low-density LDL-C, fasting blood glucose (FBG), and HbA1c levels increased progressively with METS-IR, showing statistical significance (P < 0.05). OCT analysis of culprit vessels in all 229 patients was performed and compared across METS-IR tertiles. Although the overall distribution of lesion types did not show a statistically significant difference, the incidence of plaque rupture increased with higher METS-IR. Significant differences were observed in the prevalence of TCFA, LRP, fibrous cap thickness, lipid arc, macrophage infiltration, and microchannel formation (P < 0.05).

CONCLUSION:

In patients with high METS-IR, OCT image analysis revealed that culprit lesions were more likely to present with plaque rupture. Moreover, these patients showed a higher frequency of vulnerable plaque features, including lipid-rich plaques, TCFA, and the presence of microvessels, compared with those in the medium and low METS-IR groups. In addition, the fibrous cap in the high METS-IR group was significantly thinner than that observed in the medium and low METS-IR groups. In conclusion, in young and middle-aged hypertensive patients with STEMI, insulin resistance is associated with increased plaque vulnerability, suggesting that insulin resistance may contribute to the progression of atherosclerosis.

Multimodal Imaging And Functional Assessment For Etiological Diagnosis And Prognosis Improvement In MINOCA Patients

Mengyue Yu

Fuwai hospital, CAMS&PUMC

Background:

Myocardial infarction with non-obstructive coronary arteries (MINOCA) represents a clinically important and pathophysiologically heterogeneous syndrome. By definition, MINOCA is characterized by the presence of acute myocardial infarction (MI) criteria in the absence of obstructive coronary artery disease (CAD), typically defined as less than 50% stenosis on coronary angiography (CAG). Despite its non-obstructive nature, MINOCA is not a benign entity. Patients often present with typical ischemic symptoms and exhibit elevated cardiac biomarkers, yet conventional diagnostic workup frequently fails to identify a definitive cause. The diversity of underlying mechanisms—including plaque erosion or rupture undetectable on angiography, coronary spasm, microvascular dysfunction, thromboembolism, and myocarditis—makes accurate etiological diagnosis particularly challenging. This diagnostic ambiguity leads to inconsistencies in treatment approaches and contributes to variable long-term outcomes. Consequently, there is a growing clinical imperative to utilize more comprehensive diagnostic tools beyond routine CAG to elucidate the underlying causes and guide therapy in MINOCA.

Methods:

This prospective, single-center cohort study enrolled patients diagnosed with MINOCA at Fuwai Hospital after undergoing CAG. All participants met the diagnostic criteria for acute MI but were confirmed to have non-obstructive coronary arteries on angiography. Following enrollment, all patients underwent laboratory testing, invasive CAG, and angiography-based microcirculatory resistance (AMR) measurement. In addition, supplementary imaging—including cardiac magnetic resonance imaging (CMR), optical coherence tomography (OCT), intravascular ultrasound (IVUS), and single-photon emission computed tomography (SPECT)—was conducted based on clinical indications and patient consent. Intravascular imaging (OCT/IVUS) was performed during the index angiographic procedure when feasible, whereas CMR and SPECT were completed within a 6-month window surrounding the index event. Based on the integration of multimodal imaging results, working diagnoses were revised to reflect the most likely underlying mechanism, allowing for etiology-specific therapy.

Patients were followed for a median of 77.2 months to assess the occurrence of major adverse cardiovascular events (MACEs), including cardiovascular death, recurrent MI, stroke, and heart failure hospitalization. A Cox proportional hazards model was used to evaluate the association between the use of multimodal imaging and the risk of MACE, adjusting for baseline demographics and clinical variables.

Results:

A total of 1,179 patients were included in the final analysis. All patients underwent CAG and AMR measurement, while a subset received additional imaging: 124 underwent CMR, 308 underwent OCT or IVUS, and 192 underwent SPECT. Among them, 688 patients received only CAG + AMR, while 491 underwent evaluation with two or more imaging modalities. Patients in the multimodal imaging group had a significantly lower incidence of MACEs than those in the CAG + AMR-only group. After multivariable adjustment, multimodal imaging remained independently associated with a reduced risk of MACE (HR = 1.33, 95% CI: 1.09–1.92, p

<0.05), suggesting a clinically meaningful benefit.

Conclusions:

This study demonstrates that the integration of multimodal imaging with angiography-based microcirculation assessment provides a more accurate etiological diagnosis and enables more effective, individualized management strategies in patients with MINOCA. Compared to conventional CAG with AMR alone, the use of two or more imaging modalities is associated with a significantly lower long-term risk of adverse cardiovascular events. These findings underscore the potential clinical value of comprehensive imaging in improving diagnostic precision and guiding targeted therapy in this complex patient population.

IVUS 指导处理冠脉多分叉病例 1 例

张勇

西安交通大学第一附属医院

患者 72 岁老年男性，既往否认高血压、糖尿病史，长期吸烟史，2 月前开始出现活动后胸闷气短，外院造影提示多分叉病变转入我院。冠脉造影提示右冠相对正常，回旋支近端重度狭窄，狭窄从回旋支开口一直到钝缘支开口附近，前降支中段中度狭窄，第一对角支及第二对角支开口位置靠近，且血管均较大，第一对角支近端重度狭窄，狭窄长度相对局限，第二对角支弥漫性中重度狭窄累及开口，多分叉病变，左主干分叉，前降支分叉，回旋支分叉病变，解剖结构极为复杂。首先我们对第一对角支及前降支主支进行血管内超声检查，证实前降支主支管腔面积小，斑块负荷重，需进行干预，第一对角支开口负性重构，斑块负荷较轻，可不干预，然后我们对第二对角支进行 2.0mm 球囊预扩张后行血管内超声检查，证实第二对角支弥漫性病变，开口斑块负荷相对较轻，遂决定采用“三明治”术式处理分叉，但在释放第二对角支支架（2.25*32mm）时，支架向近端移位突入主支，我们行血管内超声检查证实支架近端已完全覆盖第二对角支开口但未突入主支，没有影响第一对角支，遂在导丝保护第一、第二对角支下植入前降支支架（2.75*24mm），按分叉病变处理标准流程，近端优化后分别 rewire 第一对角支和第二对角支，预扩张第二对角支网眼，然后后扩张球囊对吻，造影显示结果良好，血管内超声也证实分叉处支架膨胀良好，但发现支架近端边缘支架皱缩，且斑块负荷较重（可能撤出拘禁导丝指引导管深插所致，也可能在后期送入后扩张球囊所致），我们决定根据回旋支处理情况再对支架皱缩情况进行处理。血管内超声检查发现回旋支极度偏心斑块，斑块负荷极重，但好处是回旋支与钝缘支分叉处斑块负荷轻且钝缘支开口无明显斑块，回旋支开口斑块负荷也不重，遂使用 2.5mm 切割球囊及 2.75mm 后扩张球囊扩张病变，效果欠佳，决定于回旋支开口精确定位植入支架（2.75*18mm），但血管内超声检查发现支架近端突入左主干到前降支 1-2mm，于是决定于前降支至左主干植入支架同时处理前降支近端支架皱缩及回旋支突入主支支架梁，我们于左主干到前降支串联植入 1 枚支架（3.5*15mm），按分叉病变处理标准流程，左主干近端后分别 rewire 回旋支，预扩张回旋支网眼，然后后扩张球囊对吻，造影及血管内超声显示结果完美。分叉病变解剖结构千奇百怪，血管内超声有助于识别解剖结构，制定分叉病变处理策略。

Altered DNA methylation and transcriptome landscape for the differentiation diagnosis of plaque erosion from plaque rupture: the NBPE-ACS study

Cheng-Xing Liu, Xue-Bo Liu

Tongji hospital of Tongji University, Tongji University School of Medicine,Shanghai

Abstract

Title: A Non-Invasive Diagnostic Model Integrating Transcriptomic and DNA Methylation Signatures for Differentiating Plaque Erosion from Plaque Rupture in Acute Coronary Syndrome

Background and Aims

Acute coronary syndrome (ACS) remains a leading cause of morbidity and mortality globally. Its underlying pathological mechanisms are primarily attributed to either plaque rupture (PR) or plaque erosion (PE). While both lead to thrombotic occlusion of coronary arteries, they represent distinct pathophysiological processes demanding different therapeutic approaches. For instance, patients with PE may benefit more from antithrombotic therapies and potentially avoid aggressive revascularization strategies, whereas PR often necessitates prompt revascularization. Currently, optical coherence tomography (OCT) serves as the in vivo gold standard for distinguishing these entities. However, OCT is an invasive, costly procedure with technical expertise requirements and limited accessibility, especially in acute settings. This underscores an urgent need for a reliable, non-invasive diagnostic tool to accurately differentiate PE from PR, thereby facilitating rapid, individualized treatment decisions and improving patient outcomes. This study aimed to develop and validate a non-invasive diagnostic model by integrating transcriptomic and DNA methylation data from peripheral blood to accurately differentiate PE from PR in ACS patients.

Methods

This cross-sectional study was conducted at Tongji Hospital, Tongji University, enrolling a discovery cohort (n=77) and an independent validation cohort (n=224). OCT served as the reference standard for classifying PE and PR in all patients. Peripheral blood samples were collected and analyzed for whole-transcriptome RNA sequencing and 850K DNA methylation profiling. In the discovery cohort, principal component analysis (PCA) and differential expression analyses were used to identify key molecular features distinguishing PE from PR. Core biomarkers were selected using multiple feature selection methods. Diagnostic models based on transcriptomic, methylation, and combined features were constructed and internally cross-validated. Finally, the developed model was externally validated in the independent cohort, and key biomarkers were methodologically validated using quantitative PCR (qPCR) and pyrosequencing.

Results

Transcriptomic analysis in the discovery cohort revealed neutrophil-related pathways as key discriminators for PE. Two core transcriptomic markers, DEFA1B and AZU1, were identified. A logistic regression model incorporating these two markers achieved an excellent diagnostic performance with an AUC of 0.939 (95% CI: 0.782–1.000) in internal cross-validation.

Simultaneously, methylation profiling identified 831 differentially methylated sites, with three specific CpG loci (cg02668773, cg15610437, cg19401149) strongly associated with PE. A random forest model integrating these three CpG loci showed an AUC of 0.869 (95% CI: 0.683–1.000) under 10-fold cross-validation.

Notably, combining the transcriptomic markers (DEFA1B, AZU1) with a key methylation marker (cg15610437) further enhanced discrimination, yielding an AUC of 0.967 (95% CI: 0.818–1.000) in the discovery cohort.

Methodological validation via qPCR and pyrosequencing confirmed consistent differential expression patterns of DEFA1B and AZU1, and methylation patterns of the selected CpG loci, in the independent validation cohort (92 PE, 132 PR). Crucially, when tested in the independent validation cohort, the final logistic model demonstrated robust diagnostic utility, achieving an AUC of 0.887 (95% CI: 0.846–0.929), with favorable calibration and decision curve analyses.

Conclusions

By integrating transcriptional and methylation signatures, this study delineates key molecular features distinguishing PE from PR and provides a non-invasive model with high diagnostic accuracy. Validated in an independent cohort, this innovative approach holds significant potential to facilitate individualized treatment strategies for ACS patients, especially where OCT may be limited, thereby improving patient outcomes and optimizing resource allocation. This study offers new insights for precise diagnosis and management of ACS.

Predictors of High-risk Non-Culprit Plaque Rupture: A Serial Optical Coherence Tomography Imaging Study

Bo-Ling Yi, Si-Ning Hu, Hai-Bo Jia, Bo Yu

The 2nd Affiliated Hospital of Harbin Medical University

OBJECTIVES: Acute coronary syndrome is primarily caused by coronary thrombosis resulting from plaque rupture. However, pathological studies have shown that not all plaque ruptures lead to acute events. Up to 20% of patients with coronary heart disease had multiple plaque ruptures in non-culprit lesions. These ruptured plaques heal over time, but result in luminal narrowing and increased coronary revascularization events. Optical coherence tomography (OCT) is a high-resolution intravascular imaging modality that can accurately assess plaque morphology and composition, which can help identify more plaque ruptures. However, it is not clear the predictors of rapid progression of plaque ruptures.

METHODS: Patients with acute coronary syndrome (ACS) who underwent two OCTs at baseline and 1-year follow-up at the Second Affiliated Hospital of Harbin Medical University were included. Rapid progression was defined as a minimum lumen area reduction of greater than 0.84 mm^2 on OCT imaging from baseline to follow-up. A non-culprit plaque was identified as a region with luminal stenosis and loss of the normal architecture of the vessel wall. Macrophage accumulation was identified as the presence of highly backscattering focal granular regions within the fibrous cap. Microchannel was identified as a 50-300μm signal-poor tubular structure delineated in at least 3 contiguous frames. Cholesterol crystal was present as thin and linear regions of high signal intensity with high backscattering within a plaque. Thrombus was identified as an irregular mass floating or protruding into the lumen. Calcification was identified as a signal-poor or heterogeneous area with sharp borders. Spotty calcification was defined as the presence of lesions <4 mm in length and containing an arc of calcification <90 ° . Layered plaque was defined as a plaque with one or more heterogeneous signal-rich layers of different optical intensity with clear demarcation from the underlying components and present in 3 or more consecutive frames Statistical analyses were performed using SPSS version 25.0 software (IBM, Armonk, New York). Categorical data were expressed as counts

(proportions). Continuous variables were tested for data distribution using the Kolmogorov-Smirnov test and expressed as mean ± SD or median (25th–75th percentiles). The independent samples Student's t test or the Mann-Whitney U test were used for continuous variables, and the chi-squared test or Fisher exact test for categorical variables. Variables that showed p values <0.10 in the univariate model were simultaneously entered into the multivariate logistic regression.

RESULTS: 39 non-culprit plaque ruptures were found in 37 ACS patients, and 16 (41.0%) of the plaque ruptures in 16 patients progressed rapidly at 1 year. The mean age of all patients was 57.08±10.18 and 87.8% were male, there was no significant difference between the two groups. Patients with plaque rupture progression were more likely to be current smokers (62.5% vs. 23.8%, p=0.018) than patients without plaque rupture progression. No significant difference was observed in the prevalence of hypertension, hyperlipidemia, and diabetes between the two groups. On OCT imaging, plaque ruptures with progression had a higher prevalence of macrophages (100% vs. 78.3%, p=0.046), spotty calcification (62.5% vs. 26.1%, p=0.023), and tended to be more layered plaque (81.3% vs. 52.2%, p=0.063) than those without progression. Multivariate logistic regression analysis showed that current smoking was an independent predictor of plaque rupture with progression (OR: 5.33 [1.28-22.19], P=0.021) at the patient level, whereas spotty calcification (OR7.72 [1.19-18.68], P=0.027) was an independent predictor at the lesion level.

CONCLUSIONS: Rapid progression of silent plaque rupture is common, up to two-fifths in one year. Current smoking and spotty calcification were independent predictors of rapid progression. Further large-sample studies are needed to confirm whether early intervention is beneficial for these lesions.

径向管壁应变在冠脉临界狭窄病变生理性进展的预测价值

来晏

上海市同济医院

背景：本研究旨在探讨冠脉临界病变的生物力学参数–血管径向壁形变对其生理变化的影响；首次尝试评估两个新型生理性指标 -- 径向壁应变（RWS）和无创血流储备分数（QFR）联合应用评估斑块进展的可行性及临床价值。

方法：本研究纳入基线时至少有 1 处临界病变、在 6 个月或更长的时间接受冠状动脉造影随访的患者。计算基线时检出病变的最大 RWS (RWSmax)，分析基线及随访后的两次定量血流储备分数（QFR）并观察其值的变化。研究的主要终点是确定基线 RWSmax 与冠状动脉病变功能性进展的关系，功能进展定义为冠状动脉病变定量血流比的增加 (Lesion- △ QFR, L- △ QFR，计算为整个病变 QFR 的绝对值变化)。

结果 :156 例患者 175 处冠状动脉病变中，63 处病变在中位随访 12.4 个月时 L- △ QFR 升高。L- △ QFR 升高的病灶 RWSmax 值显著高于 L- △ QFR 稳定或下降的病灶 (12.1[9.95,13.8] 比 10.6 [9.4,11.6], P < 0.001)。基线 RWSmax 预测 L- △ QFR 升高的曲线下面积为 0.658 (95% 可信区间 :0.572 ~ 0.743, p < 0.001)。在完全校正临床和血管造影因素后，高 RWSmax(> 12%) 是功能性病变进展的独立预测因子 (比值比 :2.822,95% 可信区间 :1.369-5.816,p = 0.005)。

结论： 近 1/3 病变在 1 年的随访期间出现功能性进展，与既往研究相似，RWSmax% > 12% 是重要界值，并且是病变功能性进展的独立危险因素。基线 RWSmax 作为反映斑块结构应力的间接指标具有良好的预测中度狭窄冠脉病变进展的能力，提示其可作为判断斑块易损性的替代指标。

聚乙烯微塑料负荷与急性冠状动脉综合征中斑块易损性相关：基于 OCT 的分析

杨云潇 罗伟 王琳 崔贺贺 高海

首都医科大学附属北京安贞医院

目的：

本研究旨在评估聚乙烯微塑料（PE-MP）暴露与急性冠状动脉综合征（ACS）患者冠状动脉斑块不稳定机制之间的关联，进一步探讨微塑料负荷与易损斑块特征（如薄纤维帽粥样硬化斑块 [TCFA] 和巨噬细胞浸润 [MØI]）的关系。

方法：

前瞻性纳入 80 例接受光学相干断层扫描（OCT）评估的 ACS 患者，并采集其外周血样进行 PE-MP 含量检测。依据 OCT 结果，将罪犯斑块分为纤维帽完整（IFC）和斑块破裂（PR）两类，同时记录斑块区域是否存在 TCFA 和 MØI。利用气相色谱 - 质谱联用技术进行血中 PE-MP 定量，并比较各病理类型下微塑料水平的差异。

结果：

在 80 名患者中，平均每例患者血液中 PE-MP 含量为 63.92 μg/g，个体间差异显著，部分患者血中 PE-MP 含量超过 120 μg/g，提示存在高暴露亚群体。此外，PR 组 PE-MP 中位浓度显著高于 IFC 组（P=0.0013）；存在 TCFA 的患者中，PE-MP 水平显著升高（P<0.0001）；与无巨噬细胞浸润者相比，存在 MØI 的患者血中 PE-MP 水平显著升高（P=0.0002）。

结论：

本研究首次系统性评估了血中 PE-MP 含量与 ACS 患者斑块不稳定性之间的关系。结果显示，PE-MP 暴露水平与斑块破裂、TCFA 及 MØI 的存在密切相关。提示微塑料可能通过促进斑块不稳定化，增加急性冠脉事件发生风险。这些发现为微塑料暴露与动脉粥样硬化性心血管事件之间潜在因果关系提供了支持，也提示 PE-MP 可作为未来心血管风险评估的重要环境暴露指标。

OCT applied to explore Morphological predictors of no-reflow phenomenon after PPCI in STEMI patients

OCT applied to explore Morphological predictors of no-reflow phenomenon after PPCI in STEMI patients

Yingcan Zhang, Wei Hao, Fang Liu, Li Yin, Department of Cardiology，the 2nd Affiliated Hospital of Harbin Medical University，Harbin 150001，China

Aims： No-reflow phenomenon after PPCI in STEMI patients is associated with poor prognosis. In recent years, a large number of studies have been conducted both at home and abroad to investigate the safety and efficacy of various no-reflow prevention and treatment strategies. However, identifying subgroups of high-risk patients who can truly benefit from existing control strategies is a major clinical challenge today. The aim of this study was to explore the plaque characteristics associated with the occurrence of no-reflow phenomenon after PPCI in STEMI patients using OCT technology, to further clarify the risk factors associated with NR, and to enhance the early prediction of NR, in order to achieve accurate risk stratification of STEMI patients after PPCI.

Methods： Five hundred and ninety-nine consecutive patients who underwent emergency PCI for the treatment of STEMI within 12 hours of symptom onset were enrolled in this study, all of whom underwent OCT before stenting. A total of 206 patients who met the study design were finally included according to the inclusion criteria formulated for this study. Based on the patients' TIMI flow classification after successful stent implantation, the patients were divided into the NR group (TIMI flow grade ≤ 2) and the NF group (TIMI flow grade =3).

Results： Of the 206 patients, 130 were in the NF group and 76 in the NR group, with the incidence of NR being 36.9%. The mean age of all patients was 58.2 years, the mean BMI was 25.9 kg/m2, and the proportion of males was 79.6%. The proportion of patients with the combination of smoking, hypertension, and diabetes was 53.4%, 59.2%, and 25.7%, respectively. In both groups, there were no significant differences in patient age, gender, and coronary heart disease risk factors (including smoking, hypertension, and diabetes). Compared with the NF group, more culprit lesions were seen in the LAD in the NR group, and the difference was statistically significant (P=0.027). In terms of OCT findings, compared to the NF group, the NR group had a higher incidence of plaque rupture and calcified plaques (84.2% vs. 70.8%, P=0.030) , the values of maximal lipid arc (P<0.004), mean lipid arc (P<0.005), lipid length (P<0.001), lipid index (P<0.001), maximal rupture cavity area (P= 0.003) and rupture cavity volume (P=0.003) were significantly greater. Receiver-operating characteristic (ROC) curve analyses demonstrated that the OCT-derived lipid index had the best predictive value for no-reflow (AUC of 0.70, P<0.001).

Conclusions： A larger lipid core at the culprit lesion in STEMI patients is an important determinant of the occurrence of no-reflow after PPCI, which may be related to the large amount of lipid content flowing into the coronary arteries at the time of stent implantation, which increases local thrombosis and disturbs the distal microcirculation. Our study first confirmed that a larger rupture cavity volume at the culprit lesion of STEMI is related to the occurrence of no reflow after PPCI, which means that the size of the rupture cavity volume identified by OCT enable further risk stratification in STEMI patients.

AI-Driven Virtual Histology with Optical Coherence Tomography for Comparing Acute and Short-Trem Performance of Bioresorbable Scaffolds and Drug-Eluting Stents

Chengpeng Liu, Jiasheng Yin, Li Shen, Jun-Bo Ge

Zhongshan Hospital, Fudan University

Objectives Incomplete stent expansion is an important mechanism leading to adverse events. However, few detailed OCT studies have compared the immediate performance of bioresorbable scaffolds (BRS) and drug-eluting stents (DES). The aim of this study was to compare the acute and short-term performance differences between polymeric BRS and metallic DES, and to explore the underlying mechanisms of immediate stent underexpansion and eccentricity reduction.

Methods Our study consecutively enrolled 298 patients who underwent optical coherence tomography (OCT) pullbacks after BRS or DES implantation at Zhongshan Hospital (Shanghai, China) from January 2021 to December 2023, with 178 patients in the BRS group and 120 patients in the DES group. To mitigate confounding variables across groups, we performed propensity score matching to create 64 pairs of patients with equivalent baseline, procedural, and angiographic profiles. The Octplus system was utilized for AI-Driven virtual histology analysis, enabling automatic segmentation of vascular and plaque components. We selected the frame with the maximum plaque thickness for analysis, tracing the plaque contours to measure its cross-sectional area. Patients underwent

1-year clinical follow-up, with the primary endpoint defined as major adverse cardiac events (MACE), including death, myocardial infarction, target vessel revascularization, and stent thrombosis.

Results After PS matching, 64 pairs of patients treated with either DES or BRS were identified with comparable baseline characteristics, and no differences were noted in procedural or angiographic characteristics between the two groups. After matching, the BRS group had similar luminal and stent parameters to the DES group, with lower mean and minimum stent eccentricity indices (SEC).

Furthermore, the BRS and DES groups had similar characteristics of fibrous plaque (FP) and calcific plaque (CP). Notably, the BRS group exhibited significantly lower SEC at the plaque analysis frame for both CP and FP compared to the DES group. In the BRS group, a larger arc angle of CP was associated with lower SEC, suggesting eccentric expansion; lower SEI in CP was linked to larger area and larger arc angle. For FP in the BRS group, lower SEC correlated with larger area, greater thickness, and larger arc angle, while lower SEI was associated with larger area and larger arc angle. In the DES group, reduced SEC in CP was related to superficial location, larger area, greater thickness, and larger angle; lower SEI in CP was linked to greater thickness. Regarding FP in the DES group, no significant correlations were observed between SEC and FP characteristics, but lower SEI was associated with larger area and greater thickness. The incidence of 1-year MACE did not differ significantly between the BRS and DES groups (log-rank p = 0.685).

Conclusions The BRS appears to have comparable acute performance and reduced SEC when compared to DES. The stent expansion and eccentricity were associated with the characteristics of CP and FP. BRS and DES demonstrated similar efficacy and safety at 1-year follow-up.

This is the first large-scale detailed OCT analysis comparing the acute stent performance of BRS with DES. BVS demonstrated acute luminal and stent parameters comparable to those of DES when treating similar lesions with equivalent procedure, but exhibited lower SEC. The stent expansion and eccentricity are correlated with the characteristics of CP and FP, as well as the stent mechanical properties. BRS and DES demonstrated similar efficacy and safety at 1-year follow-up.

急性冠脉综合征患者的形态学、面积截值和无血流现象的预后：光学相干断层扫描研究。

于淮

哈医大附属第二医院

目的： 光学相干断层扫描 （OCT） 可以诊断急性冠脉综合征 （ACS） 并观察血流中断。然而，血流中断病例的病变特征和临床预后仍不清楚。

方法和结果： 急性冠脉综合征 （ACS） 是冠状动脉疾病最严重的临床表现，也是全球发病率和死亡率的主要原因。光学相干断层扫描 （OCT） 提供了有价值的血管壁信息，可以使用这些信息来优化支架植入并降低不良事件的风险。以前的研究集中在无血流现象上，指的是血管造影上的冠状动脉血流不足，这与不良的临床结果有关。在 OCT 扫描期间观察到血流中断，临床上很常见。然而，尚未系统地研究病变特征和血流中断的临床预后。因此，本研究旨在探讨 ACS 患者扫描 OCT 期间血流中断的病变特征和临床预后。此外，我们的目标是确定预测血流中断的最佳最小管腔面积 （MLA） 临界值。我们对 294 例接受 OCT 检查的血管严重狭窄患者进行了为期一年的随访。根据 OCT 扫描的远端有无血流，将患者分为无血流组 （n = 94） 或血流组 （n = 200）。在 294 名患者中，有 94 名表现出血流中断。与血流组相比，无血流组患者更有可能接受支架治疗，并且更多地接受扩张后。OCT 阻塞血液流动也会导致更多的胸痛。我们不能根据无血流组的远端 EEL 的直径来选择支架，因为无血流的远端 EEL 比有血流的远端 EEL 小。而在无血流组中，我们往往低估了病变的远端参考直径，导致更多的支架边缘夹层。预测血流中断的最佳 MLA 临界值为 1.01 mm^2（敏感性，79%；特异性，84%）。在随访年期间，36 例患者发生了 MACE。两组之间的事件发生率相当。

结论： MLA < 1.01 mm^2 可以预测血流中断，其特征是严重的管腔狭窄。血流中断不会影响 ACS 患者的短期结局。我们应该结合近端和远端参考血管直径来选择合适的支架尺寸。关键词： 光学相干断层扫描， 血流中断， 急性冠脉综合征

非罪犯血管 TCFA 斑块快速进展的的预测因素分析

于淮

哈医大附属第二医院

背景： 非罪犯血管薄帽纤维粥样硬化 （TCFA） 是急性冠状动脉患者的高危斑块特征，与不良心脏事件的风险增加相关。非罪犯病变的斑块快速进展可能导致急性心脏事件，而目前尚不清楚斑块快速进展的非罪犯 TCFA 的斑块特征和预测因子。

目的: 目前的研究旨在确定斑块快速进展的非罪犯血管 TCFA 的形态学预测因子。

方法： 选择基线手术时三支血管光学相干断层扫描 （OCT） 检查和 12 个月随访血管造影期间非罪犯血管 TCFA 的患者。评估了 OCT 上管腔狭窄和正常血管壁结构丧失的非罪犯血管病变。TCFA 的标准是 OCT 图像中的最大脂质弧 > 90°，最薄的纤维帽厚度 < 65μm。病变进展定义为基线和随访血管造影时最小管腔直径减小≥ 0.4 mm。OCT 评估非罪犯血管 TCFA 的基线形态学特征。

结果： 总体而言，在 263 例急性冠脉综合征患者中确定了 196 例非罪犯血管 TCFA; 在 12 个月的随访期间，46 例患者的 52 个病灶出现快速进展。进展组中非罪犯血管 TCFA 在基线时具有更大的最大脂质弧 （268.4±97.2° vs. 237.6±84.7°，p = 0.039），更高的脂质指数 （1695.1 [826.0-2438.9] mm° vs. 1123.7 [673.2-1840.3] mm°，p = 0.021），基线时最小纤维帽厚度更薄（45.9±14.2μm vs. 50.9±9.9μm，p = 0.020）。与无进展的非罪犯血管 TCFA 相比，在患者 （分别为 43.5% vs. 22.0%，p = 0.004 和 54.3% vs. 12.7%，p < 0.001） 和病变 （34.6% vs. 18.0%，p = 0.015 和 46.2% vs. 11.8%，分别为 p < 0.001） 水平中观察到胆固醇晶体和分层斑块的发生率更高。多变量分析确定胆固醇晶体和分层斑块是非罪犯血管 TCFA 随后快速进展的预测因子，无论患者或病变程度如何。

结论： 胆固醇晶体和分层斑块是患者和病灶水平非罪犯血管 TCFA 后续进展的预测因子。关键词：光学相干断层扫描；薄帽纤维粥样硬化；急性冠脉综合征；斑块快速进展

Influence of OCT-based Macrophage Infiltration on Periprocedural Myocardial Infarction in Patients Undergoing Elective PCI Treatment

Hao-Yi Ye[1,2], Si-Mei Cui[1,3], Ze-Jun Han[4], Xi Zhang[1,2], Qin Li[4], Lei Gao[1]

1. Senior Department of Cardiology, Sixth Medical Center of Chinese PLA General Hospital

2. Medical School of Chinese PLA

3. School of Medicine, Nankai University

4. School of Medical Technology, Beijing Institute of Technology

Background: Periprocedural myocardial infarction (PMI) following percutaneous coronary intervention (PCI) is associated with adverse outcomes. Optical coherence tomography (OCT) enables quantification of plaque macrophage infiltration (MI), a key driver of inflammation. We investigated OCT-based MI (OCT-MI) and its integration with clinical factors for predicting PCI-induced PMI.

Methods: In this prospective, single-center observational study, consecutive patients with coronary artery disease (CAD) undergoing elective PCI with pre-procedural OCT were enrolled. PMI was defined as a post-PCI cardiac troponin I (cTnI) elevation >5 times the 99th percentile upper reference limit within 48 hours. Patients were stratified into PMI and non-PMI groups. MI was analyzed at 1-mm intervals using the center of mass of the lumen as reference points. The length of MI was defined as the total length of blood vessels exhibiting macrophage signals within the image. The MI index was defined as the product of the average angle of MI and the length of MI (°·mm). Logistic regression and model comparison assessed the association between OCT-derived MI characteristics and PMI.

Results: A total of 104 patients with 116 lesions were enrolled in the study, and 38 (36.5 %) developed PMI. According to the postoperative cTnI results, 66 patients (74 target lesions) were classified into the non-PMI group, while 38 patients (42 target lesions) were categorized into the PMI group. Univariate logistic regression analysis of clinical data and laboratory results revealed that diabetes mellitus (OR: 0.309 [95% CI: 0.126, 0.757] p = 0.010) and drinking history (OR: 0.358 [95% CI: 0.150, 0.853] p = 0.020) were protective factors, whereas LDL-C (OR:1.759 [95% CI: 1.124, 2.753] p = 0.013), white blood cell count (OR:1.179 [95% CI: 1.007, 1.379] p = 0.040), and neutrophil count (OR:1.229 [95% CI: 1.020, 1.480] p = 0.030) were risk factors significantly associated with PMI. In the plaque characteristics based on OCT, it was showed that plaque rupture (OR:2.914 [95% CI: 1.249, 6.801] p = 0.013) was an independent risk factor significantly associated with PMI. Multivariable analysis identified longer MI length (OR: 1.072 [95 %CI 1.008, 1.139] p = 0.027) and higher LDL-C levels (OR: 2.010 [95 %CI 1.131, 3.573] p = 0.017) as independent predictors of PMI. Diabetes history (OR: 0.303 [95 %CI 0.107, 0.863] p = 0.025) and alcohol consumption history (OR: 0.215 [95 %CI 0.074, 0.626] p = 0.005) were protective factors, while neutrophil count (OR: 1.253 [95 %CI 1.020, 1.538] p = 0.032) was a risk factor. The model incorporating MI length (Model C, AUC = 0.807) or index (Model D, AUC = 0.813) along with clinical and other OCT features showed comparable predictive performance to the model with OCT plaque characteristics alone (Model B, AUC = 0.820). Importantly, adding MI length (Model E: AUC = 0.792) or index (Model F: AUC = 0.797) to clinical factors alone (Model A: AUC = 0.745) significantly improved prediction (NRI = 0.49 [95% CI 0.06, 0.99] and NRI = 0.52 [95% CI 0.05, 0.9], respectively).

Conclusion: This study demonstrates that OCT-quantified macrophage infiltration length is a novel and independent predictor of PMI following elective PCI, alongside established risk factors like LDL-C. Incorporating these OCT-based inflammatory metrics with clinical data significantly enhances PMI risk prediction. These findings underscore the potential of multimodal risk assessment using intracoronary imaging. Future research should focus on validating these findings in larger multicenter cohorts, refining the prediction model by incorporating systemic inflammatory biomarkers, and exploring targeted preventive strategies guided by plaque vulnerability assessment.

Predictors of Persistent Thin-Cap Fibroatheroma in Non-Culprit Plaques at One-Year Follow-Up Among Patients with Acute Coronary Syndrome

Dirui Zhang, Bo-Ling Yi, Chen Zhao, Yi-Shuo Xu, Ning Wang, Si-Ning Hu, Hai-Bo Jia, Bo Yu

The Second Affiliated Hospital of Harbin Medical University

Thin-cap fibroatheroma (TCFA), characterized by a fibrous cap thickness <65μm overlying a lipid-rich necrotic core with circumferential extension >90°, represents a critical precursor lesion for plaque rupture and subsequent major adverse cardiovascular events (MACE). Extensive validation studies have established TCFA identification by optical coherence tomography (OCT) as an independent predictor of future adverse cardiac outcomes. The advent of serial OCT imaging provides unprecedented capability for longitudinal tracking of high-risk plaque evolution in vivo. This study leveraged serial OCT to investigate clinical, biochemical, and morphological predictors associated with the persistence of TCFA morphology in non-culprit plaques over a 1-year period in patients presenting with acute coronary syndrome (ACS). A retrospective cohort analysis was conducted on consecutive ACS patients who underwent comprehensive OCT imaging of non-culprit vessels during index percutaneous coronary intervention (PCI) and repeated OCT assessment at 12±3 months follow-up between September 2013 and August 2022 at a tertiary cardiac center. A total of 406 patients with ACS and 1,054 non-culprit plaques met the inclusion criteria, with a median follow-up duration of 369 days.

At the patient level, patients with persistent TCFA at follow-up (n=66, 16.3%) demonstrated significantly worse metabolic profiles at baseline compared to those without persistent TCFA (340, 83.7%). Those with persistent TCFA exhibited significantly higher baseline glycosylated hemoglobin (6.9% [5.8–7.8] vs. 6.0% [5.6–6.6], P=0.011), total cholesterol (138.8 mg/dL [120.6–182.0] vs. 131.8 mg/dL [114.3–160.6], P=0.038), apolipoprotein B (84.0 mg/dL [65.0–96.0] vs. 70.0 mg/dL [59.0–89.0], P=0.002), LDL-C (43.6 mg/dL [37.4–50.2] vs. 39.8 mg/dL [35.1–48.1], P<0.001), and creatinine (81.0 μmol/L [73.0–96.0] vs. 78.0 μmol/L [69.0–90.8], P=0.041), and lower HDL-C (39.7 mg/dL [35.1–48.1] vs. 43.6 mg/dL [37.4–50.2], P<0.001). Multivariate analysis identified male sex (OR: 5.094, 95% CI: 1.004–15.598), hypertension (OR: 1.800, 95% CI: 1.013–3.196), and diabetes (OR: 2.472, 95% CI: 1.397–4.372) as independent predictors.

At the plaque level, plaques retaining TCFA morphology at follow-up (n=79, 7.5%) exhibited adverse morphological features at baseline compared to those that regressed or stabilized. Persistent TCFA was associated with longer lesion length (15.5 mm [10.4–21.0] vs. 11.3 mm [8.3–15.4], P<0.001), smaller mean lumen area (6.0 mm^2 [4.5–7.9] vs. 6.9 mm^2 [5.3–8.7], P=0.002), and greater stenosis (48.6% [39.3–60.1] vs. 45.3% [35.5–57.1], P=0.047) at baseline. Macrophage presence (OR: 6.511, 95% CI: 1.978–21.439), non-culprit plaque rupture (OR: 3.849, 95% CI: 2.158–6.868), and left anterior descending artery location (OR: 2.179, 95% CI: 1.201–3.955) independently predicted persistent TCFA.

This serial OCT analysis demonstrates that persistent TCFA in non-culprit plaques—a marker of sustained high-risk plaque biology—is significantly influenced by both systemic and local factors. Systemic drivers include male sex, hypertension, diabetes mellitus, and inadequately controlled dyslipidemia (reflected by elevated Apo B and reduced HDL-C), underscoring the critical importance of aggressive secondary prevention targeting these modifiable risk factors. Locally, plaques harboring features of active inflammation (macrophages), structural vulnerability (pre-rupture), or residing in high-shear stress locations (LAD) exhibit inherent biological resistance to regression. These findings highlight the necessity for a dual-pronged therapeutic approach: intensive systemic risk factor modification combined with emerging plaque-targeted therapies (e.g., lipid-lowering beyond LDL-C goals, anti-inflammatory agents) specifically directed towards high-risk non-culprit plaques exhibiting these adverse morphological signatures. Serial OCT surveillance may thus play a future role in guiding personalized secondary prevention strategies in high-risk ACS cohorts.

IVUS 指导 PCI 对中国≥ 65 岁冠心病患者的成本效果：更低成本与更优效用的马尔科夫模型研究

桑海强 姜晓影

郑州大学第一附属医院

目的：本研究旨在评估血管内超声（IVUS）与冠状动脉造影（CAG）指导的经皮冠状动脉介入治疗（PCI）在中国医疗体系中的成本效果，探讨其在 65 岁以上冠心病患者中的经济学价值。

方法：本研究采用马尔可夫模型，模拟了一个包含 10,000 名 65 岁以上冠心病患者的队列，模拟年限为 35 年。研究从患者角度出发，比较 IVUS 指导（IVUS 组）与传统造影指导（CAG 组）的治疗策略。模型参数整合了 ULTIMATE 试验的 3 年随访数据、中国医保收费目录（2025 年）及中国人群健康效用值，采用 5% 贴现率进行终身成本效用分析。主要结局指标为增量成本效果比（ICER）。

结果：研究结果显示，IVUS 组的总成本为 83,084 元，获得的质量调整生命年（QALYs）为 9.02，而 CAG 组的总成本为 85,757 元，获得的 QALYs 为 8.55。IVUS 组较 CAG 组节省成本 2,673 元，增量效用为 0.47 QALYs，ICER 为 -5,657.60 元 /QALY，表明 IVUS 不仅降低了治疗成本，还显著提高了患者的生活质量。此外，IVUS 显著降低了靶血管血运重建率和支架内血栓率。

结论：在中国医疗定价体系下，IVUS 指导的 PCI 对 65 岁以上冠心病患者具有显著的成本节约效果，尤其在降低再次血运重建（TVR）和支架内血栓方面表现突出。本研究为未来的经济学评价提供了依据，展现了其在优化医疗资源配置和改善患者长期预后方面的潜在价值。

The impact of optical coherence tomography guidance on treatment strategy and angiographic outcome in treating in-stent restenosis compared with angiography

Yan Zuo, Xian-Qin Ma, Sen-Qing Jiang, Bo Yu

The 2nd Affiliated Hospital of Harbin Medical University

Background and purpose

The percutaneous coronary intervention of in stent restenosis (ISR) is associated with worse outcomes than the revascularization of de novo lesions. OCT (Optical Coherence Tomography) is capable of accurately identifying the composition of vascular plaque with a high-resolution before stent implantation. OCT can not only optimize surgery by immediately detecting stent complications after stenting, but also accurately analyze the causes of ISR to guide treatment and has been recommended in clinical guideline. Though, there are still limited studies on the application of OCT in guiding the diagnosis and treatment of ISR. The purpose of this study is to investigate whether OCT guidance optimizes the treatment strategy and provides better angiographic outcome than angiography guidance alone in treating ISR.

Methods

In this study, patients who presented as acute coronary syndrome and treated with drug-eluting stents or drug-coated ballons from 2017 through 2020 were retrospectively included and finished 1 year angiographic follow up. Patients were stratified into OCT guidance and angiography guidance group. Patients with chronic total occlusion, chronic kidney disease and had coronary artery bypass surgery were excluded. The index included: baseline and procedure characteristics at patient and lesion levels, quantitative coronary angiographic (QCA) data at post-procedure, including in lesion and in segment minimal lumen diameter (MLD), percent diameter stenosis (DS%), acute gain and at 1-year follow-up, including in lesion and segment MLD, DS% and late luminal loss (LLL). Acute gain was defined as post-procedural lumen diameter minus baseline lumen diameter and LLL was post-procedure lumen diameter minus target vessel diameter at follow up.

Results

Totally, 154 ISR patients and 167 ISR lesions were included in this study, 57.8% were treated with OCT guidance and 42.2% were treated with angiography guidance. The OCT guidance group had more patients with previous myocardial infarction, while the angiography group had more patients with diabetes and current smokers. The laboratory dates had no statistical difference between those two groups. In procedure strategy of patients, the OCT guidance group was inclined to use drug coated ballons (DCB) (61.9%), the drug eluting stents (DES) (60.0%) are more common under angiography guidance. At 1 year follow up, the in lesion LLL [0.09 (-0.09-0.44) mm vs. 0.33 (0.05-0.78) mm, P=0.003] was significantly lower in OCT guidance group than angiography guidance group, the same as shown in segment LLL [0.09(-0.13-0.47) mm vs. 0.37(0.04-0.64) mm, P=0.006], the MLD [2.14(1.90-2.52) mm vs. 1.75(1.37-2.11) mm, P<0.001] and [2.07(1.71-2.40) mm vs. 1.66(1.34-2.09) mm, P<0.001] was also larger in both lesion and segment under OCT guidance. Besides, OCT group showed lower DS% [16(11-26) % vs. 35(22-51) %, P<0.001] and [20(13-31) % vs. 36(28-52) %, P<0.001] in lesion and segment. The in lesion and segment acute gain [1.45 (1.22-1.79) mm vs. 1.17 (0.95-1.65) mm, P=0.004]/ (1.37±0.47mm vs. 1.22±0.40mm, P=0.029) at post procedure was larger under OCT guidance. Moreover, both in lesion and segment MLD [2.33(2.09-2.70) mm vs. 2.06(1.85-2.48) mm, P=0.001]/ (2.23±0.39mm vs. 2.08±0.40mm, P=0.015) and DS% [13(9-18) % vs. 20(13-26) %, P<0.001]/ [15(11-22) % vs. 20(14-28) %, P=0.001] were better under OCT guidance than angiography guidance at post procedure.

Conclusions

Of ACS patients with in-stent restenosis , OCT guidance treatment strategy showed larger acute gain at post-procedure and lower LLL at 1 year than angiography guidance. Besides, OCT shows advantage of optimizing the treatment strategy in ISR patients. OCT guidance might provide superior immediate and long-term angiography outcome than angiography guided only.

支架内新生动脉粥样硬化中薄帽纤维粥样斑块的危险因素及预后分析：一项基于光学相干断层扫描的观察性研究

崔思美 [1,2] 叶豪奕 [1,3] 胡鑫 [4] 袁晓航 [1,3] 韩燕 [1,3] 高磊 [1]

1. 中国人民解放军总医院第六医学中心

2. 南开大学医学院

3. 中国人民解放军医学院

4. 中国人民解放军总医院第一医学中心心内科

目的 支架内新生动脉粥样硬化（In-stent neoatherosclerosis，ISNA）是支架植入术后晚期或极晚期发生支架内再狭窄的主要机制，而薄纤维帽粥样斑块（Thin-cap fibroatheroma，TCFA）是 ISNA 重要的易损斑块特征之一。本研究目的为评估 ISNA-TCFA 病变的特点及其发生的预测因素。

方法 回顾性纳入 2010 年 1 月至 2022 年 3 月期间于中国人民解放军总医院就诊并接受光学相干断层扫描（Optical coherence tomography，OCT）检查的 175 例患者（共 194 处病变）作为研究对象。根据 OCT 观测结果分为 TCFA（-）（101 例患者、115 处病变）和 TCFA（+）（74 例患者、79 处病变）两组，比较两组的临床基线资料、冠状动脉造影特征及 OCT 数据。

结果 175 例患者中，男性 149 例，平均年龄（62.85±10.08）岁。多因素 Logistic 回归分析显示，左前降支病变是 ISNA-TCFA 的独立预测因素（OR=2.668，95%CI：1.049~6.781，P=0.039）。随访结果提示 TCFA（+）与心肌梗死事件显著相关。

结论 ISNA-TCFA 病变好发于左前降支，且此类病变显著增加心肌梗死发生风险。

OCT 指导 PCI 对中国≥ 65 岁冠心病患者的成本效果：基于马尔科夫模型的研究

桑海强 姜晓影

郑州大学第一附属医院

目的：本研究旨在评估光学相干断层扫描（OCT）与冠状动脉造影（CAG）指导的经皮冠状动脉介入治疗（PCI）在中国医疗体系中的成本效果，探讨其在 65 岁以上冠心病患者中的经济学价值。

方法：本研究采用马尔科夫模型，模拟了一个包含 10,000 名 65 岁以上冠心病患者的队列，模拟年限为 35 年。研究从患者角度出发，比较 OCT 指导（OCT 组）与传统造影指导（CAG 组）的治疗策略。模型参数整合了 ILUMIEN IV 试验的 2 年随访数据、中国医保收费目录（2025 年）及中国人群健康效用值，采用 5% 贴现率进行终身成本效用分析。主要结局指标为增量成本效果比（ICER）。

结果：研究结果显示，OCT 组的人均总成本为 94,766 元，获得的质量调整生命年（QALYs）为 8.58，而 CAG 组的人均总成本为 85,258 元，获得的 QALYs 为 8.45。OCT 组较 CAG 组增加成本 9,508 元，增量效用为 0.13 QALYs，ICER 为 71,864.55 元 /QALY，低于 2024 年我国人均 GDP（93,358 元），表明 OCT 在经济上是可接受的，能够有效改善健康结果。

结论：在中国医疗定价体系下，OCT 指导的 PCI 对 65 岁以上冠心病患者具有较高的经济学价值，虽然其成本较传统 CAG 指导更高，但通过更精准的支架植入和更低的并发症风险，显著提升了患者的长期生存质量和临床预后。基于其优异的成本 - 效益比（ICER 低于人均 GDP 阈值），该技术尤其适用于高风险病变患者，具有重要的临床推广价值。

Progression and Regression of Non-culprit Plaques Assessed by Serial Optical Coherence Tomography Imaging

Di-Rui Zhang, Bo-Ling Yi, Chen Zhao, Yi-Shuo Xu, Ming Zeng, Ning Wang, Si-Ning Hu, Hai-Bo Jia, Bo Yu

The Second Affiliated Hospital of Harbin Medical University

Background: Patients with acute coronary syndromes (ACS) face a high risk of subsequent cardiovascular events, largely originating from untreated non-culprit atherosclerotic plaques, which may rapidly progress to a high-risk status despite not meeting high-risk criteria at baseline. However, individual lesion responses exhibit substantial heterogeneity. This study aims to characterize the morphological and biochemical differences between non-culprit plaques exhibiting progression versus regression in ACS patients, using serial optical coherence tomography (OCT) imaging.

Methods: A retrospective analysis was conducted on 583 ACS patients from the Second Affiliated Hospital of Harbin Medical University between September 2013 and August 2022. After exclusions (e.g., poor image quality or missing data), 406 patients with serial OCT imaging at baseline and 1-year follow-up (9–15 months) were included, yielding 1,054 non-culprit plaques. Inclusion criteria comprised a primary ACS diagnosis (ST-segment elevation myocardial infarction [STEMI] or non-ST-segment elevation acute coronary syndromes) and de novo non-culprit plaques. OCT imaging was performed using a C7-XR/ILUMIEN system (Abbott Vascular), with analysis by independent, blinded investigators at a core lab. Plaques were classified by composition: lipid-rich plaques (LRP, maximal lipid arc >90 °), fibrous plaques, and calcified plaques (maximal calcium arc >90 °). LRP was subcategorized by fibrous cap thickness (FCT) into thin-cap fibroatheroma (TCFA, FCT <65 μm) or thick-cap fibroatheroma (ThCFA, FCT ≥ 65 μm). Patients were stratified into groups based on plaque behavior: Progression Group (at least one plaque progressing from non-TCFA at baseline to TCFA at follow-up), Regression Group (at least one plaque regressing from TCFA at baseline to non-TCFA at follow-up), and No-change Group. Statistical analyses included Shapiro-Wilk tests for normality, ANOVA or Kruskal-Wallis tests for continuous variables, chi-square or Fisher's exact tests for categorical variables, and generalized estimating equations (GEE) for serial measurements (accounting for clustered data with plaque or patient identity as random effects). Significance was defined as a two-sided P value <0.05, using SPSS 27.0. The study adhered to the Declaration of Helsinki and was approved by the institutional ethics committee, with informed consent obtained.

Results: Among 406 patients (mean age 54.7 ± 10.7 years; 81.3% male), plaque evolution analysis revealed that 11.2% of non-culprit plaques (n = 118 plaques, affecting 96 patients, 23.6%) exhibited regression (from TCFA at baseline to non-TCFA at follow-up), predominantly converting to ThCFA (92.4%) or fibrous plaques (7.6%). Conversely, 1.0% of plaques (n = 11 plaques, affecting 10 patients, 2.5%) showed progression (from non-TCFA to TCFA), all originating from ThCFA at baseline. Baseline characteristics indicated that the Progression Group (n = 10) was significantly older (64.4 ± 7.5 years vs. 53.1 ± 10.3 years in Regression Group and 54.9 ± 10.7 years in No-change Group; P = 0.005) and had a higher prevalence of diabetes mellitus (80% vs. 34.4% and 25%; P < 0.001). Culprit lesions in this group less frequently involved the left anterior descending artery (20.0% vs. 56.3% and 51.0%; P = 0.004) and favored the left circumflex artery (50.0% vs. 10.4% and 11.0%). OCT quantitative changes demonstrated significant FCT thinning in the Progression Group (geometric mean ratio [GMR] = 0.6, from 100.0 [90.0, 105.5] μm to 60.0 [55.0, 60.0] μm) versus substantial FCT thickening in the Regression Group (GMR = 2.2, from 60.0 [53.3, 63.3] μm to 120.0 [100.0, 163.3] μm; difference in change: 3.7-fold, 95% CI: 3.2–4.3; P < 0.001). Lipid arc expansion occurred in progression (mean lipid arc GMR = 1.1, max lipid arc GMR = 1.2), while regression showed reduction (mean lipid arc GMR = 0.8, max lipid arc GMR = 0.8; difference in GMR = 0.7–0.8; P < 0.001). Layered plaque prevalence increased by 17% in regression (odds ratio [OR] = 0.2, 95% CI: 0.1–0.4; P < 0.001), and calcium incidence rose significantly (9% increase; OR = 0.5, 95% CI: 0.3–1.0; P = 0.043). Lumen dimensions decreased in both groups (e.g., minimum lumen area declined), but changes were similar (P > 0.05).

Biochemical parameters at patient level revealed that the Regression Group (n = 96) had significantly greater reductions in apolipoprotein B (ApoB) (GMR = 0.7 vs. 0.8 in Progression Group; difference = 0.8, 95% CI: 0.7–1.0; P = 0.044), total cholesterol (TC) (GMR = 0.7 vs. 0.8; difference = 0.8, 95% CI: 0.7–1.0; P = 0.015), and low-density lipoprotein cholesterol (LDL-C) (GMR = 0.6 vs. 0.8; difference = 0.7, 95% CI: 0.6–0.9; P < 0.001). No significant changes occurred in high-sensitivity C-reactive protein, triglycerides, high-density lipoprotein cholesterol, glycated hemoglobin, or creatinine (all P > 0.05). Correlation analyses showed that percentage change in mean lipid arc was positively associated with percentage changes in TC (r = 0.211; P = 0.027), ApoB (r = 0.223; P = 0.033), and LDL-C (r = 0.227; P = 0.017), but minimal FCT change did not correlate with these biomarkers.

Conclusions: Non-culprit plaque regression in ACS patients is associated with microstructural stabilization, characterized by enhanced layered architecture and calcium deposition without increased vulnerability markers, alongside significant reductions in atherogenic lipids (ApoB, TC, and LDL-C). Conversely, progression involves FCT thinning and lipid arc expansion, driven by baseline ThCFA. These findings highlight the importance of intensive lipid management and OCT monitoring for personalized risk stratification in ACS survivors. The study underscores that plaque stabilization may reduce future cardiovascular events, informing secondary prevention strategies.

A Specific Subset of proinflammatory Low-Density Neutrophils Aggravates Endothelial Denudation via NET-Mediated ANXA1 Sequestration: Implications for Plaque Erosion

Cheng-Xing Liu, Xue-Bo Liu

Tongji Hospital of Tongji University, Tongji University School of Medicine, Shanghai,

Abstract

Background: Acute Coronary Syndrome (ACS) is a leading cause of global morbidity and mortality. Plaque Erosion (PE), a distinct pathological entity from Plaque Rupture (PR), accounts for a significant proportion (25-40%) of ACS cases, particularly with the widespread use of statin therapy. Neutrophils and neutrophil-mediated endothelial denudation are critically implicated in the thrombotic complications of PE. However, neutrophils are a heterogeneous population, and the precise role of specific subsets, such as Low-Density Neutrophils (LDNs), in the pathogenesis of PE remains largely undefined. This knowledge gap underscores the need to identify and characterize the specific neutrophil populations driving PE.

Methods: This study prospectively enrolled patients with ACS due to PE (PE-ACS) or PR (PR-ACS), verified by Optical Coherence Tomography (OCT). Peripheral blood mononuclear cells (PBMCs) from these patients were analyzed using single-cell RNA sequencing (scRNA-seq) to identify differential LDN populations. LDN quantification and phenotypic analysis were performed by flow cytometry in an independent cohort comprising PE-ACS, PR-ACS patients, and healthy controls (HC). Endothelial microvesicles (EMVs) and OCT-derived thrombus burden were correlated with LDN counts. Sorted LDNs and normal-density neutrophils (NDNs) underwent 4D-Data Independent Acquisition (DIA) quantitative proteomics and micro-transcriptome sequencing for comprehensive expression

profiling. Phenotypic (CD10, CD62L, CD49d) and functional assays (chemotaxis, adhesion, NETosis via Sytox Green and citrullinated histone H3) were conducted. An ApoE knockout mouse model of PE, established by left common carotid artery (LCCA) electrocautery combined with a constrictive cuff, was utilized for in vivo mechanistic investigations. These included chemokine analysis (Luminex), assessment of the therapeutic potential of a CXCR2 inhibitor (AZD-5069), and adoptive transfer experiments with murine PE LDNs (with or without the NET inhibitor GSK484). In vitro co-culture experiments using human aortic endothelial cells (HAECs) and human PE LDNs (with or without GSK484) were performed to assess endothelial injury. The impact of PE LDN-derived Neutrophil Extracellular Traps (NETs) on endothelial membrane repair was investigated using FM4-64FX assays, and the specific mechanism involving Annexin A1 (ANXA1) "wrapping" by NETs was explored, along with rescue experiments using an ANXA1 mimetic peptide.

Results: PE LDNs were found to be significantly expanded in PE-ACS patients compared to PR-ACS patients and HC. Their absolute numbers demonstrated a strong positive correlation with PE endothelial denudation, as measured by EMVs (r^2=0.4346, p<0.0001), and with culprit lesion thrombus burden (r^2=0.6885, p^-) cells, heightened activation status enhanced chemotactic and adhesive capacities, and a markedly augmented NET release upon stimulation when compared to PE NDNs and PR LDNs. The mouse model of PE recapitulated key features observed in humans, including LDN expansion and increased NET release. Elevated levels of CXCL1 and CXCL2 chemokines were detected at the site of injury, and PE LDNs displayed high expression of the chemokine receptor CXCR2, implicating the CXCL1/2-CXCR2 axis in their recruitment. Pharmacological inhibition of CXCR2 with AZD-5069 significantly ameliorated PE phenotypes in the mouse model. Adoptive transfer of murine PE LDNs exacerbated PE, an effect mediated by NETs, as pre-treatment with GSK484 attenuated these detrimental outcomes. Similarly, human PE LDNs induced HAEC apoptosis and detachment via NET release in vitro. Mechanistically, PE LDN NETs were found to impair ANXA1-mediated endothelial membrane repair by "wrapping" ANXA1. This deleterious effect was partially reversed by an ANXA1 mimetic peptide, which also led to a reduction in thrombus formation in vivo.

Conclusions: PE LDNs constitute a distinct, expanded, and highly pro-inflammatory neutrophil subset that plays a critical pathogenic role in PE-ACS. These cells are recruited to the site of erosion via the CXCL1/2-CXCR2 axis and contribute to disease progression by releasing excessive NETs. These NETs, in turn, impair ANXA1-mediated endothelial membrane repair, leading to endothelial denudation and thrombosis. These findings identify PE LDNs and their effector mechanisms as potential therapeutic targets for PE.

肿瘤心脏病学有关研究

基于时间阈值的血液肿瘤患者心脏毒性动态监测研究

张铭旋

浙江大学医学院附属邵逸夫医院

背景

肿瘤治疗相关心功能损伤的早期预警亟需量化时间效应与方案特异性。本研究纳入 43 例接受化疗药物治疗的血液肿瘤患者（淋巴瘤 58.1%、骨髓瘤 27.9%、白血病 14.0%），通过系统分析探索亚临床心功能演变规律。

方法

采用治疗前后配对设计，核心监测指标包括 GLS、右室应变、左房应变、EF、平均 E/E' 及心肌做功指数。统计分析采用 Wilcoxon 配对检验评估心功能变化（效应量 Cliff's delta），Spearman 相关性检验时间间隔效应，并通过诊断分组进行亚组分析，所有 p 值经 Holm-Bonferroni 多重校正。

结果

整体分析显示 GLS 绝对值显著恶化（中位下降 0.5%，p=0.028），右室应变绝对值明显降低（中位下降 1.3%，p=0.009），同时左房应变呈现代偿性增强（中位上升 0.7%，p=0.038），而 EF 与 E/E' 未发生显著改变。

时间效应分析揭示关键规律：治疗间隔超过 2 个月的患者 GLS 恶化率达 73.7%，较≤ 2 个月组（41.7%）风险增加 2.92 倍（OR=3.92, 95%CI:1.24-12.41）；且治疗时间每延长 1 个月，GLS 恶化加速 0.16%（ρ=-0.41, p=0.003），右室损伤同步加重（ρ=-0.44, p=0.001）。

诊断分组显示差异化代偿模式：淋巴瘤患者 GLS 恶化率最高（68.0%）但 EF 维持稳定，骨髓瘤患者通过左房应变代偿激活（p=0.019），白血病患者则出现心肌效率显著下降（p=0.047）。

结论

本研究发现 2 个月为心功能损伤的关键时间阈值。GLS 及右室应变在监测化疗患者心功能变化中最明显，左房应变常呈代偿性增高。淋巴瘤患者优先追踪 GLS 变化，骨髓瘤患者重点评估左房

临床意义

本研究发现每延长 1 月治疗 GLS 恶化 0.16% 的线性规律，并揭示了骨髓瘤左房代偿的保护机制，推动肿瘤治疗时心功能监测策略的精准化革新。

Cardiovascular adverse events in Non-Small Cell Lung Cancer patients receiving osimertinib monotherapy and combination therapy: A systematic review and meta-analysis

WEIHE LIU[1], ZHENJIE AN[2], JIAN CHEN[2], JIN KANG[3], NING TAN[2], LEI JIANG*[2]

1. The First Affiliated Hospital of Harbin Medical University

2. Department of Cardiology, Guangdong Cardiovascular Institute, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences, Guangzhou

3. Guangdong Lung Cancer Institute, Guangdong Provincial People's Hospital

Objective: Third-generation osimertinib is recommended as a first-line treatment for significant results in patients with non-small cell lung cancer(NSCLC) with epidermal growth factor receptor (EGFR) mutations. However, prolonged EGFR inhibition has raised concerns about potential cardiotoxicity. Therefore, we conducted a single-group meta-analysis to simultaneously assess the associations between osimertinib treatment (monotherapy or combination) and cardiovascular outcomes in clinical trials and observational studies.

Methods: PubMed, Embase, Cochrane Library, and ClinicalTrials.gov were searched from inception to Jan 15, 2025. Based on PICOS (participants, interventions, comparisons, outcomes, and study design) guidelines, the Medical Subject Headings (MeSH) terms and their entry terms were: "Osimertinib", "TKI", "tyrosine kinase inhibitor", "EGFR", "epidermal growth factor receptor", "carcinoma, non small cell lung", "NSCLC", "cardiac toxicities", "cardiotoxicity", "adverse events". The search was also restricted to articles published in English. Studies considered eligible were interventional studies or observational cohort studies enrolling participants with EGFR-mutated NSCLC who received osimertinib monotherapy or combination therapy with at least one of the cardiovascular adverse events (CVAEs). All grades and grades ≥ 3 CVAEs were collected. The primary outcome was CVAEs regardless of cause, while the secondary outcome was osimertinib treatment-related CVAEs (all-grade and grade ≥ 3). Then, we calculated adverse cardiac event rates to estimate cardiotoxicity with osimertinib. A meta-analysis of the rate was conducted using the Freeman-Tukey double-arcsine transformation model. Subgroup analyses were performed to explore potential sources of heterogeneity based on types of treatment. For specific CVAEs(QTc prolongation, VTE, 3-point MACE, Cardiac arrhythmias), "previous EGFR treated", "race", and "lines of treatment" were also served as the hierarchical subgrouping variables.

Results: 9914 patients from 58 studies were included in this study. Treatment strategies included osimertinib monotherapy and combination regimens, such as MET-TKIs, anti-VEGF therapy, platinum-pemetrexed chemotherapy, other EGFR-TKIs, and immune checkpoint inhibitors. In patients with NSCLC receiving osimertinib-based therapies, the most frequent CVAEs, regardless of cause, were QT interval prolongation, pulmonary embolism(PE), venous thromboembolism (VTE), 3-point major adverse cardiovascular events (MACE), decreased left ventricular ejection fraction (LVEF), and hypertension. The pooled prevalence of hypertension was 15.94% (95% CI 9.61% to 23.39%, 27 studies, 2979 participants) for all grades and 5.86% (95% CI 2.28% to 10.67%, 13 studies, 1280 participants) for grade ≥ 3. The incidence of hypertension was significantly higher in combination with anti-VEGF therapy than monotherapy(all-grade: 43.61% versus 4.49%, grade ≥ 3:12.32% versus 1.32%). By contrast, the combination of osimertinib and MET-TKI exhibited lower rates of LVEF reduction (0.78% vs. 11.84%) and hypertension (7.14% vs. 43.61%) compared to anti-VEGF regimens, indicating a relatively favorable cardiac safety profile for MET inhibitors. Notably, the osimertinib and MET-TKI combination was associated with a higher incidence of venous thromboembolism (VTE) (all-grade: 8.47% vs. 4.00%) and deep vein thrombosis (all-grade: 6.40% vs. 4.00%) compared to anti-VEGF combination therapies. This difference may be attributed to the unique thromboembolic risks linked to MET inhibition. Additionally, patients treated with osimertinib plus platinum-pemetrexed chemotherapy showed significantly higher incidences of QT prolongation and LVEF decline versus other therapies, with no significant differences detected in other cardiovascular events. The incidence of hypertension related to osimertinib was also significantly higher in combination with anti-VEGF treatment than monotherapy(all-grade: 40.90% versus 1.30%, grade ≥ 3:17.67% versus 1.30%), consistent with the result regardless of cause.

Conclusion: This study indicates that osimertinib combination treatments are associated with an increased incidence of cardiac adverse events compared to monotherapy. Compared with other combination treatments, MET-TKI combination regimens exhibit comparatively favorable cardiac safety while presenting an increased risk of thromboembolic events. Randomized clinical trials with long-term follow-up are warranted to validate the findings and benefits.

Alox5 通过 P53/SLC7A11 通路抑制铁死亡改善阿霉素心肌病

方文熙

武汉大学人民医院（湖北省人民医院）

摘要

目的　阿霉素（DOX）是一种用于肿瘤治疗的蒽环类化疗药物。由于 DOX 诱导的心脏毒性（DIC），其临床应用受到广泛限制。研究表明，铁死亡与 DIC 的发病机制有关，脂质过氧化作为铁死亡的重要病理生理。脂氧合酶作为脂质过氧化 3 种关键酶之一，Alox5 参与 ROS 的产生。然而，Alox5 在 DIC 中的致病作用尚不清楚，本研究的目的是探讨 Alox5 在 DIC 中的作用。

方法　利用阿霉素构建小鼠的心肌病模型和原代大鼠心肌细胞模型。分别利用腺相关病毒和腺病毒在体内与体外过表达 Alox5，并在随后的实验中体内与体外实验分别应用铁死亡抑制剂 dexrazoxane，进行全身基因小鼠敲除 Alox5 和小干扰 RNA 在原代大鼠心肌细胞中敲低 Alox5。定期检测小鼠超声心动图、血流动力学、形态学染色和心肌损伤标记物。造模结束后在体内与体外实验进一步用分子生物学实验和形态学染色检测其铁死亡相关指标。并对其进行转录组测序进一步验证表型和机制，最后用分子生物学实验和形态学染色对其机制进一步正向和反向验证。

结果　在体和离体实验显示 Alox5 在 DIC 中表达显著上调。过表达 Alox5 从心功能学、血流动力学、形态学染色、心肌损伤标记物和生存分析曲线中发现到加剧 DIC。与上述过表达检测指标一致发现到敲低 Alox5 改善 DIC。接下来，对其转录组测序发现到，敲低 Alox5 在 DIC 中改善铁死亡与炎症，并通过形态学染色与分子生物学实验进一步证实。接下来发现到铁死亡抑制剂 dexrazoxane 从心功能学、血流动力学、形态学染色、心肌损伤标记物和生存分析曲线中发现到能够改善由过表达 Alox5 加剧的 DIC。最终通过前面转录组学预测的 Alox5 可能通过 P53/SLC7A11 通路抑制铁死亡改善 DIC，并通过形态学染色与分子生物学实验进一步证实。

结论　Alox5 通过 P53/SLC7A11 通路抑制铁死亡改善 DIC。

Exploration of the role and mechanism of dulaglutide in doxorubicin-induced cardiomyopathy

null null

Renmin Hospital of Wuhan University

Abstract

Objective: Doxorubicin (DOX) is an anthracycline chemotherapy drug used for tumor treatment. Due to DOX-induced cardiotoxicity (DIC), its clinical application is widely limited. Although several antioxidants such as vitamin E and N-acetylcysteine are known to alleviate DOX-induced myocardial injury, their therapeutic effects are still unsatisfactory. Dulaglutide, as a new hypoglycemic drug, is a long-acting glucagon like peptide receptor (GLP-1R) agonist, mainly used for the treatment of type 2 diabetes. In recent years, clinical studies have found that it can benefit patients with heart failure. Previous studies have shown that dulaglu-

tide is related to diabetes cardiomyopathy and myocardial hypertrophy, but the role of Dulaglutide in Adriamycin-induced cardiac toxicity is still unclear. This study aims to explore the effect of dulaglutide on DOX-induced cardiotoxicity and its possible mechanism based on the DOX-induced cardiotoxicity model, in order to provide new strategies for the clinical treatment of doxorubicin-related myocardial injury.

Methods: Construct mouse cardiomyopathy model and H9C2 cardiomyocytes model using doxorubicin. Inject dulaglutide before constructing the doxorubicin-induced cardiomyopathy model. Regularly monitor mouse echocardiography, hemodynamics, morphological staining, survival analysis curves, and myocardial injury markers. Observe the number of myocardial apoptosis in myocardial tissue through Tunnel staining, detect reactive oxygen species (ROS) in myocardial tissue through DHE staining, and detect the mRNA expression levels of BCL-2 and BAX, as well as the mRNA expression levels of antioxidant factors NQO1, GPX, and pro-oxidant factor NOX4 in myocardial tissue through real-time PCR. Western blot was used to detect the expression of apoptosis related proteins and signaling pathway proteins in myocardial tissue. After co culturing H9C2 cardiomyocytes with dulaglutide and doxorubicin for 24 hours, the activity of H9C2 myocardial tissue was detected by CCK8, the number of H9C2 myocardial apoptosis was observed by Tunnel staining, reactive oxygen species (ROS) were detected by DCFH-DA fluorescent probe technology, and the mRNA expression levels of BCL-2 and BAX, as well as the mRNA expression levels of antioxidant factors NQO1, GPX, and pro-oxidant factor NOX4 in H9C2 cardiomyocytes were detected by real-time PCR to investigate apoptosis related relationships. Western blot was used to detect the expression of apoptosis-related proteins and signaling pathway proteins in H9C2 cells. Finally, the use of PI3K inhibitors in in vitro and in vivo experiments on doxorubicin-induced cardiomyopathy further demonstrated that dulaglutide improves doxorubicin-induced cardiomyopathy through the PI3K/AKT/JNK pathway, as evidenced by cardiac function, hemodynamics, morphological staining, molecular biology, myocardial injury markers, and survival analysis curves.

Results: In vivo experiments have shown that dulaglutide can improve doxorubicin-induced cardiomyopathy based on cardiac function, hemodynamics, morphological staining, myocardial injury markers, and survival analysis curves. Dulaglutide can increase cell survival in the doxorubicin-induced cardiomyocytes injury model. Molecular biology and morphological experiments in vitro and in vivo have shown that dulaglutide intervention can increase the expression levels of anti-apoptotic markers BCL-2 and BCL-2/BAX, while reducing the protein expression level of caspase-3. And it was found that dulaglutide also reduced the ROS levels induced by doxorubicin. Dulaglutide promotes the expression of NQO1 and GPX, while reducing the level of NOX4. In PI3K inhibitor related experiments, we further found that PI3K inhibitors reduced the protective effect of dulaglutide on doxorubicin-induced cardiomyopathy from cardiac function, hemodynamics, morphological staining, myocardial injury markers, and survival analysis curves. Subsequently, molecular biology and morphological experiments further confirmed that dulaglutide mainly antagonizes doxorubicin-induced cardiomyocytes apoptosis by activating the intracellular PI3K/AKT/JNK signaling pathway.

Conclusion: Dulaglutide can improve doxorubicin-induced cardiomyopathy through the PI3K/AKT/JNK pathway.

构建肿瘤化疗病人的心血管风险事件的临床预警评估模型

薛远征

陆军军医大学第三附属医院大坪医院

摘要：

目的：随着医学水平的进步和人均寿命的延长，肿瘤和心血管病共病防治的重要性凸显，本研究旨在建立一种针对接受化疗（Chemotherapy, CT）的肿瘤患者的心血管风险事件预警评估模型，以帮助临床医生早期识别和干预潜在的心血管并发症，改善患者预后。

方法：选取 1067 名接受化疗的肿瘤患者，收集其化疗前后的临床数据，包括血压、心率、心电图、心脏超声以及各项实验室检查指标等。通过多因素分析，结合机器学习算法（如支持向量机（Support Vector Machine, SVM）和随机森林（Random Forest, RF）），构建心血管风险预警评估模型。评估模型在预测心血管事件（如心力衰竭、心肌损伤、冠状动脉粥样硬化性心脏病等）中的敏感性、特异性及准确性。

结果：该评估模型在预测心血管风险事件中的准确率达到了较高水平，敏感性和特异性均在较为理想的范围内。通过该模型，能够识别出高风险患者，并能根据预测结果提前采取预防措施，从而有效降低心血管事件的发生率。模型特别适用于化疗过程中存在心血管疾病高危因素的患者群体。

结论：肿瘤化疗病人的心血管风险显著增加，在化疗过程中预测心血管事件的风险，能够帮助临床医生制定个性化的预防和治疗方案，从而改善患者的长期预后。

Percutaneous coronary interventionlobectomy for Lung Cancer hybrid surgery: an initial case series

Jing Zeng

Department of Cardiology, Daping Hospital, The Third Military Medical University (Army Medical University), Chongqing, P.R. China

Abstract

Background For patients diagnosed with both lung cancer and severe coronary heart disease (CHD), the conflict between revascularization and lung cancer surgery remains to be settled to balance how to attenuate the cardiovascular risk for lung surgery and shorten the waiting time of anti-platelet therapy after revascularization. This study presents the percutaneous coronary intervention (PCI)-lobectomy for lung cancer hybrid surgery (PLHS), and its antithrombotic therapeutic strategy. PCI-lobectomy for lung cancer hybrid surgery (PLHS) combines the advantages of both PCI and lung cancer resection, shortening preoperative preparation time for cancer surgery, and therefore, may provide a more effective avoidance of tumor malignancy, progression, and metastasis. This pilot study aims to provide a new strategy for patients with lung cancer and severe CHD, providing physicians with the option to shorten the time to surgery and avoid tumor progression.

Methods From October 2020 to June 2023, 14 patients, with unstable angina and resectable lung cancer received PLHS. All procedures were performed in a hybrid operating room. Drug-eluting stents (DES) were implanted during PCI. Lobectomy was carried out within one hour after PCI.

Results Procedural success was 100%. All the patients subjected to PLHS were alive after 12 months of follow-up; 2 patients (14.29%) died due to distant metastasis within 12–24 months post-PLHS. There were no intraoperative complications, or 30-day- and 3-month-mortality. Except for one patient who suffered pneumothorax, no other postoperative complications, including severe bleeding, or in-stent restenosis, occurred in the 31.7±10.9 months follow-up.

Conclusions PLHS is a feasible and potentially safe option for patients with both lung cancer and severe CHD.

Keywords Coronary heart disease, Lung cancer, Percutaneous coronary intervention, Lobectomy, Antithrombotic therapy

Prevalence and Association of Statin with Mortality Risk Among Older US Cancer Survivors with and without Coronary Heart Disease

Jiasuer Alifu, Wen-Liang Che

Department of Cardiology, Shanghai Tenth People's Hospital, Tongji University School of Medicine, Shanghai, China

Abstract

Aims: Cardiovascular disease represents a leading cause of morbidity and mortality among the expanding population of cancer survivors. Statins, primarily prescribed for cardiovascular risk reduction, possess pleiotropic effects with potential anti-cancer properties suggested in preclinical and some observational studies. This study aimed to comprehensively investigate the prevalence of statin utilization among older

U.S. cancer survivors and critically evaluate its association with all-cause mortality, cardiac-specific mortality, and cancer-specific mortality. Recognizing the complex interplay between cancer survivorship and cardiovascular health, a primary objective was to stratify these associations based on the critical factor of pre-existing coronary heart disease (CHD) status.

Methods: We conducted a prospective cohort study utilizing data from ten contiguous cycles of the National Health and Nutrition Examination Survey (NHANES), a nationally representative survey of the non-institutionalized U.S. population. Cancer survivors aged 60 years or older at baseline were identified through self-reported physician diagnosis. Statin exposure was ascertained via linkage to the NHANES Prescription Medication Database, which verifies participant-reported medication use against prescription containers. Vital status and cause of death were determined through probabilistic linkage to the National Death Index (NDI) mortality files up to December 31, 2019, utilizing ICD-10 codes for cardiac mortality (I00-I09, I11, I13, I20-I51) and cancer mortality (C00-C97). Mortality hazard ratios (HRs) and 95% confidence intervals (CIs) were estimated using multivariable Cox proportional hazards regression models, progressively adjusted for key covariates: Model 1 (minimally adjusted: age, sex, race/ethnicity); Model 2 (+ lifestyle factors: smoking status, alcohol consumption, physical activity level); Model 3 (fully adjusted: Model 2 + body mass index, diabetes status, hypertension status, estimated glomerular filtration rate, history of stroke, poverty-income ratio, and time since cancer diagnosis). Survival probabilities were visualized and compared using Kaplan-Meier curves with log-rank tests. Extensive subgroup analyses and interaction tests were performed to explore potential effect modification by demographic and clinical factors.

Results: The final analytic cohort comprised 2,714 older adult cancer survivors. The mean age was 75.47 years (standard error: 0.29 years), 1,473 (54.27%) were male, and 649 (23.91%) had a documented history of CHD at baseline. Analysis spanning ten NHANES cycles revealed a striking three-fold increase in statin use prevalence, rising from 20.0% in 1999-2000 to 56.0% in 2015-2016. This increase exhibited distinct temporal patterns when stratified by CHD status and sex. Over a mean follow-up duration of 81 months (approximately 6.75 years), crude mortality rates starkly contrasted between statin users and non-users with CHD. Statin users demonstrated significantly lower all-cause mortality (52.0% vs. 72.8%), cardiac mortality (18.3% vs. 25.9%), and cancer-related mortality (11.5% vs. 18.0%; P

Conclusion: This large, nationally representative cohort study demonstrates a significant increase in statin utilization among older U.S. cancer survivors over nearly two decades. Critically, statin use is associated with a significant reduction in the risk of all-cause, cardiac, and cancer-related mortality specifically among older cancer survivors with concomitant coronary heart disease. However, this mortality benefit pattern does not extend to cancer-specific mortality for statin users without pre-existing CHD. These findings underscore the paramount importance of considering baseline cardiovascular comorbidity, particularly CHD status, when evaluating the potential mortality benefits of statin therapy in the growing population of older cancer survivors. The results advocate strongly for a personalized medicine approach to statin prescribing in this complex patient group, emphasizing tailored risk stratification based on CHD history to optimize long-term survival outcomes beyond primary cancer treatment. Further research, including mechanistic studies and ideally randomized controlled trials, is warranted to confirm causality and elucidate the underlying biological pathways driving these differential associations based on CHD status.

肠道菌群介导心房肌焦亡促进结直肠癌相关房颤的机制研究

张航 盛力

哈尔滨医科大学附属第一医院

目的：结直肠癌（CRC）患者心房颤动（AF）患病率显著升高，严重影响患者预后。研究表明 CRC 可导致肠道菌群紊乱，而菌群紊乱在 AF 发生发展中扮演关键角色。本研究旨在明确肠道菌群是否通过激活心房肌细胞焦亡信号通路介导 CRC 相关 AF，为防治提供新靶点。

方法：纳入本院 94 例 CRC 患者，分析 AF 患病率并与中国成人标准化患病率比较。建立动物模型：1) C57BL/6 小鼠结肠原位接种 MC38 癌细胞（CRC 荷瘤组）或 PBS（Sham 组）；2) 小鼠灌胃健康人粪菌（NC-FMT 组）、CRC 患者粪菌（CRC-FMT 组）或 CRC 粪菌 + 抗生素（CRC-FMT+ANX 组）；3) CRC 荷瘤小鼠给予抗生素（CRC+ANX 组）。检测指标：小鼠心房电生理（AF 诱发率、持续时间、AERP）；心脏及结肠组织病理染色（HE/Masson/Tunel）；粪便 16S rRNA 测序；Western Blot 检测心房焦亡蛋白（NLRP3, GSDMD, Caspase-1 p20, ASC）及肠屏障蛋白（ZO1, OCC）。

结果：CRC 患者 AF 患病率（7.5%）显著高于中国标准化患病率（1.6%, P=0.0405）。动物实验显示：1) CRC 荷瘤组较 Sham 组 AF 易感性显著增加（诱发率及持续时间升高，AERP 缩短，P<0.01），心房纤维化及凋亡加重（P<0.01），肠道菌群 α 多样性降低（P<0.05），肠屏障损伤（ZO1/OCC 表达下调，P<0.01）；2) CRC 荷瘤组心房焦亡通路关键蛋白表达显著上调（NLRP3, GSDMD 等，P<0.05）；3) CRC-FMT 组呈现类似 AF 易感性增加及心房 / 肠屏障损伤，且心房焦亡蛋白升高（P<0.05），抗生素干预（CRC-FMT+ANX 组）可逆转此效应（P<0.05）；4) 抗生素清除菌群（CRC+ANX 组）显著降低 CRC 荷瘤小鼠 AF 诱发率（P=0.0291）、减轻心房重构及焦亡蛋白表达（P<0.05），并改善肠屏障功能。

结论：CRC 显著增加 AF 风险。其机制为：CRC 导致肠道菌群紊乱及肠屏障损伤，激活心房肌 NLRP3/GSDMD 焦亡信号通路，诱导心房结构重构与电生理异常，最终促进 AF 发生。靶向肠道菌群或抑制焦亡通路是潜在防治策略。

Olaparib reduces the high blood pressure caused by VEGF inhibitors

jie ma, xin Fan, xin Ma, Ying-Dong Wang, Chu-Yan Feng, Fei Si, Jing Yu

The Second Hospital of LanZhou University

Olaparib reduces the high blood pressure caused by VEGF inhibitors

Background: Poly(ADP-ribose) polymerase encompasses a family of seventeen proteins that engaged in poly or mono ADP-ribosylation, crucial for various cellular processes including DNA repair, cell death, transcription, translation, cell proliferation, and cell response to oxidative stress. PARPs play an important role in the development of cardiovascular diseases. During the progression of cardiovascular diseases, including hypertension, hypertension mediated organ damage, atherosclerosis, acute myocardial infarction, heart failure, abnormal energy metabolism in muscle cells and endothelial cells can lead to related diseases and injuries. Activation of the PARP1 in vascular smooth muscle cells could cause vascular calcification. PARP inhibitors have demonstrated specific anti-tumor activity in BRCA- and homologous recombination-deficient cancers. Moreover, PARP activation, marked by increased PAR accumulation, contributes to several pathological conditions, such as ischemia, ischemia-reperfusion injury, neurological injury, vascular disease and diabetes. Notably, PARP inhibitors, when combined with anti-angiogenic agents, not only show efficacy as monotherapy in treating epithelial ovarian cancer but also mitigate the hypertension associated with anti-angiogenic treatments.

Objectives: Poly-ADP-ribose polymerase(PARP) inhibitors have been demonstrated significant anti-tumor activity in a variety of tumors, such as ovarian cancer, breast cancer, and prostatic cancer. Anti-angiogenic drugs are mainly targeted at Vascular endothelial growth factor (VEGF) signaling pathway inhibitors (VSPIs), including small-molecule tyrosine kinase inhibitors (TKIs, e.g., sunitinib and apatinib) and monoclonal antibodies (e.g., bevacizumab). Meanwhile, some studies have found that PARP inhibitors combined with anti-angiogenic drugs have achieved significant results in the treatment of ovarian cancer compared with single drugs. While there are few studies on the vascular safety of the combination of PARP inhibitors and anti-angiogenic drugs. Therefore, we conducted this study to observe vascular function in vivo experiment treated with PARP inhibitors Olaparib in combination with VEGF inhibitors cediranib.

Methods: we select C57 model mice, and the C57 mice were randomly divided into 4 groups with 5 mice in each group. The weight of mice in each group was similar. The groups are as follows (I)control: 0.2 ml of normal saline gavage; (II)cediranib:6 mg/kg cediranib dissolved in normal saline by gavage; (III)cediranib+ olaparib: 6 mg/kg cediranib dissolved in 0.2ml of normal saline by gavage and 50 mg/kg olaparib dissolved in 0.2ml of normal saline by gavage; (IV) Olaparib: 50 mg/kg olaparib dissolved in 0.2ml of normal saline by gavage; The tail pressure of the mice was measured every 7 days and before sacrifice. The mice were placed within the instrument while the temperature was set to 34℃ . After 15–20 min of relative quiet, the systolic blood pressure (SBP), diastolic blood pressure (DBP) and mean blood pressure (MBP) were collected when the mice were awake. Measurements were performed three times every 15 s, and the average value was recorded.

Results: After 28 days of administration, blood pressure was significantly higher in the cediranib group than in the control group, the BP of the cediranib group was 122.20/92.20 ± 5.67/2.75 mmHg, which was higher than that of the control group (119.75/74.75 ± 4.27/3.33, p <0.05), However, there was no significant increase in blood pressure after combined treatment with Olaparib, the BP of cediranib group and cediranib+ Olaparib was 122.20/92.20 ± 5.67/2.75 mmHg and 110.25/71.75±5.98/2.21 mmHg(P < 0.05).

Conclusion: PARP inhibitors can relieve elevated blood pressure caused by VEGF pathway inhibitors. Ongoing and future preclinical and clinical studies are essential to further delineate the anti-tumor capabilities and cardiovascular protective effects of these compounds.

Single-nucleus transcriptomics reveals the pathological process and key targets of sorafenib-induced cardiotoxicity

Dan Liu, Yani Wang, Zheming Yang, Yaling Han

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Abstract

Background: Sorafenib, a multi-kinase inhibitor, is widely used in the treatment of various cancers including advanced hepatocellular carcinoma and renal cell carcinoma. However, its clinical utility is significantly constrained by dose-limiting cardiotoxicity, which manifests as a spectrum of cardiovascular complications including cardiomyocyte injury, myocardial ischemia, and arrhythmias. These cardiac complications not only severely impair patient prognosis and quality of life but also lead to treatment discontinuation, posing substantial challenges to cancer therapy. Despite its clinical significance, the key pathogenesis of sorafenib-induced cardiotoxicity remains poorly understood. The precise cell type-specific responses and molecular mechanisms driving these cardiac complications are yet to be fully elucidated. Therefore, to explore the key mechanisms and identify the key molecular is urgent for prevention and treatment of sorafenib-induced cardiotoxicity.

Methods: To determine the changes in cell composition and transcriptomic alterations of different cell types related to sorafenib-induced cardiotoxicity, we performed single-nucleus RNA-sequencing (snRNA-seq) on the hearts of sorafenib-induced cardiotoxicity mice. Through weighted gene co-expression network analysis (WGCNA), the analysis of differentially expressed genes (DEGs), intercellular communication and transcription factor, we identified the key mechanisms of sorafenib-induced cardiotoxicity.

Results: The snRNA-seq results demonstrated that sorafenib treatment induced the loss of cardiomyocytes and endothelial cells, accompanied by a shift in cellular composition characterized by fibroblast accumulation and immune cell infiltration. DEGs revealed that sorafenib-affected cell populations exhibited transcriptional signatures promoting myocardial fibrosis and inflammation, with upregulated DEGs consistently mapping to cardiomyopathy-related pathways. The elevated gene set scores were associated with cardiac fibrosis and inflammatory responses in both cardiomyocytes and fibroblasts. Correspondingly, we observed significantly enhanced cell-cell communication between these cell populations. Further analysis focused on high-frequency sorafenib-induced myocardial injury DEGs shared among cardiomyocytes, endothelial cells, and fibroblasts. The downregulated DEGs were predominantly enriched in biological functions related to antioxidant defense, fibrosis suppression, and inflammatory regulation, while the upregulated DEGs displayed dysregulation of circadian rhythm proteins (PER1, TEF). Augur analysis unequivocally identified cardiomyocytes as the cell type most profoundly affected by sorafenib treatment. To elucidate the core cellular mechanisms underlying sorafenib-mediated cardiotoxicity, we performed WGCNA analysis using the Hotspot (v1.1.1) tool on our integrated scRNA-seq/snRNA-seq dataset. This approach revealed that cardiomyocytes scored highest in module 1, which showed strong association with cardiomyopathy phenotypes. Pathological assessments demonstrated significant reduction in ejection fraction alongside compensatory upregulation of calcium signaling and myocardial contraction pathways in cardiomyocytes. These results collectively established cardiomyocytes as the primary mediators of sorafenib-induced cardiotoxicity. Transcriptional regulatory network analysis implicated the melanocyte-inducing transcription factor (MITF) as a key regulator in sorafenib-mediated cardiotoxicity. MITF upregulation and subsequent overactivation of downstream effectors appeared to function as a metabolic-inflammatory nexus. MITF may act as a metabolic-inflammatory cross-regulatory node, and intervention in its activity can improve myocardial injury and myocardial hypertrophy phenotypes.

Conclusion: Based on the first single-cell atlas of sorafenib-induced cardiotoxicity, we identified MITF as a novel master regulator driving sorafenib-mediated cardiotoxicity. Our study provides mechanistic insights into the key molecular pathways underlying sorafenib-induced cardiotoxicity and establishes a comprehensive resource for developing targeted therapies to mitigate the sorafenib-induced cardiotoxicity. Notably, we demonstrate for the first time that MITF activation promotes sorafenib-induced cardiotoxicity, uncovering its previously unrecognized role in exacerbating drug-induced cardiotoxicity. These findings position MITF as a critical metabolic-inflammatory node in Sor-induced cardiotoxicity and highlight its potential as a therapeutic target.

CREG1 Alleviates Sorafenib-Induced Cardiotoxicity via the Modulation of Necroptosis

Dan Liu, Zhe-Ming Yang, Cheng-Hui Yan, Ya-Ling Han

General Hospital of Northern Theater Command，State Key Laboratory of Frigid Zone Cardiovascular Diseases (SKLFZCD)

Background

Sorafenib (Sor) is a widely used chemotherapeutic agent that has demonstrated significant efficacy in inhibiting tumor growth and prolonging patient survival, particularly in hepatocellular carcinoma and renal cell carcinoma. However, its clinical application is limited by cardiotoxicity and adverse effects on cardiac function, which can affect up to 30% of treated patients and often necessitate dose reduction or discontinuation. Cellular Repressor of E1A-Stimulated Genes 1 (CREG1) is an endogenous lysosomal protein that has been implicated in cardioprotection and various physiological processes in the heart, such as maintaining myocardial structure, regulating cellular stress responses, and inhibiting pathological hypertrophy. Despite its potential role in cardiac health, the involvement of CREG1 in Sor-induced cardiotoxicity remains unexplored. This study aimed to comprehensively investigate the role and mechanism of CREG1 in Sor-induced cardiotoxicity, with the potential to identify a novel therapeutic target for mitigating cardiac side effects while preserving the anti-tumor efficacy of Sor.

Methods

To identify key regulatory molecules involved in Sor-induced cardiotoxicity, single-nucleus RNA sequencing (snRNA-seq) was performed on cardiac tissues from Sor-treated mice. Cardiomyocyte-specific CREG1 knockout (CREG1-CKO) and adeno-associated virus (AAV)-mediated cardiac overexpression models were established to elucidate the functional role of CREG1. Cardiac function was assessed using animal ultrasound technology, while histological analyses, quantitative RT-PCR, and Western blotting were employed to examine Sor-induced myocardial injury. The mechanism of CREG1 in Sor-induced cardiotoxicity was further explored by stimulating cultured cardiomyocytes with Sor. Flow cytometry, Western blotting, and transmission electron microscopy (TEM) were used to evaluate cardiomyocyte necroptosis. Downstream proteins directly regulated by CREG1 were identified through immunoprecipitation, mass spectrometry, immunofluorescence staining, and Western blotting. Molecular docking, dynamic simulation, and Western blotting were utilized to identify the active fragments of CREG1 involved in regulating necroptosis. Additionally, the anti-tumor effects of CREG1 were validated in HepG2 xenografts to assess its potential therapeutic impact.

Results

Our snRNA-seq analysis revealed that cardiomyocytes are the predominant cellular targets in Sor-induced cardiotoxicity, with CREG1 emerging as a key hub gene inversely associated with cardiac injury. In vivo studies demonstrated that CREG1-CKO exacerbated cardiac dysfunction, myocardial fibrosis, and hypertrophy, and significantly aggravated necroptosis in Sor-treated mice. Conversely, CREG1 overexpression exerted protective effects against Sor-induced cardiotoxicity, preserving cardiac function and reducing myocardial injury. We identified TYK2, a necroptosis-related gene, as a direct binding partner of CREG1. Mechanistically, CREG1 was found to promote TYK2 protein degradation via the lysosomal pathway, thereby reducing STAT1 activation and alleviating necroptosis. The protective effect of CREG1 on necroptosis was reversed upon TYK2 overexpression, confirming the critical role of the CREG1-TYK2 axis in Sor-induced cardiotoxicity. Furthermore, the anti-tumor efficacy of CREG1 was validated in HepG2 xenografts, demonstrating that CREG1 augmentation not only provides cardioprotection but also enhances antitumor efficacy.

Conclusion

This study identifies CREG1 as a novel regulator of necroptosis that mitigates sorafenib-induced cardiotoxicity via inhibition of the TYK2-STAT1 pathway. The dual benefits of CREG1 augmentation include cardioprotection and enhanced antitumor efficacy. These findings provide novel insights into the application of CREG1 as a therapeutic target for Sor-induced cardiotoxicity. Modulation of CREG1 expression may represent a viable strategy to enhance both the safety and efficacy of Sor therapy in clinical settings.

免疫检查点抑制剂（ICI）在肿瘤治疗中展现出显著疗效，已被证明可通过调节免疫系统治疗各种癌症。但其引发的心肌炎（ICI-myocarditis）作为罕见但致死率高的不良反应日益受到关注。本文综述了近年 ICI 相关心肌炎的流行病学特征、病理机制、诊断标准及治疗策略的研究进展。流行病学数据显示其发病率约为 0.04%-1.14%，但病死率高达 25%-50%，且多发生于联合用药或早期治疗阶段。病理机制涉及 T 细胞过度激活导致心肌细胞损伤，可能与 CTLA-4/PD-1 信号通路抑制后免疫稳态失衡相关。诊断方面，心脏磁共振（CMR）与心肌活检的金标准地位逐步确立，而生物标志物（如肌钙蛋白、BNP）联合心电图监测提升了早期识别率。cTnI 和 hs-cTnT 等传统生物标志物敏感但缺乏特异性，而 miR-155 等新兴生物标志物则显示出组织特异性。NLR 和 CRP 等炎症标志物有助于预后，但诊断价值有限。治疗策略以糖皮质激素为基础，必要时联用免疫抑制剂（如 ATG、IVIG），但个体化方案仍需优化。本综述研究了目前关于 ICI 相关心肌的有限知识，强调了加强 ICI 相关心肌炎识别和管理的必要性，总结了相关研究的最新进展。我们讨论了流行病学、临床特征、免疫机制以及生物标志物在诊断和风险分层中的作用。通过综合当前证据，旨在增强理解并指导制定策略，以改善 ICI 相关心肌炎患者的预后

端粒酶逆转录酶缓解阿霉素诱导心脏毒性的作用研究

顾青青[1] 陈倩雯[1] 王宇[1] 蔡达贝[1] 肖婷婷[1] 王庆捷[1] 孙铃[2]

1. 南京医科大学附属常州市第二人民医院

2. 南京医科大学附属无锡市人民医院

目的

探讨端粒酶逆转录酶（TERT）缓解阿霉素（DOX）所致心脏毒性的作用。

方法 ① 细胞实验：将大鼠 H9C2 心肌细胞分为对照组（CON 组）、空载腺病毒转染组（NC 组）、TERT 过表达腺病毒转染组（TERT 组）、DOX 组（1 μmol/L DOX）、DOX+NC 组和 DOX+TERT 组（转染空载腺病毒或 TERT 过表达腺病毒 24 h 后用 DOX 处理 12 h）。采用实时荧光定量聚合酶链反应（RT-qPCR）检测心肌细胞 TERT mRNA 表达，采用免疫荧光法检测细胞线粒体膜电位水平，采用蛋白质免疫印迹试验（Western blotting）检测细胞内 Bcl-2、BAX、P62 和微管相关蛋白 1A/1B- 轻链 3（LC3）表达水平。② 动物实验：将雄性 C57BL/6 小鼠随机分为假手术组（Sham 组）、DOX 组（腹腔注射 DOX 15 mg/kg 构建急性心脏毒性损伤模型）、DOX+NC 组和 DOX+TERT 组（转染空载腺病毒或 TERT 腺病毒 7 天后制模）。制模 1 周后采用天狼猩红染色检测心肌纤维化面积，采用超声心动图检测心功能。

结果 ① 细胞实验：TERT 组心肌细胞 TERT mRNA 表达水平较 CON 组和 NC 组明显升高。与 CON 组相比，DOX 组和 DOX+NC 组心肌细胞 TERT mRNA 表达水平显著降低，线粒体膜电位水平显著降低，BAX、LC3 的蛋白表达量明显增加，Bcl-2、P62 的蛋白表达量显著降低。DOX 组与 DOX+NC 组各指标差异无统计学意义。与 DOX 组和 DOX+NC 组相比，DOX+TERT 组 TERT mRNA 表达水平升高（1.02±0.10 比 0.61±0.05、0.54±0.03，均 P < 0.01），线粒体膜电位水平显著升高（1.14±0.05 比 0.96±0.01、0.96±0.01，均 P < 0.01），BAX、LC3 的蛋白表达量明显降低，Bcl-2、P62 的蛋白表达量显著升高（BAX：0.88±0.01 比 1.31±0.02、1.26±0.01，LC3：2.16±0.05 比 2.64±0.06、2.58±0.02，Bcl-2：0.65±0.01 比 0.40±0.01、0.41±0.01，P62：0.45±0.01 比 0.23±0.02、0.29±0.01，均 P < 0.01）。② 动物实验：与 Sham 组相比，DOX 组和 DOX+NC 组小鼠心肌纤维化面积百分比显著增加，左室射血分数（LVEF）和短轴缩短率（FS）显著降低。与 DOX 组和 DOX+NC 组相比，DOX+TERT 组小鼠心肌纤维化面积百分比显著减少 (2.33±0.06 比 3.76±0.07、3.87±0.06，均 P < 0.01)，LVEF 和 FS 显著升高（LVEF：67.00±1.14 比 54.60±1.57、53.40±2.18，FS：38.60±0.51 比 30.60±1.10、30.00±0.71，均 P < 0.01）。

结论 上调 TERT 表达可抑制 DOX 引起的心肌细胞自噬及凋亡，减轻 DOX 诱导小鼠的心肌纤维化，改善心功能，进而缓解 DOX 所致心脏毒性。

基于结构修饰的线粒体衍生肽 MOTS-c 纳米递送系统对化疗相关性心功能障碍的多靶点调控机制研究

张敏 李想

上海交通大学医学院附属胸科医院

目的

探究基于结构修饰的线粒体衍生肽 MOTS-c 变体（MOTS-cv2）纳米递送系统对阿霉素（Dox）诱导的化疗相关性心功能障碍的多靶点调控机制，为克服化疗心脏毒性提供新型智能化治疗策略。

方法

1. **肽变体设计与验证**：

· 通过基因编辑优化 MOTS-c，整合 α- 螺旋增强基序及线粒体靶向序列（MTS），提升心肌靶向性和稳定性。

2. **分子机制模拟**：

· 采用高斯加速分子动力学（GaMD）模拟分析 MOTS-cv2 与 AMPKγ 亚基的结合模式（ΔG_{bind} 计算）。

3. **纳米递送系统构建**：

· 制备 MOTS-cv2@ 脂质体纳米颗粒（粒径、包封率表征）。

4. **体内外模型评价**：

· Dox 诱导心功能障碍小鼠模型：检测血清 cTnI、心脏超声（LVEF）；单细胞转录组测序分析通路变化；CRISPR-Cas9 全基因组筛选关键效应分子（STOML2）。

· 双功能肽 MOTS-DP6 设计：整合铁螯合结构域，评估心肌细胞存活率。

结果

1. **肽变体特性**：

· MOTS-cv2 心肌靶向效率较原型提高，半衰期延长。

2. **纳米递送效能**：

· 纳米颗粒粒径 **98.6 nm**，包封率 **92.3%**；显著降低血清 cTnI 水平（p<0.001），LVEF 从 **41.2%** 提升至 **58.7%**。

3. **多靶点调控机制**：

· **激活 AMPKα/ULK1 通路**：促进线粒体自噬（PINK1/Parkin 表达↑）。

· **抑制 mTORC1/SREBP1 轴**：降低铁死亡关键因子（ACSL4、LOX 表达↓。

· CRISPR-Cas9 筛选验证 **STOML2** 为调控 OXPHOS 的核心效应分子（sgRNA 富集 >**9.4 倍**）。

4. **双功能肽优势**：

· MOTS-DP6 使心肌细胞存活率达 **89.3%**（较单功能肽↑），兼具 AMPK 激活与铁死亡抑制功能。

结论

MOTS-cv2 纳米递送系统通过**双重调控机制**（激活 AMPKα/ULK1 自噬通路 + 抑制 mTORC1/SREBP1 铁死亡轴）显著改善 Dox 诱导的心功能障碍。基于深度突变扫描设计的双功能肽 MOTS-DP6 进一步整合铁螯合能力，为开发新一代抗化疗心脏毒性制剂提供了智能化策略。

Blood Leukocyte Counts and Multimorbidity of Cancer and Cardiometabolic Diseases: A Prospective Cohort Study in UK Biobank

Fei-Yuan Han, Song-Cai Xie, Peng Zhao, Zhong-Zhi Yu, Cheng Jin, Jin-Wei Tian

哈尔滨医科大学附属第二医院

Aims: The role of blood leukocyte counts, including total and subtypes, in influencing the dynamic progression from a healthy state to cancer or cardiometabolic disease (CMD), and subsequently to multimorbidity and death, remains insufficiently understood. CMD refers to chronic conditions such as coronary heart disease (CHD), type 2 diabetes (T2D), and stroke. These conditions often coexist with cancer in later life stages, constituting a significant multimorbidity pattern with complex clinical trajectories and outcomes. As the global burden of multimorbidity rises, identifying early biomarkers that reflect systemic inflammatory states becomes crucial for guiding preventive strategies and reducing downstream complications.

Methods: We analyzed data from 391,791 participants aged 40–70 years in the UK Biobank who were free of cancer and CMD at baseline. Multimorbidity was defined as the coexistence of both cancer and CMD, regardless of the order of diagnosis. Leukocyte counts and five subtypes (neutrophils, lymphocytes, monocytes, eosinophils, and basophils) were measured at baseline. Using multi-state models and restricted cubic splines, we evaluated the associations between leukocyte levels (in percentile categories) and all transitions between healthy state, cancer, CMD, multimorbidity, and death. Models were adjusted for demographic, lifestyle, and clinical factors. We further estimated 10-year transition intensities to quantify the impact of leukocyte levels on disease trajectories.

Results: During a median follow-up of 12.8 years, 42,029 participants developed cancer, 43,572 developed CMD, 8,136 progressed to cancer–CMD multimorbidity, and 26,224 died. Elevated leukocyte counts, particularly in the 75th–95th and >95th percentiles, were positively associated with most disease transitions. For example, individuals in the 75–95th percentile of total leukocyte count had a modestly increased risk of cancer from a healthy state (HR: 1.07, 95% CI: 1.05–1.10), but a substantially higher risk of transitioning from CMD to multimorbidity (HR: 1.22, 95% CI: 1.13–1.33). Neutrophils showed a similar pattern. These associations were more pronounced in older adults and consistent in multiple sensitivity analyses. Notably, transition intensities from CMD to multimorbidity were higher than from a healthy state to CMD, suggesting a cumulative effect of inflammation.

Conclusions: Leukocyte counts, especially elevated neutrophils, play differential and stage-specific roles in the progression of chronic disease. Our findings highlight a stronger link between elevated leukocyte levels and the transition from CMD to multimorbidity than from a healthy state to cancer. This suggests that low-grade, chronic inflammation in CMD patients may accelerate the development of cancer and compound disease burden. These results underscore the pivotal role of systemic inflammation—mediated by leukocyte activity—in facilitating pathological interactions between metabolic and oncological diseases. Furthermore, leukocytes may contribute to an unfavorable tumor microenvironment and promote oncogenic transformation through secretion of cytokines, chemokines, and proteolytic enzymes. The observation that leukocyte-related risk was more pronounced in transitions involving T2D supports previous evidence linking insulin resistance, immune dysregulation, and cancer risk. From a clinical perspective, routine assessment of leukocyte counts—often available in standard blood panels—may offer a cost-effective tool for identifying high-risk individuals who could benefit from enhanced monitoring or early preventive strategies. This large-scale, prospective study provides novel epidemiological evidence supporting inflammation-driven pathways linking cardiometabolic and oncological disease processes. Future research should explore potential therapeutic approaches targeting chronic inflammation to delay or interrupt these adverse disease trajectories.

临床试验中 PD-1/PD-L1 抑制剂联合治疗的心血管相关不良事件：一项系统综述和荟萃分析

于东源

大连医科大学附属第一医院

目的：

免疫疗法使癌症治疗迎来革新变化。以 PD-1/PD-L1 抑制剂为代表的免疫检查点抑制剂可显著提升晚期癌症患者生存率。然而，该类药物的使用常常伴随严重的心血管毒性，导致癌症患者在其生存期内心血管事件发生率明显升高，成为威胁其生命安全的重要隐患。本研究对多篇随机对照临床试验结果进行系统回顾及荟

萃分析，旨在明确 PD-1/PD-L1 抑制剂心血管毒性发生风险，确定不同心血管事件的发生率和高危特征，并对其发生机制进行探讨，为 PD-1/PD-L1 抑制剂的药物管理及安全应用提供新的依据。

方法：

在 PubMed、Embase 以及 Cochrane 数据库中搜索 2015 年 1 月至 2022 年 5 月发表的论文，搜索词为“PD-1”、“PD-L1”、“combination”、“cardiovascular”、“cardiac”以及“clinical trials”，纳入相关临床试验，统计心血管事件发生情况及其临床特征。从每项纳入的研究中提取作者、出版年份、患者临床基线资料、癌症类型、PD-1 和 PD-L1 抑制剂名称、联合药物名称、接受联合治疗的患者总样本量、发生心血管不良事件数等主要参数。应用具有 Logit 转换的随机效应模型对心血管不良事件总体发生率及其特征进行荟萃分析，采用 I^2 评估研究间的异质性。所有分析均使用 Stata18.0、R 统计软件（3.6.1 版本）和 RevMan5.3 软件完成。

结果：

本研究通过检索和筛选，最终纳入 23 篇文献进行 Meta 分析。我们发现：1. 与安慰剂相比，PD-1/PD-L1 抑制剂呈现出更高的心血管事件发生率 [RR = 1.19，95%CI（1.11，1.29），I^2 = 45%，P < 0.00001]；2. 对不同心血管事件进行亚组分析发现，与安慰剂组相比，使用 PD-1/PD-L1 抑制剂的患者冠心病 [RR=1.77，95% CI（1.18，2.64），P=0.005]、心律失常 [RR=1.36，95% CI（1.03，1.79），P=0.03]、心力衰竭 [RR=2.14，95% CI（1.44，3.20），P=0.0002] 及低血压 [RR=1.45，95% CI（1.07，1.96），P=0.02] 的发生率显著升高；3. 对不同的癌症种类进行亚组分析发现，在肺癌 [RR=1.44，95% CI（1.13，1.84），P=0.003]、多发性骨髓瘤 [RR=2.57，95% CI（1.40，4.70），P=0.002]、尿路上皮癌 [RR=1.60，95% CI（1.15，2.24），P=0.005] 以及头颈部鳞状细胞癌 [RR=1.54，95% CI（1.09，2.17），P=0.02] 患者中，PD-1/PD-L1 抑制剂的心血管不良事件发生率明显升高；4. 通过对 PD-1/PD-L1 抑制剂联合不同治疗方案的心血管事件发生风险进行统计，我们发现 PD-1/PD-L1 抑制剂联合靶向药物治疗组心血管事件总体发生率最高 [IR=0.40，95% CI（0.38，0.42），P < 0.0001]。

结论：

本研究发现，与安慰剂相比，PD-1/PD-L1 抑制剂的使用显著增加了心血管毒性的发生风险，包括冠心病、心律失常、心力衰竭以及低血压等。肺癌、多发性骨髓瘤、尿路上皮癌以及头颈部鳞状细胞癌患者具有更高的心血管不良事件发生率。PD-1/PD-L1 联合靶向药物治疗组心血管不良事件总体发生率最高。在联合化疗时高血压出现较多，联合靶向药物治疗时同样以高血压更为常见，而联合其他免疫治疗方案的患者心律失常和高血压均较为多见。

Antiplatelet Use and Mortality in Cancer Patients With and Without Coronary Artery Disease

Wenliang Che

Department of Cardiology, Shanghai Tenth People's Hospital, Tongji University School of Medicine, Shanghai, China

Abstract

Background: Antiplatelet agents, such as low-dose aspirin and clopidogrel, are widely prescribed to prevent cardiovascular events in patients with coronary artery disease (CAD). Emerging evidence suggests that these medications may also influence cancer risk and mortality, though findings across studies have been inconsistent. Some research indicates that antiplatelet drugs could inhibit tumor progression by reducing platelet-mediated angiogenesis or metastasis, while other studies report no significant benefits or even potential harms. This study aims to clarify the relationship between antiplatelet use and mortality in cancer patients, with a focus on distinguishing outcomes between those with and without comorbid CAD. By analyzing a large, nationally representative cohort, we seek to provide clearer guidance for clinical decision-making in this complex patient population.

Methods: We conducted a prospective cohort study using data from four cycles of the National Health and Nutrition Examination Survey (NHANES), linked to mortality records through 2019. The study included 2,099 adult cancer patients (mean age: 66.7 years; 47.5% male), of whom 349 (16.6%) had a history of CAD. Antiplatelet exposure was identified via prescription registries, with primary focus on low-dose aspirin and clopidogrel. Mortality outcomes were categorized as all-cause, cardio-cerebrovascular (CCD), and cancer-related. Survival analyses were performed using Kaplan-Meier curves to compare mortality rates between antiplatelet users and non-users. Cox proportional hazards regression models were employed to estimate hazard ratios (HRs), adjusting for potential confounders such as age, sex, smoking status, body mass index, comorbidities (e.g., diabetes, hypertension), and cancer type. Subgroup analyses were conducted to evaluate differences between CAD and non-CAD patients.

Results Among the 2,099 cancer patients, aspirin and clopidogrel use were significantly more prevalent in those with CAD (66.8% and 16.6%, respectively) compared to non-CAD patients (39.1% and 1.9%). Over a median follow-up of 52 months, aspirin use in CAD patients was associated with lower all-cause mortality (24.9% vs. 37.9%, P=0.012) and CCD mortality (8.6% vs. 15.5%, P=0.040). In contrast, among non-CAD patients, aspirin use was linked to higher all-cause mortality (18.9% vs. 14.9%, P=0.030) and CCD mortality (5.0% vs. 2.4%, P=0.005). Similarly, clopidogrel use in non-CAD patients was associated with increased mortality risks. Fully adjusted Cox models revealed that aspirin use in CAD patients was independently associated with reduced all-cause mortality (HR: 0.50; 95% CI: 0.31–0.81), CCD mortality (HR: 0.40; 95% CI: 0.18–0.89), and cancer-related mortality (HR: 0.37; 95% CI: 0.19–0.72). However, in non-CAD patients, neither aspirin nor clopidogrel use showed a statistically significant association with mortality after full adjustment for covariates.

Conclusion This study demonstrates a divergent effect of antiplatelet therapy on mortality in cancer patients depending on CAD status. Aspirin use was associated with significant survival benefits in cancer patients with CAD, potentially due to its dual role in mitigating cardiovascular risk and modulating cancer progression. Conversely, in non-CAD patients, aspirin and clopidogrel were linked to increased mortality in unadjusted analyses, though these associations did not persist after adjustment for confounding factors. These findings underscore the importance of individualized treatment strategies, emphasizing antiplatelet therapy for cancer patients with CAD while cautioning against routine use in those without cardiovascular indications. Further research is needed to explore the mechanisms underlying these observations and to validate these results in diverse populations.

脯氨酸合成限速酶 P5CS 在阿霉素诱导心肌病中的保护作用

汪雪华 [1,2,3] 汪朝晖 [1,2,3]

1. 华中科技大学同济医学院附属医院协和医院

2. 华中科技大学同济医学院附属协和医院生物靶向治疗湖北省重点实验室

3. 华中科技大学同济医学院附属协和医院湖北省心血管疾病免疫诊疗工程研究中心

目的：吡咯啉 -5- 羧酸合酶（P5CS）是脯氨酸合成的限速酶，具有多种复杂的生物学功能，其功能受损与多种疾病有关。本研究旨在探讨 P5CS 与阿霉素（doxorubicin, DOX）诱导的心脏毒性（DIC）之间的相关性，并重点解析其潜在作用机制。

方法：基于 GEO 数据库筛选 DIC 数据集，分析脯氨酸代谢关键酶 mRNA 的表达，并采用 DOX 诱导 DIC 小鼠模型（15mg/kg 单次腹腔注射）和刺激 H9C2 细胞（2μm）进行体内和体外验证。通过尾静脉注射 AAV-9 过表达 P5CS 构建转基因小鼠模型，随后诱导 DIC（n=10/ 组）。体外实验采用慢病毒转染 H9C2 细胞过表达 P5CS，同步评估 DOX 心肌毒性。结合超声心动图、组织学（HE/Masson 染色）评估心功能及病理改变，运用 WB、PCR、免疫荧光检测关键分子表达与定位，通过 CO-IP、亚细胞分离等技术挖掘作用通路。同步整合蛋白质数据库（PDB）、CB-DOCK2 和蛋白质变构位点服务器（PASSer）数据库等数据库进行 P5CS 结构预测。

结果：DOX 导致心脏 P5CS 表达下调。P5CS 的过表达提高了其蛋白质丰度，促进了 P5CS 丝的组装，增强了 P5CS 的结构稳定性。基于 PDB、CB-DOCK2 和 PASSer 数据库的预测分析，观察到 DOX 可能诱导 P5CS 蛋白的结构变化。Co-IP 和质谱结果显示，P5CS 在 DIC 中与心肌肌动蛋白 A1（ACTC1）相互作用，促进聚合肌动蛋白（F-actin）解离，球状单体肌动蛋白（G-actin）增加。MKL1 与细胞质 G- 肌动蛋白结合，抑制其核转位，从而抑制 SRF/BCL2 通路并增强细胞凋亡。此外，我们发现 P5CS 对心肌线粒体具有保护作用。过表达 P5CS 可以减少 DOX 诱导的线粒体断裂、ATP 耗竭、活性氧（ROS）激增和线粒体膜电位破坏。

结论：本研究将脯氨酸合成限速酶 P5CS 与 DIC 联系起来，并突出 P5CS 可能是 DIC 治疗的可行靶点。

外泌体介导肿瘤心脏病理通讯加重阿霉素心肌毒性的机制研究

5. 复旦大学生命科学院

目的：阿霉素 (Doxorubicin, DOX) 是乳腺癌最有效的化疗药物之一，但常伴有严重的心脏毒性。深入研究肿瘤与心脏之间的跨器官通讯机制并寻找潜在的干预靶点对减轻其副作用至关重要。本研究旨在探索 DOX 处理后的乳腺癌细胞 (Breast Cancer Cells, BCCs) 通过外泌体 (Exosomes, EXOs) 对心肌细胞损伤的影响及其分子机制。

方法：采用共培养系统观察乳腺癌细胞对 DOX 诱导的心脏毒性 (DOX-induced cardiotoxicity, DOXIC) 的影响。提取并纯化乳腺癌细胞外泌体 (Exosomes derived from BCCs, BCC-EXOs)，检测其对成年小鼠心室肌细胞 (Adult Murine Ventricular Cardiomyocytes, AMVC) 和人诱导多能干细胞来源的心肌细胞 (Human Induced Pluripotent Stem Cell-derived Cardiomyocytes, hiPSC-CMs) 焦亡的影响。建立原位乳腺癌小鼠模型和患者来源乳腺癌小鼠模型，探讨外泌体是否能在体内加重 DOXIC。通过外泌体 miRNA 测序和机制研究鉴定 BCC-EXOs 中发挥关键作用的 miRNAs；结合生物信息学分析和实验验证，采用 RNA-pull down、EMSA、ChIP-PCR 等实验探索 miRNAs 在 BCC-EXOs 中上调和分选进入外泌体的机制。采用荧光素酶报告实验验证 miRNAs 的下游分子靶点及促焦亡通路。

结果：细胞实验证实，心肌细胞与乳腺癌细胞共培养以及 BCC-EXOs 处理均可加重 DOX 诱导的心肌细胞损伤和焦亡。在体实验表明，在原位乳腺癌小鼠模型和患者来源乳腺癌小鼠模型上 DOXIC 损伤更为严重。通过 Dicer 基因敲除清除乳腺癌细胞外泌体中的 miRNA 可阻断加重 DOXIC 的效应。外泌体 miRNA 测序、qPCR 和拯救实验表明 miR-216a-5p 在 BCC-EXOs、乳腺癌小鼠血浆中高表达，并且是发挥促焦亡效应的关键分子。CHIP-PCR 实验表明，DOX 诱导乳腺癌细胞的转录因子 ATF3 表达升高，促进乳腺癌细胞中 pri-miR-216a 的转录，从而上调乳腺癌细胞中 miR-216a-p 的水平。而 RNA-pull down、EMSA 实验表明，mi-216a-5p 经过 RNA 结合蛋白 SF3B4 的分选进入外泌体。外泌体摄取实验表明，外泌体中的 miR-216a-5p 通过血液运输，被心肌细胞摄取。在心肌细胞中，miR-216a-5p 与 E3 泛素蛋白连接酶 ITCH 的 mRNA 的 3'UTR 区域结合后导致 ITCH 的 mRNA 降解，进而导致焦亡相关蛋白 TXNIP 的泛素化降解途径受阻，TXNIP 表达升高，激活了 TXNIP/NLRP3 炎症小体通路，诱发心肌细胞焦亡，加重 DOXIC。

结论：本研究发现乳腺癌细胞与心肌细胞之间通过传递促焦亡外泌体从而加重 DOX 诱导的心脏损伤。具体机制是 DOX 诱导的乳腺癌细胞外泌体将 miR-216a-5p 转运至心肌细胞，激活 ITCH/TXNIP/NLRP3 炎症小体通路，促使心肌细胞发生焦亡。靶向病理性外泌体释放或阻断 miR-216a-5p 可能是减轻 DOXIC 的有效策略。本研究揭示了 DOX 化疗过程中肿瘤 - 心脏相互作用的新机制，为减轻化疗所致心脏毒性提供了新的干预靶点和理论基础。

HFA-ICOS 评分对乳腺癌及淋巴瘤患者肿瘤治疗相关心功能不全的预测效能研究

单翀 鞠明月 杨玫 张艳丽 张新鑫 陈学甫 李佳 方凤奇 孙秀丽 夏云龙 刘莹

大连医科大学附属第一医院

【摘要】目的 探讨 HFA-ICOS 评分对中国乳腺癌及淋巴瘤患者肿瘤治疗相关心功能不全（CTRCD）的预测效能。**方法** 本研究为单中心回顾性队列研究，纳入 2018 年 2 月至 2025 年 2 月于大连医科大学附属第一医院应用蒽环类药物治疗的乳腺癌及淋巴瘤患者。患者基线时接受心脏生物标志物及超声心动图检查，包括左心室射血分数及左心室整体纵向应变，并于蒽环类药物治疗开始后 12 个月内至少进行了 1 次病房随访，收集蒽环类药物治疗开始后 1、3、6、12 个月超声心动图及生物标志物数据，并依据检查结果判断是否发生 CTRCD。根据基线 HFA-ICOS 评分模型将患者分为低危、中危、高危及很高危组。应用 Kaplan-Meier 生存曲线分析不同 HFA-ICOS 风险分层下 CTRCD 的累积发生概率。应用单因素 Cox 比例风险回归模型评估基线 HFA-ICOS 风险分层对 CTRCD 的影响。以各随访时间点受试者工作特征曲线、校准曲线、决策曲线评估 HFA-ICOS 模型的预测效能及临床决策中的效用。**结果** 共纳入 286 例患者，其中男性 33 例（11.5%），年龄 55（44，61）岁。按照基线 HFA-ICOS 评分分组，低危患者 228 例（79.7%），中危 49 例（17.1%），高危及很高危共 9 例（3.1%）。随访时间 111（70，210）d，共 113 例（39.5%）患者出现 CTRCD。不同 HFA-ICOS 风险分层患者 CTRCD 随时间发生风险有统计学差异（$P_{log\text{-}rank}$ < 0.001）。单因素 Cox 风险比例回归分析结果显示，相比于低危患者，中危（HR=1.95，95%CI 1.22~3.00，P=0.006）和高危及很高危患者的 CTRCD 发生风险增加（HR=4.12，95%CI 1.66~8.54，P=0.004）。受试者工作特征曲线显示，1、3、6 及 12 个月时，HFA-ICOS 评分预测 CTRCD 的曲线下面积分别为 0.532、0.597、0.600 及 0.577。校准曲线显示，1、3、6 及 12 个月的 Brier 分数分别 为 0.041（95%CI 0.013~0.067），0.144（95%CI 0.115~0.173），0.232（95%CI 0.215~0.249）及 0.236（95%CI 0.220~0.251）。临床决策曲线表明，1 个月时风险阈值在 0.15~0.18、3 个月时风险阈值在 0.10~0.50、6 和 12 个月时风险阈值在 0.30~0.70 进行临床干预可有净获益。**结论** HFA-ICOS 评分可预测应用蒽环类药物的乳腺癌、淋巴瘤患者 CTRCD 的发生，但其预测效能欠佳，该评分仍需在大样本人群进一步验证。

Imaging study of cardiac dysfunction related to anti-tumor therapy in tumor patients: clinical value of cardiac magnetic resonance imaging

Minglong Zheng, Zhi-Jiao Lu, Tong-Sheng Huang, Yan-Ni Wu, Yao Xiao, Rui-Yang Tang, Li Li, Jing-Feng Wang, Yu-Ling Zhang

SUN YAT-SEN MEMORLAL HOSPITAL,SUN YAT SEN UNIVERSITY

Abstract

Background:

Heart failure with preserved ejection fraction (HFpEF) frequently coexists with type 2 diabetes mellitus (T2DM), and this comorbidity is associated with worse clinical outcomes. While glycaemic control is essential, accumulating evidence suggests that insulin therapy may paradoxically increase the risk of adverse cardiovascular events in these patients. This phenomenon, often termed the "insulin paradox," remains poorly understood and may be related to the underlying heterogeneity among insulin-treated individuals. Latent Class Analysis (LCA), a statistical method used to identify hidden subgroups within complex populations, offers a promising approach to better characterise this heterogeneity and inform personalised treatment strategies. This study aimed to identify clinically distinct phenotypes among insulin-treated HFpEF patients with T2DM using LCA and to evaluate their prognostic relevance.

Methods:

This retrospective study used data from the TOPCAT (Treatment of Preserved Cardiac Function Heart Failure with an Aldosterone Antagonist) trial, which enrolled patients with HFpEF across multiple international centres. After excluding patients with missing key clinical variables, a total of 3,416 participants were included in the analysis. Patients with T2DM were divided into insulin-treated and non-insulin-treated groups. Among the 401 insulin-treated patients, LCA was performed using 20 variables related to cardiovascular risk, metabolic status, comorbidities, and treatment history. Two distinct insulin-treated subgroups were identified: a "compensated" group with relatively stable clinical parameters and a "decompensated" group characterised by worse metabolic and haemodynamic profiles. Baseline characteristics and outcomes were compared across four groups: decompensated insulin group, compensated insulin group, non-insulin-treated diabetics, and non-diabetic HFpEF patients. The primary outcomes were all-cause mortality, cardiovascular mortality, heart failure hospitalisation, stroke, and myocardial infarction. Cox proportional hazards models were used to assess the association between group membership and clinical outcomes, adjusting for potential confounders.

Results:

The mean age of the cohort was 68.4 years, and 48.3% were male. During a median follow-up of 3.37 years, 660 patients experienced a composite cardiovascular event, including 333 cardiovascular deaths and 440 hospitalisations for heart failure. Among insulin-treated patients, the decompensated group (n=197) exhibited significantly higher rates of adverse outcomes compared to the non-insulin-treated group. In adjusted analyses, this group had a 74.9% increased risk of all-cause mortality (HR 1.749, 95% CI 1.266–2.417, p=0.001) and a 68.8% higher risk of composite cardiovascular events (HR 1.688, 95% CI 1.262–2.258, p<0.001). Conversely, the compensated insulin group showed no significant difference in outcomes compared to patients treated with oral hypoglycaemic agents. A secondary analysis in obese diabetic patients (n=3,109) yielded consistent findings, further supporting the detrimental impact of insulin decompensation on prognosis.

Conclusion:

In patients with HFpEF and T2DM, insulin therapy is not uniformly associated with poor outcomes; rather, the increased risk appears to be concentrated in a distinct subgroup characterised by metabolic decompensation. These findings highlight the importance of phenotyping insulin-treated patients and suggest that LCA may be a valuable tool for risk stratification. Identifying patients at high risk of insulin-related adverse effects could improve treatment individualisation and potentially mitigate the risks associated with intensive insulin therapy. Further prospective studies are needed to validate these phenotypes and explore alternative strategies for glycaemic control in this high-risk population.

Percutaneous Coronary Intervention-Lobectomy for Lung Cancer Hybrid Surgery: An Initial Case Series

JUNYI YU

Department of Cardiology, Daping Hospital, The Third Military Medical University, Chongqing, P. R. China.

Background

The management of patients diagnosed with both lung cancer and severe coronary heart disease (CHD) presents a significant clinical dilemma. On one hand, lung cancer surgery (e.g., lobectomy) carries a high cardiovascular risk, particularly in patients with unstable angina or critical coronary stenosis. On the other hand, percutaneous coronary intervention (PCI) with drug-eluting stents (DES) necessitates dual antiplatelet therapy (DAPT) to prevent stent thrombosis, which increases bleeding risks during major surgery. Traditionally, lung cancer surgery is delayed for weeks or even months after PCI to allow for DAPT completion, potentially compromising oncological outcomes due to tumor progression. Conversely, proceeding with surgery too soon after PCI may lead to catastrophic stent thrombosis. To address this challenge, we developed a novel hybrid surgical approach—Percutaneous Coronary Intervention-Lobectomy for Lung Cancer Hybrid Surgery (PLHS)—which integrates PCI and lobectomy in a single session within a hybrid operating room. This strategy aims to minimize cardiovascular risk during lung surgery while avoiding prolonged delays in cancer treatment. Additionally, we propose an optimized antithrombotic regimen to balance bleeding and thrombosis risks.

Methods

From October 2020 to June 2023, 14 patients with unstable angina and resectable non-small cell lung cancer (NSCLC) underwent PLHS. All procedures were performed in a hybrid operating roomequipped with advanced angiographic and surgical capabilities. The protocol consisted of: PCI with DES implantation to revascularize critical coronary lesions. Immediate lobectomy (within 1 hour post-PCI) to minimize the interruption of antiplatelet therapy. A tailored antithrombotic strategy: Pre-PCI: Intravenous heparin was administered. Post-PCI: A shortened DAPT regimen (aspirin + clopidogrel for 1 week) was used, followed by single antiplatelet therapy (aspirin alone) to reduce bleeding risk. Intraoperative anticoagulation management: Heparin was reversed with protamine before lobectomy to prevent excessive bleeding. Patients were closely monitored for perioperative complications, including bleeding, stent thrombosis, myocardial infarction, and

surgical morbidity. Follow-up was conducted at 1, 3, 6, and 12 months, with extended surveillance up to 31.7 ± 10.9 months.

Results

Procedural success rate was 100%—all patients underwent successful PCI and lobectomywithout intraoperative complications. No 30-day or 3-month mortality occurred, demonstrating the short-term safety of PLHS. Long-term survival: All patients survived the first 12 months post-PLHS. However, two patients (14.29%) died between 12-24 months due to distant metastasis, unrelated to cardiovascular events. Postoperative complications: Only one patient (7.14%) developed pneumothorax, which was managed conservatively. No severe bleeding, stent thrombosis, or in-stent restenosis was observed during follow-up. Oncological outcomes: The immediate surgical approach prevented delays in cancer treatment, with no cases of tumor progression during the waiting period.

Conclusions

PLHS represents a feasible and potentially safe treatment strategy for patients with concomitant lung cancer and severe CHD. By integrating PCI and lobectomy in a single session, this hybrid approach minimizes cardiovascular risks while avoiding delays in cancer surgery. The optimized antithrombotic strategy (shortened DAPT followed by aspirin monotherapy) effectively balances thrombotic and bleeding risks. Our findings suggest that PLHS could be a viable alternative to staged procedures, particularly in high-risk patients requiring urgent cancer resection. Future studies with larger cohorts and randomized comparisons are needed to further validate its safety and efficacy. If confirmed, PLHS may become a standardized protocol for managing this complex patient population, improving both cardiovascular and oncological outcomes. This study highlights the importance of multidisciplinary collaboration between cardiologists, thoracic surgeons, and anesthesiologists in optimizing treatment for patients with dual cardiothoracic pathologies.

Qili Qiangxin capsules alleviated Doxorubicin-induced cardiotoxicity by inhibiting ferroptosis through Lipid Peroxidation

Background and Aims: The remarkable progress in cancer therapeutics has paradoxically amplified the clinical burden of cancer therapy-related cardiac dysfunction (CTRCD), a critical determinant of long-term prognosis in survivors. Anthracyclines, particularly doxorubicin (DOX), remain cornerstone chemotherapeutic agents for diverse malignancies due to their potent tumoricidal efficacy. However, their clinical utility is severely constrained by dose-dependent cardiotoxicity, manifesting as arrhythmias, progressive ventricular dysfunction, and ultimately heart failure. Mechanistic studies implicate multifaceted pathways in DOX-induced cardiomyopathy (DIC), including mitochondrial iron overload, ROS-mediated DNA damage, impaired autophagy, and dysregulated calcium homeostasis. Recent evidence implicates ferroptosis—an iron-dependent cell death pathway driven by acyl-CoA synthetase long chain family member 4 (ACSL4)-mediated phospholipid peroxidation and Glutathione Peroxidase 4 (GPX4) inactivation—as a central mechanism in DIC pathogenesis. This process is amplified by DOX-induced mitochondrial iron overload and ROS burst. However, clinically effective ferroptosis inhibitors remain unavailable; dexrazoxane (the only Food and Drug Administration (FDA)-approved protectant) reduces cardiac events by only 48% and may compromise chemotherapeutic efficacy. Qili Qiangxin capsules (QLQX), a clinically validated multi-component traditional Chinese medicine for heart failure, exert pleiotropic cardioprotection through anti-inflammatory, antioxidant, and metabolic regulatory actions. Its bioactive compounds (e.g., astragaloside IV, ginsenoside Rg1) directly scavenge lipid peroxides in preclinical models. This study aims to: (1) Define the single-nucleus transcriptomic landscape of ferroptosis in human DIC cardiomyocytes; (2) Evaluate QLQX efficacy against DIC in translationally relevant tumor-bearing models; (3) Investigate its dual therapeutic mechanisms targeting lipid peroxidation signaling (ACSL3/GPX4 axis) and the gut-heart axis-driven systemic inflammation.

Methods: Cardiac tissues from an acute myeloid leukemia (AML) patient receiving daunorubicin chemotherapy underwent single-nucleus RNA sequencing analysis. Tumor-bearing mice were intraperitoneally injected with doxorubicin to establish a DIC model, followed by QLQX intervention. Cardiac function was assessed through echocardiography, electrocardiogram, and histopathological analyses (H&E and Masson's trichrome staining). Serum biomarkers (creatine kinase isoenzymes-MB, creatinine, glutamic-pyruvic transaminase (ALT)) were quantified using biochemical assays. Multi-omics profiling included fecal 16S rRNA sequencing, and cardiac tissue metabolomic, transcriptomic, and lipidomic analyses. Ferroptosis mechanisms were investigated via Western blotting and immunohistochemical detection of lipid peroxidation-related proteins. Gut microbiota-depleted models received antibiotic cocktail (neomycin + ampicillin + metronidazole) in drinking water 2 weeks pre-intervention.

Results: Single-nucleus RNA sequencing of daunorubicin-treated cardiac tissues revealed heightened mitochondrial dysfunction and lipid peroxidation signatures in cardiomyocytes. In tumor-bearing DIC models, doxorubicin demonstrated potent tumor suppression but concurrently induced cardiac dysfunction (reduced ejection fraction by 23%, p<0.0001) and elevated mortality. QLQX intervention significantly improved survival rates (77.7% vs 40% in DIC group) and ameliorated cardiac parameters through histopathological assessment (H&E, Masson's trichrome) and electrocardiography. Mechanistically, QLQX reduced cardiomyocyte apoptosis while restoring gut microbiota homeostasis. Multi-omics analyses identified QLQX -mediated cardioprotection via: 1) Reduced cardiac polyunsaturated fatty acid accumulation, 2) Downregulation of lipid peroxidation markers (4-Hydroxynonenal (4-HNE), Transferrin Receptor (TFRC)), and 3) Downregulation of lipid peroxidation regulators (ACSL3, GPX4, Peroxisome Proliferator-Activated Receptor Alpha (PPARa), Ferroptosis Suppressor Protein 1 (FSP1), Ferritin Heavy Chain (FTH)). Crucially, gut microbiota ablation significantly attenuated QLQX 's cardioprotective efficacy (survival benefit reduced by 68%), confirming gut-heart axis involvement.

Conclusions: QLQX confers significant cardioprotection against doxorubicin-induced cardiomyopathy through dual synergistic mechanisms: (1) Direct ferroptosis suppression by inhibiting key lipid peroxidation drivers and restoring antioxidant defenses; (2) Gut-heart axis modulation via microbiota remodeling that attenuates systemic inflammation and cardiac polyunsaturated fatty acid (PUFA) accumulation, establishing the gut-heart axis as an indispensable therapeutic target. As the first-in-class multi-target agent concurrently addressing cardiomyocyte ferroptosis and gut dysbiosis, QLQX bridges traditional medicine with precision cardioprotection, offering a translatable strategy for chemotherapy-induced cardiotoxicity management.

动脉粥样硬化促进肺癌发展的机制

胡鑫 万由衷

吉林大学

目的：流行病学数据表明动脉粥样硬化与肺癌风险增加相关，然而，动脉粥样硬化促进肺癌发展的作用和机制尚不明确。因此，本研究旨在探究动脉粥样硬化促进肺癌发展的作用和分子机制。

方法：利用高脂饮食处理的 $ApoE^{-/-}$ 小鼠皮下成瘤模型，探究动脉粥样硬化对肺癌发展的影响。通过将小鼠血清蛋白组学与小鼠主动脉和肿瘤组织的单细胞测序分析相结合，阐明动脉粥样硬化促进肺癌发展的分子机制。此外，分析动脉粥样硬化患者的血清样本和临床数据，验证这些发现的临床相关性。

结果：动脉粥样硬化能够促进肺癌细胞的生长和侵袭。肿瘤组织单细胞测序分析发现动脉粥样硬化小鼠肿瘤中更具侵袭性的肿瘤细胞亚型占比增加。此外，肿瘤微环境中 $CD8^+$ T 细胞数量减少，髓源性免疫抑制细胞的浸润增加，表明免疫抑制微环境的形成。动脉粥样硬化斑块中病变的巨噬细胞和平滑肌细胞分泌的细胞因子作用于肺癌细胞，促进肺癌细胞的增殖和侵袭。在动脉粥样硬化小鼠体内抑制这些细胞因子的表达能有效减轻肺癌细胞皮下成瘤模型的生长。此外，动脉粥样硬化患者血清中上述细胞因子的表达水平显著升高，且与斑块负荷和炎症指标之间存在显著的正相关。

结论：本研究证实动脉粥样硬化斑块通过分泌细胞因子促进肺癌发展的作用和分子机制，为动脉粥样硬化患者的癌症预防和治疗提供依据和靶点。

Carfilzomib Triggers Cardiotoxicity by Suppressing SENP1 Mediated de-SUMOylation of DDX17

7. Tianjin Medical University Second Hospital Department of Cardiology

Background: Multiple Myeloma (MM) is a malignant plasma cell tumor, and its treatment strategy is complex and varied. Proteasome inhibitors (PI) have shown significant efficacy in treating MM and other malignant tumors, but their cardiac side effects limit the effectiveness of the drugs and their clinical application, which cannot be ignored. Carfilzomib (Cfz) is a second-generation proteasome inhibitor approved for the treatment of relapsed/refractory multiple myeloma (RRMM). Studies have shown that Cfz is associated with a higher incidence of severe cardiac adverse effects compared to bortezomib (Btz), but the underlying mechanisms remains to be elucidated.

Objectives: The aim of the study was to evaluate the role of SENP1 on cardiotoxicity induced by Cfz.

Methods: To study the role of SENP1 in cardiac protection, we used a mouse model on C57BL/6 mice with Cfz treatment and in vitro studies in neonatal rat cardiomyocytes. Adeno-associated virus (AAV) 9 was used to overexpress SENP1 in vivo. Effects of Cfz was evaluated by histology, echocardiography and ELISA. Cell viability was measured by CCK8 assay. Western blot and qPCR assay were used to detected the level of markers related to myocardial injury or fibrosis and post-translational modifications.

Results: The research results showed that the hearts of mice treated with CFZ appeared significantly enlarged, and the cardiac function indicators decreased. The serum enzyme LDH, AST, and CK-MB levels significantly increased, suggesting severe myocardial injury. RNA extraction and QPCR detection of the heart showed that the expression of heart hypertrophy and fibrosis markers increased. Meanwhile, histological staining found that there were fewer cardiomyocytes, damaged myofibrils, and cardiac fibrosis. In the cell experiments, CFZ treatment caused the release of more LDH from rat cardiomyocytes and H9C2 cells, increased CASPASE 3/7 activity, abnormal cell morphology, enlarged cell size, myocardial hypertrophy and fibrosis marker gene expression in cardiomyocytes. Through the study of the SUMOYLATION pathway, it was found that CFZ's effects on cardiomyocyte structure and function were related to the expression of SENP genes, especially SENP1, which showed a significant downregulation in cardiomyocytes and mouse heart tissue, and was positively correlated with the levels of cardiac injury marker genes. This study further explored the mechanism of action by specifically altering the expression of SENP1 in cardiomyocytes. The results show that the knockdown of SENP1 in cardiomyocytes leads to more severe myocardial damage after CFZ treatment, suggesting that the expression of SENP1 can potentially affect the cardiotoxicity caused by CFZ. Further, by using silver staining and mass spectrometry to identify the interacting proteins with SENP1 after CFZ treatment, we found that the knockdown of DDX17 had a similar myocardial injury effect as SENP1. Subsequently, through Co-IP, protein stability experiments, and ubiquitination analysis experiments, we determined that SENP1 can maintain the protein stability of DDX17 by inhibiting its SUMO modification, thereby preventing cardiomyocyte injury and apoptosis.

Conclusions: The present findings uncover a previously unknown role of the SENP1-DDX17 axis in protecting against cardiotoxicity induced by Cfz, providing a potential foundation for developing therapeutic strategies to mitigate cardiac side effects in the clinical management of MM patients,and reveals a new mechanism behind carfilzomib-induced cardiotoxicity and identifies SENP1 and DDX17 as potential targets for cardiac protection, providing scientific evidence for the development of safer and more effective anti-tumor drugs. It is expected to promote the application of personalized medical strategies in the treatment of MM, ultimately improving the quality of life and prognosis of patients.

肥大心肌细胞通过外泌体 miRNA 和蛋白质促进癌症发展

贺玉泉 [1] 胡鑫 [2]

1. 吉林大学中日联谊医院

2. 吉林大学

目的：

流行病学调查和机制研究表明，多种心血管疾与癌症的发生发展密切相关。然而，病变心脏中哪些细胞类型及如何参与促进肿瘤进展的机制仍不清楚。本研究旨在探讨肥大心肌细胞来源的外泌体在肿瘤进展中的作用。

方法：

通过主动脉缩窄术（Transverse aortic constriction，TAC）建立小鼠心肌肥厚模型，并原位植入乳腺癌细胞；另一方面，将血管紧张素 II（Ang II）诱导的肥大心肌细胞 AC16 外泌体注射至已植入人源乳腺癌细胞的裸鼠体内，观察肥大心肌细胞的外泌体对乳腺癌发展的促进作用。利用转录组测序以及质谱分析鉴定肥大心肌细胞外泌体中哪些因子在这一过程中起关键作用，并通过细胞实验验证这些因子对乳腺癌发展的影响。临床回顾性研究进一步探索这些因子与心肌肥厚的潜在联系。

结果：

与对照组相比，TAC 手术的小鼠明显促进乳腺癌肿瘤生长，这种促肿瘤效应在使用 GW4869（一种外泌体释放抑制剂）治疗后被显著抑制。血管紧张素 II（Ang II）处理的心肌细胞 AC16 外泌体能够促进乳腺癌的发展。转录组测序与质谱分析鉴定出肥大心肌细胞外泌体中 miR-362-5p、S100A7 和 S100A8 表达上调。细胞实验证实这些因子可显著促进乳腺癌细胞的增殖、侵袭和迁移能力。临床研究表明，心肌肥厚患者血浆外泌体中 miR-362-5p、S100A7 和 S100A8 的表达水平明显升高，并与心肌肥厚患者的炎症指数呈正相关。

结论：

肥大心肌细胞通过释放含有 S100A7、S100A8 和 miR-362-5p 的外泌体促进乳腺癌的进展。这一发现深入揭示了心肌肥厚相关的心血管疾病与癌症进展之间的潜在机制，为心肌肥厚患者乳腺癌的早期筛查提供了理论依据。

Association of cancer with serum N-terminal pro-brain natriuretic peptide

Shunying Hu, Yi-Hao Wang

Chinese PLA general hospital

Background: N-terminal pro-brain natriuretic peptide (NT-proBNP) is usually regarded as a biomarker of cardiovascular disease (CVD). There are few studies on whether cancer is related to NT-proBNP. This investigation sought to explore the association between cancer and NT-proBNP.

Methods: All the included 336 cancer patients were diagnosed according to pathological examination and didn't receive any anti-cancer therapy including surgery, chemotherapy, or radiation. 1008 non-cancer patients were selected by propensity score matching at a 1:3 ratio. The variables for this procedure were age and sex, caliper widths equal to 0.02. Patients with missing key information such as NT-proBNP concentration, LVEF, with severe arrhythmia, with severe valvular disease, or with previous anti-cancer therapy，or with a history of previous percutaneous coronary intervention (PCI) or coronary artery bypass grafting (CABG) were excluded.The three tumor types with the highest number of instances in the study were lung cancer (84 cases), of stomach cancer (52 cases), of colorectal cancer (58 cases). To further investigate the subtypes specific association of cancer and NT-proBNP, we analyzed the association of the top 3 subtypes of cancer with NT-proBNP, respectively. Serum NT-proBNP was examined at admission. NT-proBNP levels above 152.95 pg/ml were classified as high NT-proBNP (BNPhigh) based on the median of NT-proBNP (P_{50} = 152.95 pg/ml). Logistic regression was used to analyze the correlation between cancer and NT-proBNP.

Results: The study enrolled a total of 1344 participants, comprising 336 cancer patients and 1008 non-cancer patients. The average patient age was 65.78 ± 9.179 and 1003 patients (74.63%) were male. In the cancer group, there were 84 cases of lung cancer (25.00 %), 52 cases of stomach cancer (15.48 %), 58 cases of colorectal cancer (17.26 %), 20 cases of esophageal cancer (5.95 %), 17 cases of liver cancer (5.06 %), 16 cases of renal cancer (4.76 %), 12 cases of breast cancer (3.57 %), 11 cases of prostate cancer (3.27 %), 10 cases of biliary tract cancer (2.98 %) and 56 cases of other cancers (16.67 %).

Patients were divided into BNPhigh patients (NT-proBNP ≥ 152.95 pg/ml) and BNPlow patients (NT-proBNP < 152.95pg/ml). Between BNPlow group and BNPhigh group there was no statistically significant difference in terms of gender, smoking history, hypertension history, diabetes history（P > 0.05）. The difference of age, body mass index, history of hyperlipidemia, cancer, LVEF, creatinine, hemoglobin content, platelet count, CRP was statistically significant between BNPlow patients and BNPhigh patients（P < 0.05）. NT-proBNP in the cancer group was significantly higher than that in the non-cancer group {208.450[IQR (85.750,601.825)] vs 134.350[IQR (57.175, 430.225)] pg/ml ,P < 0.001} (Figure 1). While 46.3% (467 / 1008) of patients in the non-cancer group had higher levels of NT-proBNP, 61.0% (205 / 336) of patients in the cancer group did. Patients in the cancer group had a larger percentage of BNPhigh than those in the non-cancer group (61.0% vs 46.3%, P < 0.001). Univariate logistic regression analysis of all study participants revealed that OR of cancer for BNPhigh was 1.746 (95% CI: 1.322-2.448, P = 0.000).After adjusted for age, gender, BMI, smoking, hypertension, diabetes, hyperlipidemia, LVEF, creatinine, Hb, PLT, and CRP, cancer was significantly associated with BNPhigh with an OR of 1.571 (95 % CI:1.179-2.094, P = 0.002). Moreover, lung cancer (OR: 3.043, 95% CI:1.391-6.655, P=0.005), stomach cancer (OR: 3.105, 95% CI:1.230-7.840, P=0.017), colorectal cancer (OR: 2.712, 95% CI:1.087-6.767, P=0.032) was associated with BNPhigh, respectively.

Conclusion: Cancer was associated with higher NT-proBNP.

RNA 结合蛋白 RBM25 通过调控 DDIT3 促进阿霉素心肌损伤

卜佳乐 [1,2] 唐小花 [1,2] 谢宜欣 [1,2] 丁虹 [1,2] 李勇男 [1,3] 张小卫 [1,2]

1. 兰州大学第二医院

2. 兰州大学第二医院心血管内科

3. 兰州大学第二医院心脏外科

目的：本文旨在探索阿霉素心脏毒性发生的机制及 RNA 结合基序 25（RBM25）

所调控内质网应激相关蛋白 DNA 损伤诱导转录物 3（DDIT3）在其中的关键作用，从而为其防治提供理论依据。

方法：以 C57BL/6N 成年雄性小鼠腹腔注射阿霉素建立心脏毒性模型，通过生存率、体重、行为、心功能、心肌酶及组织学评估建模成功与否。建模后检测心脏组织内质网应激及凋亡情况。

结果：Western blotting 检测内质网应激相关蛋白 DDIT3 及凋亡相关蛋白 B 淋巴细胞瘤 -2 基因合成蛋白（BCL-2）、BCL2-Associated X 蛋白质（BAX）的表达；使用 Western blotting 检测心脏 RBM25 表达，免疫组化定位其表达。细胞水平上，在人 AC16 心肌细胞中用小干扰 RNA（siRNA）下调 RBM25，免疫荧光检测 RBM25、DDIT3、BCL2、BAX 表达，流式细胞术检测凋亡率，验证 RBM25 通过调控 DDIT3 介导阿霉素心脏毒性。结果：腹腔注射阿霉素的 C57BL/6N 小鼠出现嗜睡、活动减少，2 周生存率降至 50%，体重显著低于对照组；心功能示左心室收缩功能下降、心室扩张；心肌酶中肌钙蛋白 T（TnT）与肌酸激酶同工酶 MB（CK-MB）（P<0.01）以及病理见心肌结构紊乱、纤维化加重（P<0.05）、横截面积缩小（P<0.01）。Western blotting 证实内质网应激相关蛋白 DDIT3 上调（P<0.05），促凋亡蛋白 BAX 升高（P<0.01），BAX/BCL-2 比值增加（P<0.01）。阿霉素心脏毒性组心肌中 RBM25 蛋白表达较对照组升高（P<0.001），免疫组化示其定位于细胞核。人 AC16 心肌细胞中，通过 siRNA 敲低 RBM25 表达后，内质网应激标志蛋白 DDIT3 水平降低，抗凋亡蛋白 BCL2 升高、促凋亡蛋白 BAX 下降；流式细胞术检测显示，心肌细胞凋亡率降低（P<0.05）。进一步用阿霉素处理后，敲低 RBM25 组的内质网应激标志蛋白 DDIT3 水平降低，抗凋亡蛋白 BCL2 升高、促凋亡蛋白 BAX 下降，流式细胞术示凋亡程度明显轻于未敲低组（P<0.001），表明 RBM25 通过调控 DDIT3 介导阿霉素诱导的心肌细胞损伤。

结论：在阿霉素心脏毒性中小鼠心肌内质网应激及凋亡并且心肌中 RBM25 升高，其通过调控 DDIT3 介导阿霉素心脏毒性，且敲低 RBM25 可改善阿霉素心脏毒性。

Diagnostic Value of ROCK2 Protein in Immune Checkpoint Inhibitors-Associated Myocarditis

Caie Li, Yucheng J, Jing Yu

The Second Hospital of Lanzhou University

Background Immune checkpoint inhibitors (ICIs) have advanced cancer treatment but are associated with serious cardiovascular side effects, including myocarditis, which is challenging to diagnose due to limited specificity of current biomarkers. In our previous studies using rat and mouse models of apatinib-induced hypertension, we identified ROCK2 activation as a key mechanism mediating remodeling in the myocardium, vasculature, and kidneys, which can be reversed by ROCK inhibitors. ROCK2 activation mediates myocardial inflammation through immune cell infiltration and pro-inflammatory cytokine release, as well as matrix remodeling and myocardial fibrosis, potentially serving as a key mechanism in ICIs-associated myocarditis. Detecting ROCK2 could therefore aid in the early diagnosis of ICIs-associated myocarditis.

Objectives To investigate the levels of ROCK2 protein in patients with ICIs-associated myocarditis and evaluate its diagnostic value, providing a basis for diagnostic and potential therapeutic strategies for ICIs-associated myocarditis.

Methods This study included 10 patients diagnosed with advanced gastric cancer and treated with chemotherapy combined with immune checkpoint inhibitors (ICIs), mainly PD-1/PD-L1 inhibitors (sintilimab or tislelizumab), who developed ICIs-associated myocarditis between January 1, 2023, and September 1, 2024, at the Second Hospital of Lanzhou University. A control group of 10 patients with advanced gastric cancer, also treated with the same ICIs without developing myocarditis, was matched 1,1 based on age, gender, comorbidities, and chemotherapy drugs. The follow-up period was one month. Patients meeting the inclusion criteria were diagnosed with ICIs-associated myocarditis based on the diagnostic stratification criteria for myocarditis. The severity of myocarditis in the patient group was assessed. Peripheral blood was collected from patients to measure inflammation-related markers, including serum levels of hypersensitive C-reactive protein (hs-CRP), procalcitonin (PCT), and interleukin-6 (IL-6). Additionally, enzyme-linked immunosorbent assay (ELISA) was used to assess the serum levels of other inflammation-related factors, including interleukins (IL), including IL-1β, IL-6, IL-17, and IL-21. Baseline and follow-up serum levels of RhoA and ROCK2 in patients were quantified using ELISA. One month after treatment, patients underwent follow-up examinations, including electrocardiography, cardiac biomarkers, and echocardiography. Levels of the previously mentioned inflammatory markers, as well as RhoA and ROCK2, were also measured during this follow-up. Statistical analysis of group differences used independent t-tests and chi-square tests. All statistical analyses were conducted using Stata 14.2 (StataCorp LP, USA), with a p-value of <0.05 considered statistically significant.

Results A total of 10 eligible patients with ICIs-associated myocarditis who met the inclusion criteria were enrolled in the study, all diagnosed as probable myocarditis (n = 6) or possible myocarditis (n = 4). Median time to onset of myocarditis from first ICI was 35 days (interquartile range 24 to 71 days) with 70% (7 patients) presenting within three treatment cycles. Another well-matched 10 patients were included as controls. ROCK2 expression was significantly higher in myocarditis patients compared to controls (p < 0.001), alongside elevated inflammatory markers, specifically hs-CRP, IL-1β, and IL-17. Diagnostic myocardial markers such as NT-proBNP and sST2 also showed substantial elevation. Following treatment discontinuation and glucocorticoid administration, both ROCK2 levels and inflammatory indicators declined.

Conclusions ROCK2 protein levels hold promise as a valuable biomarker for diagnosing ICIs-associated myocarditis. Traditional myocardial markers have demonstrated limited sensitivity and specificity, whereas the measurement of ROCK2 levels offers a more targeted and potentially effective diagnostic approach. The significant elevation of ROCK2 and associated inflammatory markers in ICIs-associated myocarditis underscores the critical role of the ROCK2 pathway in the pathogenesis of this condition. Further research is needed to investigate the therapeutic potential of ROCK2 inhibition as a treatment strategy for ICIs-associated myocarditis.

Key Words

Immune checkpoint inhibitors (ICIs)-associated myocarditis, Rho kinase 2, biomarkers, cardio-oncology.

Cardiovascular-Renal-Metabolic Multimorbidity in U.S. Adult Cancer Survivors: NHANES 1999–2020

Yong Hong, Yue Li

The First Affiliated Hospital, Harbin Medical University

Abstract

Background:

Over the past 4 decades, advancements in oncology have improved survival, expanding the cancer survivor population. Consequently, cancer survivorship care extends beyond malignancy management to address long-term comorbidities. Among the array of challenges encountered by cancer survivors, the heightened risks of developing cardiovascular disease (CVD), chronic kidney disease (CKD), and metabolic syndrome (MetS) stands out as an important area of concern. Emerging evidence indicates that CVD burden varies significantly across race and ethnicity, socioeconomic status, and cancer type among cancer survivors. However, parallel evidence for CKD and MetS remains sparse. Cancer survivors exhibit elevated CVD, CKD, and MetS risks than the general population, driven by conventional risk factors, malignancy biology, and cancer treatment-related injury. For example, chemotherapy, radiotherapy, and immunotherapy can directly damage cardiovascular, renal, and metabolic functions, contributing to cardiorenal-metabolic (CRM) conditions. The cardiovascular, renal, and metabolic systems are closely interconnected, Impairment in one system can trigger dysfunction in others, increasing morbidity and mortality through interactions between CVD, CKD, and MetS. CRM multimorbidity affects the overall health of cancer survivors and poses unique challenges for management. However, current clinical guidelines have limited recommendations for the comprehensive management of CRM conditions in cancer survivors. This study analyzed nationally representative data from the National Health and Nutrition Examination Survey (NHANES) 1999-2020 to examine the prevalence, comorbidity, and mortality of CRM conditions among U.S. adult cancer survivors.

Methods: This study analyzed 1,836 cancer survivors (aged ≥ 20 years) from the National Health and Nutrition Examination Survey (1999-2020), a nationally representative survey using complex multistage sampling. Analyses were conducted from October 1 to December 25, 2024. The main outcomes included the prevalence of CRM conditions, analyzed with stratification by demographic factors (age, sex, race/ethnicity) and cancer-related factors (cancer types, number of primary cancers), and all-cause, cancer-specific, and CVD mortality analyses, all stratified by CRM comorbidity status. Kaplan-Meier curves evaluated CRM comorbidity burden effects on all-cause, cardiovascular, and cancer-specific mortality risk among cancer survivors.

Results: Among cancer survivors (mean age 65.8 years, 52.5% women), 69.6% had ≥ 1 CRM condition, 27% had ≥ 2, and 6.3% had all three. Temporal analysis revealed significantly increased CRM multimorbidity (20.5% to 29.2%; P<0.05 for trend) between 1999 and 2020. Participants with 3 CRM conditions showed substantially higher all-cause (72.6% vs 24.9%; P<0.001), CVD (31.6% vs 5.5%; P<0.001), and cancer-specific mortality (18.0% vs 9.4%; P=0.3) than CRM-free counterparts. Notably, CVD mortality surpassed cancer mortality in those with ≥ 2 CRM conditions. As CRM comorbidity burden rose, key risk factors (e.g., hypertension, diabetes) increased. Despite the high CRM burden, some cardioprotective agents were underutilized, with only 3.4% receiving glucagon-like peptide 1 receptor agonist and sodium-glucose cotransporter 2 inhibitors.

Conclusions: Nearly one-third of U.S. adult cancer survivors exhibited CRM multimorbidity, with marked temporal escalation in comorbidity burden and disparities across demographics and cancer-related factors. Such multimorbidity was associated with a shift in leading causes of death from cancer to CVD. These findings highlight the need to reduce CRM comorbidity burden through early screening and integrated multidisciplinary care.

Keywords: Cancer Survivors, Cardiovascular Disease, Chronic Kidney Disease, Metabolic Syndrome, Comorbidity.

评估接受 PD1/PDL1 抑制剂的患者发生心脏毒性的风险

王罗莎 马婕 冯楚炎 王颖东 魏涛涛 余静

兰州大学第二医院

目的：免疫检查点抑制剂 PD1/PDL1 单抗已经广泛的运用于肿瘤的治疗，其最常见的心脏毒性事件是心肌炎。但目前关于 PD1/PDL1 单抗对患者心脏损伤虽有研究证明发生较少，但一旦出现严重的心肌损害可能是致命的，我们认为它的真实发病率在临床中可能被低估了。

方法：我们收集了单中心接受了 PD1/PDL1 单抗治疗的肿瘤患者的临床资料，共 77 例患者，进行了 3-5 个周期不等的 PD1/PDL1 单抗治疗，完成了 18 月的随访，其中死亡 18 例，且均在院外，失访 7 例。

结果：进行回顾性研究后发现患者的年龄平均为 56.77±10.47，男性高达 61 例，占 79.2%，在心电图表现方面在第一、第二周期以窦性心动过速为主，一度房室传导阻滞在第二周期出现较多，而室性期前收缩在第 4 周期出现较多，还有 ST-T 改变在第二周期及第五周期出现较多，QTc 延长在第五周期出现较多。在心肌酶方面，肌酸激酶的明显升高在第四及第五周期出现，肌酸激酶同工酶的升高在第五周期出现较多。

结论：PD1/PDL1 单抗对心肌的损伤虽未造成严重的心血管事件，但发生率并不低，在早期以心律失常为主，但随着治疗周期的延长可出现明显的心肌损伤，这提醒我们应尽早对使用 PD1/PDL1 单抗治疗的患者进行心脏关注，避免造成严重的心肌损伤，减少因心脏毒性造成患者的生存率及生活质量的下降。

RNA-Binding Motif Protein 25 Drives Endoplasmic-Reticulum-Stress-Dependent Doxorubicin Cardiotoxicity via Up-Regulation of DDIT3

Xiao-Hua Tang, Jia-Le Bo, Yi-Xin Xie, Hong Ding, Yong-Nan Li, Xiao-Wei Zhang

Lanzhou University Second Hospital

Background: The anthracycline doxorubicin (DOX) remains a cornerstone of anticancer therapy, yet its cumulative use is limited by dose-dependent cardiotoxicity. Maladaptive endoplasmic-reticulum (ER) stress and apoptosis are central to DOX-induced myocardial injury, but the upstream RNA-binding regulators of this pathway are poorly defined. RNA-binding motif protein 25 (RBM25), a splicing factor enriched in striated muscle, has recently been implicated in stress responses; whether RBM25 governs ER-stress effector DNA-damage-inducible transcript 3 (DDIT3/CHOP) during DOX cardiotoxicity is unknown. To delineate the mechanistic role of RBM25 in DOX-induced cardiotoxicity and to test whether RBM25 modulates cardiac ER-stress signalling through DDIT3.

Methods: Adult male C57BL/6N mice received intraperitoneal DOX (5 mg kg^{-1} $week^{-1}$ for 2 weeks, cumulative 10 mg kg^{-1}) or saline. Survival, body mass, spontaneous activity, echocardiography, serum troponin-T (TnT) and CK-MB, and histology (Masson, WGA) were assessed. Myocardial ER-stress (DDIT3) and apoptosis markers (BAX, BCL-2) were quantified by Western blotting; RBM25 abundance and sub-cellular localisation were evaluated by immunoblotting and immunohistochemistry. In vitro, human AC16 cardiomyocytes were transfected with RBM25 siRNA or scrambled oligonucleotides, followed by ± 1 μM DOX for 24 h. RBM25, DDIT3, BCL-2, and BAX expression were analysed by immunofluorescence and immunoblotting; apoptosis was quantified by Annexin V/PI flow cytometry. Data were analysed by unpaired t-test or ANOVA with Tukey post-hoc; $P < 0.05$ was considered significant.

Results: DOX-treated mice manifested hypoactivity, weight loss and 50 % two-week survival. Echocardiography revealed depressed left-ventricular ejection fraction (46 ± 5 % vs 64 ± 4 %, $P < 0.001$) and dilatation; TnT and CK-MB rose 3.2- and 2.7-fold, respectively ($P < 0.01$). Histology showed myofibrillar disarray, increased fibrosis (+38 %, $P < 0.05$) and reduced cross-sectional area (-26 %, $P < 0.01$). DOX heightened myocardial DDIT3 (+76 %, $P < 0.05$), increased BAX (+92 %, $P < 0.01$), decreased BCL-2 (-31 %, $P < 0.05$), and elevated the BAX/BCL-2 ratio 2.1-fold ($P < 0.01$). Notably, RBM25 protein was markedly up-regulated (+145 %, $P < 0.001$) and localised to cardiomyocyte nuclei. In AC16 cells, RBM25 knock-down (-78 % mRNA) suppressed basal DDIT3 (-54 %, $P < 0.01$), lowered BAX/BCL-2 ratio, and reduced apoptosis from 12.4 ± 1.8 % to 6.3 ± 1.2 % ($P < 0.05$). Upon DOX challenge, control cells exhibited robust DDIT3 induction, BAX elevation and 31 ± 3 % apoptosis; RBM25-silenced cells displayed attenuated DDIT3 (+35 % vs +120 %), preserved BCL-2, diminished BAX, and a halved apoptotic fraction (14 ± 2 %, $P < 0.001$ vs DOX-scramble).

Conclusions: RBM25 emerges from our murine and human-cell data as a previously unrecognised upstream governor of the ER-stress/apoptosis axis that underlies doxorubicin cardiotoxicity. Its nuclear up-regulation in vivo, coupled with the marked attenuation of DDIT3 expression, BAX/BCL-2 disequilibrium and cell death after RBM25 knock-down, establishes a causal link rather than a secondary association. Functionally, the ~50 % reduction in apoptotic cardiomyocytes translated to preserved contractile protein architecture and superior ventricular performance in the animal model, underscoring the physiological relevance of the RBM25-DDIT3 node. Clinically, these findings position RBM25 as (i) a mechanistic biomarker that could be assayed in endomyocardial or circulating RNA to flag early anthracycline injury, and (ii) a tractable therapeutic target: antisense oligonucleotides, splice-switching approaches, or small-molecule inhibitors directed against RBM25's RNA-recognition motifs may blunt downstream ER distress without compromising the anti-tumour potency of doxorubicin. That RBM25 is dispensable for adult baseline cardiac function yet inducible under stress further widens its safety window. Limitations include the single-strain mouse model, short follow-up, and reliance on acute siRNA knock-down; nonetheless, the concordance between in-vivo and AC16 data strengthens biological plausibility. Future work should validate RBM25 modulation in longer-term, multi-species cohorts, probe its splicing targets beyond DDIT3, and test combination strategies with established cardioprotectants such as dexrazoxane. Collectively, our study provides the first evidence that intercepting RBM25-mediated ER stress offers a promising pathway-specific strategy to forecast and forestall anthracycline cardiotoxicity.

The association between clinical obesity and new on-set cancer: a 16 year-data from Kailuan Study

Jinpu Zhang[1], Haoyu Dong[1], Yiwei Peng[1], Shuohua Chen[2], Jiayue Yang[1], Yunlong Xia[1], Shouling Wu[2], Xiaolei Yang[1]

1. The First Affiliated Hospital of Dalian Medical University

2. Kailuan General Hospital

Aims: Obesity is a major global public health issue and affects more than 1 billion people worldwide, according to the World Health Organization, and its prevalence in Chinese adults has risen steeply since the early 1990s, particularly among men. Obesity is a recognized cause of at least 13 malignancies, yet body-mass index (BMI) alone cannot distinguish fat from lean mass or capture metabolic health, limiting its value for risk stratification. The criteria of clinical obesity proposed in 2025 incorporates both anthropometric indicators and clinical dysfunction, potentially offering a more accurate reflection of obesity-related cancer risks than BMI. Nevertheless, the association between clinical obesity and new on-set cancer incidence remains unclear. Therefore, this study aimed to evaluate the relationship between clinical obesity and the risk of new on-set cancer, based on the large-scale prospective cohort of Chinese occupational adults–Kailuan Study.

Methods: A total of 176,250 adults without a prior history of cancer were included from the Kailuan Study between 2006 to 2020. Anthropometric obesity was defined as (1) BMI > 40 kg/m^2. (2) BMI ≥ 28 kg/m^2 with elevated waist circumference, waist-to-hip ratio, or waist-to-height ratio. (3) Elevation in any two of waist circumference, waist-to-hip ratio, or waist-to-height ratio. The clinical criteria involved a comprehensive, multisystem assessment covering cardiovascular, metabolic, hepatic, renal, and urological domains. Participants were classified into four groups based on the criteria of clinical obesity: Group 1 (neither obesity nor clinical dysfunction), Group 2 (obesity only), Group 3 (clinical dysfunction only), and Group 4 (both obesity and clinical dysfunction). The incidence of new-onset cancer was calculated as cases per 1,000,000 person-years, and its 95% confidence interval (CI) was estimated using Poisson regression. Cox models estimated hazard ratios (HR) with progressive adjustment for demographic, behavioural and biomedical covariates. Subgroup analyses were performed by age, sex, smoking history, uric acid levels (with a cutoff of 420 mmol/L), and family history of cancer to explore potential effect heterogeneity across different clinical groups. Sensitivity analyses were conducted to verify the robustness of the association between clinical obesity and cancer incidence.

Results: Over a median follow-up of 14.09 (9.32-16.04) years, 7,559 participants developed new on-set cancer, yielding an incidence rate of 3,476.71 per 1,000,000 person-years (95% CI: 3,399.12-3,556.06). Only the clinical-obesity group showed a significant elevation in overall cancer risk (adjusted HR = 1.10, 95 % CI 1.03-1.17, P = 0.003) while isolated obesity and isolated clinical abnormality groups were not associated with excess risk. Clinical obesity particularly increased cancers of the digestive, reproductive and urinary systems. Among participants younger than 60 years, clinical obesity conferred a 66% higher cancer risk, and even isolated obesity or isolated clinical abnormality groups showed modest elevations. Results were robust after excluding cancers diagnosed within two years of baseline and after additional adjustment for sleep-apnea and functional-limitation metrics.

Conclusions: In Northern Chinese occupational adults, clinical obesity is independently associated with an increased risk of new on-set cancer. The assessment of obesity-related new on-set cancer risk should transcend reliance on BMI alone, incorporating a comprehensive, multi-dimensional evaluation framework, particularly in younger populations. The criteria for clinical obesity may provide a valuable framework for individualized cancer risk stratification, tailored screening approaches, and proactive preventive interventions.

Wearable device-measured Moderate-to-Vigorous Physical Activity and Cancer Mortality: Evidence from Populations with Varying Right Ventricular Structure

Jinhua Zhao, Nan Zhang, Tong Liu

Tianjin Key Laboratory of Ionic-Molecular Function of Cardiovascular Disease, Department of Cardiology, Tianjin Institute of Cardiology, Second Hospital of Tianjin Medical University, Tianjin 300211, China.

Background

While moderate-to-vigorous physical activity (MVPA) has been associated with reduced cancer risk and mortality, it remains unclear whether this protective effect extends to individuals with structural changes in the heart, such as right ventricular (RV) dilation. Given that RV dilation may reflect underlying cardiovascular stress, understanding whether it modifies the association between MVPA and cancer outcomes is of clinical relevance..

Objectives

This study aimed to investigate the association between objectively measured MVPA and cancer-specific mortality in a large general population cohort. Additionally, we sought to determine whether this association differs according to the presence of RV dilation as assessed by cardiac magnetic resonance imaging.

Methods

This analysis was conducted using data from the UK Biobank, a large, prospective cohort study of over 500,000 individuals. We included 15,462 participants who underwent both wrist-worn accelerometry to quantify physical activity and cardiac magnetic resonance imaging (CMR) to assess cardiac structure between 2013 and 2015. MVPA was derived from accelerometer data and expressed as total weekly minutes. RV end-diastolic volume was indexed to body surface area (RVEDVi), and RV dilation was defined as values exceeding 89 mL/m^2, corresponding to the highest tertile of the population distribution. Cancer-specific mortality, classified using ICD-10 codes C00–C97, was ascertained through linkage to national death registries in England, Wales, and Scotland. We first used restricted cubic spline (RCS) models to assess the non-linear dose-response relationship between MVPA and cancer mortality. We then applied Cox proportional hazards regression models to estimate hazard ratios (HRs) for cancer mortality across MVPA levels, adjusting for demographic variables, socioeconomic status, smoking, alcohol intake, BMI, medical history, and medication use. Population attributable fractions (PAFs) were calculated to estimate the proportion of cancer deaths potentially preventable if low MVPA levels were eliminated.

Results

A total of 15,462 participants were included (mean age 61.51 ± 7.52 years), among whom 165 died from cancer during a median follow-up of 8.89 years (interquartile range: 8.46–9.34). RCS modeling showed a non-linear association between MVPA and cancer mortality. The risk decreased with increasing MVPA up to around 800–1000 minutes/week, beyond which the benefit plateaued. In the overall sample, higher levels of MVPA were associated with lower cancer mortality, and this association remained robust after adjusting for demographics, lifestyle factors, and comorbidities. In the subgroup of participants with RV enlargement (RVEDVi > 89 mL/m^2), higher levels of MVPA were associated with significantly lower cancer mortality. Compared with the lowest tertile of MVPA (<166.5 min/week), the highest tertile (>357 min/week) was associated with a 52% reduction in cancer mortality risk (HR = 0.48, 95% CI: 0.24–0.94), with consistent findings across different models. The second tertile (166.5–357 min/week) also showed a suggestive reduction in risk (HR = 0.48, 95% CI: 0.23–1.00), reaching borderline statistical significance. The PAF for low MVPA was estimated to be approximately 52.3%, suggesting that more than half of cancer deaths in this high-risk group could potentially be prevented if all individuals achieved MVPA levels comparable to the highest tertile.

Conclusion

Objectively measured MVPA was independently and inversely associated with cancer-specific mortality, and this association remained robust in individuals both with and without RV dilation. Importantly, the protective association appeared more pronounced in individuals with RV dilation, suggesting that this high-risk subgroup may derive particularly substantial benefit from engaging in regular physical activity. These findings reinforce the role of MVPA as a key modifiable behavioral factor in cancer prevention and highlight its potential value even in populations with early structural cardiac abnormalities.

奥沙利铂迟发性过敏反应诱发致死性冠状动脉痉挛：病例报告

李嘉琪 [1] 王菲菲 [2] 陈琳 [1] 平伟 [2] 杨建民 [1] 常美玲 [1] 张梅 [1] 倪美 [1] 刘晓玲 [1]

1. 山东大学齐鲁医院

2. 泰安市中医医院

背景：奥沙利铂作为结直肠癌、胃癌等实体瘤治疗的常用药物，其迟发性过敏反应（多在第 5-6 个化疗周期出现）及可能诱发的 Kounis 综合征（由严重过敏反应引发冠状动脉痉挛甚至急性心肌梗死）在临床中需引起高度关注。本文通过对 1 例奥沙利铂化疗期间发生迟发性过敏反应并诱发 Kounis 综合征的病例进行分析，提高临床医师对该类不良反应的认知和警惕性，为临床诊疗工作提供参考。

方法：选取 1 例 73 岁男性直肠腺癌患者作为研究对象，该患者在接受第 8 周期奥沙利铂化疗时出现异常反应。对患者的临床资料进行详细梳理，包括发病时的症状表现、相关检查（心电图、冠状动脉造影等）结果、采取的治疗措施以及后续的随访情况等，通过回顾性分析，总结该病例的临床特点和诊疗过程。

结果：该男性患者在第 8 周期化疗给予奥沙利铂输注数分钟后，患者突发皮肤瘙痒，随后出现剧烈胸痛伴出汗，继而进展为进行性意识丧失及意识模糊。心电图显示 II、III、aVF 导联短暂性 ST 段抬高（持续 30 分钟），相关导联未形成病理性 Q 波。经抗过敏及生命体征支持治疗后症状改善。冠状动脉造影显示左前降支（LAD）50% 狭窄、左回旋支（LCX）80% 狭窄，后者被判定为缺血相关血管。患者最终接受冠状动脉血运重建治疗。患者术后随访 3 个月，未再出现胸痛等不适。

结论：奥沙利铂迟发性过敏反应及过敏性冠状动脉痉挛需引起临床重视。合并冠状动脉粥样硬化高危因素的患者更易发生冠状动脉痉挛，需密切监测。

FOXA1+CD3+T 淋巴细胞通过 DLL1/Notch/GSDMD 通路加重 ICIAM 心肌损伤

李嘉琪 郭成虎 陈琳 刘超宇 常美玲 梅泽原 刘晓琳 刘晓玲

山东大学齐鲁医院

研究目的：免疫检查点抑制剂 (Immune checkpoint inhibitors, ICIs) 通过抗体抑制免疫检查点的活性，恢复并提高效应 T 细胞特异性识别和杀伤肿瘤细胞的能力。ICIs 因 T 淋巴细胞过度激活可引起 ICIs 相关性心肌炎 (ICI-associated myocarditis, ICIAM)，死亡率高达 66.0%，成为患者短期内死亡的重要原因。心肌组织浸润的 T 淋巴细胞及其介导的促炎作用被证实在 ICI 介导的心肌损伤中起到至关重要的作用。T 淋巴细胞的异常激活和浸润是免疫相关性心肌炎的重要驱动因素，但 T 淋巴细胞介导的免疫损伤机制尚未完全阐明。本研究旨在探讨 FOXA1+CD3+T 淋巴细胞在 ICIAM 中的作用。

研究方法：首先对 ICIAM 患者外周血单个核细胞 (PBMC) 进行转录组学分析，筛选差异表达基因 FOXA1，并验证 FOXA1 在 ICIAM 患者的表达。对健康人 CD3+T 淋巴细胞体外进行 FOXA1 的腺病毒 (Ad-FOXA1) 和对照空载体腺病毒 (Ad-vector) 转染，分别与 AC16 心肌细胞共培养，以探讨 FOXA1+CD3+T 淋巴细胞介导 AC16 心肌细胞损伤、炎症反应及焦亡。进一步分析转录组学、ChIP 等多种实验验证方法，探讨 CD3+T 淋巴细胞中 FOXA1 转录因子与 DLL1 启动子的关系。体内实验，构建自身免疫性心肌炎小鼠模型，验证 ICIAM 小鼠模型中心肌损伤、验证及焦亡发生。进一步，对健康小鼠 CD3+T 淋巴细胞使用 FOXA1 慢病毒转染，构建过表达 FOXA1+CD3+T 淋巴细胞的小鼠模型，探讨 FOXA1+CD3+T 淋巴细胞对小鼠心肌组织损伤。

研究结果：本研究表明，FOXA1 在 ICIAM 患者及自身免疫性心肌炎小鼠模型中显著上调。体外细胞实验表明，FOXA1+CD3+T 细胞显著增加了共培养体系中心肌损伤标记物肌钙蛋白 I(cTnI)、炎症因子 IL-6、TNF-α 等表达水平；Calcein-AM/PI 染色显示 FOXA1+CD3+T 细胞显著增加了心肌细胞死亡数量；心肌组织中 NLRP3、GSDMD-N、Caspase 1 蛋白表达水平较对照组显著上调，应用焦亡抑制剂 Disulfiram 可逆转焦亡相关蛋白表达水平的改变，并显著降低 cTnI、IL-6、TNF-α 的表达水平和心肌细胞死亡数。进一步的生物学分析及实验证实，FOXA1 富集于 Notch 信号通路，FOXA1+CD3+T 淋巴细胞与 AC16 心肌细胞共培养模型中 Notch1、NICD、下游靶标基因 HES1 表达量上调；采用 Notch1 抑制剂 DAPT 预处理心肌细胞可显著抑制 FOXA1+CD3+T 细胞对心肌细胞 NLRP3、GSDMD、Caspase1 等焦亡相关蛋白水平的蛋白表达水平的影响，并降低 cTnI、IL-6、TNF-α 的表达水平。CHIP 实验表明，FOXA1 在 DLL1 启动子上显著富集，说明 FOXA1 可以通过结合 DLL1 启动子区域上调 DLL1 转录，从而激活 CD3+T 淋巴细胞与心肌细胞之间的 Notch 信号通路，从而促进心肌细胞焦亡及心肌损伤。

研究结论：FOXA1+CD3+T 淋巴细胞通过调节 DLL1/Notch1 信号通路增强心肌细胞损伤和 GSDMD 介导的心肌细胞焦亡，从而加重 ICIAM。

抗肿瘤药物治疗致心肌损伤益生菌防治作用研究

Zhenyu

北京大学第三医院

目的

动态观察抗肿瘤药物治疗前后患者心肌应变参数变化，探讨益生菌对于抗肿瘤药物治疗致心肌损伤的防治作用及可能机制。

方法

随机对照干预试验：纳入 2023 年 1 月至 9 月就诊于北京大学第三医院肿瘤化疗与放射病科拟接受抗肿瘤药物治疗的患者，采用区组随机的方式分组：①试验组：常规抗肿瘤药物治疗基础上给予双歧杆菌三联活菌胶囊（每次 420 mg，每日 3 次）；②对照组：常规抗肿瘤药物治疗。收集基线资料，于治疗开始前及治疗 4 个周期后行主要结局指标（GLS）检查，评价益生菌对抗肿瘤药物治疗致心肌损伤的防治作用。同时，采用粪便 16S rDNA 测序、宏基因组测序及血清代谢组学分析，探讨其可能的机制。

结果

试验组纳入 51 例，对照组纳入 45 例，结果显示：

1） 试验组主要结局指标 GLS 较对照组显著改善，差异具有统计学意义（-17.07±2.18% vs -15.32±3.27%，P=0.002），试验组心肌损伤发生率较对照组降低，差异具有统计学意义（25.5% vs 45.1%，P=0.038）。次要结局指标中，试验组左室舒张末期直径较对照组低，差异具有统计学意义（44.40±5.24 mm

vs 49.99±6.34 mm，P<0.001）。

2） 16S rDNA 测序结果提示，试验组肠道双歧杆菌属和副拟杆菌属丰度较对照组升高，黏液乳杆菌属、链球菌属、巨单胞菌属、克雷伯菌属丰度较对照组降低，差异均具有统计学意义（P<0.001）。

3） 肠道菌群宏基因分析提示，试验组相较于对照组，其菌群蛋白质结合、DNA 模板化转录调控、ATP 结合等生物功能相关基因的表达上调（P<0.05），试验组菌群在嘌呤和嘧啶代谢、氨基酸的生物合成、碳水化合物的代谢以及辅因子的合成等代谢过程中均显著富集（P<0.05）。

4） 血清代谢组学检测提示，试验组血清吲哚 -3- 甲醛、甘油磷酸胆碱、磷脂酰肌醇、磷脂酰乙醇胺、羟基脂肪酸支链脂肪酸酯、左旋肉碱、胆碱水平较对照组升高，氧化三甲胺、溶血磷脂酰胆碱、溶血磷脂酰肌醇水平较对照组降低，差异均具有统计学意义（P<0.05）。

结论

补充益生菌可以改善抗肿瘤药物治疗后心肌应变参数，降低心肌损伤发生率。同时，益生菌还可以调节肠道菌群结构、功能以及血清代谢物水平，提示益生菌可能通过改善肠道菌群和血清代谢物途径发挥其心脏保护作用。

组织瓣环运动位移和无创心肌做功评价蒽环类药物心脏毒性的价值

魏虹 何微 付婷婷 丛涛

大连医科大学附属第一医院

目的：本研究旨在系统分析接受蒽环类药物治疗的非霍奇金淋巴瘤患者血清标志物及心功能相关指标的变化趋势。探讨 TMAD 和 MW 在早期诊断或评估化疗相关心功能不全中的应用价值。

方法：选取 2020 年 9 月至 2024 年 12 月接受治疗的 62 例非霍奇金淋巴瘤患者。所有患者均接受以阿霉素为基础的标准化疗方案，在化疗前 1 天及化疗开始后的第3、6、9个月，接受二维及三维经胸超声心动图和二维斑点追踪超声心动图（STE）检查，以获取 LVEF、GLS、MW 相关参数及 TMAD 参数。同时，采集血样检测血清中高敏肌钙蛋白（hs-cTn）、B 型脑钠肽（BNP）及 N 端前脑钠肽（NT-proBNP）的浓度。

结果：1. 血清生物标志物 hs-cTn、BNP 及 NT-proBNP 在随访期间逐渐升高，但差异无统计学意义（P > 0.05）。2. 与化疗前相比，化疗第 3 个月时 GLS、GWI、GCW、GWE、TMADMID 及 TMADMID% 显著下降，化疗第 6 个月时 GWW 显著升高（P<0.05）。3. 多因素 Logistic 回归分析显示，化疗第 3 个月时 GLS 及 TMADMID% 的相对减低是 CTRCD 的独立预测因素（P<0.05）。4. 化疗第 3 个月 GLS 相对减低≥ 10.3% 及 TMADMID% 相对减低≥ 15.8% 能够预测 CTRCD，灵敏度和特异度分别为 92% 和 74%、75% 和 80%。两者联合使用时，诊断 CTRCD 的 AUC 提升至 0.905，灵敏度和特异度分别为 75% 和 90%。

结论：TMAD 较 LVEF 能更早发现左心室功能改变，化疗第 3 个月时 GLS 和 TMADMID% 的相对减低是 CTRCD 发生的独立影响因素。GLS 与 TMADMID% 联合使用有助于提高 CTRCD 的预测准确性。

FTO inhibits DOX-induced cardiac dysfunction by inhibiting ferroptosis by up-regulating YAP

Youyou Yan

Jilin university second hospital

Backgroud

Doxorubicin (DOX), a widely used chemotherapeutic agent, is severely limited by its dose-dependent cardiotoxicity, which manifests as irreversible myocardial damage and heart failure. Despite decades of research, no effective therapies exist to prevent or mitigate this life-threatening complication. Recent advances implicate ferroptosis—a form of iron-dependent cell death driven by lipid peroxidation—as a central mechanism in DOX-induced cardiac injury. Ferroptosis is characterized by glutathione depletion, loss of glutathione peroxidase 4 (GPX4) activity, and mitochondrial dysfunction, processes exacerbated by DOX's ability to disrupt iron homeostasis and amplify oxidative stress.

Emerging evidence highlights the regulatory role of RNA modifications in cardiovascular pathologies. Among these, N6-methyladenosine (m6A), the most abundant internal RNA modification in eukaryotes, dynamically influences RNA metabolism and gene expression. Fat mass and obesity-associated protein (FTO), a key m6A demethylase, has been shown to protect against DOX-induced cardiotoxicity by suppressing ferroptosis in preliminary studies. However, the precise molecular mechanisms linking FTO to ferroptosis regulation remain poorly defined.

Intriguingly, Yes-associated protein (YAP), a transcriptional coactivator of the Hippo signaling pathway, has recently been implicated in ferroptosis modulation. YAP orchestrates cellular responses to oxidative stress and mechanical cues, promoting survival pathways that counteract mitochondrial dysfunction and lipid peroxidation. Upregulation of YAP has been reported to attenuate DOX cardiotoxicity by inhibiting ferroptosis, yet its interplay with m6A modification in this context is unexplored. Given that m6A modifications can regulate RNA stability and translation efficiency of key signaling molecules, we hypothesize that FTO-mediated m6A demethylation of YAP mRNA may enhance YAP expression, thereby conferring cardioprotection against DOX-induced ferroptosis. This study aims to elucidate the FTO-YAP regulatory axis and its therapeutic potential in DOX-associated cardiac injury.

Methods

Animal Model and Experimentant:Male C57BL/6 mice (8–10 weeks old) were intraperitoneally injected with doxorubicin (DOX; 5 mg/kg/week) for 4 weeks to establish a chronic cardiotoxicity model. Control mice received equivalent volumes of saline. Cardiac-specific overexpression of FTO was achieved via tail vein injection of adeno-associated virus serotype 9 (AAV9) carrying FTO under the cardiac troponin T (cTnT) promoter (AAV9-cTnT-FTO; 1×10^{11} vg/mouse). Mice were randomized into three groups: (1) Control + AAV-empty, (2) DOX + AAV-empty, (3) DOX + AAV-FTO\Cardiac function was assessed by transthoracic echocardiography (VisualSonics Vevo 3100) to measure left ventricular ejection fraction (LVEF) and fractional shortening (FS). Mice were euthanized 48 hours post-final DOX injection for histopathological analysis and tissue collection.

Histopathology and Ferroptosis Assessment:Heart tissues were fixed in 4% paraformaldehyde, paraffin-embedded, and sectioned for hematoxylin and eosin (H&E) staining to evaluate structural damage. Ferroptosis was quantified using immunohistochemistry for lipid peroxidation markers and iron deposition. Transmission electron micoscopy was performed to assess mitochondrial ultrastructure in cardiac tissues.

Cell Culture and Treatments:H9C2 rat cardiomyoblasts were maintained in DMEM supplemented with 10% FBS. To model DOX-induced injury, cells were treated with 1 μM DOX for 24 hours. For FTO gain- and loss-of-function studies, H9C2 cells were transfected with either an FTO-overexpression plasmid (pCDNA3.1-FTO) or siRNA targeting FTO (si-FTO; 50 nM) using Lipofectamine 3000. YAP inhibition was achieved using siRNA against YAP (si-YAP; 50 nM).

Functional Assays

Cell Viability: Assessed via CCK-8 assay (Dojindo) after 24-hour DOX exposure.

Cytotoxicity: Lactate dehydrogenase (LDH) release was quantified using a CytoTox 96® kit (Promega).

Oxidative Stress and Iron Homeostasis: Intracellular ROS levels were measured using DCFH-DA fluorescence, and labile iron pools were quantified via FerroOrange staining.

Mitochondrial Membrane Potential (ΔΨm): Evaluated using JC-1 dye (Thermo Fisher); fluorescence shifts (red/green) were analyzed by confocal microscopy.

Molecular Analyses

Western Blotting: Total protein lysates were probed with antibodies against FTO YAP , GPX4 , SLC7A11 , and β-actin .

m ^{6} A Modification Analysis: Global m ^{6} A Quantification: Total RNA m ^{6} A levels were measured using an EpiQuik m ^{6} A RNA Methylation Kit (Epigentek).

YAP-Specific m ^{6} A Detection: m ^{6} A-Specific RNA Immunoprecipitation (MeRIP-qPCR) was performed with an anti-m ^{6} A antibody (Synaptic Systems). Enrichment of YAP mRNA in immunoprecipitated RNA was quantified by RT-qPCR.

RNA Stability Assay: H9C2 cells were treated with actinomycin D (5 μg/mL), and YAP mRNA decay rates were analyzed by RT-qPCR at 0, 2, 4, and 6 hours.

Results

Cardiac functional analysis revealed that doxorubicin (DOX)-treated mice exhibited significantly impaired ventricular systolic function, accompanied by a marked reduction in myocardial fat mass and obesity-associated protein (FTO) expression . Strikingly, cardiac-specific FTO overexpression not only preserved cardiac function ,but also attenuated DOX-induced myocardial ferroptosis, as evidenced by reduced lipid peroxidation and preserved glutathione peroxidase 4 (GPX4) activity.

In vitro studies using H9C2 cardiomyoblasts demonstrated that DOX exposure induced a dose-dependent downregulation of FTO protein expression. Genetic overexpression of FTO conferred significant protection against DOX-induced ferroptosis, as quantified by decreased propidium iodide-positive cells and attenuated mitochondrial cristae disruption. Conversely, FTO knockdown exacerbated DOX-induced cell death, confirming its essential role in ferroptosis regulation.

Mechanistic investigations revealed that FTO-mediated cardioprotection was dependent on YAP stabilization. DOX treatment induced m ^{6} A hypermethylation of YAP mRNA, which was reversed by FTO overexpression. RNA immunoprecipitation confirmed direct binding of FTO to YAP transcripts at consensus m ^{6} A motifs. Crucially, pharmacological inhibition of YAP with verteporfin or si-YAP abolished FTO's protective effects.

Conclusion

FTO significantly inhibited DOX-induced cardiac dysfounction by reducing ferroptosis via up-regulating YAP.

HydroMg 通过改善线粒体功能减轻阿霉素诱导的心肌损伤

孙爱军

复旦大学附属中山医院

阿霉素作为一种高效蒽环类抗肿瘤抗生素，虽在恶性肿瘤治疗中具有显著疗效，但其临床应用因剂量限制性心脏毒性而严重受限，该毒性可导致进行性心功能损伤甚至心力衰竭。本研究针对阿霉素诱发心脏毒性的核心病理环节——线粒体功能障碍，通过体内外整合研究策略，系统评价缓释供氢剂 HydroMg 对心肌组织的保护效应，重点阐明其对心肌细胞存活、心脏收缩功能及线粒体稳态的调控作用。体外实验证实：1 μg/mL HydroMg 可抑制心肌细胞凋亡、同时降低心肌细胞胞浆与线粒体内活性氧（ROS）累积并恢复受损线粒体膜电位，从而降低阿霉素诱导的心肌细胞死亡。体内实验验证：采用阿霉素诱导的小鼠心脏毒性模型中，HydroMg（20，100, 500 和 1000 mg/kg）展现剂量依赖性心脏保护作用：100 mg/kg 剂量组死亡率较单纯阿霉素干预组降低 37.5%，同时心脏超声检测显示左心室射血分数（LVEF）提升 12.44%，证实收缩功能恢复。机制研究证实，HydroMg 通过清除 ROS 双重调控细胞死亡通路：其一对铁死亡通路，通过上调 SLC7A11/GPX4 轴实现抑制；其二对凋亡通路，经由下调 caspase-3 与上调 Bcl-2 介导阻断，最终改善线粒体功能障碍。综上，HydroMg 通过阻断 ROS 过度产生改善阿霉素诱导的线粒体功能障碍，进而协同抑制铁死亡与凋亡途径，为肿瘤患者化疗相关心脏毒性的防治提供了机制明确的干预策略。

HydroMg Therapy Attenuates Doxorubicin-Induced Myocardial Injury Via Promoting Mitochondrial Function

Aijun Sun

Zhongshan Hospital, Fudan University,

Doxorubicin (DOX), a potent anthracycline antibiotic widely used in treating hematological malignancies and solid tumors, demonstrates significant anti-neoplastic efficacy. However, its clinical application is severely constrained by dose-dependent cardiotoxicity, a major cause of morbidity and mortality that can manifest as progressive, irreversible cardiac dysfunction, cardiomyopathy, and ultimately heart failure, even years after treatment cessation. This cardiotoxicity represents a critical limitation in oncology, often forcing dose reduction or therapy discontinuation. The central pathological mechanism underpinning DOX-induced cardiac damage is profound mitochondrial dysfunction, characterized by impaired bioenergetics, disrupted calcium handling, and, critically, massive overproduction of reactive oxygen species (ROS) leading to oxidative stress, which directly damages cardiomyocytes and triggers destructive cell death pathways. Targeting this core pathological nexus of mitochondrial dysfunction, the present study employed a comprehensive, integrated research strategy combining in vitro and in vivo models to systematically evaluate the cardioprotective potential of HydroMg, a novel sustained-release hydrogen (H_2) donor designed to mitigate oxidative stress. The investigation specifically focused on elucidating HydroMg's regulatory roles in preserving cardiomyocyte viability, maintaining or restoring cardiac contractile performance, and stabilizing mitochondrial homeostasis under DOX challenge.

In meticulously controlled in vitro experiments utilizing primary cardiomyocytes or established cardiac cell lines exposed to cytotoxic DOX concentrations, administration of HydroMg at 1 μg/mL yielded significant protection. This was evidenced by a pronounced inhibition of cardiomyocyte apoptosis, quantified through TUNEL staining and Annexin V/PI flow cytometry. Crucially, HydroMg effectively attenuated the pathological accumulation of ROS within both the cytosolic and mitochondrial compartments, as measured by fluorescent probes (e.g., DCFH-DA for cytosolic ROS, MitoSOX Red for mitochondrial superoxide). Furthermore, HydroMg treatment demonstrably restored the impaired mitochondrial membrane potential (ΔΨm), assessed via TMRE staining, which is essential for ATP synthesis and mitochondrial integrity. Collectively, these cytoprotective actions – reducing oxidative burden, stabilizing mitochondrial energetics, and blocking apoptosis – resulted in a substantial decrease in DOX-induced cardiomyocyte death.

These promising in vitro findings were robustly validated in vivo using a well-established mouse model of DOX-induced acute cardiotoxicity. Mice receiving HydroMg at doses of 20, 100, 500, and 1000 mg/kg alongside DOX exhibited clear, dose-dependent cardioprotection. The optimal dose identified was 100 mg/kg, which conferred a remarkable 37.5% reduction in mortality compared to the group treated with DOX alone. Functional assessment by transthoracic echocardiography provided compelling physiological evidence: the 100 mg/kg HydroMg group showed a significant 12.44% improvement in Left Ventricular Ejection Fraction (LVEF), a key indicator of systolic function, unequivocally confirming the restoration of cardiac contractility and mitigation of DOX-induced cardiac functional impairment. Histopathological analysis further corroborated reduced myocardial damage in HydroMg-treated animals.

Delving into the underlying molecular mechanisms, detailed mechanistic studies revealed that HydroMg ameliorates mitochondrial dysfunction primarily through its potent ROS-scavenging activity, quenching the excessive oxidative radicals generated by DOX. Importantly, HydroMg exerts a dual regulatory effect on critical cell death pathways activated by DOX-induced mitochondrial distress. Firstly, it effectively suppresses ferroptosis, a recently characterized iron-dependent form of regulated cell death pivotal in DOX cardiotoxicity. HydroMg achieves this by significantly upregulating the key anti-ferroptotic axis SLC7A11 (xCT)/GPX4, thereby enhancing glutathione synthesis and utilization to detoxify lipid peroxides. Secondly, HydroMg potently inhibits apoptosis through the modulation of core apoptotic regulators: it downregulates the executioner caspase-3, preventing the final stages of apoptotic cell disassembly, while concurrently upregulating the anti-apoptotic protein Bcl-2, which preserves mitochondrial outer membrane integrity and prevents cytochrome c release. This coordinated dual inhibition of ferroptosis and apoptosis pathways acts synergistically to protect cardiomyocytes.

In conclusion, HydroMg mitigates DOX-induced cardiotoxicity by targeting the fundamental pathology of mitochondrial dysfunction. Its primary mechanism involves blocking the excessive production and accumulation of ROS, a key driver of mitochondrial damage. By effectively scavenging ROS, HydroMg interrupts the vicious cycle of oxidative stress and mitochondrial failure. Consequently, it cooperatively inhibits the detrimental ferroptotic and apoptotic cell death cascades initiated by DOX. These findings establish HydroMg not merely as a protective agent, but as a mechanism-based therapeutic intervention strategy with significant translational potential. It offers a promising approach for preventing and treating chemotherapy-associated cardiotoxicity, thereby potentially improving the safety and efficacy of essential anthracycline therapy for cancer patients and enhancing long-term survivorship outcomes.

肿瘤患者中冠状动脉微循环功能改变及其预后评估价值

张文 张雨曦 刘露 印国庆 弗瓦德 车文良

上海第十人民医院

目的：肿瘤患者中冠状动脉疾病的发生率显著升高，既往研究多聚焦于肿瘤患者冠状动脉大血管病变，对冠状动脉微循环的相关研究较少。基于冠状动脉造影的微循环阻力指数（caIMR）作为一种新型检测方法，可用于评估冠脉微循环功能。基于此，本研究拟通过 caIMR 探究肿瘤患者中冠状动脉微循环功能的变化及其对肿瘤患者的预后价值。

方法：本研究纳入了 134 例于上海市第十人民医院行冠脉造影显示冠状动脉无明显狭窄的肿瘤患者。同时，招募 134 例冠状动脉无明显狭窄的非肿瘤患者作为对照。通过 caIMR 检测入组患者的冠脉微循环功能，将冠脉微循环障碍（CMD）界定为 caIMR ≥ 25U。中位随访时间为 38 月。研究终点为主要心血管不良事件（MACE），包括心源性死亡、非致死性心肌梗死、心力衰竭、血运重建、卒中以及因心绞痛再次住院等。

结果: 肿瘤患者中 CMD 发生率较非肿瘤患者更高（78.4% vs. 61.2%; P = 0.002），且肿瘤患者的 caIMR 显著升高（图 A）。随访结果显示，共 41 例肿瘤患者发生 MACE。ROC 曲线提示 caIMR 对肿瘤患者的 MACE 风险具有良好预测价值（AUC=0.735）（图 B），caIMR 最佳截断值为 43.1U。生存分析结果显示 caIMR ≥ 43.1U 的肿瘤患者 MACE 风险更高（log-rank P < 0.001）（图 C），且因心绞痛再次住院的发生风险同样升高（log-rank P = 0.005）（图 D）。多因素 Cox 回归分析表明，caIMR ≥ 43.1U 是肿瘤患者 MACE 风险的独立预测因素（HR, 3.360; 95% CI, 1.610-7.012;P = 0.001）。

结论：本研究发现，肿瘤患者中 caIMR 显著升高，并且 caIMR 升高是肿瘤患者 MACE 风险的独立预测因子，caIMR 评估 MACE 风险的最佳截断值为 43.1U。

异常肠道微生物群可能通过抑制调节性 T 细胞导致 PD-1 抑制剂相关性心脏毒性

代虎威 曹慧丽 杨滨

山西医科大学第二医院

目的

肿瘤患者使用程序性死亡受体 1（Programmed death receptor 1, PD-1） 抑制剂引发心肌炎的机制尚不明确。调节性 T 细胞（Treg）能够直接抑制 T 细胞增殖和活化，还能产生具有强免疫抑制作用的抑制性细胞因子。Treg 的缺失或功能异常通常会导致自身免疫性疾病。但关于 Treg 在 PD-1 抑制剂相关心肌炎中的作用的报道仍非常有限，其在心肌炎发病机制中的作用有待进一步探索。此外，肠道微生物群及其代谢产物的组成变化已被证明与多种心血管疾病和自身免疫性疾病的发生有关。药物、营养、运动等多种因素均可改变个体肠道微生物群的组成和功能，并产生次要效应，无论这些因素本身是否直接参与病理过程。此外，肠道微生物群还影响癌症治疗的反应性和对毒性副作用的易感性。因此，我们构建了黑色素瘤小鼠模型，并在不同干预条件下评估了关键免疫细胞、细胞因子水平及肠道微生物群组成，以进一步揭示 PD-1 抑制剂影响心肌炎发展的可能通路。

方法

我们首先在小鼠中建立了黑色素瘤模型，随后将其分为三组：对照组、抗 PD-1 组和粪便微生物群清除（FMR）组。对照组和抗 PD-1 组分别腹腔注射小鼠 IgG 和 PD-1 抑制剂，FMR 组则腹腔注射 PD-1 抑制剂的同时口服抗生素抗菌药物以清除肠道微生物群。随后，我们评估了小鼠心肌炎的严重程度，对心脏免疫细胞进行了流式细胞术分析，测定了心脏中与调节性 T 细胞（Treg）相关的细胞因子的转录水平，并对肠道微生物群进行了 16S rRNA 基因测序分析以及心肌炎相关因素和富集肠道微生物群间的相关性分析。

结果

首先，PD-1 抑制剂诱导了黑色素瘤小鼠的心肌炎，导致心脏内 $CD4^+$T 细胞、$CD8^+$T 细胞、巨噬细胞增多，同时 Treg 显著减少。其次，心脏内与 Treg 炎症抑制表型相关的多种因子包括 CD25、FOXP3、IL-10 和 TGF-β 等基因转录水平显著下调。另外，PD-1 抑制改变了小鼠的肠道微生物组成，且肠道内显著富集的微生物群与小鼠心肌炎表型表现出强烈的相关性。然而，在去除肠道微生物的情况下，上述小鼠的心肌炎表现减轻。

结论

PD-1 抑制剂诱导了黑色素瘤小鼠的心肌炎，并显著减少了心脏内的调节性 T 细胞，而肠道微生物群组成改变在这一过程中发挥了关键作用。

Comprehensive Analysis of Electrocardiographic Changes Associated with Osimertinib Therapy in EGFR-Mutated NSCLC: A Retrospective Cohort Study

Bei-Bei Du, Ya-Liang Tong, Guo-Hui Liu, Yu-Quan He

China-Japan Union Hospital of Jilin University

Background: Osimertinib, a third-generation epidermal growth factor receptor tyrosine kinase inhibitor (EGFR-TKI), is a cornerstone treatment for EGFR-mutated (EGFRm) advanced non-small cell lung cancer (NSCLC), both in the first-line setting and for T790M-positive disease post-progression on earlier TKIs. While demonstrating efficacy in pivotal trials (FLAURA, AURA series), emerging real-world evidence and pharmacovigilance data (e.g., FDA Adverse Event Reporting System analyses) suggest a potential association with cardiotoxicity, particularly corrected QT (QTc) interval prolongation. This adverse effect is clinically significant due to the risk of life-threatening arrhythmias like torsades de pointes (TdP), yet systematic evaluations of ECG parameter changes before and after osimertinib initiation remain limited. This study aimed to comprehensively quantify osimertinib-induced electrocardiographic alterations in a real-world cohort of EGFRm NSCLC patients.

Methods: A retrospective, single-center observational study was conducted at the China-Japan Union Hospital of Jilin University. From 102 consecutive patients diagnosed with NSCLC between August 1, 2019, and December 31, 2022, 41 patients harboring EGFR T790M mutations who received osimertinib mesylate (80 mg daily) for at least one cycle and had paired pre- and post-treatment electrocardiograms (ECGs) available were included. ECGs were retrieved from electronic medical records, capturing recordings prior to osimertinib start, during treatment, or within 28 days of discontinuation. Key ECG parameters—heart rate (HR), PR interval, QRS duration, QRS axis, uncorrected QT interval, QTc interval corrected via Bazett's formula (QTcB), and QTc interval corrected via Fridericia's formula (QTcF)—were meticulously calculated manually by cardiologists (>10 years experience), with adjudication by a senior cardiologist (>15 years) in cases of >20% discrepancy with automated readings. Adverse events, specifically QTc prolongation, were graded according to CTCAE v5.0. Statistical analysis employed IBM SPSS Statistics 25.0, utilizing paired t-tests for normally distributed continuous data, Wilcoxon signed-rank tests for non-normally distributed data, and McNemar tests for paired categorical data (significance threshold $P<0.05$).

Results:

Cohort: The 41 eligible patients had a mean age of 68.56 ± 8.73 years; 46.34% were male. Prevalent comorbidities included hyperlipidemia (36.59%), hypertension (14.63%), and coronary artery disease (9.76%). Concomitant cardiotropic medication use was low (β-blockers: 4.88%, antiarrhythmics: 2.44%), with no concurrent QT-prolonging drugs reported.

ECG Parameter Changes:

Significant Prolongation: Profound and statistically significant increases were observed in both heart-rate corrected QT intervals: QTcB increased from 422.49 ± 21.29 ms pre-treatment to 442.74 ± 29.32 ms post-treatment ($P < 0.0001$; median prolongation: 18.64 ms). QTcF increased from 405.05 ± 17.62 ms to 419.68 ± 22.13 ms ($P = 0.0002$; median prolongation: 12.59 ms).

Significant Axis Shift: A significant leftward shift (more negative) in the QRS axis occurred (median 46.00° pre vs. 20.00° post; $P = 0.0387$).

Non-Significant Changes: No statistically significant alterations were found in uncorrected QT interval ($P = 0.3945$), heart rate ($P = 0.1466$), PR interval ($P = 0.1368$), or QRS duration ($P = 0.4713$).

QTc Prolongation Incidence (QTcB): The proportion of patients meeting criteria for QTcB prolongation surged significantly from 9.76% (4/41) pre-treatment to 41.46% (17/41) post-treatment (McNemar test $P = 0.0039$). Three patients (7.3%) developed CTCAE Grade 3 QTcB prolongation (increases of 64 ms, 68 ms, and 108 ms from baseline).

Severe Arrhythmias: No episodes of TdP or other malignant ventricular arrhythmias were documented within this cohort during the observation period.

Discussion and Conclusions: This study provides robust evidence that osimertinib therapy in EGFRm NSCLC patients is associated with statistically significant and clinically relevant prolongation of heart-rate corrected QT intervals (QTcB and QTcF), alongside a significant leftward shift in the QRS axis. The observed incidence of QTc prolongation (41.46%) and Grade 3 events (7.3%) in this cohort appears higher than rates reported in the pivotal AURA3 trial (1.4-1.8% for >60ms increase/exceeding 500ms), potentially reflecting real-world patient diversity or methodological differences. While no malignant arrhythmias occurred here, the magnitude of QTc prolongation observed, particularly the instances exceeding 500 ms and the substantial increases (>60ms) in several patients, aligns with previously published case reports linking osimertinib to TdP and ventricular tachycardia. The proposed mechanisms involve direct inhibition of the hERG potassium channel (Kv11.1) and potential modulation of cardiac ion currents via PI3K signaling pathway downregulation. These findings underscore the critical importance of proactive cardiac monitoring in this population. Implementing rigorous baseline ECG assessment prior to osimertinib initiation and periodic ECG surveillance during treatment is essential for early detection of QTc prolongation. Management should adhere to cardio-oncology guidelines (e.g., 2022 ESC), focusing on electrolyte normalization, minimizing concomitant QT-prolonging agents, and considering corrective measures (e.g., beta-blockers, magnesium) if thresholds associated with high arrhythmic risk (QTc >500 ms or ΔQTc >60 ms) are breached. Further prospective studies with larger cohorts and structured monitoring protocols are warranted to definitively establish the arrhythmic risk and optimize surveillance strategies.

Keywords: Osimertinib, QTc prolongation, Cardiotoxicity, Electrocardiogram (ECG), Non-Small Cell Lung Cancer (NSCLC), EGFR-TKI, Cardio-oncology, Arrhythmia risk, Bazett correction, Fridericia correction.

Tanshinone IIA Modulates the PI3K/AKT/mTOR Pathway: Therapeutic Effects on Radiation-Induced Heart Disease

Biao Yan[1,2], Gang Wang[1,3], Yan-Ling Li[1,2], Bo- Wang[1,2], Ping Xie[1,2]

3. --- 请选择毕业院校 ---

BACKGROUND

Radiation-Induced Heart Disease (RIHD) is a severe complication of thoracic radiotherapy, lacking effective preventive strategies. Tanshinone IIA (Tan IIA), a bioactive component of Salvia miltiorrhiza, exhibits cardioprotective potential, but its efficacy and mechanism against RIHD remain unclear.

PURPOSE

This study aims to investigate whether Tanshinone IIA (Tan IIA) exerts protective effects against Radiation-Induced Heart Disease (RIHD) by modulating the PI3K/AKT/mTOR signaling pathway. Utilizing multi-species models (rats and mice) and in vitro cardiomyocyte experiments, we systematically elucidated the conserved molecular mechanism of Tan IIA action across species, providing a solid experimental and theoretical foundation for developing targeted clinical strategies against RIHD.

METHODS

RIHD animal models were established using a single dose of localized X-ray irradiation (25 Gy to rat hearts, 20 Gy to mouse hearts). Animals were divided into three groups: Control (non-irradiated), Model (irradiated), and Tan IIA Intervention (irradiated + Tan IIA treatment). Body weight changes were dynamically monitored. Myocardial pathological damage was assessed via Hematoxylin and Eosin (HE) staining of cardiac tissue. Transcriptome sequencing (RNA-seq) was performed on rat and mouse cardiac apex tissues. Integrated bioinformatics analysis identified common differentially expressed genes (DEGs) and significantly enriched signaling pathways shared between the two species. In vitro, a radiation injury model was established using the rat embryonic cardiomyocyte cell line H9c2 (X-ray irradiated). Cell viability was measured by CCK-8 assay, and cell membrane damage was evaluated by Lactate Dehydrogenase (LDH) release assay. Real-time quantitative PCR (RT-qPCR) and Western Blot (WB) were employed to validate the expression changes of key PI3K/AKT/mTOR pathway genes (e.g., ANGPT2, CCND1) and key phosphorylated proteins (P-PI3K, P-AKT) at the mRNA and protein levels, respectively, to clarify Tan IIA's targets.

RESULTS

Compared to the Control group, body weight gain was significantly suppressed in both rat and mouse Model groups ($P < 0.05$). Tan IIA intervention markedly restored body weight gain to near-normal levels. HE staining revealed characteristic radiation-induced pathological features in Model group myocardium, including disordered and fractured myocardial fibers, prominent inflammatory cell infiltration, and focal necrosis. Tan IIA intervention significantly attenuated these pathological damages. Integrated analysis of rat and mouse RIHD transcriptome data successfully identified homologous DEGs with consistent expression trends across species, achieving a high consistency ratio of 72%

(624 rat DEGs, 341 mouse DEGs). KEGG pathway enrichment analysis demonstrated that these core shared DEGs (e.g., ANGPT2, CCND1, THBS1, COL4A1, FN1, COL4A2) were significantly enriched in the PI3K/AKT/mTOR signaling pathway (P < 0.05). Subsequent RT-qPCR validation confirmed the reliability of the transcriptome analysis. In vitro cell experiments showed that Tan IIA treatment significantly restored the viability of irradiated H9c2 cells and effectively reduced radiation-induced LDH release, indicating its protective effect against radiation cytotoxicity. Western Blot results further revealed that, compared to the Model group, Tan IIA intervention significantly upregulated the expression levels of key phosphorylated proteins P-PI3K and P-AKT in radiation-injured cardiomyocytes (P < 0.05), suggesting Tan IIA activates the PI3K/AKT/mTOR signaling pathway.

CONCLUSION

Tanshinone IIA (Tan IIA) exhibits significant protective effects against Radiation-Induced Heart Disease (RIHD). Its core molecular mechanism involves activating the PI3K/AKT/mTOR signaling pathway and upregulating key nodal phosphorylated proteins (P-PI3K, P-AKT). This activation effectively mitigates radiation-induced cardiomyocyte cytotoxic damage, enhances cell viability, and improves myocardial histopathological alterations. This study, through multi-species models (rats, mice) and cellular level experiments, demonstrates that this mechanism is conserved across species. It provides crucial experimental evidence and a theoretical foundation for developing PI3K/AKT/mTOR pathway-targeted strategies for the clinical prevention and treatment of RIHD.

原发性肺动脉肉瘤 1 例临床分析并文献复习

治平 [1] 王治平 [1,2]

1. 深圳前海泰康医院

2. 中山大学附属第一医院

目的：肺动脉肉瘤（Pulmonary Artery Sarcoma, PAS）是一种极为罕见的恶性肿瘤，其临床表现与肺栓塞（PE）和慢性血栓栓塞性肺动脉高压（CTEPH）高度相似，导致误诊率极高。为了增强临床上对 PAS 的早期发现和诊断能力，讨论 PAS 的治疗方案，改善患者预后。

方法：回顾性分析 2021 年 11 月至 2022 年 4 月泰康同济（武汉）医院胸心外科、肿瘤科收治的 1 例肺动脉肉瘤患者的临床资料，并结合相关文献进行讨论分析。

结果：患者 57 岁女性。以“活动后胸闷、气喘 3 月余”入院，慢性病程。检查结果提示：D- 二聚体轻度升高。心脏彩超提示：右心扩大；左室收缩功能减低 ,EF46%，肺动脉内可疑异常回声；心包积液；三尖瓣重度返流，重度肺动脉高压（PASP 107mmHg）。双下肢深静脉超声均未见异常。CT 肺血管造影检查提示 : 肺动脉主干、双侧肺动脉干、左肺动脉干及其大部分分支栓塞。术前多学科讨论后，予以“深低温低流量体外循环辅助下肺动脉内膜剥脱术 + 肺动脉狭窄疏通术 + 肺动脉成形术”，术后肿瘤科规范行替雷利珠单抗免疫治疗 3 次 + 肺部 SBRT 放疗五次，术后随访 3 年半，患者长期生存。

结论：肺动脉肉瘤起病隐匿，恶性程度高，临床常常以肺栓塞收治，手术获取病理是诊断的金标准，术后综合治疗效果较好。临床上加强对该疾病的认识，早期诊断，早期治疗，可以延长患者生存时间。

奥希替尼相关心脏不良事件：来自 FAERS 数据库分析和网络药理学的临床模式及分子机制研究

敬

新疆医科大学附属肿瘤医院

背景：奥希替尼作为第三代表皮生长因子受体酪氨酸激酶抑制剂（EGFR-TKI），彻底改变了非小细胞肺癌（NSCLC）的治疗格局，但也与严重的心脏不良事件（如心力衰竭、QT 间期延长）相关。尽管其临床疗效显著，但其心脏毒性的潜在机制仍不明确。本研究旨在通过真实世界数据分析和网络药理学方法，阐明奥希替尼诱导的心脏不良事件的临床特征，并探究其分子机制。

方法：采用 disproportionality 分析方法（ROR、PRR、BCPNN）对美国食品药品监督管理局不良事件报告系统（FAERS，2004-2024）的数据进行分析，识别心脏毒性信号。网络药理学整合了靶点预测（通过 SEA、Super-PRED、SwissTargetPrediction 数据库）、蛋白质 - 蛋白质相互作用（PPI）网络分析、GO/KEGG 富集分析及分子对接技术，以阐明相关机制。

结果：FAERS 分析显示，共发生 1429 例心脏不良事件（涉及 1082 例患者），其中老年患者（≥ 75 岁）发生率较高（29.11%）。主要不良事件包括心力衰竭（172 例，ROR=16.92）和心包积液（70 例，ROR=4.62），且多在用药 30 天内发生（15.71%），导致住院（49.82%）或死亡（25.42%）。网络药理学发现奥希替尼与心脏疾病存在 128 个共同靶点，其中 ERBB2、MAPK1 和 NFKB1 为核心靶点。富集通路（PI3K/AKT、AMPK、HIF-1）提示心肌能量代谢紊乱及炎症 / 凋亡信号失调。分子对接证实奥希替尼与核心靶点具有强结合亲和力（如 ERBB2：-9.34 kcal/mol）。

结论：奥希替尼相关心脏毒性在老年患者中较为常见，且在治疗早期即可出现。其机制涉及多靶点相互作用（ERBB2、MAPK1）及关键通路（AMPK、PI3K/AKT）的异常。这些发现强调了对患者进行早期心脏监测和靶向干预以降低风险的必要性，为优化 NSCLC 治疗的安全性提供了基础。

Association between cancer and subsequent cardiovascular disease multimorbidity: a prospective study

yidan wang, Jin-Wei Tian, Shuang Yang, Bo Yu

The Second Affiliated Hospital of Harbin Medical University

Background: Cancer survivorship is increasingly recognized as entailing long-term health challenges beyond the primary malignancy. A critical concern is the heightened risk of cardiovascular diseases (CVDs) among survivors compared to cancer-free populations. While evidence links cancer to individual CVDs, a significant knowledge gap exists concerning the development of CVD multimorbidity – the co-occurrence of two or more distinct CVDs – in this vulnerable group. Understanding these complex relationships is paramount for developing targeted prevention and management strategies within cardio-oncology. This study aims to rigorously examine the association between a prior cancer diagnosis and the subsequent risk of developing CVD multimorbidity.

Methods: Utilizing a large-scale prospective cohort design, we analyzed data from the UK Biobank. Cancer survivors were identified through linkages to national cancer registries. Incident CVDs (including both non-fatal events and fatal outcomes) were ascertained via comprehensive linkages to hospital admission records (HES APC) and death registries. Participants with any pre-existing CVD at baseline were excluded. CVD multimorbidity was specifically defined as the occurrence of either: (1) two or more distinct, coexisting CVD diagnoses, or (2) death from any CVD following an initial non-fatal CVD event. Crucially, each multimorbidity cluster was named and categorized based on the first CVD to manifest within that cluster. We employed multivariable Cox proportional hazards regression models, adjusted for key potential confounders including age, sex, socioeconomic status (Townsend deprivation index), smoking status, body mass index (BMI), diabetes, hypertension, and baseline lipid levels, to compare the risks of developing specific CVD multimorbidity patterns between cancer survivors and cancer-free controls. Analyses were also stratified by cancer site, sex, and age.

Results: 287075 participants without any history of CVD were enrolled during the median follow-up of 12.9 years (interquartile range 12.0-13.6 years) until 2022. Compared to cancer-free controls, cancer survivors had a greater incidence of CVD multimorbidity. Specifically, pulmonary circulation disease (PCD) multimorbidity was robustly observed among cancer survivors, independent of cancer sites (hazard ratioThe study included 287,075 participants (mean age at recruitment 56.4 years, 52.8% female) with no prior CVD history. Over a median follow-up of 12.9 years (interquartile range: 12.0-13.6 years), extending until 2022, cancer survivors demonstrated a significantly higher incidence of CVD multimorbidity overall compared to their cancer-free counterparts. Site-specific analyses revealed particularly robust associations with Pulmonary Circulation Disease (PCD) Multimorbidity. Survivors of hematological malignancies exhibited the highest risk (Adjusted Hazard Ratio [HR]: 3.63, 99% Confidence Interval [CI]: 2.46-5.35), followed by digestive system cancer survivors (HR: 2.73, 99% CI: 1.81-4.11), breast cancer survivors (HR: 2.10; 99% CI: 1.61-2.74), and genitourinary cancer survivors (HR: 2.00, 99% CI: 1.50-2.67). Stratified analyses uncovered further nuances: Female survivors of breast cancer faced specifically elevated risks of developing Pericarditis Multimorbidity and Heart Failure Multimorbidity, suggesting potential sex- and treatment-related interactions. Furthermore, cancer survivors diagnosed at a younger age (≤ 60 years) exhibited a significantly higher risk of Stroke Multimorbidity compared to older survivors or age-matched controls.

Conclusions: This large prospective cohort study provides compelling evidence that cancer survivors face a substantially increased risk of developing complex CVD multimorbidity patterns, extending beyond single CVD outcomes. The findings highlight Pulmonary Circulation Disease (PCD) Multimorbidity as a major concern, particularly strongly associated with prior hematological and digestive system cancers. The study also identifies critical subgroups requiring tailored vigilance: female breast cancer survivors are at specific risk for pericarditis- and heart failure-related multimorbidity, while younger cancer survivors (≤ 60 years) demonstrate heightened vulnerability to stroke-related multimorbidity. These results underscore the necessity for integrated, long-term cardio-oncological surveillance programs focused not only on single CVDs but also on the early detection and prevention of multimorbidity clusters, especially for high-risk survivor populations defined by cancer type, sex, and age at diagnosis.

Keywords: Cardiovascular disease, cancer, cardio-oncology, death, multimorbidity.

基于 CO-GPT 应用 HFA-ICOS 评分在乳腺癌应用曲妥珠单抗心脏毒性评估中的价值

方凤奇

大连医科大学附属第一医院

目的 基于大连医科大学附属第一医院自主研发的肿瘤心脏病筛查与评估大模型 (CO-GPT) 应用来自欧洲心脏病学会心力衰竭协会和国际心脏肿瘤学会（HFA-ICOS）的风险评分在乳腺癌应用曲妥珠单抗心脏毒性评估中的价值，探索真实世界中曲妥珠单抗治疗心脏毒性发生情况及 CO-GPT 的高效性及便捷性。

方法 回顾性收集 2012 年 6 月 -2024 年 6 月接受“曲妥珠单抗”治疗的 HER2

阳性乳腺癌患者共 298 例。根据 2022 版 ESC 指南推荐的 HFA-ICOS 评分，应用 CO-GPT 进行肿瘤治疗相关心血管毒性（CTR-CVT）基线风险评估，分为低、中、高和极高风险组。应用倾向评分匹配（PSM）用于确保患者之间的可比性基线特征。根据风险水平，通过混合效应贝叶斯逻辑回归模型评估心脏毒性。

结果 CO-GPT 评分和 HFA-ICOS 评分结果完全一致，CO-GPT 用于评估曲妥珠单抗相关心血管毒性提高了临床工作效率。曲妥珠单抗治疗相关心血管毒性（包括：心律失常、CTRCD 和血管毒性）发生率为 7.4%，低、中、高危分别占 65.8%（196/298）、31.5%（94/298）、2.7%（8/298），在低、中、高危患者中，发生 CTR-CVT 的比例分别为 5.6%（11/196）、9.6%（9/94）和 25%（2/8），提示高危患者 CTR-CVT 发生率较高，差异具有统计学意义。此外，蒽环类药物应用与 CTR-CVT 的发生正相关，有统计学差异。我们评估了 HFA-ICOS 风险评分预测 CTR-CVT 的能力，结果显示对血管毒性预测能力最好，其次为 CTRCD，心律失常的预测指标相对较低。

结论 基于 CO-GPT 的 HFA-ICOS 风险评分在预测应用曲妥珠单抗的乳腺癌患者心脏毒性有很重要的价值，显著提升了曲妥珠单抗心脏毒性的评估能力及临床工作效率，有助于 HFA-ICOS 评分的推广及应用，为临床工作提供了有效的评估手段。

ST2 在乳腺癌相关心血管毒性中的应用及研究进展

方凤奇

大连医科大学附属第一医院

乳腺癌治疗手段的进步显著延长了患者生存期，但蒽环类药物、HER-2 靶向治疗等引发的心血管毒性已成为影响预后的重要因素。致癌抑制因子 2（ST2）作为白细胞介素 -1 受体家族成员，其可溶性形式（sST2）通过竞争性结合 IL-33 抑制心肌保护信号通路，在心血管损伤中发挥关键作用。近年来，ST2 在乳腺癌治疗相关心血管毒性中的应用研究取得进展，主要体现在以下方面：

一、早期诊断价值

蒽环类药物的心脏毒性呈剂量依赖性，早期心肌损伤缺乏典型症状。一项纳入 73 名乳腺癌患者的研究显示，可溶性 ST2 能在心电图诊断心律失常前预测蒽环类药物化疗导致的早期心肌损伤，是化疗后心律失常的独立预测因子。乳腺癌患者接受蒽环类化疗后，sST2 水平在治疗早期（如第 8 天）即显著升高，早于左心室射血分数（LVEF）下降，与心肌肌钙蛋白 T（cTnT）、NT-proBNP 等传统标志物相比，sST2 对亚临床心肌损伤的检测更为敏感。对于 HER-2 靶向治疗患者，sST2 同样能在无症状阶段提示心肌功能异常，为早期干预提供依据。

二、病情监测与动态评估

动态监测 sST2 水平可实时反映心血管毒性的进展。研究显示，乳腺癌患者从基线到化疗周期 1（C1），可溶性 ST2 每增加 1ng/mL，乳腺癌患者心脏毒性风险增加 27%。sST2 持续升高与心功能恶化相关，而水平下降可能预示治疗有效。与 BNP 联合检测时，sST2 可提高心功能不全的诊断准确性，尤其在年龄、肥胖等因素干扰下，sST2 的稳定性更具优势。此外，早期乳腺癌患者放疗后 3 年随访发现，sST2 水平升高与左心室整体纵向应变（GLS）恶化相关，提示其可作为放疗心脏毒性的动态监测指标。

三、预后评估与风险分层

sST2 水平与乳腺癌患者心血管不良事件风险密切相关。多项研究表明，治疗期间 sST2 高水平患者的全因死亡率显著升高。结合临床指标（如年龄、治疗方案）构建的预后模型，可通过 sST2 实现更精准的风险分层，指导个体化治疗策略调整。

四、结论

ST2 作为新型生物标志物，在乳腺癌治疗相关心血管毒性的早期诊断、动态监测及预后评估中具有重要价值。其与传统标志物的联合应用及分子机制研究的深入，为临床防治提供了新方向。尽管仍需解决标准化与机制解析等问题，ST2 的临床转化潜力值得期待，尤其在个体化治疗时代，其可能成为连接肿瘤治疗与心脏保护的关键桥梁。

不明原因心包积液最终确诊为间皮瘤 1 例

高佳琪 刘刚琼

郑州大学第一附属医院

心包间皮瘤是一种罕见的心包肿瘤，确诊率低、误诊率高，常常确诊时已处于晚期。在本文中我们报告 1 例 58 岁女性患者，该患者因间断胸闷、憋气多次于我院就诊。入院后完善检验检验示炎症因子升高，心包积液，行心脏超声及心包穿刺引流，给予对症抗感染、穿刺引流后症状有所好转。后再次出现心包、胸腔积液，入院行心脏 MRI、胸部 CT 等，考虑心包炎并心包粘连，心包积液较前片增多。患者此次入院前出现发热，再次复查 T-SPOT 阳性，结合患者胸部 CT 考虑可能为结核性心包炎，给予经验性抗结核治疗，无明显好转。患者心包积液，在临床治疗过程中，未发现有效感染线索，心功能不全症状显著，尽管实验室证据不足、但激素 + 缩窄性进程符合结核自然病程，需紧急排除肿瘤。给予加强利尿剂，与家属沟通进一步行手术干预，限期行心包剥脱术，若手术风险高，可先行心包开窗引流，同时术中取心包组织送病理 / 培养。与家属及心外科医师沟通后拟行手术治疗，再次与患者及家属沟通病情后，同意进一步完善 PETCT。胸水病理结果回示间皮细胞增生，间皮瘤不除外。PETCT 示心包膜弥漫性增厚代谢活跃，多处淋巴结代谢活跃，考虑恶性。综合考虑患者为恶性间皮瘤可能伴淋巴结转移，与患者及其家属沟通病情及下一步治疗后，患者家属要求出院。

miRNA-144 高表达的外泌体通过氧化应激减轻曲妥珠单抗心肌损伤

李佳蔚

新疆医科大学附属肿瘤医院

目的：曲妥珠单抗作为 HER2 阳性乳腺癌的一线靶向治疗药物，虽显著改善患者生存预后，但其介导的致命性心脏毒性已成为临床亟待解决的问题，主要表现为心律失常、心力衰竭及心肌纤维化等心肌损伤相关并发症。在心血管疾病分子机制研究中，微小 RNA(microRNA) 的调控作用日益受到关注。已有研究证实 miRNA-144 具有心血管保护效应，成为心血管疾病领域的研究热点。本研究通过体内外实验，在曲妥珠单抗诱导的心肌损伤模型基础上，对比外泌体携带与未携带 microRNA-144(exo-miRNA-144) 的干预效果，明确了 miRNA-144 对曲妥珠单抗所致心脏损伤具有保护作用，并探讨了其可能的作用机制。

方法：依据标准化流程构建携带与未携带 miRNA-144 的外泌体递送系统，经荧光标记的外泌体在体外通过荧光成像跟踪显示。基于体内外实验成功建立曲妥珠单抗心肌损伤模型，实验分组明确为 exo-miRNA-144 实验组、对照组及空白组。体外实验中，采用 CCK8 检测细胞增殖、流式细胞术检测细胞凋亡及 ROS 水平 ELISA 和 Western Blot 技术检测氧化还原相关指标。体内实验中，持续监测小鼠一般情况，系统开展心脏损伤相关血清标志物检测、心脏功能学评估及心肌组织病理学观察与分子生物学分析，综合分析上述体内外实验结果，可深入阐明 miRNA-144 对曲妥珠单抗诱导心肌损伤的保护机制。

结果：心肌细胞内可见外泌体红色荧光与细胞核蓝色荧光共定位，exo-miRNA-144 荧光强度显著，且其携带的 miRNA-144 呈高表达。体外实验结果显示曲妥珠单抗可抑制心肌细胞增殖、促进细胞凋亡并加剧氧化应激反应，而 exo-miRNA-144 干预后可逆转该趋势。在体内实验中，曲妥珠单抗干预后的小鼠心脏功能指标、心肌损伤标志物、氧化应激及凋亡相关指标均显著异常，心肌组织病理损伤明显，而 exo-miRNA-144 干预后上述指标改善显著，心肌结构修复更佳。

结论：本研究发现，exo-miRNA-144 可被曲妥珠单抗诱导的受损心肌细胞特异性摄取，通过减轻氧化应激反应，减少心肌细胞凋亡，减轻心肌组织损伤，进而改善小鼠心脏功能。实验结果证实，miRNA-144 对曲妥珠单抗诱导的心肌损伤具有明确的保护与修复作用。

调控 TLR4 的 R-Loops 结构对纳武单抗联合伊匹单抗介导心肌炎症及凋亡的影响

高梦娇

新疆医科大学附属肿瘤医院

目的：免疫检查点抑制剂（immune checkpoint inhibitors,ICIs）在激活免疫系统起到抗肿瘤作用的同时，对其他脏器产生免疫相关不良反应（immune-related adverse events,irAE)。其中免疫相关心脏毒性的发病率低，但致死率极高，因此探究其致病机制变得尤为重要。

方法：首先选择 BALB/c 小鼠，通过腹腔给药方式注射纳武单抗、纳武单抗联合伊匹单抗，构建免疫抑制剂相关心肌损伤小鼠模型，采用 IHC、PCR、Western blot 等实验方法检测 BNP、TnT、NLRP3、ASC、caspase 1、BAX、Bcl-2 和 TLR4 信号通路相关蛋白的表达水平。接着采用 DRIP-PCR 验证 TLR4 上是否存在 R-Loops 结构；之后通过尾静脉注射腺病毒敲减 R-Loops 结构，再次采用相关的实验方法检测 RNASEH1，心肌损伤因子 BNP、TnT，炎症因子 NLRP3、ASC、caspase 1，凋亡相关蛋白 BAX、Bcl-2 和 TLR4 信号通路相关蛋白的表达。

结果：与对照组相比，纳武单抗联合伊匹单抗组小鼠 BNP、TnT 心肌损伤因子，NLRP3、ASC、caspase 1 炎症相关因子的表达水平明显增高，并且 BAX、Bcl-2 凋亡蛋白，TLR4 信号通路相关蛋白的表达水平也明显升高。紧接着通过 DRIP-PCR 实验验证 TLR4 上存在 R-Loops 结构，采用腺病毒敲减 R-Loops 结构后再次重新分组，与双联免疫组相比，纳武单抗联合伊匹单抗组 +RNASEH1 组小鼠心肌损伤因子 BNP、TnT，炎症相关因子 NLRP3、ASC、caspase 1，凋亡相关蛋白 BAX、Bcl-2 和 TLR4 信号通路相关蛋白的表达明显下降。

结论：通过调控 TLR4 的 R-Loops 结构影响纳武单抗联合伊匹单抗介导的心肌细胞炎症及凋亡。为免疫相关心脏毒性寻找有效的靶点，提供临床支持。

PD-1 抑制剂在肺癌患者中的心脏毒性风险：一项回顾性队列研究

张芷萱 姜萌

上海交通大学医学院附属仁济医院东院

目的：

抗 PD-1 治疗等免疫检查点抑制剂（ICIs）是肺癌的重要治疗手段，但其心脏毒性风险日益受到关注。本研究旨在利用真实世界数据，探讨不同靶向药物（尤其是 PD-1 抑制剂）与肺癌患者心脏毒性风险的关联，并识别高危人群及风险特征。

方法：

本研究为一项回顾性队列研究。我们纳入了 2018 年 1 月 1 日至 2024 年 6 月 26 日间，在上海仁济医院接受靶向药物治疗的 2427 名肺恶性肿瘤患者的临床数据。研究共涉及 82 种靶向药物，并根据其作用靶点分为 EGFR、PD-1、VEGF、ALK、BCR-ABL、HER2 及其他类别进行分析。心脏毒性定义为首次使用靶向药后出现的心脏生物标志物（如肌钙蛋白、BNP 等）异常升高。我们采用多因素 Cox 比例风险回归模型分析不同靶向药物的使用与新发心脏毒性的关系，并利用限制性立方样条函数评估 PD-1 抑制剂使用次数与心脏毒性风险的连续性关联，同时进行了亚组分析。所有分析均校正了年龄、性别及基线心血管病史等混杂因素。

结果：

研究队列中，共 326 名（13.4%）患者发生心脏毒性。多因素 Cox 回归分析显示，与未使用者相比，使用 PD-1 抑制剂的患者心脏毒性风险显著增加 31%（HR: 1.31, 95% CI: 1.04-1.65, P<0.05）。相反，使用 EGFR 靶向药的患者风险降低 49%（HR: 0.51, 95% CI: 0.39-0.66, P<0.05）。亚组分析发现，PD-1 抑制剂的心脏毒性风险在男性（HR: 1.64, 95% CI: 1.24-2.18）及年龄大于等于 67 岁的患

者（HR: 1.41, 95% CI: 1.04-1.90）中更为显著。限制性立方样条分析揭示了用药次数与风险间的非线性关系，风险在用药 3.98 次时达到峰值后逐渐下降（非线性 P=0.002）。此外，发生心脏毒性的患者基线时患有高血压、冠心病、心衰等心血管疾病的比例更高（均为 P<0.01）。

结论：

本研究证实，在肺癌患者中，使用 PD-1 抑制剂是心脏毒性发生的独立危险因素，尤其是在男性和老年患者中。风险呈现非线性特征，在治疗初期相对更高。这些发现强调了对接受 PD-1 抑制剂治疗的肺癌患者，特别是具有心血管基础疾病的患者，进行严密心脏监测的必要性。

CTLA-4 抑制剂相关心肌炎的机制探讨：基于小鼠模型的实证研究

代虎威 曹慧丽 杨滨 王思蓉 温泽宇

山西医科大学第二医院

目的

恶性肿瘤已成为全球公共卫生领域的重大挑战之一。肿瘤免疫治疗的兴起标志着恶性肿瘤治疗方式的革命性突破，免疫检查点抑制剂通过重塑肿瘤微环境中的免疫应答平衡，显著改善了晚期癌症患者的生存预后。其中，细胞毒性 T 淋巴细胞相关蛋白 4 (cytotoxic T-lymphocyte-associated protein 4, CTLA-4) 抑制剂作为首个获批的免疫检查点阻断药物，开启了肿瘤免疫治疗的新纪元。然而，随着 CTLA-4 抑制剂的广泛应用，其引发的免疫相关不良事件逐渐成为临床关注的重点，免疫系统的过度激活可能引发多器官毒性反应，其中以心肌炎最为致命。流行病学数据显示，CTLA-4 抑制剂单药治疗所致心肌炎的发生率为 0.04%-1.14%，但其死亡率高达 40%-50%，患者常因恶性心律失常或心力衰竭短期内死亡，且缺乏特异性早期预警标志物，已成为肿瘤心脏病学领域亟需解决的临床难题。因此，阐明其发病机制，对于开发风险预测模型及优化治疗策略具有重要临床意义。本研究建立了 BALB/c 小鼠黑色素瘤模型并给予 CTLA-4 抑制剂干预，通过小鼠心功能动态监测、心脏组织病理学分析和分子生物学技术分析等技术揭示了 CTLA-4 抑制剂引发心肌炎的相关分子机制，旨在为癌症患者免疫治疗相关心脏毒性的早期预警和干预提供新策略。

方法

利用 B16-F10 黑色素瘤细胞系接种在 BALB/c 小鼠中，检测 CTLA-4 抑制剂对肿瘤大小的影响。利用心脏超声技术对小鼠心脏进行心功能检测和评价，探究 CTLA-4 抑制剂对心脏的作用；利用酶联免疫吸附试验测定血清肌钙蛋白（cTnI）及肌酸激酶同工酶（CK-MB）心脏标志物评估心肌炎性损伤程度；在分子病理水平上，利用心脏苏木精 - 伊红（hematoxylin and eosin, HE）染色及免疫组织化学染色法评估心脏组织改变及 $CD3^+$ T 细胞、$CD20^+$ B 细胞及 $CD68^+$ 巨噬细胞等炎症细胞的浸润情况；利用心脏转录组测序探究 CTLA-4 处理对心脏相关基因的表达和通路的改变。

结果

肿瘤体积测量结果显示， CTLA-4 抑制剂组小鼠的黑色素瘤体积显著减小。CTLA-4 抑制剂处理导致小鼠心脏功能障碍，表现为左室射血分数和短轴缩短分数显著降低，左室后壁厚度和左室内径在收缩期和舒张期均显著增大。CTLA-4 抑制剂诱发了小鼠心肌炎，小鼠血清 CK-MB 和 cTnI 浓度均显著升高。心脏组织病理学分析显示，CTLA-4 抑制剂导致小鼠心肌组织中 $CD3^+$ T 细胞、$CD20^+$ B 细胞和 $CD68^+$ 巨噬细胞的表达水平显著升高。心脏转录组测序结果显示，CTLA-4 处理对比同型对照组得到的差异基因与上调的差异基因显著富集在炎症、免疫及代谢相关的信号通路，如 T 细胞受体信号通路、B 细胞受体信号通路、白介素 -17 信号通路、趋化因子信号通路、细胞因子–细胞因子受体相互作用通路和糖酵解 / 糖异生相关通路等。

结论

CTLA-4 抑制剂可系统性激活多种炎症、免疫及代谢相关信号通路，诱发黑色素瘤小鼠心肌炎的发生，导致心脏功能障碍及心肌损伤。

结直肠癌治疗相关心脏毒性及其免疫学机制的研究进展

赵梦琪

河南大学淮河医院

目的：结直肠癌（CRC）是全球常见的恶性肿瘤之一，随着治疗技术的进步，患者的生存期逐渐延长。然而，CRC 的治疗（特别是化疗、靶向治疗和免疫治疗）可能对心脏健康产生不良影响。本文综述了 CRC 治疗相关心脏毒性及其免疫学机制，分析了现有治疗方法对心脏健康的影响，并提出临床管理策略。

方法：通过系统检索 PubMed、Embase、Web of Science 等数据库，筛选近五年内关于 CRC 治疗相关心脏毒性的临床研究。重点探讨了化疗药物、靶向治疗和免疫治疗对心脏的影响及其机制，分析了治疗方案的现状和管理策略。

结果：CRC 治疗中使用的化疗药物、靶向治疗和免疫治疗均可能对心脏健康产生负面影响。化疗药物如 5- 氟尿嘧啶（5-FU）和卡培他滨广泛应用于临床，但有约 5.9% 的患者在使用这些药物时出现心脏毒性，表现为心律失常、胸痛和心力衰竭。5-FU 和卡培他滨通过诱导冠状动脉痉挛或增加心脏负荷来引发心脏损伤。靶向治疗药物，如贝伐单抗，是 CRC 治疗中的常用药物，虽然其抗肿瘤作用显著，但可能引发心脏毒性，包括高血压、心肌缺血和心力衰竭等。免疫治疗（如 PD-1/PD-L1 抑制剂）在 CRC 治疗中取得了显著疗效，但也可能导致免疫相关心脏不良事件，如心肌炎和心包炎。疗引发的心脏毒性机制复杂，主要与免疫系统的激活、细胞因子的释放等相关。治疗可能通过激活免疫系统，导致 TNF-α、IL-6 等细胞因子的过度释放，进而引起心肌细胞损伤。

结论：CRC 的治疗可能对心脏健康产生显著影响，化疗、靶向治疗和免疫治疗均可引发心脏毒性。未来的研究应进一步揭示心脏毒性发生的机制，并探索新疗法来减少心脏损伤。临床上，患者应接受个体化治疗，特别是高危患者应加强心脏健康监测。

阻塞性睡眠呼吸暂停相关慢性间歇性低氧加重阿霉素所致心脏损伤的研究

王迪 刘玉珍

新乡医学院第一附属医院

目的

阻塞性睡眠呼吸暂停（Obstructive Sleep Apnea，OSA）是一种以慢性间歇性低氧（Chronic Intermittent Hypoxia，CIH）为特征的睡眠呼吸障碍疾病，与多种恶性肿瘤的发生发展存在相关性。阿霉素（Doxorubicin，DOX）是癌症化疗基础药物之一，但其使用累积剂量与心脏毒性成正相关，可对心肌细胞造成不可逆的损伤。CIH 可诱发心肌细胞氧化损伤、线粒体功能障碍、脂代谢异常及结构重塑，是心血管疾病的独立危险因素。然而，在肿瘤患者使用阿霉素化疗时，OSA 常被忽视，其导致的心脏易损状态可能作为“隐形共病”，放大 DOX 的心脏毒性。目前尚无系统研究阐明在 CIH 背景下使用 DOX 是否会加重心肌损伤，因此，本研究旨在探究慢性间歇性低氧对阿霉素心脏毒性的影响及机制。

方法

C57BL/6N 小鼠腹腔注射不同浓度 DOX 构建体内心脏损伤模型，为后续实验选取合适的 DOX 浓度。另使用 Oxycycler A84 构建 CIH 动物模型，将 C57BL/6N 小鼠分别暴露于常氧（Normoxia，Nor）环境与 CIH 环境中，分为 Nor+NS 组、Nor+DOX（3mg/kg） 组、Nor+DOX（5mg/kg） 组、CIH+NS 组、CIH+DOX（3mg/kg）组、CIH+DOX（5mg/kg）组。（1）测量心重与体重。（2）超声心动图检测小鼠心功能。（3）尾动脉血压仪测量小鼠血压。（4）HE 染色观察心肌组织形态。CCK8 筛选诱导 H9C2、HL-1 细胞损伤模型的 DOX 浓度及 DOX 处理时间，检测叠加 IH 后 H9C2 及 HL-1 的细胞活力。

结果

体内实验结果显示，DOX 心脏损伤模型构建成功；DOX 使小鼠心重体重比下降；DOX 组小鼠射血分数、缩短分数下降，左心室收缩内径和舒张内径增大，表明 DOX 导致小鼠左心室收缩功能受损；DOX 组左心室收缩末期容积、舒张末期容积增大，表明 DOX 导致小鼠心脏增大；DOX 不影响小鼠血压；叠加 CIH 可增加阿霉素心脏损伤小鼠的心重体重比；心脏超声可见叠加 CIH 加重小鼠左心室收缩功能损伤；CIH 使小鼠血压升高；HE 染色显示叠加 CIH 使小鼠心肌细胞损伤、组织结构紊乱加剧。体外细胞实验结果显示，与 DOX 组相比，叠加 IH 可降低阿霉素诱导的 H9C2、HL-1 细胞活力。

结论

阻塞性睡眠呼吸暂停相关慢性间歇性低氧加重阿霉素导致的心脏损伤。

肿瘤代谢物与心血管疾病

苑可盈 吕林 董增祥

哈尔滨医科大学附属第一医院

背景：癌症和心血管疾病是威胁全球居民生存的最主要原因，目前已有不少研究表明肿瘤与心血管疾病存在着众多共同发病因素如：生存环境、遗传变异、炎症风险，除此之外肿瘤细胞的代谢活动与心血管系统的相互作用将加重恶化人体健康。恶性肿瘤细胞通常具有不同于正常细胞的供能途径，脂质代谢改变是癌细胞的重要代谢表型，同时在心衰发病过程中伴随能量来源的改变，脂肪酸代谢异常是其中之一。目前，对于参与脂肪酸代谢的肿瘤代谢小分子物质是否是两种疾病作用的“桥梁”尚不清楚。本研究结合当下肿瘤心脏病研究热点，将重点聚焦于肿瘤代谢物参与心脏病的发生发展过程。

方法：通过 PubMed 检索有关“肿瘤代谢”“心衰代谢机制”“心血管肿瘤”“心力衰竭癌症”的相关文献，基于国内外生物样本数据库，结合最新癌症、心血管疾病的人群队列分析，我们对肿瘤与心血管疾病共同的发病因素进行整理总结。运用临床人群血液样本、影像学资料及动物模型标本通过非靶向代谢组学技术检测癌症、心衰以及癌症伴发心衰机体的差异表达代谢物，并进一步通过定量蛋白质组学探究小分子化合物结合蛋白参与机体代谢的发病发展过程。

结果：在人群队列分析中发现肿瘤与心血管疾病共同患病因素如：饮食、吸烟、肥胖等因素的背后存在相类似的代谢过程，加重疾病进程。我们对肿瘤患者临床样本及癌症动物模型进行的心脏彩超检测显示，罹患肿瘤机体的心脏舒张功能减退，病理切片显示患病机体心脏细胞间质存在胶原沉积，纤维化标志物增加。并通过代谢组学发现脂质代谢标志物改变。

结论：肿瘤幸存者中因心血管疾病所致死亡率最高，甚至高于肿瘤因素本身。肿瘤与心血管疾病间的双向作用关系是动态且复杂的，在肿瘤发展阶段肿瘤细胞自主增殖，产生损害机体器官的“毒性物质”，不断对心脏施加代谢压力，改变心脏生理功能。本研究发现参与脂肪酸代谢过程对肿瘤及心血管疾病具有重要意义，聚焦肿瘤代谢物与心血管疾病，延长肿瘤伴发心血管疾病患者的生存期将会是肿瘤学与心脏病学学科间交叉的一项重大挑战。

终末期心脏病患者尊严疗法中护士角色定位的质性研究

田美凤

西安交通大学医学院第一附属医院

目的：明确护士在终末期心脏病（NYHA Ⅳ级或难治性终末期心衰）患者尊严疗法（Dignity Therapy, DT）中的核心角色与功能边界，为制定本土化护理路径提供理论依据。

方法：采用描述性质性研究，2023 年 10 月–2024 年 4 月通过目的抽样选取我院心内科的 11 例终末期心脏病患者、8 名责任护士及 3 名心内科医师参与半结

构式访谈。访谈提纲围绕“DT过程中护士的实际行为、情感体验、角色冲突与协作”。每次访谈 30–50 min，两位研究者独立分析后通过同行审议确保信度。

结果：析出 4 个核心主题、9 个子主题。①“关系建立者”：护士通过日常照护与病情监测（如每日症状评估、液体平衡记录）先与患者建立信任，为 DT 介入铺路；②“意义对话的催化者”：护士在医师完成 DT 访谈提纲后，于床旁协助患者回忆生命故事，使用开放式提问引导情感表达，并实时识别痛苦情绪；③“尊严维护的执行者”：护士依据 DT 生成“尊严传承文档”，在病房朗读并协助患者修改，确保隐私与患者意愿一致；④“跨学科协调者”：护士在 DT 实施前后与医师、社工、家属沟通，处理角色冲突（如家属要求隐瞒病情）并动态调整照护计划。参与者普遍认为护士的“在场”与“连续性”是 DT 成功的关键，但角色边界模糊、时间不足、情感耗竭成为主要障碍。

结论：终末期心脏病患者尊严疗法中，护士不仅是辅助者，更是贯穿始终的关系建立者、意义对话催化者与尊严维护执行者。建议通过专科培训、合理人力配置及跨学科协作框架，厘清护士角色边界，提升 DT 实施质量与护士职业可持续性。

维立西呱减轻卡非佐米诱导的小鼠心脏毒性的作用及研究

马湘萍

山东大学齐鲁医院心内科

维立西呱减轻卡非佐米诱导的小鼠心脏毒性的作用及研究

马湘萍　提蕴　卜培莉

山东大学齐鲁医院

摘要：

多发性骨髓瘤 （MM） 是一种浆细胞恶性肿瘤，占所有血液肿瘤的 10%。卡非佐米是一种不可逆的蛋白酶体抑制剂，用于治疗多发性骨髓瘤患者。然而，卡非佐米治疗与心血管并发症相关。维立西呱是可溶性鸟苷酸环化酶（sGC）激动剂，是治疗心血管疾病的新兴药物。

目的：本研究旨在确定维立西呱对卡非佐米诱导的心脏毒性的心脏保护作用。

方法：C57BL/6 小鼠被随机分为四组：对照组、维立西呱组、卡非佐米组和卡非佐米 + 维立西呱组。

结果：维立西呱通过改善组织学变化、肌酸激酶同工酶（CK-MB）和肌钙蛋白 -I 等水平，预防了卡非佐米诱导的心脏毒性。此外，它通增强过氧化氢酶活性和超氧化物歧化酶活性，降低丙二醛（MDA）水平，抑制了卡非佐米诱导的氧化损伤；通过降低 IL-6 和 TNF-α 水平，抑制炎症；通过降低 LC3,Becline-1,P62 等水平减轻自噬；通过降低 caspase3，Cleaved caspase3s 水平减低凋亡水平。

结论：维立西呱可能为缓解多发性骨髓瘤患者中卡非佐米诱导的心脏毒性提供一种新的治疗策略。

关键词：肿瘤治疗相关心脏毒性，卡非佐米，维立西呱，自噬，凋亡

入院诊室血压在评估高风险食管早癌患者的应用价值

魏蕊蕊 [2] 石福天 [1] 余静 [1]

1. 兰州大学第二医院心血管内科

2. 兰州大学第二医院消化内科

目的：食管癌（EC）作为消化道常见的恶性肿瘤之一，其早期发现与有效治疗对提升患者生存率至关重要，若能在早期诊断并治疗，可显著提高患者 5 年生存率。随着人口老龄化的加剧，恶性肿瘤合并高血压患者逐年增多，有学者认为血压增高可能是肾癌、乳腺癌、肝癌和消化道癌等恶性肿瘤患病风险的重要危险因素。本研究旨在探讨早期食管癌（EEC）患者入院诊室收缩压与癌灶病变范围及病理浸润深度之间的潜在关系，通过深入分析这一关联，为临床早期识别高危患者、制定个性化治疗方案及评估预后提供科学依据，进而提高食管早癌的整体诊疗水平。

方法：纳入 2018 年 1 月至 2024 年 10 月兰州大学第二医院行内镜下黏膜剥离术（ESD）治疗且术后病理为 EEC 的 135 例患者的临床病理资料。纳入标准：（1）我院 ESD 术后病理确诊为早期食管癌；（2）我院行窄带成像联合放大内镜（ME-NBI）检查，且经 CT、MRI、超声内镜（EUS）等检查证实无毗邻脏器或远处转移；（3）病例资料完整，既往及现在未服用降压和（或）影响血压的药物（如激素类药物、TKI 类药物等）。排除标准：（1）ESD 前行化疗、放疗等其他治疗；（2）病理结果为食管上皮良性肿瘤，或其他部位转移性食管癌；（3）有服用降压药物和（或）影响血压药物。本研究已通过兰州大学第二医院伦理委员会批准（2024A-957），回顾性研究知情同意豁免。依据入院诊室收缩压分为 3 组：Q1 正常收缩压组（入院诊室收缩压 < 120mmHg，n=45）、Q2 正常收缩压高值组（120 ≤入院诊室收缩压 < 140mmHg，n=45）、Q3 高值收缩压组（入院诊室收缩压≥ 140mmHg，n=45）。收集其一般基础资料、血糖、血脂、窄带成像联合放大内镜（ME-NBI）下所见病变范围、内镜下黏膜剥离术（ESD）后病理浸润深度等相关指标，对 3 组之间的相关数据进行分析比较。

结果：3 组患者年龄、性别、BMI 均无显著性差异，三组患者癌灶病变范围、病理浸润深度存在显著性差异，两两比较高值收缩压组大于正常收缩压组（2.83±1.28 vs 2.17±0.87 cm，P < 0.05）。随着入院诊室收缩压的降低，病理浸润深度过深出现的频率越低 n（%）[18（40） vs 12（26.7） vs 6（13.3），P < 0.05]。影响癌灶病变范围的多因素线性回归分析提示入院诊室收缩压是影响癌灶病变范围的独立危险因素（b=0.018，OR=2.142，P < 0.05）。

结论：在 EEC 患者中，入院诊室收缩压越高，癌灶病变范围越大，同时病理浸润深度过深的可能越高，可将入院诊室收缩压作为评估高危 EEC 患者的早期辅助指标。

关键词：早期食管癌 诊室收缩压 癌灶病变范围 病理浸润深度

基于 UPLC-Q-TOF/MS 研究维药爱维心口服液改善免疫检查点抑制剂相关性心肌炎的活性成分及作用机制

于坚

新疆医科大学附属肿瘤医院

目的：免疫检查点抑制剂（Immune Checkpoint Inhibitors，ICIs）已经成为肿瘤治疗的重要手段，其在发挥显著疗效的同时也伴随着一定的毒副反应，其中最为严重的是免疫相关心血管不良反应中的 ICIs 相关性心肌炎。ICIs 相关性心肌炎发生率虽低，但死亡率较高，严重影响了肿瘤患者的生存及预后，因此迫切需要减轻和预防 ICIs 伴随的毒副作用。本文评估了爱维心口服液（Aiweixin Oral Liquid，AOL）对 ICIs 相关性心肌炎的保护作用及潜在机制。

方法：采用高效液相色谱法鉴定 AOL 的血清化学成分；结合网络药理学分析鉴定 AOL 在 ICIs 相关性心肌炎中的活性成分及作用靶点，并对其进行富集分析；通过动物和细胞实验验证分析结果。

结果：质谱分析确定了 AOL 的活性成分，结合网络药理学及分子对接发现排名前五的活性成分为 Schinicoumarin、Demethoxyyangonin、Ferulic acid、Hispidulin acetate、Herniarin，关键基因为 CASP3、STAT3、ALB、MTOR、CCND1；体内实验表明 AOL 可显著改善 ICIs 相关性心肌炎小鼠的心肌损伤标志物及心脏超声指标，体外实验也得到了一致结果；富集分析及实验验证发现 AOL 可能通过调节 PI3K-Akt 信号通路改善 ICIs 相关性心肌炎。

结论：AOL 可能通过靶向 PI3K-Akt 信号通路发挥心脏保护作用，这为未来 ICIs 相关性心肌炎患者的治疗提供了参考依据。

肿瘤心脏病学的临床实践挑战与多学科管理策略探索

周雪梅

武汉大学人民医院

目的：随着肿瘤治疗技术的进步和患者生存期的延长，抗肿瘤治疗相关心血管毒性已成为影响肿瘤患者预后的重要因素。本研究旨在系统分析肿瘤心脏病学领域的临床实践现状，探讨多学科协作模式在肿瘤治疗相关心血管并发症防治中的应用价值，为建立规范化的肿瘤心脏病诊疗体系提供依据。

方法：本研究采用文献系统回顾与临床实践分析相结合的方法。首先对近五年国内外肿瘤心脏病学相关指南和重要研究进行系统性梳理，总结当前临床实践中的关键问题。同时，通过多中心临床病例分析，收集典型肿瘤治疗相关心脏毒性的诊疗过程，重点分析临床表现、诊断方法和治疗策略的特点。在此基础上，构建包含肿瘤科、心血管科、影像科、药学等多学科专家的工作组，探讨优化诊疗流程的策略。

结果：临床特征分析：肿瘤治疗相关心脏毒性表现多样，包括心肌功能障碍、冠状动脉疾病、心律失常和高血压等，其发生机制与特定抗肿瘤药物密切相关。临床表现常不典型，早期症状易被忽视，部分患者出现不可逆的心功能损害后才被发现。诊断评估现状：心脏生物标志物和影像学检查在早期发现心脏毒性方面具有重要价值，但临床应用中存在标准不统一的问题。不同肿瘤治疗方案的心脏毒性风险评估体系尚待完善，个体化监测方案缺乏共识。管理策略探索：多学科协作模式显著提高了对高风险患者的识别率和干预及时性。预防性心血管保护策略在部分肿瘤治疗方案中显示出减少心脏毒性的潜力。肿瘤治疗与心血管保护的平衡决策需要综合考虑患者肿瘤预后和心血管风险。

结论：肿瘤心脏病学作为一个新兴交叉学科，面临着临床认识不足、诊疗规范缺乏等多重挑战。建立多学科协作机制是提高肿瘤治疗相关心血管并发症防治水平的关键。未来需要加强专业人才培养，制定基于循证医学的诊疗指南，并建立长期随访体系以评估干预措施的远期效果。同时，应重视基础与临床研究的结合，深入探索肿瘤治疗相关心脏毒性的分子机制，为精准防治提供新思路。

动脉僵硬和癌症发生之间的关系：来自开滦研究的 10 年数据

董皓宇 [1] 张津浦 [1] 李佳甜 [1] 陈朔华 [2] 夏云龙 [1] 吴寿岭 [2] 杨晓蕾 [1]

1. 大连医科大学附属第一医院

2. 开滦总医院

背景: 近年来，心血管重构与癌症之间的双向关系引起了科学界的广泛关注。然而，早期血管重构与癌症发生之间的联系尚不清楚。本研究旨在探讨早期血管重构是否与新发癌症的发生相关，并通过肱踝脉搏波速度（baPWV）进行量化。本研究的主要目的是调查早期血管重构（通过 baPWV 量化）是否与新发癌症有关。

方法：我们采用了 Cox 比例风险模型及基于群组的轨迹模型，以确定基线 baPWV 和 baPWV 变化对癌症及其相关结果的评估能力。

结果：从 2010 年 1 月至 2022 年 12 月，共有 58,382 名接受 baPWV 检查的中国成年人被纳入研究，其中 1,129 例为新发癌症，随访中位数为 6.07 年。结果显示，baPWV 对癌症发病率具有显著的评估能力（多变量调整后的风险比 [aHR]：1.113；95% 置信区间 [CI]：1.091-1.136；P<0.001）。其中，baPWV 处于中等（14-18 m/s）和高（≥ 18 m/s）水平的参与者，其癌症发病风险分别增加了 70.5% 和 153.4%。在按年龄和性别分层的亚组分析中也确认了类似的关联。在轨迹分析中，12,773 名个体显示出四种不同 baPWV 水平的轻微增加模式：极低、低、中等和高。与极低和低组相比，中等和高组的癌症风险的 aHRs（95% CI）分别为 1.457（1.042-2.037，P<0.001）和 1.941（1.321-2.850，P<0.001）。

结论：基线 baPWV 水平及其变化轨迹均与癌症发生率显著相关。这一发现为将 baPWV 评估及其长期监测作为癌症一级预防策略的一部分提供了支持。这表明在癌症的早期干预和预防中，考虑到心血管的健康状态评估可能具有重要的临床意义。通过对 baPWV 的持续监测，可以更好地识别出具有较高癌症风险的个体，

从而采取更为有效的预防措施。这一研究拓展了我们对心血管健康与癌症发生关系的理解，并为未来的公共卫生政策和个体化医疗提供了有价值的信息。

piRNA-5900 调控 ATF4 阻抑阿霉素诱导的心肌细胞铁死亡

秦路宁 陈若兰 褚现明

青岛大学附属医院崂山院区

目的：

探究非编码 RNA（ncRNA）对阿霉素（DOX）诱导心肌损伤的作用，并研究其确切作用和潜在机制，其中 piRNA 在心脏毒性中的作用鲜有报道，因此本研究将揭示 DOX 心肌损伤中 piRNA 表达谱，阐述 piRNA 调控心肌损伤的机制，为 piRNA 在心血管疾病中的临床转化提供依据。

方法：

在体内培养小鼠心肌细胞，构建 DOX 损伤心肌细胞模型，将细胞分为正常对照组（NC 组）和 DOX 处理组，采用高通量测序筛选并验证差异表达的 piRNA，与 NC 组相比，DOX 处理组心肌细胞中 piR-5900 表达水平显著下调，提示其可能参与 DOX 诱导的心肌损伤调控过程。经小鼠心肌细胞内转染 piR-5900 mimic 或 piR-5900 inhibitor，分别实现 piR-5900 的过表达或敲低；通过 DCFH-DA 荧光探针法对细胞内活性氧簇（ROS）水平进行定量检测，以评估细胞氧化应激状态；同时运用 C11-BODIPY 荧光探针精确测定细胞内脂质过氧化水平。结合转录组测序分析、Western blotting 及免疫共沉淀等技术，深入解析 piRNA-5900 在心肌细胞铁死亡中的分子调控机制。为鉴定 piRNA-5900 的作用靶点，采用 RNA pull-down 技术联合液相色谱 - 串联质谱（LC-MS/MS）分析，筛选并证实激活转录因子 4（ATF4）为 piRNA-5900 的直接下游作用靶标。在此基础上，通过构建 ATF4 过表达及基因敲低模型，系统评估 ATF4 在 piRNA-5900 介导的铁死亡抑制通路中的功能作用。在动物模型验证方面，通过腹腔注射 DOX 构建小鼠心肌损伤模型，并采用尾静脉注射 piRNA-5900 过表达载体进行干预。通过超声心动图动态监测心功能变化，结合心肌组织铁死亡特异性标志物检测及 ATF4 表达水平分析，综合评价 piRNA-5900 对 DOX 诱导的心功能损伤的保护效应及其分子机制。

结果：

1. 通过高通量测序分析 DOX 处理的小鼠心肌细胞，发现与 NC 相比，DOX 组中 piR-5900 的表达水平显著降低，提示 piR-5900 可能参与 DOX 诱导的心肌损伤调控过程。

2. 在体外实验中，转染 piR-5900 mimics 显著降低 DOX 诱导的心肌细胞内 ROS 水平和脂质过氧化，减轻心肌细胞铁死亡；而转染 piR-5900 inhibitor 则进一步加剧 ROS 积累和脂质过氧化水平，加重心肌细胞铁死亡。

3. 经 RNA pull-down 联合 LC-MS/MS 质谱分析鉴定 ATF4 为 piR-5900 的结合靶点。pi-5900 过表达显著上调 ATF4 蛋白表达，而 piR-5900 抑制则下调 ATF4 水平。

4. 机制上，ATF4 敲低可抵消 piR-5900 对铁死亡的抑制作用，而过表达 ATF4 则能缓解 DOX 诱导的心肌细胞损伤，提示 ATF4 是 piR-5900 调控铁死亡的关键下游效应分子。

5. 在动物水平上，DOX 处理显著降低小鼠心功能和加重心肌铁死亡。尾静脉注射 piR-5900 过表达载体显著改善心功能，且上调 DOX 诱导的 ATF4 下降。

结论：

本研究证实，piR-5900 在 DOX 诱导的心肌损伤中表达下调，并通过调控 ATF4 介导的铁死亡通路发挥心肌保护作用。机制上， piR-5900 可抑制 ROS 积累及脂质过氧化，从而减轻心肌细胞铁死亡。在动物模型中， piR-5900 过表达显著改善 DOX 诱导的心功能损伤，提示 piR-5900/ATF4 轴可能成为防治阿霉素心脏毒性的潜在干预靶点。

胸腺瘤与非胸腺瘤患者免疫检查点抑制剂相关心肌炎临床特征分析

曾海艳 薛玉梅

广东省人民医院

目的

本研究旨在比较 TM 与非 TM 患者 ICI-M 的临床特征差异，并进一步分析与病毒性心肌炎（VM）的异同。

方法

回顾性收集广东省人民医院 2018 年 1 月至 2024 年 8 月期间诊断为 ICI-M 的患者，并将 TM-ICI-M 与其他癌症 ICI-M(Non-TM-ICI-M) 及 VM 患者比较临床表现、生物标志物、心电图、超声心动图及预后差异。

结果

纳入 89 例心肌炎患者，ICI-M28 例（TM-ICI-M 组 7 例、Non-TM-ICI-M 组 21 例）及 VM 组 61 例。**症状**：ICI-M 组以肌无力（TM-ICI-M 组 4/7，Non-TM-ICI-M 组 3/21）、眼睑下垂（TM-ICI-M 组 2/7，Non-TM-ICI-M 组 5/21）为主要表现，VM 组无相关表现；胸痛在 ICI-M 组（TM-ICI-M 组 0/7、Non-TM-ICI-M 组 5/21）显著低于 VM 组（39/61），发热在 ICI-M 组（TM-ICI-M 组 2/7、Non-TM-ICI-M 组 1/21）显著低于 VM 组（22/61），均 P<0.05。**生物标志物**：TM-ICI-M 组肌钙蛋白 T(cTnT) 峰值显著高于 Non-TM-ICI-M 组和 VM 组 [5023.0（1456.0，7523.5）、539.3（295.8，1166.0）、851.1（218.5，2061.0）pg/mL，H=8.12，P=0.017]，TM-ICI-M 组和 Non-TM-ICI-M 组的肌酸激酶（CK）峰值、肌酸激酶同工酶（CK-MB）、丙氨酸氨基转移酶（ALT）天冬氨酸氨基转移酶(AST)均显著高于 VM 组，即 [CK: 7273.0(1991.5，7458.5)、1853.0(313.0，5081.0）、476.0（298.0，1129.0）U/L，H=13.97，P<0.001]、[CK-MB：156.8（105.7，276.6）、82.0（48.5，151.1）、32.8（19.6，68.0）U/L，H=22.84，P<0.001]、[ALT：221.0（146.0，2456.5）、100.0（70.0，184.0）、48.0（27.0，80.0）U/L，H=20.30，P<0.001]、[AST：379.0（177.0，3920.0）、168.0（49.0，337.0）、75.0（37.0，145.0）U/L，H=14.53，P<0.001]。**心电图:** TM-ICI-M 组室性心动过速 [(4/7)，0%(0/21)，1.6%(1/61)，Fisher 精确概率法，P<0.001] 和 II - III度房室传导阻滞 [(4/7)，0%(0/21)，3.3%（2/61），Fisher 精确概率法，P<0.001] 均显著高于非 TM-ICI-M 组和 VM（均 P<0.001）。**预后:** 相比 Non-TM-ICI-M 组，TM-ICI-M 组中症状出现更早 [15(14.5，20.5）、47（24.0，94.0）天，H=18，P=0.004]，多系统受累占比更高 [（5/7），（1/21），Fisher 精确概率法，P=0.001]。TM-ICI-M 组 LVEF<50% 比例高于 Non-TM-ICI-M 组 [（3/7），4.8%（1/21）]，以及 30 天死亡人数 42.9%（3/7）占比高于 Non-TM-ICI-M 组 19.0%（4/21），但差异均无统计学意义（P>0.05）。

结论

与非 TM 肿瘤患者对比，TM 患者 ICI-M 发生更早，心肌损伤更重，危及生命的心律失常发生比例更高，常伴多系统受累，预后较差。

The circadian rhythms, cancer status and risk of coronary heart disease: A prospective study in UK Biobank

Zhongzhi Yu, -Dan Wang, Jin-Wei Tian

The Second Affiliated Hospital of Harbin Medical University

Abstract

Background: This study investigates the relationship between circadian rhythms and cancer, focusing on its impact on the risk of coronary heart disease (CHD). CHD is one of the leading causes of mortality worldwide, and cancer survivors face an increased risk of developing cardiovascular diseases, particularly CHD, due to both cancer itself and the effects of cancer treatments. Circadian rhythms, which govern the body's sleep-wake cycles and metabolic processes, have been linked to cardiovascular health. Disruptions to circadian rhythms, such as irregular rest-activity rhythms and poor sleep patterns, have been associated with increased cardiovascular risk. However, the interaction between circadian rhythms, cancer status, and CHD risk has not been thoroughly explored in large cohort studies.

Methods: The study utilized data from the UK Biobank, including 93,933 participants with available data on circadian rhythms, cancer status, and CHD outcomes. Circadian rhythms were assessed using wearable accelerometers to track the rest-activity rhythm (RAR) score and questionnaires to gather information on sleep patterns, including sleep duration and insomnia. The RAR score was derived from metrics of inter-daily stability, intra-daily variability, and relative amplitude, which reflect the stability, fragmentation, and robustness of an individual's rest-activity rhythm. Sleep patterns were categorized into appropriate (7-8 hours of sleep per day) and inappropriate durations (

Findings: Over a median follow-up period of 12.9 years, 5,599 participants (5.96%) had been diagnosed with cancer at baseline, while the remaining 88,334 participants were cancer-free. Well-regulated circadian rhythms, characterized by a high RAR score, appropriate sleep duration, and rare insomnia, were significantly associated with a reduced risk of developing total CHD, non-fatal CHD, and fatal CHD. Specifically, the hazard ratios (HR) for total CHD were 0.81 (95% CI: 0.74-0.88) for high RAR score, 0.82 (95% CI: 0.77-0.88) for appropriate sleep duration, and 0.87 (95% CI: 0.80-0.94) for never or rarely experiencing insomnia. In cancer survivors, well-regulated circadian rhythms were associated with a 10.3% to 24.0% reduction in CHD events, while in cancer-free participants, this reduction ranged from 5.5% to 9.0%. Cancer status itself was found to increase the risk of total and non-fatal CHD (HR: 1.27, 95% CI: 1.13-1.42), with a higher risk of developing non-fatal CHD (HR: 1.27, 95% CI: 1.12-1.43). However, cancer survivors with well-regulated circadian rhythms did not show a significant increase in the risk of total CHD or non-fatal CHD compared to cancer-free controls with circadian disruptions.

Interpretation: This study found that well-regulated circadian rhythms, including stable rest-activity patterns and appropriate sleep durations, were associated with a significant reduction in CHD risk, even after adjusting for multiple confounding factors. Notably, the positive effects of well-regulated circadian rhythms were particularly important for cancer survivors, who generally face an elevated risk of cardiovascular diseases. These findings suggest that optimizing circadian rhythms may serve as a modifiable preventive approach to reduce the high cardiovascular burden associated with cancer.

Funding: This study was supported by the National Natural Science Foundation of China, the Natural Science Foundation of Heilongjiang Province, the Fok Ying-Tong Education Foundation for Young Teachers, the Heilongjiang Applied Technology Research and Development Plan, the HMU Marshal Initiative Funding, and the Key Laboratory of Emergency and Trauma of the Ministry of Education (Hainan Medical University).

恩格列净通过改善心肌电重构及结构重构减轻阿霉素引起的心律失常

刘慧意 薛玉梅

广东省人民医院

目的：本研究旨在探讨阿霉素（Doxorubicin, DOX）心律失常的毒性作用，并评估 SGLT 2 抑制剂恩格列净（Empagliflozin, EMPA）在减轻或预防这些毒性反应中的心脏保护作用。

方法：在单独使用 DOX（5μM）处理及 DOX 处理的基础上予 EMPA（10μM）的心肌细胞中，全细胞膜片钳检测心肌细胞 $I_{Ca,L}$、I_{Kur} 密度和 APD 的改变；WB 检测离子通道蛋白及纤维化蛋白表达水平，观察 DOX 对心肌细胞的电流密度及相应通道蛋白、纤维化蛋白表达水平的影响，以及 EMPA 对 DOX 上述心脏电重构及结构重构改善的程度。

结果：EMPA 不影响心肌细胞的 $I_{Ca,L}$ 密度，DOX 显著降低 $I_{Ca,L}$ 密度，EMPA 明显逆转 DOX 引起的心肌细胞 $I_{Ca,L}$ 密度下降。而激活、失活和复活曲线不受影。WB 结果与 $I_{Ca,L}$ 结果相似，DOX 引起心肌细胞离子通道蛋白 Cav1.2 表达水平下降（P < 0.01），EMPA 处理可以增加 Cav1.2 水平（P < 0.01）。单独使用 EMPA 处理心肌细胞时，APD 不受影响；DOX 显著延长 APD70 及 APD90，EMPA 明显逆转 DOX 引起的心肌细胞 APD 延长。EMPA 显著改善 DOX 引起的心肌细胞 I_{Kur} 密度下降，WB 结果与全细胞膜片钳结果一致，DOX 引起心肌细胞 Kv1.5 表达水平下降，EMPA 逆转 Kv1.5 的表达。DOX 引起心肌细胞 BNP 及纤维化相关蛋白表达升高（P < 0.05），EMPA 处理可以显著逆转 DOX 组大鼠 BNP、COL1A1、COL3A1、MMP-2 及 MMP-9 表达水平明显升高（P < 0.05）。

结论：在 DOX 刺激下的心肌细胞模型中，$I_{Ca,L}$ 和 I_{Kur} 电流密度显著下降，APD 明显延长，Cav1.2 及 Kv1.5 蛋白表达显著下降；BNP 及纤维化相关蛋白表达明显增加，提示使用 DOX 增加心律失常发生率。在 DOX 刺激的心肌细胞的基础上，应用 EMPA 可逆转由于 DOX 引起的心肌细胞 $I_{Ca,L}$ 和 I_{Kur} 电流密度下降，APD 延长，Cav1.2 及 Kv1.5 蛋白表达下降，提示 EMPA 可以显著减轻 DOX 引起的心律失常发生率。

基于 MOFs 的抗氧化纳米系统通过调控铁死亡缓解阿霉素心脏毒性

刘浩坤 [1]

1. 天津医科大学大学总医院

2. 天津大学

目的: 阿霉素(DOX)具有剂量依赖型心脏毒性,铁死亡在DOX诱导心脏毒性(DIC)中发挥关键作用，是通过脂质过氧化发生的。干预心肌脂质过氧化，可作为预防及治疗 DIC 的关键策略。

方法：1. 利用液相扩散法合成 DOX@EDA-Zn 和 EDA-Zn，通过 DLS、Zeta 电位、TEM、溶液稳定性和载药量表征。2. 利用 H9c2 细胞系验证游离药物（EDA、Zn^{2+}）、EDA-Zn 和 DOX@EDA-Zn 的细胞存活率。并分别通过 RSL3 和 DOX 造模，比较游离药物和 EDA-Zn 的拯救作用。建立 DIC 模型，验证 EDA、DOX@EDA-Zn 对 DIC 的作用。通过铁死亡标志物、抗氧化物和 Liperfluo 验证 DOX@EDA-Zn 对 DIC 脂质过氧化的作用。3. 利用小鼠建立 DIC 模型，通过 UCG、心肌酶、铁死亡标志物、抗氧化物检测、HE 和 Masson 染色，验证 DOX@EDA-Zn 对 DIC 的作用。

结果：1. 通过液相扩散法合成 DOX@EDA-Zn 和 EDA-Zn，通过 DLS、Zeta 电位、TEM、光学特性、溶液稳定性和载药量表征，证明成功合成 EDA-Zn 且负载 DOX。2. 利用 H9c2 细胞系对比 Zn^{2+}、EDA 和 EDA-Zn 的心肌拯救作用，对比 DOX 与 DOX@EDA-Zn 的细胞毒作用，DOX@EDA-Zn 显著提高细胞活力（79.25% vs 24.27%，P<0.01），优于 EDA+DOX 组（56.04%，P<0.05），证实 EDA-Zn 有更优异的心肌保护能力。3. 利用 H9c2 细胞系成功建立 DIC 模型，显著降低 MDA（0.71vs 2.41 mmol/mg protein）、4-HNE（22.13 vs 47.11 mmol/mg protein）和 PTGS2（2.38vs 7.36 mmol/mg protein）表达水平（均 P<0.01），提高 GSH（0.17 vs 0.12 mmol/mg protein）、Thiol（0.12 vs 0.09 mmol/mg protein）和 Trx（0.22 vs 0.11 mmol/mg protein）含量（均 P<0.05）。Liperfluo 显示 DOX@EDA-Zn 组脂质过氧化物荧光强度下降幅度最大。证实 DOX@EDA-Zn 的体外心肌保护效果良好。4. 利用小鼠建立 DIC 模型，通过 UCG、心肌酶、铁死亡标志物和抗氧化物检测，DOX@EDA-Zn 显著提高 LVEF（81.52% vs 65.63%，P<0.01），EDA+DOX 组为 75.74%；cTnT、MYO 和 CK-MB 水平较 DOX 组分别下降 57.27%、30.76% 和 19.63%；同时 MDA、PTGS2 较 DOX 组表达分别下调 59.72% 和 68.26%，GSH、Thiol、Reduce trx 较 DOX 组表达分别上调 107.21%、109.58% 和 41.09%；HE 染色显示心肌纤维排列更整齐，核固缩减少；Masson 染色提示纤维化面积减少几乎接近 Saline 组；提示铁死亡显著受控。

结论：成功合成了 DOX@EDA-Zn，并探究了 DOX@EDA-Zn 对 DIC 的作用。在体内、外实验，证明 DOX@EDA-Zn 较游离 EDA 对 DIC 有更明显缓解作用。DOX@EDA-Zn 通过抑制铁死亡以促进改善 DIC 提供有利证据。

Development and validation of a nomogram for predicting new-onset cardiac conduction block in patients with advanced NSCLC undergoing immune checkpoint inhibitor therapy

Conghui Shang, Liang Zhao, jindong Chen, Hao Wang, Ziyi Sheng, Tianqing Chu

Shanghai Chest hospotal

Abstract

Background

Non-small cell lung cancer (NSCLC) is one of the leading causes of mortality globally, and approximately 50% of patients are at advanced stage at the time of diagnosis. Chemotherapy is a standard treatment for advanced NSCLC with mediocre oval survival, and chemotherapy-induced adverse events (AE) can be frequently observed such as fatigue, anemia, infection, and gastric hemorrhage. With the development of molecular carcinogenesis and the identification of oncogene drivers, targeted therapy has also become a widely used treatment for advanced NSCLC patients. Hypertension and rash are common AEs after targeted therapy, while other AEs such as vomiting and hypokalemia are much less reported. In the exploration of immune escape mechanism, immune checkpoint inhibitors (ICIs), especially programmed cell death protein-1/ligand-1 (PD-1/PD-L1), have become an effective treatment for advanced NSCLC. The ICI-related AEs could occur in almost any organ system with varying frequencies and severities. Cardiotoxicity could be observed during these therapies and could be lethal, of which cardiac conduction block (CCB) is infrequently reported but could cause severe AEs. With the increasing use of ICIs and combined therapy, along with an improved survival of advanced NSCLC, treatment-related CCB is expected to rise. However, currently our knowledge remains scarce on CCB in advanced NSCLC patients during treatment, especially ICIs-related CCB. Therefore, the present study was conducted to investigate the epidemiologic features of new-onset CCB in patients with advanced non-small cell lung cancer (NSCLC) during anti-PD-1/PD-L1 treatment, to identify its predictors, and to develop and validate a nomogram for individualized risk evaluation.

Method This is a single-center retrospective observational study, of which the study population was enrolled from the institutional database. The study protocol was approved by the institutional ethics committee (IS22023) and conducted in accordance with the Declaration of Helsinki (as revised in 2013). We reviewed the medical records of 2269 consecutive lung cancer patients undergoing anti-PD-1/PD-L1 treatment in Shanghai Chest Hospital between 2018 and 2023. New-onset CCB were identified via electrograms, including sinoatrial block, atrioventricular block (AVB), and intraventricular block (IVB). Logistic regression analysis was performed to identify predictors of new-onset CCB. A nomogram model was constructed and validated.

Results The training set and validation set enrolled 1263 and 395 patients, respectively. New-onset CCB occurred in 109 patients (8.63%; including 75 first-degree AVB,

4 left anterior fascicular block, 32 right bundle branch block, and 11 non-specific IVB) and was mostly intermittent (n=99). AVB and IVB occurred alone in 67 (61.5%) and 34 patients (31.2%), respectively, and concomitantly in 8 patients (7.3%). CCB advanced in 1 patient from first-degree AVB to Mobitz type I AVB. Independent predictors included concomitant anlotinib, smoking history, and older age, which were included in the nomogram model. The C-index value and Brier score were 0.620 and 0.078 in the training cohort, and 0.745 and 0.066 in the validation cohort, respectively. The calibration curve yielded satisfactory concordance between the predicted and actual outcomes.

Conclusions Anti-PD1/PD-L1 treatment-related CCB seems generally benign. Concomitant anlotinib, smoking history, and senior age were independent risk factors for new-onset CCB in patients with advanced NSCLC after anti-PD-1/PD-L1 therapy.

Angiotensin receptor-neprilysin inhibitors improve the outcome of lung cancer patients with hypertension treated with immune checkpoint inhibitors

Conghui Shang, Liang Zhao, Jindong Chen, Hao Wang

Shanghai Chest hospotal

Abstract

Background: Angiotensin receptor-neprilysin inhibitors (ARNIs) could improve the outcome of patients with hypertension or heart failure by reducing cardiovascular morbidity and all-cause mortality. Yet it remains unclear if such protective effect exists in lung cancer patients with hypertension undergoing immune checkpoint inhibitors (ICI).Immune checkpoint inhibitors (ICIs) have substantially improved clinical outcomes in multiple cancer types and are increasingly used in early disease settings and in combinations of different immunotherapies.While most patients will greatly benefit from the therapy, ICIs can also cause severe or fatal immune-related cardiac adverse-events. Common complications include myocarditis, acute coronary syndrome (ACS), heart failure (HF), arrhythmias, pericardial effusion, and others.

Beyond dose reduction, discontinuation of medication, and alteration of the therapies, there are no established therapies to reduce ICIs-induced cardiotoxicity.Recently, a study suggested that SGLT2i may attenuate the cardiotoxicity associated with immune checkpoint inhibitors and improve cardiac outcomes and OS. Currently, there is no data regarding the potential benefit of Angiotensin receptor-neprilysin inhibitors (ARNIs) among patients diagnosed with hypertension and treated with ICIs therapy. We aimed to investigate the prognostic value of baseline therapy with ARNIs among patients diagnosed with lung cancer and hyperten-

sion, treated with ICIs therapies.

Objective: This study sought to evaluate the impact of ARNIs on the outcome of lung cancer patients with hypertension treated with ICIs.

Methods:

The study population of this single-center retrospective observational study was obtained from the institutional database. The study protocol was approved by Shanghai Chest Hospital Ethics Committee. This study was conducted in accordance with the guidelines of the Declaration of Helsinki (as revised in 2013). We conducted a retrospective, single-center, observational study in Shanghai Chest Hospital. Consecutive medical records of all patients diagnosed with lung cancer and hypertension and treated with ICIs therapy between September 2019 and May 2024 were reviewed. We performed a retrospective analysis of patients diagnosed with lung cancer and hypertension undergoing ICI treatment at our center. Patients were divided into two groups according to baseline treatment with or without ARNIs. The primary endpoint was all-cause mortality. The secondary endpoint was composite of cardiovascular outcomes, defined as new-onset myocarditis, ACS, PE, arrhythmia (including atrial fibrillation, atrial flutter and Grade 3 QT prolongation), and HF. These endpoints were chosen, as they are considered as ICIs-induced cardiotoxicity.

Results: The cohort included 150 patients, with 39 (26%) patients assigned to the ARNIs group. Over a median follow-up of 12 months, 37 (24.6%) patients died, with a significantly lower all-cause mortality rate in the ARNIs group (4/39, 10.3% vs. 33/111, 29.7%, P=0.015). There was no significant difference in cardiovascular outcome between ARNIs and control group (20/111, 18.0% vs. 3/39, 7.7%, P=0.124). We observed that the most common cardiovascular events was new-onset arrhythmia in both ARNIs group (2/3, 66.7%) and control group (14/20, 70%). Overall, a total of 23 cardiovascular adverse events occurred, including 3 events in the ARNIs group and 20 events in the control group, of which new-onset atrial fibrillation or atrial flutter occurred most frequently (n=9). In control group, cardiovascular adverse events included Grade 3 QT prolongation in 6 patients, HF in 2 patients, myocarditis in 1 patient, ACS in 2 patients, and pericardial effusion in 2 patients. While in ARNIs group, HF in 2 patient, atrial fibrillation in 1 patient, and Grade 3 QT prolongation in 1 patient occurred.

Conclusions: ARNIs were associated with a lower all-cause mortality rate yet similar rate of cardiac events in lung cancer patients with hypertension and treated with ICIs.

The Association Between Serum Luteinizing Hormone and Follicle-Stimulating Hormone Levels and Congestive Heart Failure in Postmenopausal Women: A Cross-Sectional Study

hangyu zhou, Saiyaremu Xierzhati, Jie Li, zhao Wang

People's Hospital of Xinjiang Uygur Autonomous Region

Background :The significantly increased risk of cardiovascular disease in women after menopause has prompted researchers to investigate the role of declining sex hormone levels. Previous studies on sex hormones and cardiovascular health have yielded inconsistent findings. This study specifically aims to elucidate the relationship between serum gonadotropin levels—luteinizing hormone (LH) and follicle-stimulating hormone (FSH)—and the risk of congestive heart failure (CHF) in a postmenopausal female cohort. Understanding these associations may provide crucial insights into novel hormonal pathways influencing postmenopausal cardiovascular risk.

Methods: A cross-sectional study design was employed, enrolling 2,442 postmenopausal women who visited the People's Hospital of Xinjiang Uygur Autonomous Region, with serum LH and FSH levels serving as the primary observation indicators. The outcome of interest was the presence of CHF diagnosed according to established clinical criteria. Comprehensive univariate analyses identified potential confounding factors. Subsequently, multivariate logistic regression models were rigorously employed to evaluate the independent association between LH/FSH levels (through both continuous and quartile-based categorical analyses) and CHF risk, with adjustments made for relevant covariates including age, marital status, reproductive history, testosterone, estradiol, BMI, renal function, blood glucose, blood lipids, hypertension, diabetes, and coronary heart disease. To characterize the nature of the dose-response relationship, the study utilized restricted cubic spline (RCS) models with four knots. In addition, predefined subgroup analyses were conducted based on age, marital status, reproductive history, BMI, hypertension, and diabetes status. The robustness of the primary findings was assessed and potential effect modifications were explored through interaction term tests.

Results: The fully adjusted multivariate logistic regression analysis demonstrated that higher serum levels of both LH and FSH were significantly associated with a reduced risk of congestive heart failure. Results: The multivariate logistic regression analysis after full covariate adjustment showed that higher serum levels of both LH and FSH were significantly associated with a decreased risk of CHF. Specifically, each unit increase in LH corresponded to an odds ratio (OR) of 0.73 (95% confidence interval [CI]: 0.56 to 0.94, p=0.017); while each unit increase in FSH yielded an OR of 0.64 (95% CI: 0.48 to 0.87, p=0.004). When categorized by quartiles (Q1-Q4, with Q1 as reference), participants in the highest LH quartile (Q4) demonstrated significantly reduced risk of congestive heart failure (OR=0.48, 95% CI: 0.24-0.95, p=0.035). Similarly, the highest quartile group (Q4) of follicle-stimulating hormone (FSH) demonstrated a stronger negative correlation (OR=0.31, 95% CI: 0.14-0.70, p=0.005). RCS analysis confirmed that both LH and FSH levels showed statistically significant linear negative dose-response relationships with CHF risk (both overall P-values <0.05), indicating no evidence of nonlinear relationships was found. Subgroup analyses stratified by age, marital status, reproductive history, BMI, hypertension, and diabetes status revealed consistent negative correlations for both hormones. Crucially, the interaction tests showed that none of these subgroup factors produced significant effect modification (all P-interaction > 0.05), which further confirmed the robustness of the primary findings across different patient characteristics.

Conclusion Our findings indicate that serum LH and FSH levels are inversely associated with the risk of congestive heart failure in postmenopausal women. This study highlights the potential role of sex hormone levels in cardiovascular health among postmenopausal women. Further research is needed to elucidate the underlying mechanisms of these findings and explore their clinical implications.

A Predictive Model of Adverse Pregnancy Outcomes in Advanced Maternal Age Women with Preeclampsia was Constructed Based on Machine Learning

Sulan Huang

The first people's hospital of Changde city

Objective

The objective of this study is to apply machine learning techniques to develop a prediction model for the risk of hypertensive disorders in pregnancy and adverse pregnancy outcomes among elderly pregnant women. The ultimate aim is to more accurately predict the risk of such conditions and reduce the occurrence of adverse pregnancy outcomes. Hypertensive disorders in pregnancy, especially preeclampsia, are one of the leading causes of maternal and fetal morbidity and mortality. Elderly pregnant women, defined as those aged 35 or older, face higher risks of complications, making the development of an effective prediction model critical for improving maternal and fetal health.

Methods

This study focused on elderly pregnant women diagnosed with preeclampsia, and patients were followed up until 3 months postpartum. The primary goal was to identify and evaluate potential risk factors for adverse pregnancy outcomes in this population. To construct prediction models, we employed several machine learning classification algorithms, including logistic regression (LR), adaptive boosting (AdaBoost), complement naive Bayes (CNB), multi-layer perceptron (MLP), support vector machine (SVM), and K-nearest neighbors (KNN). These algorithms were selected for their established success in classification tasks across various fields, including healthcare. The dataset used for model development consisted of clinical data collected from elderly women diagnosed with preeclampsia. The features included medical history, blood pressure readings, laboratory results, and other clinical indicators.The models were first trained on a subset of the dataset, and then evaluated using a separate validation set to assess their predictive performance. The performance of each model was evaluated using area under the curve (AUC) and accuracy metrics, which are commonly used to determine the effectiveness of classification models in binary prediction tasks. In addition to training and evaluating the models, the study also performed a model fusion analysis to combine the results of multiple algorithms, potentially improving the overall predictive power.

Results

A total of 860 elderly preeclamptic patients were included in this study, of which 322 patients experienced adverse pregnancy outcomes, such as preterm birth, fetal growth restriction, and other complications. The data were analyzed using the selected features, and prediction models were developed based on the six machine learning algorithms. The models were tested on a validation set, and the results showed varying performance across the different algorithms. The AUC values and accuracy for each model were as follows:

Logistic Regression (LR): AUC = 0.772 (95% CI: 0.692-0.853)

AdaBoost: AUC = 0.927 (95% CI: 0.884-0.970)

Complement Naive Bayes (CNB): AUC = 0.770 (95% CI: 0.690-0.850)

Multi-Layer Perceptron (MLP): AUC = 0.653 (95% CI: 0.561-0.746)

Support Vector Machine (SVM): AUC = 0.760 (95% CI: 0.678-0.842)

K-Nearest Neighbors (KNN): AUC = 0.861 (95% CI: 0.803-0.919)

The AdaBoost model demonstrated the highest predictive power with an AUC of 0.927, which suggests that it was the most effective model for predicting adverse pregnancy outcomes in this population. Other models, such as KNN, also performed well, with an AUC of 0.861. Conversely, the MLP model had the lowest AUC (0.653), indicating that it was less effective in predicting the outcomes compared to other models.

Further analysis using SHAP (Shapley Additive Explanations) values highlighted the most important features in predicting adverse pregnancy outcomes. These included systolic blood pressure, gestational age, blood urea nitrogen, and white blood cell count. These factors showed the greatest predictive value for identifying patients at risk of complications during pregnancy. Additionally, the external validation group, which was composed of a separate set of patients, yielded an AUC of 0.916 (95% CI: 0.865-0.967), confirming the robustness of the AdaBoost model.

Conclusion

In conclusion, systolic blood pressure, gestational age, blood urea nitrogen, and white blood cell count were identified as the most significant predictors for adverse pregnancy outcomes in elderly preeclamptic patients. The AdaBoost model, with its superior performance in terms of AUC and accuracy, proved to be the most reliable tool for predicting adverse outcomes. This model can potentially be used in clinical settings to identify high-risk elderly pregnant women early and allow for targeted interventions, which may help reduce maternal and fetal morbidity and mortality.

This study highlights the potential of machine learning models, specifically AdaBoost, in improving the prediction of adverse pregnancy outcomes among elderly women with preeclampsia. The findings suggest that integrating these predictive models into clinical practice could improve the management and monitoring of high-risk pregnancies.

Association between triglyceride glucose-body mass index and preeclampsia risk in advanced maternal age pregnant women-a retrospective cohort study

Sulan Huang

The first people's hospital of Changde city

Background Preeclampsia is a complex hypertensive disorder of pregnancy that remains a leading cause of maternal and neonatal morbidity and mortality. It typically develops after 20 weeks of gestation in previously normotensive women and is characterized by high blood pressure and proteinuria. Advanced maternal age (≥ 35 years) is considered a high-risk factor for preeclampsia due to the age-associated metabolic and vascular changes that can exacerbate the condition. Recent studies have highlighted the role of insulin resistance (IR) in preeclampsia development, with particular emphasis on the triglyceride glucose index (TyG index) as a measure of IR. The TyG index, which integrates fasting glucose and triglyceride levels, has been linked to various metabolic disorders, including hypertension and type 2 diabetes. However, the relationship between the TyG index and preeclampsia risk in women of advanced maternal age remains underexplored. The TyG-BMI index, a composite metric that combines the TyG index with body mass index (BMI), has shown promise as a predictive tool for metabolic disorders. This study aims to investigate the association between the TyG-BMI index and preeclampsia risk in pregnant women of advanced maternal age.

Methods This retrospective cohort study included 2,296 pregnant women aged ≥ 35 years who attended the Obstetrics Department at Changde Hospital, China, between January 2013 and December 2023. Data were collected during the first trimester using semi-structured questionnaires and hospital records. Inclusion criteria included women with complete medical records, single pregnancies, and laboratory test data. Women with missing data or conditions such as gestational diabetes mellitus, chronic hypertension, or serious liver or kidney dysfunction were excluded. The TyG-BMI index was calculated as the product of the TyG index and BMI. The TyG index was derived using the formula: TyG = Ln (FPG × TG) / 222, where FPG is fasting plasma glucose and TG is triglyceride level. Multivariate logistic regression was used to evaluate the relationship between the TyG-BMI index and preeclampsia, adjusting for potential confounders such as maternal age, gravidity, parity, family history of hypertension, and other metabolic factors. Subgroup analyses were conducted to explore potential interactions between the TyG-BMI index and parity. Receiver operating characteristic (ROC) curves were generated to assess the predictive ability of the TyG-BMI index for preeclampsia.

Results A total of 2,296 women were included in the study, with 328 (14.29%) diagnosed with preeclampsia. The participants were divided into three groups based on their TyG-BMI index: tertile 1 (lowest TyG-BMI index), tertile 2, and tertile 3 (highest TyG-BMI index). The incidence of preeclampsia increased with higher TyG-BMI index values, with 9.42%, 12.57%, and 20.83% of women in tertiles 1, 2, and 3, respectively, developing preeclampsia (P <0.001).

Conclusion This study provides evidence that the TyG-BMI index is a significant predictor of preeclampsia in women of advanced maternal age. The index reflects metabolic dysregulation, insulin resistance, and obesity, all of which contribute to the pathogenesis of preeclampsia. The results suggest that higher TyG-BMI index values are associated with an increased risk of preeclampsia, particularly in nulliparous women. Given its simplicity and cost-effectiveness, the TyG-BMI index could serve as an important tool for early identification of women at high risk for preeclampsia, enabling targeted interventions and improved prenatal care. Further prospective studies and interventional trials are needed to confirm these findings and explore the underlying mechanisms linking the TyG-BMI index to preeclampsia.

Propensity Score Analysis of albumin/neutrophil to lymphocyte ratio(ANLR) in advanced maternal age pregnant women as a Predictor of preeclampsia

Sulan Huang

The first people's hospital of Changde city

Background: Preeclampsia is a hypertensive disorder of pregnancy that poses significant risks to both maternal and fetal health, especially in women of advanced maternal age (AMA), typically defined as women aged 35 years or older. The incidence of preeclampsia is notably higher in this demographic, making early prediction and intervention critical. Existing biomarkers for preeclampsia, such as proteinuria and blood pressure measurements, are not always sufficient for timely diagnosis. Therefore, identifying novel, reliable biomarkers is essential. Recent studies have highlighted the albumin/neutrophil to lymphocyte ratio (ANLR), a composite marker that combines inflammation and nutritional status, as a potential predictor of preeclampsia. This study aims to assess the role of ANLR as a predictor of preeclampsia in pregnant women of AMA.

Methods: This retrospective cohort study included 2,296 pregnant women aged ≥ 35 years who were enrolled at Changde Hospital between January 2013 and December 2023. The albumin/neutrophil to lymphocyte ratio (ANLR) was calculated as the ratio of albumin to the neutrophil to lymphocyte ratio (NLR). Propensity score matching (PSM) was applied to minimize confounding variables, and logistic regression analyses were performed to evaluate the relationship between ANLR and preeclampsia. Receiver operating characteristic (ROC) curves were constructed to determine the optimal cutoff value for ANLR and its sensitivity and specificity for predicting preeclampsia.

Results: Among the 2,296 women included in the study, 328 (14.29%) developed preeclampsia during pregnancy. The optimal cutoff value for ANLR to predict preeclampsia was identified as 7.75, with a sensitivity of 83.8% and specificity of 41.8%. Following propensity score matching, the incidence of preeclampsia was significantly higher in women with ANLR values below the cutoff compared to those with higher ANLR values (OR = 0.24, 95% CI: 0.17–0.33, P < 0.0001). A non-linear relationship between ANLR and preeclampsia was observed, with the risk not decreasing uniformly as ANLR increased, indicating an L-shaped curve. Sensitivity analysis confirmed that low ANLR remained a strong predictor of preeclampsia in both the original and matched cohorts. Subgroup analyses revealed that the association between low ANLR and preeclampsia remained consistent across different patient subgroups, including those stratified by BMI, age, and parity.

Conclusion: This study provides evidence that ANLR, a composite biomarker combining immune and nutritional parameters, is a significant predictor of preeclampsia in women of advanced maternal age. The findings suggest that ANLR could be a valuable tool for early identification of women at risk for preeclampsia, particularly in high-risk populations like AMA pregnancies. The moderate sensitivity and specificity observed in this study highlight the potential of ANLR as an adjunctive marker for preeclampsia prediction, alongside traditional clinical indicators such as blood pressure and proteinuria. Although the specificity of ANLR could be improved, its high sensitivity makes it a promising tool for early detection, allowing for more timely interventions. Future research should focus on validating these results in prospective cohorts and exploring the underlying mechanisms linking ANLR to preeclampsia. Additionally, integrating ANLR with other emerging biomarkers could improve its predictive performance and help refine risk stratification models for preeclampsia in advanced maternal age pregnancies.

古法健身操对更年期高血压女性心脏健康的研究

王娜 冯莹娟

西安交通大学第一附属医院

摘要

目的：分析评价古法健身操对更年期高血压女性心脏健康的研究效果

方法：选取 2024 年 3 月 -12 月就诊于我院心血管内科的 80 位更年期高血压女性患者作为观察对象，按照患者出院后有无时间及意愿继续古法健身操将患者分为单双号，其中单号的 40 位患者为对照组（常规护理及常规出院宣教），双号的 40 位患者为观察组（在常规的基础上，增加古法健身操的锻炼），对比两组患者出院前、出院一个月、出院三个月，出院半年及出院一年后的血压控制情况、总胆固醇和低密度脂蛋白水平。

结果：患者基本都于 3-5 天出院，经实验数据表明，观察组患者的血压控制情况明显优于对照组（P < 0.05），尤其是随着出院时间的推移，观察者患者的血压控制更加稳定（P < 0.05）；观察者患者的总胆固醇和低密度脂蛋白水平也明显低于对照组患者（P < 0.05），并且出院时间越久，总胆固醇和低密度脂蛋白水平也是控制的更加稳定（P < 0.05）。

结论：古法健身操作为一种优秀的传统健身方法，因其为低至中等强度的有氧运动，可以作为更年期高血压女性患者康复的锻炼方法，能有效控制更年期高血压女性患者的血压情况，降低总胆固醇及低密度脂蛋白水平，对女性心脏健康具有低风险、易坚持的优势，可作为现代有氧运动的有益补充，值得临床推广应用。

青年女性心血管疾病风险因素的护理干预策略及效果分析

文眉丹

西安交通大学医学院第一附属医院

目的

近年来，青年女性心血管疾病（CVD）发病率呈上升趋势，传统危险因素（如高血压、糖尿病）及性别特异性因素（如妊娠并发症、激素影响）共同作用，使其面临独特风险。本研究旨在探讨青年女性 CVD 的主要风险因素，并评估护理干预策略对降低其 CVD 风险的效果。

方法

采用类实验性研究设计（非随机对照试验），选取 2022 年 6 月至 2023 年 12 月在某三甲医院心血管科就诊的 18-45 岁女性 CVD 高危患者 200 例，分为干预组（n=100）和对照组（n=100）。对照组接受常规护理（用药指导），干预组在常规护理基础上实施为期 6 个月的综合干预，包括：

1. 分层健康教育：根据风险因素（如肥胖、吸烟）制定个性化宣教方案。

2. 生活方式管理：由营养师和康复师联合指导饮食、运动及戒烟限酒。

3. 心理社会支持：通过正念减压训练（MBSR）和焦虑抑郁量表（采用 GAD-7、PHQ-9 评估）。

干预前后比较两组血压、血脂、体质量指数（BMI）、Framingham 风险评分（FRS）及健康行为依从性（自评问卷）。

结果

1. 基线特征：干预组与对照组在年龄、风险因素分布上无统计学差异（p>0.05），主要风险因素包括肥胖（38%）、妊娠期高血压史（25%）、久坐行为（62%）及焦虑症状（45%）。

2. 干预效果：

生理指标：干预组 6 个月后收缩压降低、LDL-C 下降，BMI 值改善。

心理行为：干预组 GAD-7（-4.2±1.8 vs. -1.1±1.2, p<0.01）和 PHQ-9 评分（-3.9±1.6 vs. -0.9±1.0, p<0.01）显著降低。

风险预测：干预组 FRS 下降幅度大于对照组（-35% vs. -8%, p<0.01）。

结论

针对青年女性 CVD 风险的综合护理干预可有效改善生理指标、心理健康及行为依从性，显著降低远期心血管风险。建议临床推广“生理 - 心理 - 社会”多维度干预模式，并重点关注妊娠相关风险人群的长期随访。

超声评估妊娠期高血压疾病患者心脏结构及功能变化

洪铭锾 王秀娟 陈玲玲 孔令云 牟林涛 向伟 付丽 刘芳

北京清华长庚医院

摘要：目的 研究超声心动图评估不同类型妊娠期高血压疾病患者心功能变化的价值。**方法** 连续收集妊娠期高血压（GH 组）79 例、妊娠合并慢性高血压（CH 组）77 例、健康未孕（对照组）263 例、高血压未孕（HTN 组）111 例。应用超声心动图测量左室射血分数、心脏重构参数、组织多普勒参数、p 波到 A' 波峰值的时间间隔（PA-TDI）及左心室整体纵向应变（LV-GLS）。统计学方法采用方差分析及 Kruskal-Wallis H 检验，P < 0.05 为为差异有统计学意义。**结果** 1）基线资料 GH、CH 和 HTN 组的年龄、BMI、BSA 较对照组增大，CH 和 HTN 组的年龄和 BMI 较 GH 组增大（P < 0.05）。2）GH、CH 和 HTN 组的 LAD、LVM、RWT、IVSd、LVPWd、E/e'、E/A、较对照组增大，LV-GLS 较对照组减小（P < 0.05）。CH 组 LVMI、PA-TDI 较对照组增大，LAD、PA-TDI 较 HTN 组增大，LAD、LVMI 和 PA-TDI 较 GH 组增大（P < 0.05）。三组间 LVEF 差异无统计学意义。3）妊娠期高血压患者高龄产妇较多，妊娠合并慢性高血压患者孕前超重或肥胖较多，但高龄和超重、肥胖对妊娠期高血压及妊娠合并慢性高血压患者的心功能变化无显著影响。**结论** 妊娠期高血压疾病患者较健康妊娠女性及高血压未孕女性更易发生心功能损伤及心脏重构，且妊娠合并慢性高血压患者较妊娠期高血压患者更易发生早期心功能损伤。PA-TDI、LV-GLS 有助于早期发现妊娠期高血压疾病患者心功能变化，且 PA-TDI 更有助于发现不同类型妊娠期高血压疾病患者的心功能差异。

Sex Differences in Outcomes in Patients with Acute Myocardial Infarction

Da-Bei Cai[1,2], Li Deng[3], Ye Deng[3], Yang Zhang[4], Ting Ting Xiao[3], Qing Qing Gu[3], Yu Wang[3], Qian Wen Chen[3], Jun Wei[4], Qing Jie Wang[3], Ling Sun[1]

2. Institute of Cardiovascular Diseases of Jiangsu University

3. The Affiliated Changzhou Second People's Hospital of Nanjing Medical University

4. The Affiliated Hospital of Xuzhou Medical University,

Objective Gender is a vital factor for the development and treatment of cardiovascular diseases. This study aimed to evaluate sex-based differences in the prognosis of patients with acute myocardial infarction (AMI).

Methods AMI patients who had been prospectively registered in the MIMIC III and IV database were consecutively enrolled. The primary study endpoint was defined as 1-year all-cause mortality. The secondary study endpoints included in-hospital all-cause mortality, 28-day all-cause mortality, and in-hospital complications such as acute kidney injury (AKI) and ventricular arrhythmias (VA). Kaplan-Meier analysis was used to assess the survival rate between the two groups. Cox proportional hazards regression and logistic regression analyses were carefully performed to evaluate whether gender acts as an independent predictor of prognosis in AMI patients.

Results A total of 4890 patients with AMI were included. At 1-year follow-up, 722 (22.5%) men died and 558 (33.2%) women died, and after analysis and adjustment, men had a 17.9% lower risk of all-cause mortality compared to women [Hazard Ratio (HR)=0.821, 95% confidence interval (CI): 0.684-0.987]. Kaplan-Meier survival analysis showed a higher 1-year survival rate in the male group compared with the female group (HR= 0.532, 95% CI: 0.444 - 0.638, log-rank P<0.0001). There was no significant difference in AKI during hospitalization. After adjusting for multivariable analysis, men with AMI had a 25% increased risk of hospitalization for VA compared to women [odds ratio (OR)=1.250, 95% CI:1.030-1.518].

Conclusion Women had a higher 1-year mortality but a lower risk of ventricular arrhythmias (VA) during AMI compared to men.

老年绝经女性冠心病风险预测列线图模型的构建及多维度验证研究

樊亚宁 李娟利 贾娅琼

西安交通大学医学院第一附属医院

目的 构建老年绝经女性人群冠心病（CHD）发生风险的预测模型，并验证列线图的预测效能。

方法 回顾性分析 2024 年 3 月–2025 年 2 月在西安交通大学第一附属医院心内科就诊并接受冠状动脉造影的 639 例老年绝经女性的临床资料。根据冠脉造影结果，将患者分为 CHD 组（439 例）和对照组（200 例），并按 7:3 的比例随机分为建模组（447 例）和验证组（192 例）。在建模组中，采用多因素 Logistic 回归分析筛选老年绝经女性 CHD 发生的独立影响因素，构建个性化列线图模型，并在验证组中进行外部验证，评估模型的预测效能和适用性。

结果 多因素 Logistic 回归分析显示，每日睡眠时长（OR=0.674，95%CI：0.546 ~ 0.833）是老年绝经女性 CHD 发生的独立保护因素（P < 0.05），而生育个数（OR=1.798，95%CI: 1.391 ~ 2.325）、超敏 C 反应蛋白水平（OR=1.572，95%CI：1.381 ~ 1.789）及餐后 2h 血糖（OR=1.197，95%CI：1.097 ~ 1.305）为独立危险因素（P < 0.05）。基于上述指标构建的列线图预测模型在建模组和验证组中的 ROC 曲线下面积分别为 0.815（95%CI：0.773 ~ 0.857）和 0.823（95%CI：0.755 ~ 0.890）。校准曲线显示，列线图的预测概率与实际发生频率具有良好的一致性。临床决策分析曲线表明，当 CHD 发生的阈值概率为 0.18 ~ 0.94 时，列线图的临床净获益水平最高。

结论 本研究构建的老年绝经女性 CHD 发生风险的列线图预测模型具有良好的预测效能和适用性，可用于筛查此类人群的 CHD 发生风险，为临床早期干预提供科学依据。

Causal Associations between Pre-Pregnancy Obesity Traits and Pregnancy-Related Hypertension: A Two-Sample Mendelian Randomization Analyses

Meng-Jin Hu

Xuanwu Hospital, Capital Medical University

Background: While observational studies have established associations between pre-pregnancy obesity and pregnancy-related hypertension disorders, the causal nature of this relationship requires elucidation.

Objective: To investigate potential causal effects of pre-pregnancy obesity traits on pregnancy-related hypertension spectrum disorders–gestational hypertension, pre-eclampsia, and eclampsia–using genetic epidemiology approaches.

Methods: We performed a comprehensive two-sample Mendelian randomization (MR) analysis leveraging summary statistics from large-scale genome-wide association studies (GWAS). Eleven adiposity-related exposure traits were evaluated: body mass index (BMI), overweight status, obesity (subclassified into grades 1-3), childhood obesity, waist circumference (WC), hip circumference (HC), waist-to-hip ratio (WHR), liver fat percentage, visceral adipose tissue volume, and abdominal subcutaneous adipose tissue volume. Primary causal estimates were derived via inverse-variance weighted (IVW) regression, supplemented by sensitivity analyses using MR-Egger and weighted median methods.

Results: Genetic predisposition to high BMI was associated with an increased risk of gestational hypertension, with the following odds ratios (OR) and confidence intervals (CI): BMI (OR = 1.62; 95% CI: 1.39-1.88; P = 6.37×10^{-10}), overweight (OR = 1.56; 95% CI: 1.26-1.95; P = 5.93×10^{-5}), obesity (OR = 1.24; 95% CI: 1.15-1.33; P = 6.72×10^{-9}), obesity class 1 (OR = 1.29; 95% CI: 1.15-1.45; P = 1.77×10^{-5}), obesity class 2 (OR = 1.24; 95% CI: 1.10-1.41; P = 6.57×10^{-4}), obesity class 3 (OR = 1.16; 95% CI: 1.09-1.22; P = 4.14×10^{-7}), childhood obesity (OR = 1.20; 95% CI: 1.09-1.33; P = 2.30×10^{-4}), WHR (OR = 1.81; 95% CI: 1.19-2.75; P = 5.55×10^{-3}), and abdominal subcutaneous adipose tissue volume (OR = 2.32; 95% CI: 2.27-2.37; P = 3.43×10^{-3}). Similarly, genetic predisposition to high BMI was linked to an increased risk of pre-eclampsia, with the following OR and CI: BMI (OR = 1.61; 95% CI: 1.37-1.89; P = 5.88×10^{-9}), overweight (OR = 1.48; 95% CI: 1.22-1.81; P = 9.99×10^{-5}), obesity (OR = 1.22; 95% CI: 1.12-1.32; P = 3.26×10^{-6}), obesity class 1 (OR = 1.34; 95% CI: 1.17-1.55; P = 4.07×10^{-5}), obesity class 2 (OR = 1.19; 95% CI: 1.07-1.32; P = 1.00×10^{-3}), childhood obesity (OR = 1.20; 95% CI: 1.04-1.37; P = 0.01), WHR (OR = 1.63; 95% CI: 1.08-2.46; P = 0.02), and abdominal subcutaneous adipose tissue volume (OR = 2.93; 95% CI: 2.43-3.53; P = 9.32×10^{-30}). Genetic predisposition to obesity class 3 (OR = 1.24; 95% CI: 1.01-1.53; P = 0.04) and childhood obesity (OR = 1.50; 95% CI: 1.33-1.68; P = 4.14×10^{-12}) was linked to an increased risk of eclampsia. The MR-Egger intercept suggested the absence of horizontal pleiotropy for gestational hypertension, pre-eclampsia, and eclampsia. The leave-one-out sensitivity analysis confirmed that the overall estimate was not affected by any single SNP. Sensitivity analyses confirmed the robustness of our findings.

Conclusions: Our two-sample MR study indicated that pre-pregnancy obesity traits–such as BMI, overweight status, various obesity classes, childhood obesity, WHR, and abdominal subcutaneous adipose tissue volume–significantly affect gestational hypertension, pre-eclampsia, and even eclampsia. Therefore, implementing public health measures focused on weight management before pregnancy, starting as early as childhood, may be crucial for controlling gestational hypertension

Resting IL-6 Levels Predict Myocardial Perfusion Deficits Under Mental

Stress

Jin-Na Chang[1], Han Yin[2], Bing-Qing Bai[1], Feng-Yao Liu[1], Shu-Xia Wang[1], Qing-Shan Geng[2], Huan Ma[1]

1. Guangdong Cardiovascular Institute, Guangdong Provincial People's Hospital, Guangdong Academy of Medical Sciences

2. Shenzhen People's Hospital (The Second Clinical Medical College, Jinan University, The First Affiliated Hospital, Southern University of Science and Technology)

Background:

Mental stress is a significant determinant of prognosis and outcomes in patients with cardiovascular disease. Mental stress-induced myocardial ischemia (MSIMI) is highly prevalent in patients with angina without obstructive coronary artery disease (ANOCA), and is associated with increased risk of adverse cardiovascular outcomes. Notably, inflammation has been identified as a key pathophysiological factor underlying MSIMI. Interleukin-6 (IL-6), as a mediator of inflammation, plays an important role in the development and progression of endothelial dysfunction, atherosclerosis, and adverse cardiovascular events. However, the relationship between resting IL-6 levels and MSIMI remains unclear. Therefore, this study aimed to investigate the association between resting IL-6 levels and the presence and severity of MSIMI in women with ANOCA, and to explore potential biological mechanisms through proteomic analysis.

Methods:

A total of 80 women patients with ANOCA were enrolled. All participants underwent 13-NH3-H_2O cardiac positron emission tomography-computed tomography (PET-CT) to assess myocardial perfusion defects and myocardial blood flow (MBF) under resting, mental stress, and adenosine stress. The severity of myocardial ischemia was evaluated using a 17-segment AHA-defined left ventricular model with the semi-quantitative scoring system. MSIMI was defined as a summed difference score (SDS) ≥ 3. Mental stress was induced using a virtual reality device, which presented three tasks in a fixed sequence: the modified Stroop test, public speaking, and a mental arithmetic test. Baseline blood samples were collected between 6:00 and 7:00 AM on the second day after admission to measure IL-6 and other inflammatory markers. We employed multivariate linear regression models to explore the relationship between resting inflammation levels and MSIMI. Additionally, plasma proteomic analysis was performed using liquid chromatography mass spectrometry/mass spectrometry to characterize differentially expressed proteins associated with MSIMI and to investigate the underlying mechanisms.

Results:

Of 80 women patients with ANOCA analyzed in this study, 34(42.5%) were diagnosed with MSIMI. Compare to patients without MSIMI (SDS 0.63, IQR 0.40-0.85; total perfusion defect 1.31, IQR 0.93-1.70), those with MSIMI showed a significantly greater increase in perfusion defect (SDS 4.83, IQR 4.10-5.56; total perfusion defect 5.25, IQR 4.34-6.16) (all p

Conclusions:

This is the first study to evaluate the relationship between resting inflammatory markers and MSIMI. Our findings demonstrate a positive association between resting IL-6 levels and the severity of myocardial perfusion deficits under mental stress, suggesting that resting IL-6 levels may have potential predictive value for identifying individuals at risk for MSIMI. This study provides valuable insights into the inflammatory mechanisms of MSIMI and may point toward further interventions.

绝经后女性固体燃料使用与非致命性心血管疾病之间的关系：来自中国健康与养老纵向研究（CHARLS）的结果

梅竹 韩雅玲

中国人民解放军北部战区总医院寒地心血管病全国重点实验室

背景：绝经后女性失去激素保护，成为容易被忽视的心血管疾病高危人群。然而，很少有研究关注绝经后女性室内固体燃料使用与非致死性心血管心脏病的关系。本研究前瞻性评估了绝经后女性室内固体燃料使用与非致死性心血管心脏病的关系。

方法：本研究为一项前瞻性队列研究，采用中国健康与养老纵向研究（CHARLS）的数据，于 2011 年至 2020 年招募了 2404 名绝经后女性。家庭燃料类型根据自我报告进行评估，包括固体燃料（煤、作物秸秆或木质燃料）和清洁燃料（集中供暖、太阳能、天然气、液化石油气、电力或沼气）。非致死性心血管疾病（NCVD）定义为自我报告的医生诊断的非致死性心血管疾病。我们建立了 Cox 比例风险回归模型，并按绝经年龄分层，以评估风险比（HR）和 95% 置信区间（95%CI）。

结果：经过中位 5 年的随访，共记录到 555 例（23.07%）非致命性心血管疾病（CVD）病例。与使用清洁燃料的绝经后女性相比，接触固体燃料取暖的绝经后女性 [HR（95%CI）：1.31（1.07-1.61）]、取暖和烹饪均使用固体燃料的绝经后女性 [HR（95%CI）：1.38（1.06-1.79）]、绝经年龄 <50 岁且使用固体燃料取暖的绝经后女性 [HR（95%CI）：1.44（1.07-1.93）] 的非致命性心血管疾病风险较高。

结论：绝经后女性在取暖过程中使用固体燃料会增加罹患非致命性心血管心脏病的风险。更重要的是，50 岁以下的绝经期女性使用固体燃料，罹患非致命性心血管心脏病的风险更高。因此，对失去激素保护的绝经后女性使用固体燃料进行早期干预至关重要，以降低罹患非致命性心脏病的风险。

基于 CT 评估的骨骼肌密度与皮下脂肪量在老年女性心衰患者预后中的意义

史凯蕾 王秦月 曲新凯

复旦大学附属华东医院

目的：本研究旨在基于胸部 CT 影像，评估骨骼肌密度（SMD）、肌间脂肪组织（IMAT）面积与密度、皮下脂肪组织（SAT）面积与密度在预测老年女性心力衰竭患者预后中的价值，从而为临床实现精准化风险分层提供参考依据。

方法：本研究为双向性队列研究，纳入 2020 年 1 月至 2023 年 12 月期间在我院心脏重症监护室（CCU）住院并诊断为心力衰竭的老年女性患者共 159 例，年龄≥ 60 岁。排除标准包括恶性肿瘤、急性炎症、严重自身免疫性疾病及影像资料不完整。所有患者入院后均接受胸部 CT 检查，选取第 12 胸椎（T12）水平横断面图像作为分析层面。图像数据经 Radiant DICOM Viewer 提取，采用 SliceOMatic 5.0 软件进行组织分割和参数测量，获得 SMD、IMAT 面积与密度、SAT 面积与密度等体成分指标。患者于出院后 1 月、3 月和 12 月接受随访，之后每 12 个月随访一次，末次随访时间为 2024 年 6 月，主要终点事件为全因死亡。通过 ROC 曲线分析各指标对全因死亡的预测效能，确定其最佳截断值，并评估灵敏度、特异度及曲线下面积（AUC）。

结果: 共纳入 159 例符合纳入标准的老年女性心衰患者，平均年龄为 79.96 ± 8.86 岁。在中位随访时间 709 天（673，761, 95% CI）期间，共发生 46 例全因死亡事件。单因素分析显示，骨骼肌密度降低和皮下脂肪面积减少的患者，其不良事件发生率显著升高（均 P < 0.01）。多因素 Cox 回归分析表明，SMD 每升高 1 HU，死亡风险下降约 11%（HR: 0.892，95% CI: 0.832–0.957，P = 0.001）；SAT 面积每增加 1 cm^2，死亡风险下降约 1.2%（HR: 0.988，95% CI: 0.980–0.996，P = 0.003）。ROC 曲线分析结果显示：SMD 单因素模型的 AUC 为 0.680（95% CI: 0.589–0.771），最佳截断值为 21.365 HU；SAT 面积的 AUC 为 0.628（95% CI: 0.534–0.722），最佳截断值为 84.715 cm^2；将 SMD 与 SAT 面积联合后构建的模型表现更优，AUC 提升至 0.750（95% CI: 0.665-0.835），灵敏度为 69.9%，特异度为 71.7%。

结论：基于 CT 评估的骨骼肌密度和皮下脂肪面积均为老年女性心衰患者全因死亡的重要预测因子。其中，SMD 与 SAT 面积的联合评估模型具有更高的预测准确性，可为老年女性心衰患者的风险分层与个体化管理提供有力的影像学支持。这一策略有望为临床早期识别高危患者并制定干预措施提供新的方向。

新疆欠发达地区妊娠期高血压疾病对母婴围生期不良妊娠结局的影响

王梦卉 [1] 张国荣 [2] 董秀芳 [2] 杨梅 [1] 郭柄轩 [1] 吴婷 [1] 李南方 [1]

1. 新疆维吾尔自治区人民医院

2. 塔城地区妇幼保健计划生育服务中心

目的 妊娠期高血压疾病（Hypertensive disorders of pregnancy，HDP）常造成孕妇外周血管阻力的增加、全身小动脉痉挛，可发展为先兆子痫、子痫等严重产科疾病，也是多种不良妊娠结局（Adverse pregnancy outcomes，APO）的病因，严重影响围生期母婴健康，给家庭、社会、国家造成沉重的经济负担。新疆处于中国西部，而塔城地区处于新疆的西北角，属中温带大陆性干旱气候，冬季漫长寒冷，夏季短促炎热，该地区居民喜食风干肉等盐份较高的食物，30 岁以上成人高血压患病率超过 50%，经济欠发达，是高血压好发区域，然而，目前尚无该地区孕妇 HDP 检出率的确切数据。本研究主要通过全程孕期随访明确塔城地区孕妇 HDP 的检出状况及母婴不良结局，分析新疆欠发达塔城地区孕妇 HDP 的检出状况及对母婴 APO 的影响。**方法** 回顾并收集 2022 年 3 月至 2024 年 8 月在塔城地区妇幼保健计划生育服务中心管辖 4 家县市机构建卡且登记信息完整的 1534 例孕妇，收集孕妇早孕期（< 20 周）登记的相关信息，通过母子保健卡、就诊记录了解患者血压、尿常规等指标；HDP 及 APO 的确定主要来源于孕妇分娩时的住院记录。组间检出率比较采用 χ2 检验，Spearman 分析评价相关，采用 Logistic 回归分析，使用比值比及 95% 置信区间 OR（95%CI）评价 HDP 与孕产妇或围生儿 APO 的关系。**结果** 1534 例孕妇年龄范围为 20-49 岁，HDP 检出 117 例，占 7.6%。总 APO 共 348 例（22.6%），其中围生儿 APO 共计 208 例（13.6%），包括流产（4 例）、早产（116 例）、死胎（6 例）、低出生体重儿（79 例）、胎儿宫内窘迫（65 例）、新生儿窒息（6 例）、出生缺陷（0 例）、新生儿死亡（3 例）；孕产妇 APO 共 182 例（11.9%），包括胎盘早剥（10 例）、胎膜早破（149 例）、产后出血（28 例）、子宫切除（1 例）和孕产妇死亡（0 例）；42 例孕妇同时出现了两种 APO。HDP 与非 HDP 组间孕产妇与围生儿特征及 APO 检出率的比较结果显示：HDP 组孕妇年龄更大、分娩孕周更短、BMI 更大、早孕期收缩压及舒张压更高、谷丙转氨酶更高；围生儿 APO 检出率明显高于非 HDP 组（28.1% vs. 12.4%，P < 0.001），新生儿体重（3214.2±719.3 vs 3389.9±531.6，P=0.011）、身长（49.6±3.4 vs 50.3±2.3，P=0.002）明显低于非 HDP 组。单因素分析结果显示：HDP 与总 APO 呈正相关 OR（95CI）：1.812（1.319~2.488）P < 0.001，与围生儿 APO 呈正相关：2.788（1.809~4.297）P < 0.001，与孕产妇 APO 不相关：1.194（0.688~2.073）P=0.529；校正孕妇年龄、孕妇 BMI 及单双胎数后，HDP 与围生儿 APO 的正相关性仍然存在：2.343（1.496~3.671）P < 0.001。与非 HDP 组相比，HDP 组早产（18.80% vs 6.63%，P < 0.001）、低体重儿（14.53% vs 4.38%，P < 0.001）及新生儿窒息（1.71% vs 0.14%，P=0.017）检出率显著升高；Spearman 相关分析提示：HDP 与早产（r=0.122, P < 0.01）、低体重儿（0.122，P < 0.01）及新生儿窒息（0.061，P=0.017）有关。**结论** 塔城地区 HDP 患者易发生早产、低出生体重、新生儿窒息等围生儿 APO，更需要关注该地区 HDP 孕产妇的宣教、识别、随访及系统化管理，从而有效预防围生儿 APO。

绝经后女性血脂异常与冠状动脉微血管功能障碍的相关性研究

官柏宇

大连医科大学附属第一医院二部

目的：探讨绝经后女性血脂谱特征与冠状动脉微血管功能障碍（CMD）的关联性，为女性心脏健康管理提供循证依据。

方法: 前瞻性纳入 2020 年 1 月至 2025 年 6 月因胸痛就诊的绝经后女性 320 例（年龄 55-70 岁），均行冠状动脉造影排除阻塞性冠心病。通过冠状动脉血流储备（CFR，经胸多普勒超声测定）诊断 CMD（CFR<2.5）。检测血脂参数包括常规指标（LDL-C、HDL-C、TG）及新兴标志物（脂蛋白 a[Lp(a)]、残余胆固醇 [RC]）。采用多因素 logistic 回归分析 CMD 的独立血脂预测因子，并构建风险预测模型。

结果：CMD 组（n=137）与非 CMD 组相比，Lp(a)（35.2 vs. 18.7 mg/dL）、RC（0.78 vs. 0.51 mmol/L）水平显著升高（均 P<0.01），而 HDL-C（1.12 vs. 1.35 mmol/L）明显降低（P=0.003）。多因素分析显示，Lp(a) ≥ 30 mg/dL（OR=3.21, 95%CI 1.98-5.20） 和 RC ≥ 0.65 mmol/L（OR=2.45, 95%CI 1.52-3.94） 是 CMD 的独立预测因子。联合 Lp(a)、RC 及 HDL-C 的预测模型（AUC=0.82）优于传统血脂指标（AUC=0.71, P=0.008）。

结论: 绝经后女性 CMD 与特定血脂异常（高 Lp(a)、高 RC 及低 HDL-C）密切相关，提示需针对女性特殊血脂谱制定个性化干预策略。

女性心脏健康的研究进展与挑战：一项综合性综述

雯川 董增祥

哈尔滨医科大学附属第一医院

目的：心血管疾病（CVD）是全球女性死亡的主要原因之一，但由于性别差异，女性心脏健康的独特风险因素、临床表现及治疗策略常被忽视。本文旨在综述近年来关于女性心脏健康的研究进展，探讨其流行病学特征、病理生理机制、诊断及治疗的特殊性，并提出未来研究方向，以提高女性心血管疾病的预防和管理水平。

方法: 通过系统性检索 PubMed、Web of Science 和 Cochrane Library 等数据库，筛选 2013 年至 2023 年间发表的关于女性心脏健康的临床研究、荟萃分析和综述。重点关注女性特有的风险因素（如妊娠相关疾病、绝经期激素变化）、非典型症状（如疲劳、恶心而非典型胸痛）以及治疗反应的性别差异。

结果：研究发现，女性心血管疾病的风险因素不仅包括传统因素（如高血压、糖尿病），还涉及性别特异性因素，如多囊卵巢综合征（PCOS）、子痫前期和早绝经。此外，女性更易出现非典型症状，导致诊断延迟或误诊。在治疗方面，女性对某些药物（如阿司匹林、β 受体阻滞剂）的反应与男性不同，且血运重建手术的并发症风险更高。社会心理因素（如抑郁、社会经济地位）也对女性心脏健康产生显著影响。尽管如此，女性在心血管临床试验中的代表性仍然不足，限制了性别特异性治疗指南的制定。

结论： 女性心脏健康的研究仍 需更多关注，尤其是在风险分层、早期诊断和个性化治疗方面。未来研究应加强女性在临床试验中的纳入，探索性别差异的生物学机制，并制定针对女性的预防和管理策略。医疗工作者需提高对女性非典型症状的认识，以减少诊断延误。公共卫生政策应推动性别平等的健康宣教，以降低女性心血管疾病的发病率和死亡率。

女性心脏健康的多维保护机制：基于性别差异的临床转化研究

杨柯

中国医科大学附属盛京医院

女性心脏健康的多维保护机制：基于性别差异的临床转化研究

作者：杨柯

单位：中国医科大学附属盛京医院

目的

本研究旨在揭示女性心血管疾病的独特性病理机制，突破传统以男性为模板的防治体系局限，构建涵盖” 生物学特性 - 社会心理因素 - 临床干预” 的性别差异化防控模型，重点解决微血管功能障碍、妊娠相关心血管事件及绝经期冠心病等女性特异性问题。

方法

采用多中心前瞻性队列与分子机制研究相结合的设计：

1）建立中国女性心血管健康队列（CFCWH，n=15,236），追踪 5 年，通过多变量 Cox 回归分析性别特异性风险因子；

2）采用单细胞转录组测序（scRNA-seq）分析雌激素受体（ERα/ERβ）在冠状动脉微循环中的调控网络；

3）开发 AI 驱动的妊娠心血管风险预警模型（P-CVRISK），整合血流动力学参数、自身抗体谱及表观遗传标记；

4）实施阶梯式干预研究：RCT 验证绝经期女性靶向雌激素受体调节剂（TERM）的血管保护效应（n=683）。

结果

发现女性特异性风险簇：妊娠期高血压（HR=3.21, 95%CI[2.87-3.59]）、自身免疫性疾病（HR=2.76）对心血管事件的预测价值显著高于男性（交互作用 p<0.001）；

scRNA-seq 揭示 ERβ 通过 SERCA2a-Ca^{2+}通路调控微血管舒张，其表达下调使女性微心绞痛风险增加 4.3 倍（OR=4.28,95%CI[3.15-5.81]）；

P-CVRISK 模型对子痫前期继发心衰的预测效能（AUC=0.91）优于传统评分（AUC=0.74, p<0.01），预警窗提前 8.2 周；

TERM 干预组内皮功能（FMD 改善 +3.8%, p<0.001）及斑块稳定性（IVUS-VH 纤维帽厚度 +0.12mm）显著优于对照组，且未增加乳腺癌风险（p=0.32）。

结论

首次构建” 女性心血管健康三角模型” ，创新性贡献包括：①确立微血管 ERβ 信号通路为女性冠心病治疗新靶点；②创建妊娠期心血管事件” 时间窗预警” 体系；③验证 TERM 药物在绝经期女性中的血管保护获益。临床转化证实，性别差异化干预使女性 ACS 患者 30 天再住院率降低 38.7%，生活质量评分提升 52.4%。建议临床实践纳入女性专属风险评估工具，并开展性别特异性指南修订。

妊娠期高血压孕妇心脏结构和功能变化与子痫前期的关系

高静茹

北京大学第三医院

目的：探讨妊娠期高血压患者心脏结构和功能变化与子痫前期发生的关系。

方法：回顾性纳入 2019 年 9 月 19 日至 2022 年 12 月 31 日期间在北京大学第三医院接受产检并分娩，且具有妊娠中期（13-27 周）和 妊娠晚期（28-40 周）两次超声心动图检查结果的单纯妊娠期高血压（n=135）和子痫前期 (n=83）患者，收集患者的一般临床资料和两次超声心动图结果，比较两组患者的一般临床资料、妊娠中期和妊娠晚期超声心动图参数，采用二元 logistic 回归分析超声心动图参数与子痫前期发生的关系。

结果：（1）子痫前期组的分娩孕周小于单纯妊娠期高血压组，合并双胎及辅助生殖的比例高于单纯妊娠期高血压组（P<0.05）；（2）两组患者妊娠晚期左心房、左心室均较妊娠中期增大（P < 0.05），但两组之间无统计学差异；（3）子痫前期组妊娠晚期左心室侧壁收缩期二尖瓣环运动速度（Sm）显著低于单纯妊娠期高血压组（11.01±0.24cm/s vs.11.79±0.31cm/s，P=0.019）；子痫前期组妊娠中期至晚期 Sm 的下降值大于单纯妊娠期高血压组（2.47±0.04cm/s vs.1.20±0.05cm/s，P < 0.001）、舒张早期二尖瓣环运动速度（Em）的下降值大于单纯妊娠期高血压组（3.54±0.02cm/s vs. 2.38±0.03cm/s，P=0.006）；（4）将分娩孕周、是否合并双胎妊娠及辅助生殖、中晚期 Sm 的变化值、中晚期 Em 的变化值等作为自变量，以子痫前期作为因变量，使用二元 logistic 回归分析，显示 Sm 的变化（OR=1.12，P=0.04）及分娩孕周（OR=0.77，P=0.002）与子痫前期的发生独立相关。

结论：妊娠期高血压和子痫前期孕妇晚期左心室、左心房较中期增大，左室收缩功能（Sm）及舒张功能（Em）均有下降，子痫前期组下降更明显；分娩孕周和妊娠晚期 Sm 较中期的下降与子痫前期的发生独立相关。

基于子宫动脉血压持续监测之妊娠期高血压精准防治

王晓君 [1] 周晓阳 [2] 金涛 [1]

2. 武汉大学人民医院

【摘要】基础研究虽有发现（如免疫相关分子、易感基因、胎儿游离 RNA、基因甲基化异常、脂质代谢相关因子、间充质干细胞外泌体潜力等，及 PE 的炎症反应特征），但因动物模型难复制等局限，尚未找到有效生物标记物和干预靶点。临床研究中，2015 年国际多中心研究显示严格控压可降低严重高血压风险，但未改善主要围产期结局，国际及中国指南据此设定降压目标，同时存在肱动脉血压能否反映子宫动脉血压的疑问。当前临床存在 “唯血压论”、药物有限、忽视人文心理、过度终止妊娠等问题。现代超声贴片技术有望实现子宫动脉等小动脉血压持续监测（基于现代超声技术的超声传感器，通过融入深度学习技术和 AI 算法加持，能检测到人体皮肤下 14-15cm 的深度组织的相关信号，可感知低血流冲量小动脉的弱信号，动脉成像高度清晰并能精准测量动脉血流速度等参数），结合深度学习和 AI，需通过贝叶斯法解决校准问题（先设定具有一定可信度的理论假设，在此基础上不断寻找新证据，每个新证据并不直接证实或证伪，只是调整可信度的大小，并作一个动态判断，以不断调整一个随机事件发生概率的判断，每找到一个新信息进行一次推理，得到一个新判断，并对之前的判断进行调整，调整概率，寻找客观数据，确定调整因子，如此不断微调，直至目标达成），以对接基础研究，助力 PIH 精准预测、诊断和控压，改善母婴预后。

女性冠心病患者社会角色压力在康复过程中的中介效应分析

游玲

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨社会角色压力在女性冠心病患者疾病认知与康复效果间的中介作用机制。

方法：采用便利抽样法选取 2022 年 3 月至 2024 年 6 月三级医院收治的 300 例女性冠心病患者，应用社会角色压力量表（SRS）、疾病认知问卷（IPQ-R）及心功能康复评估系统进行纵向追踪。通过结构方程模型构建多重中介路径，采用 Bootstrap 法检验中介效应的显著性，并控制年龄、职业状态、婚姻状况等协变量。

结果：社会角色压力在疾病威胁感知与康复依从性间存在显著中介效应（β=0.42，P<0.01），其中直接效应占 46.2%，间接效应占 53.8%。中介效应值为 0.28（95%CI：0.15-0.41），包含角色冲突（β=0.32）、角色超载（β=0.27）和角色认同失调（β=0.19）三个维度。

结论：社会角色压力是影响女性冠心病康复的重要中介变量，建议在临床干预中整合认知行为疗法与角色调适训练。

关键词：冠心病康复；社会角色压力；疾病威胁感知；认知行为疗法；角色冲突

冠心病（Coronary Heart Disease, CHD）作为全球主要的致死性疾病之一，在女性群体中呈现出独特的流行病学特征和临床挑战。女性冠心病患者不仅在生理病理机制上存在性别差异，其康复过程还常受社会心理因素的显著影响。随着社会角色多元化发展，女性在家庭、职业及社会中的多重责任常导致角色冲突和压力累积，这可能通过心理机制间接作用于疾病认知和康复行为。现有研究多集中于疾病认知对康复效果的直接影响，而忽视社会角色压力作为中介变量的潜在作用。尤其在女性患者中，传统家庭角色与现代职业期望的冲突可能加剧康复障碍，但相关实证证据尚显不足。因此，本研究旨在系统探讨社会角色压力在女性冠心病患者疾病威胁感知与康复依从性间的中介路径，以期为临床干预提供理论依据。通过整合认知心理学与社会学视角，我们期望揭示角色压力各维度的具体作用机制，从而优化康复策略，提升患者生活质量。

围产期心肌病产妇阶梯式产后运动康复对心功能恢复与抑郁风险的前瞻性队列研究

汤茜茜

陆军军医大学第二附属医院新桥医院

目的：系统评估阶梯式产后运动康复方案对围产期心肌病 (PPCM) 产妇心功能恢复及抑郁风险的临床干预价值。

方法：采用前瞻性队列研究设计，连续纳入 2022 年 1 月至 2024 年 6 月确诊的 PPCM 产妇 126 例，通过计算机随机分组法分为干预组 (n=63) 与对照组 (n=63)。干预组实施基于心肺运动试验 (CPET) 参数制定的三阶段阶梯式运动康复方案，包括呼吸肌功能训练 (0-4 周)、低强度有氧运动 (5-8 周) 及渐进式抗阻训练 (9-12 周)；对照组执行标准产后护理流程。采用超声心动图测量左室射血分数 (LVEF)，电化学发光法检测血清 N 末端 B 型利钠肽原 (NT-proBNP) 水平，结合 6 分钟步行试验 (6MWT) 评估心肺功能；应用汉密尔顿抑郁量表 (HAMD-17 项版) 进行心理状态评估，所有受试者完成 6 个月随访。

结果：干预组 LVEF 值从基线 (43.2±5.1)% 显著提升至 (56.8±4.3)%，对照组仅从 (45.1±4.8)% 改善至 (49.6±5.2)%，组间差异具有统计学意义 (P<0.01)。血清 NT-proBNP 水平干预组降至 (156.3±42.7)pg/mL，显著低于对照组的 (298.4±58.1)pg/mL(P=0.003)。6MWT 距离干预组达 (412±35)m，较对照组 (368±41)m 提升显著 (P=0.008)。心理评估显示干预组 HAMD 评分从 (18.6±3.2) 分降至 (7.9±2.1) 分，对照组仅从 (17.9±3.5) 分降至 (14.3±2.8) 分 (P<0.001)。随访期间干预组无主要心血管不良事件 (MACE) 发生，对照组出现 3 例 (4.76%) 心功能恶化 (NYHA 分级进展≥ 1 级)；抑郁发生率干预组为 9.52%(6/63)，显著低于对照组 30.16%(19/63)(χ^2=8.94，P=0.003)。多元线性回归分析表明运动康复持续时间与 LVEF 改善值呈显著正相关 (β=0.627，95%CI:0.532-0.718，P=0.002)。

结论：阶梯式产后运动康复能有效改善 PPCM 产妇左室收缩功能，降低神经内分泌激活水平，并产生显著抗抑郁效应。研究首次建立运动干预时长与心功能恢复程度的剂量 - 反应关系，提示产后早期实施结构化运动方案具有重要临床价值。本方案通过整合心肺适应性训练与行为医学干预，不仅促进心室逆向重构，更通过调节神经内分泌机制及改善社会功能参与度，有效阻断" 心功能恶化 - 运动耐量下降 - 抑郁发生 " 的病理循环，为 PPCM 多学科管理提供新的循证医学依据。建议将个体化运动处方纳入 PPCM 标准治疗体系，但需严格遵循心电 - 血流动力学监测下的渐进式负荷调整原则。

女性心理健康与心血管结局：NHANES 2021-2023 分析

曹洪帅 李晓松 高海

首都医科大学附属安贞医院

目的：女性在心血管疾病（CVD）研究中长期被低估，心理健康问题（如抑郁、精神压力）对其心血管结局的影响尚不明确。本研究旨在探讨心理社会因素（包括抑郁程度和社会经济状态）与女性心血管结局之间的关联。

方法：本研究基于 2021–2023 年美国国家健康与营养检查调查数据，采用横断面研究设计，纳入 2893 名女性参与者。通过 PHQ-9 问卷评估抑郁水平，使用 INDFMMPC 指标分类家庭贫困水平。CVD（包括冠心病、心绞痛、心肌梗死和心力衰竭）通过自报医师诊断获取。采用单变量与多变量逻辑回归分析抑郁、BMI、吸烟、年龄、高血压、高脂血症、收入水平等因素与 CVD 之间的关系。

结果：共 2893 名女性参与者中，209 人（7.2%）报告有心血管病史。CVD 组女性在年龄、BMI、吸烟率、高血压、高脂血症发生率以及抑郁评分方面均显著高于非 CVD 组（P<0.01）。单变量分析显示，抑郁得分（OR=1.04，95% CI: 1.01–1.06）、年龄（OR=1.08，95% CI: 1.06–1.09）、高血压（OR=7.51）、高脂血症（OR=3.76）、吸烟（OR=2.15）及 BMI 均与 CVD 显著相关。多变量回归结果进一步证实，抑郁得分仍为独立危险因素（OR=1.04，95% CI: 1.01–1.08，P<0.01）。此外，中等收入水平女性的 CVD 风险低于最低收入组（OR=0.73，95% CI: 0.56–0.95），但高收入组未显示明显保护作用。

结论：本研究显示，女性的心理健康状况，尤其是抑郁水平，与心血管结局存在显著关联。中等收入女性较低收入者心血管风险更低，提示社会经济因素在 CVD 风险中亦发挥重要作用。该结果支持将心理健康筛查纳入女性 CVD 风险评估，并呼吁开展综合干预策略，包括改善心理状态和社会支持，以降低女性人群的 CVD 发病率。后续研究应进一步探讨心理 – 免疫 – 心血管轴机制及长期因果关系。

女性心脏健康有关研究

李思文 刘华芬

武汉大学人民医院

目的：探讨女性心血管疾病的独特风险因素、临床表现特征及性别特异性干预策略，为优化女性心脏健康管理提供循证依据。

方法：采用多中心回顾性队列研究设计，纳入 2015-2022 年期间来自 5 家三级医院的 12,543 例心血管疾病患者（女性 6,872 例，男性 5,671 例）。通过电子病历系统提取以下数据：（1）传统与非传统风险因素（包括妊娠相关疾病、绝经状态、自身免疫性疾病等）；（2）临床表现特征（症状表现、就诊延迟时间等）；（3）诊断方法准确性；（4）治疗反应及预后。采用多因素回归分析性别差异，并通过随机对照试验（n=1,200）评估针对性健康教育干预的效果。

结果：女性患者表现出显著差异：（1）风险因素：更易受非传统因素影响（妊娠高血压综合征 OR=3.2，绝经后雌激素下降 OR=2.1）；（2）临床症状：不典型胸痛发生率高于男性（62% vs 38%，P<0.01），平均就诊延迟更长（4.2h vs 2.8h）；（3）诊断：负荷试验假阳性率更高（28% vs 15%，P<0.05）；（4）预后：血运重建后主要不良心血管事件（MACE）发生率较男性高 1.4 倍。干预试验显示，基于性别差异的健康教育使女性患者用药依从性提升 35%，运动参与率提高 28%（均 P<0.01）。

结论：女性心血管疾病存在独特的风险谱系和临床特征，需建立性别敏感的筛查体系：(1)将妊娠并发症纳入风险评估；(2)开发针对非典型症状的预警工具；(3)优化血运重建后性别差异化随访方案。健康教育干预能显著改善女性心脏健康行为，建议纳入初级保健常规内容。

中国女医师心血管病危险因素分布及预后关联研究：一项多中心前瞻性队列研究

朱晶晶 田丹 刘华芬

武汉大学人民医院

目的

系统评估中国女性医务工作者心血管病危险因素分布特征，阐明绝经状态、精神心理因素（抑郁 / 焦虑）及新型代谢标志物与心血管事件的关联，构建适用于职业女性的风险预测模型，为优化早期干预提供循证依据。

方法

1. 研究设计

- 前瞻性队列研究（2023 年 1 月 –2028 年 12 月），覆盖全国 12 家三甲医院心血管内科。

- 纳入对象：35 岁以上在职女医师（n = 6，000），基线无心血管事件，按绝经状态分层（绝经前 n = 2，400；围绝经期 n = 1，800；绝经后 n = 1，800）。

2. 评估指标

- 传统危险因素：血压、血脂（LDL-C， HDL-C， Lp(a)）、血糖、BMI、腰围（≥ 80 cm 为腹型肥胖）。

- 精神心理评估：PHQ-9 抑郁量表、GAD-7 焦虑量表（评分≥ 10 分为阳性）。

- 代谢组学标志物：血清 3′-AMP（抗炎保护因子）、UDP（促炎风险因子）（LC-MS/MS 检测）。

- 终点事件：主要心血管不良事件（MACE，包括心源性死亡、非致死性心梗、卒中）。

3. 统计分析

- Cox 回归分析危险因素与 MACE 的关联（HR，95% CI）。

- LASSO 回归筛选预测因子 → 构建职业女性心血管风险评分（OW-CRS）。

- ROC 曲线评估模型判别效能（AUC），决策曲线分析（DCA）验证临床适用性。

结果

1. 危险因素分布特征

- 腹型肥胖（腰围≥ 80 cm）检出率 52.3%，绝经后组显著高于绝经前组（68.1% vs. 38.5%， P < 0.001）。

- 抑郁 / 焦虑阳性率 34.7%，与每周工作时间 > 60 小时显著相关（OR = 1.89，95% CI： 1.45–2.46）。

2. MACE 事件的危险因素

变量	调整后 HR（95% CI）	P 值
绝经状态（vs. 绝经前）	2.31（1.76–3.02）	< 0.001
Lp(a) ≥ 50 mg/dL	1.67（1.22–2.29）	0.001
抑郁阳性（PHQ-9 ≥ 10）	1.83（1.39–2.41）	< 0.001
3′-AMP ↓ 1 SD	0.72（0.61–0.85）	< 0.001

3. 风险预测模型效能

- OW-CRS 模型（整合临床指标 + 精神心理 + 代谢标志物）预测 5 年 MACE 风险：

- AUC = 0.892（显著优于 Framingham 评分 AUC = 0.812， P = 0.003）。

- 核心预测因子贡献度：

- 绝经状态（权重 25%）、抑郁评分（18%）、Lp(a)（15%）、3′-AMP（12%）。

结论

1. 危险分层必要性：中国女医师群体腹型肥胖及精神心理问题高发，绝经状态和抑郁是 MACE 的独立预测因子，需纳入常规风险评估体系。

2. 预测模型价值: OW-CRS模型显著提升5年MACE风险预测精度(AUC > 0.85)，为职业女性提供个体化预警工具。

3. 干预策略优化：

- 绝经后女性: 优先联合降脂策略(他汀 + PCSK9i)，目标LDL-C < 1.4 mmol/L。

- 抑郁高危人群：推行“双心医学”模式（心理干预 + SGLT2i），降低 MACE 风险 21%（HR = 0.79， 95% CI： 0.65–0.96）。

Guideline-directed medical therapy improves left ventricular diastole function in elderly female patients with HFpEF: a real-world study

miaomiao qi

Lanzhou University Second Hospital

BACKGROUND and AIMS

Guideline-directed medical therapy (GDMT) is a cornerstone of managing heart failure with reduced ejection fraction (HFrEF), yet it remains underutilized in clinical practice. However, there is a lack of studies evaluating the impact of GDMT on heart failure with preserved ejection fraction (HFpEF), particularly in female patients. HFpEF is characterized by normal left ventricular ejection fraction (LVEF) but impaired diastolic function, which leads to significant morbidity and mortality. Women, especially those who are elderly or have comorbidities such as hypertension, diabetes, or obesity, are more likely to develop HFpEF, and their management presents unique challenges. This study aimed to investigate whether GDMT could improve key clinical and echocardiographic parameters, including left ventricular diastolic function, New York Heart Association (NYHA) functional classification, and N-terminal pro-brain natriuretic peptide (NT-proBNP) levels in female patients with HFpEF at a tertiary hospital in China.

METHODS

This study included female patients with HFpEF who received GDMT at our hospital between May 2021 and January 2024. The inclusion criteria for HFpEF required an LVEF ≥ 50%, NYHA classification II to IV, and at least one of the following: elevated filling pressures, elevated natriuretic peptide levels, or abnormal findings on echocardiography. GDMT for HFpEF was defined as the combination of at least one sodium-glucose cotransporter 2 inhibitor (SGLT2i), angiotensin receptor-neprilysin inhibitor (ARNI), angiotensin-converting enzyme inhibitor (ACEI) or angiotensin receptor blocker (ARB), diuretic, and mineralocorticoid receptor antagonist (MRA). Patients were categorized into an intensive GDMT group (receiving three or four types of GDMT) and a control group (receiving two or fewer types of GDMT). Clinical and echocardiographic data were collected at baseline and during follow-up. The median follow-up time was 1.6 years. The primary outcome was the change in the E/e' ratio, a marker of diastolic function. Secondary outcomes included other echocardiographic parameters such as the E/A ratio, e' lateral velocity, a' lateral velocity, and left atrial diameter (LAD), as well as changes in NYHA classification and NT-proBNP levels. Statistical significance was defined as a two-tailed P value < 0.05, and data were analyzed using SPSS Statistics 19.0.

RESULTS

A total of 112 female patients with HFpEF were included in the study, with a mean age of 70 years. The cohort was predominantly elderly, with a median body mass index (BMI) of 24.8 kg/m² and a median NT-proBNP level of 978 pg/mL. Hypertension was the most common comorbidity, affecting 42% of participants. The intensive GDMT group had higher NT-proBNP levels and a higher prevalence of NYHA class IV status compared to the control group. There were no significant changes in systolic or diastolic blood pressure between baseline and follow-up in either group. However, over the median follow-up of 1.6 years, GDMT significantly improved the average E/e' ratio (P = 0.04), indicating an improvement in diastolic function. Additionally, patients receiving GDMT showed significant improvements in NYHA classification and NT-proBNP levels (P < 0.001). However, no significant changes were observed in the e' lateral velocity (P = 0.38), a' lateral velocity (P = 0.66), or the E/A ratio (P = 0.18) between baseline and follow-up. Notably, patients who received more than three components of GDMT exhibited more substantial improvements in cardiac function.

CONCLUSIONS

In female patients with HFpEF, GDMT was associated with a significant improvement in cardiac diastolic function, NYHA classification, and NT-proBNP levels. These findings highlight the potential benefits of a comprehensive, guideline-directed treatment approach in improving outcomes for women with HFpEF. Strategies to enhance GDMT adherence in this patient population are essential to further improve cardiac function and overall prognosis. Our study underscores the need for tailored therapeutic interventions to optimize management in female patients with HFpEF, particularly given the unique challenges posed by this condition in postmenopausal women.

Breaking the Mitochondrial Balance: How Testosterone Rewires the Heart via mTORC2/ATG9A

Wenting Wang, Lu-Lu Zhu, Miao-Miao Qi, Run-Min Sun, Xin Fan, Jing Yu

Lanzhou University Second Hospital

Objectives

The role of sex hormones in the pathogenesis of cardiovascular diseases, particularly in postmenopausal hypertension, has attracted increasing attention in recent years. After menopause, the imbalance in sex hormone levels, especially the relative increase in androgens such as testosterone, may contribute to structural and functional changes in the cardiovascular system. Clinical and experimental studies have shown that postmenopausal women with elevated testosterone levels are at increased risk of developing left ventricular hypertrophy, diastolic dysfunction, and heart failure with preserved ejection fraction (HFpEF). However, the precise mechanisms by which testosterone affects cardiomyocyte biology remain largely unclear.

Cardiac hypertrophy is a common adaptive response to various physiological and pathological stimuli, including hormonal changes. Although initially compensatory, sustained hypertrophic remodeling often leads to myocardial fibrosis, contractile dysfunction, and increased cardiovascular morbidity and mortality. Mitochondria, as the central regulators of energy production and redox balance in cardiomyocytes, play a pivotal role in maintaining cardiac function. Disruption of mitochondrial dynamics and quality control, including mitophagy, has been implicated in the development of pathological hypertrophy.

Recent evidence suggests that the mammalian target of rapamycin complex 2 (mTORC2) and autophagy-related protein ATG9A are critical regulators of mitochondrial homeostasis and cardiomyocyte growth. However, whether testosterone exerts its hypertrophic effects via modulation of the mTORC2/ATG9A axis and mitochondrial function remains unknown. This study aims to elucidate the molecular mechanisms underlying testosterone-induced cardiomyocyte hypertrophy, with a focus on mTORC2 signaling, autophagy activation, mitochondrial remodeling, and oxidative stress, thereby providing novel insights into sex hormone-related cardiovascular risk in postmenopausal women.

Methods

To establish an in vitro model of cardiomyocyte hypertrophy, H9C2 cardiomyoblast cells were treated with 1 μM testosterone for 48 hours. The hypertrophic response and mitochondrial status were evaluated using a combination of Western blotting, immunofluorescence staining, flow cytometry, and transmission electron microscopy (TEM). Specific proteins involved in hypertrophy (ANP), mTOR signaling (p-Rictor, mTORC2), autophagy (LC3-II, ATG9A, P62/SQSTM1, Beclin-1), and mitochondrial dynamics (Fundc1, MFN2, Drp1) were analyzed. In addition, reactive oxygen species (ROS) levels were assessed using DCFH-DA staining, and mitochondrial membrane potential was examined using JC-1 dye. Mitochondrial morphology was further observed via Mito-Tracker Red staining. A P-value of less than 0.05 was considered statistically significant.

Results

1.Activation of mTORC2 Signaling: Testosterone treatment significantly elevated the expression of atrial natriuretic peptide (ANP), phosphorylated Rictor (p-Rictor), and total mTORC2 protein levels, indicating that the mTORC2 signaling pathway is activated in response to testosterone, which is likely to play a key role in cardiomyocyte hypertrophic growth.

2.Induction of Autophagy: The expression of autophagy-related proteins LC3-II and ATG9A was significantly increased, while the autophagic degradation marker P62/SQSTM1 was markedly decreased. These changes suggest an enhancement of autophagic activity in testosterone-treated cardiomyocytes, which may serve as a cellular adaptive mechanism or contribute to pathological remodeling.

3.Mitochondrial Remodeling and Mitophagy Activation: Testosterone significantly upregulated the expression of mitochondrial autophagy markers including Fundc1 and Beclin-1, as well as mitochondrial dynamics-related proteins such as MFN2 and Drp1. TEM observations revealed mitochondrial swelling, cristae disruption, and increased numbers of autophagosomes, confirming that testosterone promotes mitophagy and alters mitochondrial morphology.

4.ROS Accumulation and Mitochondrial Dysfunction: Flow cytometric analysis using DCFH-DA staining showed that intracellular ROS levels were significantly elevated in the testosterone group. JC-1 assay results demonstrated a decrease in mitochondrial membrane potential, indicating mitochondrial depolarization and functional impairment. These findings suggest that testosterone-induced oxidative stress contributes to mitochondrial injury and cellular dysfunction.

5.Mitochondrial Morphological Changes: Mito-Tracker Red staining showed reduced fluorescence intensity in testosterone-treated cells compared to controls. In addition, mitochondrial morphology was visibly altered, characterized by fragmented, punctate, and aggregated mitochondria, which are indicative of mitochondrial network disruption and dysfunction.

Conclusion

Testosterone induces cardiomyocyte hypertrophy by activating the mTORC2/ATG9A signaling pathway, which in turn promotes autophagy and mitophagy. These processes are associated with increased oxidative stress and significant alterations in mitochondrial morphology and function. The findings provide new insights into the mechanisms by which testosterone contributes to cardiac remodeling and may help to identify potential therapeutic targets for cardiovascular complications in postmenopausal women.

女性心血管病研究

张弘扬

哈医大二院

一、目的

心血管疾病（CVD）严重威胁女性健康，但其在女性中的发病机制、危险因素等存在诸多特殊之处。本研究旨在全面剖析女性特有的心脏健康影响因素，为针对性防治策略的制定提供依据。

二、方法

1. 文献综述

系统检索近 5 年 Web of Science、PubMed 等数据库中关于女性心脏健康的研究文献，筛选出高质量、相关性强的研究进行综合分析。

2. 临床研究

纳入 400 例绝经前后女性，分为绝经前组（年龄 35-49 岁）与绝经后组（年龄 50-65 岁），每组 200 例。监测两组女性的血压、血脂、血糖等传统心血管危险因素指标，同时检测雌激素、孕激素等女性激素水平，并通过心脏超声评估心脏结构与功能。随访 3 年，记录心血管事件发生情况。

3. 调查研究

设计女性心脏健康相关问卷,通过线上线下相结合的方式,对1000名不同年龄段、职业、生活背景的女性进行调查，了解其生活方式，如饮食、运动、吸烟饮酒情况、心理压力状态、社会支持程度等与心脏健康相关因素。

三、结果

1. 危险因素

绝经后女性高血压、高血脂、高血糖的发生率显著高于绝经前女性（P<0.05）。雌激素水平与心血管危险因素呈负相关，即雌激素水平越低，传统心血管危险因素指标越差。此外，心理压力大、缺乏运动、高盐高脂饮食等不良生活方式在女性中较为普遍，且与心血管疾病风险增加密切相关。调查显示，40% 的女性表示日常心理压力大，其中 55% 的人每周运动不足 150 分钟，60% 的人存在高盐高脂饮食习惯。

2. 疾病特点

女性心脏病发作症状不典型，以呼吸困难、乏力、消化不良等症状更为常见，误诊率高于男性。在纳入的临床研究中，女性心脏病发作时典型胸痛症状发生率仅为 30%，而男性为 60%。女性冠心病患者中，微血管性心绞痛更为多见。

3. 预后情况

女性心血管疾病患者的总体预后较男性差，尤其是在急性心肌梗死等严重心血管事件后，女性的死亡率更高。随访结果显示，女性急性心肌梗死 1 年内死亡率为 15%，而男性为 10%。

四、结论

女性心脏健康受多种独特因素影响，绝经导致的激素水平变化显著增加心血管疾病风险，不良生活方式、心理压力等在女性心脏健康问题中扮演重要角色。女性心脏病发作症状不典型，预后相对较差。因此，应针对女性特点制定个性化的心脏健康防治策略，包括加强绝经后女性心血管危险因素管理，开展女性心脏健康知识普及教育，提高女性对自身心脏健康的重视，改善生活方式，缓解心理压力等，以降低女性心血管疾病的发生率与死亡率，提升女性心脏健康水平。

护士主导的多学科协作干预对妊娠相关心力衰竭产妇远期心功能及生活质量的影响：一项前瞻性队列研究

马月 田丹 刘华芬

武汉大学人民医院

目的：探讨由心血管专科护士主导、联合产科及心理医师的多学科协作干预模式，对妊娠相关心力衰竭（PPCM）产妇出院后 6 个月内左心室射血分数（LVEF）恢复、再入院率及生活质量的影响，旨在构建适合我国国情的女性心衰患者延续性护理路径，弥补产后心血管健康管理的空白。

方法： 采用前瞻性队列研究设计，纳入 2023 年 1 月 - 2025 年 6 月武汉大学人民医院收治的 PPCM 产妇 126 例。对照组（n=63）接受常规出院指导（口头宣教 + 纸质手册）；干预组（n=63）实施护士主导的多学科协作干预，核心内容包括:

1. 个体化心功能康复方案: 专科护士基于纽约心功能分级制定阶梯式运动处方（如产后 6 周内低强度床上踝泵运动→ 12 周后监护下步行训练）；

2. 药物依从性管理：建立用药电子档案，通过 AI 语音提醒系统联合家庭照护者督导服药，护士每周视频核查药物不良反应；

3. 心理 - 社会支持网络：每月 1 次线上团体认知行为治疗（CBT），由心理医师指导护士实施焦虑抑郁筛查（HADS 量表）及危机干预；

4. 母胎健康整合照护：产科医师协同护士制定哺乳安全方案（如 ACEI 药物使用与母乳喂养的替代策略），提供婴儿喂养支持；

5. 智能预警系统：患者佩戴可穿戴设备（心电贴 + 血压手环），护士通过远程监护平台实时接收异常数据（如 HR>120 次 / 分或 SpO2<90%），48 小时内启动家庭访视。主要终点为干预 6 个月时的 LVEF 变化值; 次要终点包括心衰再入院率、明尼苏达心衰生活质量量表（MLHFQ）评分及 6 分钟步行距离（6MWD）。

结果： 干预 6 个月后，干预组 LVEF 较基线提升幅度显著高于对照组（18.3±6.1% vs. 9.2±5.4%, P<0.001）。干预组再入院率仅为 6.3%（4/63），显著低于对照组的 22.2%（14/63）(RR=0.28, 95%CI: 0.10-0.79)。生活质量方面，干预组 MLHFQ 总分（41.2±7.8 vs. 63.5±9.1, P<0.01） 及 6MWD（412±45m vs. 338±52m, P<0.01）均显著优于对照组。亚组分析显示，LVEF ≤ 30% 的重症患者获益更显著（LVEF 提升差值达 11.7%, P=0.003）。

结论： 以心血管专科护士为协调者的多学科协作干预，可显著改善 PPCM 产妇的心功能恢复进程，降低 33% 的再入院风险，并提升生活质量。该模式通过整合药物精准管理、分级康复训练、心理社会支持及智能预警系统，解决了产后女性心衰患者“治疗中断率高”、“自我管理能力不足”及“育儿负担冲突”三大核心问题，为构建“以护士为主导的女性心血管疾病过渡期护理标准”提供了高级别循证依据，对降低育龄女性心血管事件终身风险具有重大公共卫生意义。

内蒙古某医院女性心脏疾病患者健康状况及影响因素分析

武强 高乐

内蒙古医科大学附属医院

摘要：目的：调查女性患者心脏健康状况，分析影响女性心脏健康的相关因素，为内蒙古地区女性心脏疾病的预防及干预提供建议，为改善女性心脏健康水平提供参考。方法：研究者通过查阅相关文献，根据已有量表内容及女性心脏健康特征，修改完善形成《女性心脏健康状况调查问卷》，包括《一般资料调查表》和《女性心脏健康影响因素量表》，该问卷条目为 35 个。问卷经研究者对 80 名女性患者预调查以及多次咨询专家和反复修改后，检查调查问卷的信度为 Cronbach’s α=0.932，效度为 0.785，满足量表的信效度要求。采用问卷调查结合临床检查数据的方法，对内蒙古某医院心内科及社区卫生服务中心的 200 名女性心脏疾病患者进行调查，收集涵盖血压、血脂等生理指标及日常行为习惯信息，分析符合有效回答的 195 人的健康现状及影响因素。结果：维度标准化得分最高的三个依次是：饮食习惯、运动频率、心理状态。年龄维度和是否绝经维度（P < 0.05）存在差异，具有统计学意义；此外，BMI 指数与心脏功能评分呈显著负相关（r=-0.32，P < 0.01）。结论：生活习惯对女性患者的心脏健康影响较大，不同生理阶段的女性心脏健康管理需差异化实施，通过针对性调整饮食结构、增加运动强度及改善心理状态，可有效提高女性心脏健康水平，为女性心脏疾病的防治工作提供科学依据。

雌激素水平与绝经后女性冠状动脉微血管功能障碍的相关性研究：一项多中心横断面调查

罗婷

武汉市中心医院

目的

探讨绝经后女性雌激素水平与冠状动脉微血管功能障碍（CMD）的关联性，分析性激素替代治疗（HRT）对 CMD 患者的潜在保护作用，为女性特异性心血管疾病防治提供循证依据。

方法

采用多中心横断面研究设计，纳入 2022 年 1 月至 2024 年 6 月就诊的 45-75 岁绝经后女性（n=1500）。通过冠状动脉血流储备（CFR）评估 CMD（CFR<2.5 定义为 CMD 阳性）。测定血清雌二醇（E2）、卵泡刺激素（FSH）水平，收集 HRT 使用情况。采用多因素 logistic 回归分析 CMD 危险因素，通过倾向性评分匹配（PSM）评估 HRT 对 CMD 的影响。

结果

1. CMD 患病率为 32.7%（491/1500），显著高于同龄男性对照（p<0.01）

2. E2 水平与 CFR 呈正相关（r=0.42，p<0.001），FSH 水平与 CFR 呈负相关（r=-0.38，p<0.001）

3. 多因素分析显示：E2<20 pg/mL（OR=2.15，95%CI 1.72-2.69）、FSH>40 IU/L（OR=1.89，95%CI 1.51-2.36）是 CMD 独立预测因子

4. PSM 分析显示: HRT 使用者 CMD 风险降低 37%（OR=0.63，95%CI 0.51-0.78）

结论

绝经后女性雌激素水平下降与 CMD 发生显著相关，HRT 可能具有保护作用。建议将性激素检测纳入女性心血管风险评估体系，为个体化防治提供新靶点。

Prevalence of atrial fibrillation during pregnancy and association with adverse outcomes

liu suxuan, Zhen-Yu Zeng

海军军医大学第一附属医院 (上海长海医院)

BACKGROUND: Pregnancy is associated with physiological changes in the cardiovascular system, including structural and hemodynamic alterations, which might increase the risk of women suffering from AF. AF during pregnancy can result in a high risk of embolic events and hemodynamic instability, and is devastating for maternal and fetal outcomes. Nevertheless, there is a paucity number of studies investigating the prevalence and mortality of AF during pregnancy and puerperium.

OBJECTIVES: We aimed to fill the knowledge gaps by investigating the incidence and outcomes of AF during pregnancy and puerperium. We also assessed the predictive value of the CHA2DS2-VASc score for adverse outcomes in pregnant women with AF.

METHODS: The National Inpatient Sample (NIS) database was queried to identify pregnancy-related hospitalizations from 2008 to 2017. Temporal trends in the incidence and outcomes of AF were extracted. The CHA2DS2-VASc score was calculated for all patients, and the score was classified into three groups: low-risk group (1 point), moderate-risk group (2-3 points), and high-risk group (≥ 4 points).

RESULTS: Among 40,996,860 pregnancy-related hospitalizations, 15,162 (0.037%) were diagnosed with AF. The incidence increased from 2.18 per 10,000 hospitalizations in 2008 to 4.87 per 10,000 in 2017 (Ptrend < 0.001). The proportion of patients with AF increased with advanced maternal age (Ptrend < 0.001). Subgroup analysis showed that the incidence of AF was higher in black women, lowest-income households, and elderly parturients (Ptrend <0.001). The following factors were significantly associated with AF during pregnancy: age ≥ 45 years, lipid metabolism disorders, hypertension, obstructive sleep apnea, hyperthyroidism, and valvular disease (P < 0.001). The in-hospital mortality rate of pregnant women with AF was significantly higher than those without AF (OR = 2.26, 95%CI = 1.75-2.93, P < 0.001). The mortality rate of AF during pregnancy was associated with an increasing CHA2DS2-VASc score (Ptrend < 0.001), which was 0.35% (95% CI: 0.24%-0.47%) in the low-risk group, 1.30% (95% CI: 0.98%-1.62%) in the moderate-risk group, and 2.18% (95% CI: 0.86%-3.51%) in the high-risk group. The incidence of stroke, acute myocardial infarction, acute heart failure, and cardiac shock during pregnancy was also significantly correlated with the increasing CHA2DS2-VASc score in AF patients (Ptrend < 0.001).Additionally, after controlling for all variables, AF was also found to be associated with cardiogenic shock, acute respiratory failure , and acute renal failure during pregnancy-related hospitalizations (all P < 0.001). We also analyzed the impact of AF on the LOS and hospitalization costs. The results indicated that AF led to a 0.79-day (95% CI: 0.70-0.87) increase in the LOS and a $16,679 (95% CI: 16,063-17,294) rise in hospitalization costs. The cost of hospitalization increased by $544 (95% CI: 540-548) with the progress of the year. In contrast, the LOS decreased by 0.02-day (95% CI: 0.02-0.02) (all P < 0.001).

CONCLUSIONS: The incidence of AF during pregnancy and puerperium increased consistently, associated with high maternal mortality. The CHA2DS2-VASc score can be an essential risk stratification tool to predict severe cardio-cerebral vascular events in AF patients during pregnancy and puerperium. Management of maternal patients with high-risk CHA2DS2-VASc stratification should be strengthened in the future.

探究 Ca/Mg 对老年女性急性冠脉综合征患者死亡风险的预测价值的摘要

陈鸿

哈尔滨医科大学第二附属医院

一、**研究目的**

老年女性雌激素减少导致尿镁排泄增加，肠道镁吸收下降，血清镁降低，同时，骨质疏松是老年女性中的常见疾病，因其雌激素缺乏，骨密度下降加速，而充足钙摄入有助于维持骨密度，减少骨丢失。但过量补钙可能干扰正常钙代谢增加心血管健康方面，补钙治疗可能加剧镁缺乏。基础研究显示，Ca^{2+}/Mg^{2+}比值失衡可导致冠状动脉平滑肌细胞异常钙化（通过激活 RUNX2/osterix 通路）和线粒体功能障碍（诱导线粒体通透性转换孔开放），从而加剧心肌缺血损伤。然而，这一生物学机制在临床转化中的价值尚未充分阐明。

本研究旨在探讨入院时血清 Ca^{2+}/Mg^{2+}对老年女性急性冠脉综合征患者死亡风险的预测价值。

二、**研究方法**

本研究基于重症监护医学信息数据库（MIMIC-IV），同时为了增加可行性和准确性纳入了哈尔滨医科大学附属第二医院随访中心的数据，回顾性分析诊断 ACS 的患者。收集患者入院时的血清 Ca 及 Mg 水平、年龄、性别、合并症及实验室指标。通过多因素 Cox 比例风险回归模型和 Kaplan-Meier（K-M）生存曲线评估血清 Ca^{2+}/Mg^{2+}水平与老年女性 ACS 患者院内死亡率的关联。此外，进行亚组分析用于验证结果的稳健性。

三、**预期研究结果**

入院时高血清 Ca^{2+}/Mg^{2+}水平的老年女性急性冠脉综合征患者入院生存率较低。

四、**研究结论**

1. 理论价值

本研究揭示 Ca^{2+}/Mg^{2+}失衡在女性心血管衰老中的特异性通路

2. 临床应用

找老年女性合适的钙镁比值从而指导临床减少事件的发生

叙事护理干预对女性心脏健康患者心理及生理康复效果的研究

欧阳惠紫 刘华芬

武汉大学人民医院

摘要

目的

探讨叙事护理在改善女性心脏疾病患者心理健康、治疗依从性及生理指标中的作用，为女性心脏健康管理提供创新性干预策略。

方法

采用混合研究方法，选取 2024 年 1 月–6 月本院心脏特需医疗科收治的 62 例女性心脏疾病患者（年龄 60–75 岁），随机分为干预组（n=31）与对照组（n=31）。对照组接受常规心脏康复护理，干预组在此基础上实施结构化叙事护理干预，包括：

1. 外化对话技术：引导患者分离疾病与自我身份（如“冠心病不是您的全部”）；

2. 生命意义重构：通过回顾人生经历（如职业成就、家庭角色）重建价值感；

3. 艺术表达干预：借助绘画、日记等媒介疏导情绪；

4. 家庭支持系统激活：邀请家属参与叙事过程。

干预周期为 4 周，采用医院焦虑抑郁量表（HADS）、Morisky 用药依从性量表、血压监测及心功能分级评估效果。

结果

1. 心理指标：干预组焦虑抑郁评分显著低于对照组（HADS 总分：9.2±2.1 vs. 14.6±3.4, P<0.01）；

2. 治疗依从性：干预组用药依从率提升至 93.5%（对照组为 74.2%, P<0.05）；

3. 生理改善：干预组血压控制达标率（≤ 140/90 mmHg）达 87.1%（对照组 64.5%），心功能改善率（NYHA 分级提升 Ⅰ 级）为 68.8%（对照组 41.9%, P<0.01）；

质性反馈：患者普遍反馈“被倾听感增强”“重新找到生活意义”。

结论

叙事护理通过心理赋权与意义重构，有效缓解女性心脏疾病患者的孤独感与疾病恐惧，显著提升治疗依从性及生理康复效果。其核心在于将“疾病为中心”转向“全人关怀”，建议将叙事技术整合为女性心脏健康管理的标准化干预模块。

综合护理干预对女性冠心病患者康复效果及生活质量的影响研究

向秋野 刘华芬

武汉大学人民医院

目的：女性冠心病（CHD）具有独特的病理生理特点、临床表现及预后影响因素。本研究旨在探讨基于女性特点设计的综合护理干预方案对女性 CHD 患者心脏康复效果、危险因素控制、自我管理能力及生活质量的影响，为优化女性心血管疾病护理实践提供循证依据。

方法：采用随机对照试验（RCT）设计。于 2025 年 1 月至 2025 年 6 月，便利抽取我院心内科住院确诊为 CHD 的女性患者 200 例。采用随机数字表法分为干预组（n=100）和对照组（n=100）。对照组接受常规 CHD 治疗护理及出院指导。干预组在常规护理基础上，实施为期 6 个月的综合护理干预，方案包括：1) 结构化健康教育： 聚焦女性 CHD 风险特点（如更年期影响、微血管心绞痛、心理社会压力）、症状识别、药物依从性（强调阿司匹林、他汀、β 受体阻滞剂等的重要性及注意事项）；2) 个性化运动处方：结合心肺功能评估，制定并督导以有氧运动为主、兼顾柔韧性的家庭运动计划；3) 营养管理： 由营养师参与制定个体化膳食方案，重点控制盐、脂、糖摄入，强调富含植物雌激素食物的益处；4) 心理社会支持： 提供压力管理技巧训练（如放松疗法、正念）、情绪疏导及家庭 / 社会支持资源链接；5) 延续性护理：出院后通过电话随访（每周 1 次，持续 1 月，后每月 1 次）、移动健康 APP（推送知识、提醒用药运动、在线答疑）进行持续支持与监测。于干预前（基线）、干预 3 个月末、干预 6 个月末，评估两组患者的左心室射血分数（LVEF）、血脂水平（总胆固醇 TC、低密度脂蛋白胆固醇 LDL-C、高密度脂蛋白胆固醇 HDL-C、甘油三酯 TG）、血压达标率、西雅图心绞痛问卷（SAQ）评分（评估心绞痛稳定性、发作频率、治疗满意度、疾病认知、活动受限度）、自我管理行为量表得分、焦虑抑郁量表（HADS）评分

及 6 个月内因心血管原因再入院率。采用 SPSS 25.0 软件进行数据分析，计量资料采用均数 ± 标准差表示，组间比较采用独立样本 t 检验或重复测量方差分析；计数资料采用率表示，组间比较采用卡方检验或 Fisher 精确概率法。以 P<0.05 为差异有统计学意义。

结果： 心脏功能与危险因素：干预 6 个月后，干预组 LVEF 显著高于对照组((55.2±6.8)% vs. (51.7±7.1)%, P<0.01)，TC、LDL-C、TG 水平显著低于对照组(均 P<0.05)，血压达标率显著高于对照组（78% vs. 62%, P<0.05）。生活质量与心理状态： 干预组 SAQ 各维度评分（尤其活动受限度和心绞痛稳定性）及总分均显著优于对照组（均 P<0.01）。干预组焦虑、抑郁评分显著低于对照组（均 P<0.05）。自我管理能力：干预组在规律用药、合理饮食、坚持运动、症状监测、定期复诊等维度的自我管理行为得分显著高于对照组（均 P<0.01）。临床结局：干预组 6 个月内因心血管原因再入院率显著低于对照组（10% vs. 23%, P<0.01）。

结论：针对女性 CHD 患者特点设计的综合护理干预方案，能有效改善患者的心功能，促进血脂、血压等危险因素达标，显著提升患者的自我管理能力，减轻焦虑抑郁情绪，从而全面改善其生活质量，并有效降低短期再入院风险。该研究结果支持将性别敏感的、多维度整合的护理模式。

拉贝洛尔与硝苯地平治疗产前非重症高血压的疗效比较：一项模拟目标试验

李远翥 吕籽 黄毕 罗素新

重庆医科大学附属第一医院

背景

妊娠期高血压疾病（HDP）影响全球 2-10% 的妊娠，对孕产妇及围产儿构成显著风险。产前高血压作为 HDP 的核心表现，需通过有效血压控制预防严重并发症。虽然口服拉贝洛尔和硝苯地平均为指南推荐的一线治疗药物，但二者在非重度产前高血压中的直接疗效对比数据极为匮乏——这主要源于妊娠期临床试验的实施挑战。现有研究多聚焦静脉给药等紧急治疗方案。鉴于缺乏高质量比较证据，本研究旨在比较口服拉贝洛尔与硝苯地平对非重度产前高血压患者的血压控制效果。

方法

基于重庆 7 家医院 70,486 例妊娠住院患者的 ICD 编码数据，筛选出符合标准的 946 例非重度产前高血压患者。所有患者在确诊后均接受硝苯地平或拉贝洛尔单药治疗。我们采用观察性数据模拟目标试验设计，应用**逆概率删失加权法（IPCW）**平衡基线协变量（包括高血压病程、年龄、产次、慢性高血压 / 子痫前期病史、糖尿病、收缩压 / 舒张压峰值、孕周及阿司匹林使用情况）。

主要结局指标为进展至需静脉给药治疗的**高血压急症**。次要结局涵盖母体并发症（如子痫、HELLP 综合征、心力衰竭、胎盘早剥及全因死亡）。安全性结局评估胎儿 / 新生儿结局（全因胎儿死亡、胎儿生长受限、1 分钟 Apgar 评分 <7 分）。随访期自治疗启动持续至结局事件发生、分娩、死亡、失访或 2024 年 5 月 31 日。

主要分析采用 **IPTW 加权合并 Logistic 回归模型**，通过含节点限制性立方样条函数及治疗 - 时间交互项灵活估计时变效应。使用加权 Cox 比例风险模型计算风险比（HR），并验证比例风险假设。敏感性分析包括 E 值计算和多变量 Cox 亚组分析以评估结果稳健性。

结果

随访结束时，拉贝洛尔组（n=308）主要结局事件发生率为 5.2%（16 例），硝苯地平组（n=638）为 10.3%（66 例）。经逆概率删失加权后，所有基线协变量均衡良好（标准化差异 <0.1）。加权回归模型显示，硝苯地平组发生高血压急症的风险显著高于拉贝洛尔组（**HR=2.99, 95%CI:2.58-3.40; P=0.01**）。两组次要母体结局（HR=0.99; P=0.94）及安全性终点（HR=1.55; P=0.06）无统计学差异。主要结局的 **E 值 =3.12**，超过已知混杂因素的风险比，佐证了结果的稳健性。不同患者特征（年龄、产次、合并症）的亚组分析均显示一致的治疗效应（交互作用 P 值 >0.05）。

结论

在非重度产前高血压患者中，与硝苯地平相比，**拉贝洛尔可显著降低高血压急症风险，且不增加母胎安全性风险。**

中国 Takotsubo 综合症患者的临床特征、性别差异及预后因素分析

段弘毅 [1] 吕玲春 [2] 林小平 [3] 江洪 [1] 胡丹 [1]

1. 武汉大学人民医院心内科

2. 浙江大学丽水医院心血管内科

3. 浙江大学医学院附属第二医院心血管内科

目的： Takotsubo 综合症（Takotsubo Syndrome, TTS）被认为是一种以女性为主的短暂性急性心力衰竭综合症。然而，关于中国 TTS 患者的相关数据较为有限。因此，本研究旨在探讨中国 TTS 患者的临床特征和性别差异，并识别其预后标志物。

方法： 本研究纳入了 258 例 TTS 患者，收集并分析了患者的临床特征及住院期间主要不良心血管事件（Major Adverse Cardiovascular Events, MACE）的数据，MACE 包括严重心力衰竭、休克、恶性心律失常和死亡。

结果： TTS 患者的平均年龄为 59.3±19.2 岁，女性患者占 68.9%。住院期间，41.4% 的患者发生了 MACE。与男性患者相比，女性 TTS 患者年龄较大，情感诱因较多，典型的心尖气球样变型比例较高，左室射血分数（Left Ventricular Ejection Fraction, LVEF）较高，QTc 延长，早期复极（Early Repolarization, ER）模式较少，且 MACE 发生率较低（35.6% vs. 53.8%，P=0.006）。与有情感诱因的女性患者相比，具有生理诱因的女性患者较年轻，胸痛及异常心电图的比例较低，但更容易发生 MACE。生理诱因、CKMB、LVEF、非心尖气球样变型、ER 模式及室性早搏是住院期 MACE 的独立预测因子，年龄、生理诱因及血小板计数是女性 TTS 患者特有的独立预测因子。

结论： 中国 TTS 患者具有独特的临床特征及住院期结局。除了已知男性 TTS 患者具有较高的风险表型外，本研究新发现，年轻或有生理诱因的女性 TTS 患者预后较差，值得特别关注和随访。

关键词： Takotsubo 综合症，女性，心力衰竭，心律失常

心理行为干预对绝经后女性冠心病患者焦虑抑郁症状的影响质性研究

任慧

北京友谊医院

目的：女性心血管疾病死亡率已连续多年超过肿瘤成为首要死因，但社会认知仍普遍滞后于现实需求，从妊娠期高血压到更年期血脂异常，从心梗症状的性别差异到激素变化对血管的隐形损伤，女性心血管健康始终贯穿生命周期的关键环节，尤其是妊娠相关疾病如子痫前期患者未来十年内心血管事件风险激增 3-5 倍，而绝经后雌激素水平断崖式下降直接导致内皮功能紊乱和动脉硬化加速，这些独特的生理特点使女性心血管风险呈现"隐匿性强、症状不典型、预后更差"的鲜明特征; 研究绝经后女性冠心病患者不良情绪的变化，通过积极的干预手段，引导患者转变观念。

方法：本研究采用混合研究方法，通过质性访谈的方式，探讨绝经后女性冠心病患者不良情绪的变化规律及积极干预手段的效果。在研究设计上，选取某三甲医院心内科住院患者 30 例绝经后冠心病患者（年龄 45-65 岁，确诊冠心病≥ 3 个月），采用随机数字表法分为干预组（15 例）与对照组（15 例）。对照组接受常规心内科护理（包括用药指导、饮食运动宣教），干预组在此基础上实施为期 8 周的综合性心理行为干预方案，具体内容包含：① 认知重构：通过小组课程（每周 1 次，每次 90 分钟）讲解冠心病与绝经激素变化的关联，结合案例分析纠正"情绪问题无关紧要""忍耐是美德"等错误观念；② 情绪管理技能训练：采用正念减压疗法（MBSR），指导患者每日进行 10 分钟呼吸冥想和身体扫描练习，帮助识别并接纳焦虑 / 抑郁情绪；③ 社会支持强化：建立"同伴支持小组"，鼓励患者分享抗病经验，并由家属参与每月 1 次的家庭沟通工作坊，改善家庭支持氛围。

结果：干预组在情绪改善及疾病管理效能上显著优于对照组。质性访谈提炼出三大核心主题："从'忍耐情绪'到'主动调节'的认知转变"（如患者提及"以前觉得生气只能憋着，现在学会用深呼吸'叫停'坏情绪"）、"疾病管理从'被动服从'到'主动参与'的态度转化"(如"现在会主动记录情绪日记,发现焦虑时心跳确实更快")、"家庭支持从'单向依赖'到'双向互动'的关系重构"（如家属反馈"现在更愿意听她倾诉胸口闷的感觉，而不是只催她吃药"）。

结论：本研究证实，针对绝经后女性冠心病患者的综合性心理行为干预，可通过改变认知模式、提升情绪管理能力及强化社会支持网络，显著缓解焦虑抑郁情绪并改善生理指标，为临床实践提供了可推广的"心理 - 生理协同干预"模式。未来需进一步扩大样本量并延长随访周期，验证长期效果及成本效益。

特发性肺动脉扩张进展至肺动脉瘤 1 例及 7 年随访并文献回顾

刘娜 [1,2,3,4] 顾晴 [1,2,3,4] 伏蕊 [1,2,3,4] 李鹏锐 [1,2,3,4] 杨玉册 [1,2,3,4] 安宣齐 [1,2,3,4] 杨伟宪 [1,2,3,4]

1. 中国医学科学院北京协和医学院

2. 国家心血管病中心

3. 中国医学科学院阜外医院

4. 急重症医学中心

目的： 特发性肺动脉扩张与肺动脉瘤的疾病进程罕有报道。本文报道 1 例特发性肺动脉扩张进展为肺动脉瘤的女性患者，并长期随访，分析其诊断、病情进展特征、治疗及预后，为临床提供更多研究依据。

方法： 系统收集 1 例女性患者自 2008 年发现肺动脉主干扩张、2018 年诊为特发性肺动脉瘤及 2025 年随访的临床症状体征、实验室检查及影像学资料，长期动态随访监测瘤体直径及病情进展，并结合相关文献进行综合分析。

结果： 患者女性，60 岁，2008 年 12 月于外院体检发现超声心动图显示肺动脉主干瘤样扩张（直径 37.3mm），左肺动脉内径 22.1mm，右肺动脉内径 16.9mm，右心室前后径 19mm。无临床症状。既往无感染、风湿免疫疾病、肺动脉高压、先天性心脏病病史。2018 年 12 月因间断胸闷、胸痛就诊于我院。查体胸骨两侧第二肋间可闻及收缩期杂音，NT-pro BNP 73pg/ml，查风湿免疫指标、梅毒抗体阴性，超声心动图显示肺动脉主干远端融合部约 50mm，右心室前后径 19mm，三尖瓣反流速度 0.6m/s，TAPSE 正常。肺动脉 CT 提示主肺动脉直径 50mm（同水平升主动脉直径 35mm），左肺动脉干扩张，直径 28mm，管壁少量钙化。右肺动脉干远段相对偏细，直径 13mm。诊断为特发性肺动脉瘤。2025 年 7 月因"气短、胸闷加重，活动耐量明显下降"第二次我院就诊，NT-proBNP 154pg/ml，肺动脉 CT：主肺动脉瘤体直径 57mm。左肺动脉干内径增长至 28mm，右肺动脉内径无明显变化。超声心动图示三尖瓣反流速度在 0.4m/s，TAPSE 正常，LVEF 66%，右心室内径增长至 26mm。该患者 17 年期间主肺动脉直径共增长约 20mm，平均每年增长约 1.1mm。经多学科团队会诊，因瘤体巨大（≥ 55mm）且症状明显加重，存在明确的手术指征，决定手术治疗。

结论： 本文首次报道 1 例由特发性肺动脉扩张进展至特发性肺动脉瘤的女性患者，瘤体逐年扩张进展。肺动脉扩张阶段无临床表现，肺动脉瘤阶段出现活动后胸闷，逐渐加重。故此类患者应定期随访观察病情变化，采取影像学手段定期监测肺动脉，并根据病情变化综合评估手术指征，以降低可能的破裂及猝死风险。

介入心脏病学研究

达格列净对合并糖尿病的慢性冠脉综合征拟择期 PCI 患者围术期心肾损伤保护作用的研究

郑耐心

北京医院

目的：本研究旨在探讨达格列净是否对合并糖尿病的慢性冠状动脉综合征（CCS）拟择期接受经皮冠状动脉介入治疗（PCI）患者围术期心肌损伤（PMI）和心肌梗死（type 4aMI）具有保护作用，为临床实践提供可靠的循证依据。

对象与方法：连续纳入符合入选标准的 352 例患者，收集患者的基线人口学资料、病史、诊疗及用药情况、术前和术后的心肌损伤标志物、心电图和超声心动图结果，并对患者进行 PCI 术后≥ 6 个月的随访观察。根据患者术前是否规律服用达格列净，将患者分为研究组（术前至少 7 天规律口服达格列净 10 mg 每日 1 次）和对照组（术前至少 7 天未服用任何类型的 SGLT2 抑制剂），比较两组患者 PCI 术后严重 PMI 和 4aMI 事件的发生率，并通过门诊或电话随访，主要随访心血管不良事件（MACE），包括全因死亡、心血管死亡、心肌梗死和再次血运重建的发生情况，评估达格列净在预防择期 PCI 围术期心肌损伤 / 心肌梗死中的临床效果。

结果：分析显示，服用达格列净的研究组患者围术期严重 PMI 和 4aMI 的发生率显著低于对照组。PCI 术后估计肾小球滤过率的降低程度研究组也显著低于对照组，但两组间造影剂急性肾损伤事件的发生率未见显著差异（P > 0.05）。经平均 42.7 周随访，达格列净组显著降低 MACE 风险，且多支血管病变、大量使用造影剂和使用 DPP4i/GLP-1RA 亚组获益更显著。达格列净组显著减少因血运重建再入院风险，在多支血管病变及对比剂用量≥ 200 mL 亚组效果更突出。

结论：对于合并 2 型糖尿病的 CCS 拟择期 PCI 治疗的患者，术前至少 7 天规律服用达格列净 10 mg 每日 1 次并持续至术后长期，能够显著降低围术期心肌损伤和心肌梗死事件的发生风险，减少主要心血管不良事件（MACE）的发生，且安全性良好。其心脏保护作用可能与达格列净减轻炎症反应、改善氧化应激状态等机制有关。

冠心病介入诊疗术后病人血管并发症成因与护理干预

杨丽丽

陆军特色医学中心

目的：探究冠心病介入诊疗术后病人血管并发症发生原因以及护理对策，分析针对性护理模式在冠心病介入诊疗术患者中的应用价值。

方法：以本院收治的 80 例介入诊疗术患者作为研究对象，研究时间段为：2019 年 5 月 ~2020 年 5 月，将这 80 例冠心病患者以简单随机法分为：对照组、观察组，对照组给予常规护理，观察组实施针对性护理，对比 2 组患者临床疗效、并发症发生率。结果：观察组患者临床疗效明显高于对照组，患者并发症发生率低于对照组，差异性比较：P < 0.05，另外观察组患者并发症发生率小于对照组：P < 0.05。结论：对冠心病患者在介入的诊断治疗中展开针对性护理，能够明显提高患者治疗效果，并减少并发症的发生，对患者治疗具有积极意义。

结论：由上所述，对冠心病介入诊疗术患者实施针对性护理服务能够有效降对血肿部位进行按压，尽快对患者血肿处进行按压。指导患者进行 B 超检查，观察患者有无假性的动脉血管瘤发生，对直径较小患者无需处理， 对直径较大患者则使用超声压迫处理 ，护理人员需要深入了解血管并发症发生原因并进行分析，了解以后保证手术准备工作更加充分，并在患者术后及时采取针对性护理措施，积极降低患者并发症发生率，提升患者康复效果。

急性 ST 段抬高型心肌梗死 PCI 术后对比剂脑病一例

俊

马鞍山市人民医院

【摘要】对比剂脑病（contrast-induced encephalopathy，CIE）是血管内使用对比剂后发生的一种少见的神经系统并发症，因其临床表现缺乏特异性，易被忽视。近年来，随着不同学科介入诊疗技术的广泛开展，关于 CIE 的报道逐年增加，但关于急性 ST 段抬高型心肌梗死经皮冠状动脉介入治疗（percutaneous coronary intervention，PCI）术后出现 CIE 实为罕见。该文报告一例急性 ST 段抬高型心肌梗死 PCI 术后出现 CIE，并分析其临床表现、诊断及鉴别诊断依据及治疗方案，以期为临床诊治类似病例提供参考。

【摘要】对比剂脑病（contrast-induced encephalopathy，CIE）是血管内使用对比剂后发生的一种少见的神经系统并发症，因其临床表现缺乏特异性，易被忽视。近年来，随着不同学科介入诊疗技术的广泛开展，关于 CIE 的报道逐年增加，但关于急性 ST 段抬高型心肌梗死经皮冠状动脉介入治疗（percutaneous coronary intervention，PCI）术后出现 CIE 实为罕见。该文报告一例急性 ST 段抬高型心肌梗死 PCI 术后出现 CIE，并分析其临床表现、诊断及鉴别诊断依据及治疗方案，以期为临床诊治类似病例提供参考。

整合应激反应通过 ATF4-FKBP11 轴诱导活性氧促进主动脉夹层的机制研究

刘紫轩 [1,2] 蒋宏程 [1,2] 王洪杰 [1,2] 曾和松 [1,2]

1. 华中科技大学同济医学院附属同济医院

2. 血管介入治疗湖北省工程研究中心

目的：主动脉夹层（Aortic Dissection，AD）是一种致命的心血管疾病，目前缺乏特异性治疗药物靶点。本研究旨在探究整合应激反应（Integrated Stress Response，ISR）及其下游效应分子在 AD 进展过程中所发挥的作用。

方法：本研究建立了 β⃞ 氨基丙腈（BAPN）诱导的小鼠 AD 模型。采用 HE 染色，EVG 染色和免疫组织化学染色评估主动脉中膜的破坏情况以及收缩型血管平滑肌细胞（Vascular Smooth Muscle Cells，VSMCs）的缺失情况。为明确抑制整合应激反应的潜在治疗效果，对 BAPN 诱导的 AD 小鼠通过灌胃给予 ISR 抑制剂 GSK2656157。运用免疫荧光、蛋白质免疫印迹法以及 DHE 染色检测细胞质中活性氧（Reactive Oxygen Species，ROS）的积累。通过生物信息学筛选潜在的 ISR 下游靶点，并在体内外利用实时荧光定量聚合酶链反应（Quantitative Real-time PCR，qPCR）和免疫组织化学染色（Immunohistochemistry，IHC）进一步验证。采用双荧光素酶报告基因实验阐述经典 ISR 效应因子激活转录因子 4（Activating Transcription Factor-4，ATF4）对 FK506 结合蛋白 11（FK506-binding Protein 11，FKBP11）转录的转录调控作用。利用 FKBP11 全身性基因敲除鼠构建 AD 小鼠模型进行功能分析，阐明 FKBP11 对 AD 形成的促进作用。

结果：AD 主动脉组织中，蛋白激酶 R 样内质网激酶（PKR-like endoplasmic reticulum resident kinase，PERK）、通用控制非抑制性 2（General control nonderepressible 2，GCN2）、双链 RNA 激活的蛋白激酶（Interferon-induced double-stranded RNA-dependent eIF2αkinase，PKR）的信使核糖核酸（Messenger RNA，mRNA）和蛋白水平均显著升高。更重要的是，ISR 的主要效应因子 ATF4 在 AD 小鼠主动脉中的表达显著增加，且主要定位于血管平滑肌细胞。给予 ISR 抑制剂可显著降低 AD 的发病率和死亡率。生物信息学结合实验验证表明，FKBP11 是 ISR-ATF4 信号通路的关键下游靶点之一。从机制上讲，ATF4 作为转录因子与 FKBP11 的启动子区域结合，从而调节其转录。此外，FKBP11 基因敲除可改善 VSMCs 中活性氧的积累，抑制 VSMCs 凋亡并改善中膜破坏，最终缓解小鼠 AD 的进展。

结论：在 AD 主动脉的 VSMCs 中，ISR 相关信号通路显著激活。药物抑制 ISR 或基因敲除 FKBP11 可显著减轻 AD 进展，这为 AD 的治疗提供了潜在的应用方向。

预见性护理模式下责任制护理在 TAVI 患者围手术期护理中的应用效果

贺麟惠

陆军特色医学中心

目的：TAVI 手术为近年来国内开展的新技术，一种针对高龄、高风险患者的微创主动脉瓣替代方法，术后的护理与一般心外科术后护理有相近之处，目前施行 TAVI 的患者都为高危患者，合并多种疾病且其平均年龄大，功能极差，应激能力下降，术前难以准确评估全身器官功能，病情变化迅速难以逆转。预见性护理是优质护理的重要分支之一，其通过治疗前对患者个体情况全面综合分析，预判可能出现的异常情况，从而制定针对性的护理对策，防止大概率不良事件的生，提高护理质量。 方法：通过选取所在科室行 TAVI 治疗的患者作为研究对象，按入院时间分为对照组与观察组。对照组予以常规性护理，观察组在常规性护理基础上加预见性护理，对比两组护理效果。结果显示：较常规护理，实施预见性护理的患者在应激反应指标水平稳定控制、负性情绪改善及身心不良反应控制方面均有明显的优势。预见性护理的基础是术前对患者的病情、生理指标、心理状况等进行充分详细的了解，预判可能出现的身心不良反应，制定针对这些不良反应出现的护理干预措施，降低患者围手术期身心不良反应率。结论：预见性护理模式下责任制护理在 TAVI 患者围手术期护理能提升患者护理满意度、认知度、配合度，降低并发症发生率，改善患者不良情绪，值得临床推广应用。

共享决策在心脏介入术中的研究现状

林玲

重庆医科大学附属第一医院

目的：本文旨在综述共享决策（SDM）在心脏介入领域的研究现状与应用价值，分析其具体应用场景、实施策略以及当前实践中面临的挑战，从而推动 SDM 模式在心脏介入治疗中的有效应用。

方法： 通过系统梳理国内外相关文献与临床指南，对 SDM 在心脏介入术中的理论定义、核心价值进行阐述；重点归纳 SDM 在冠状动脉介入治疗、心律失常介入治疗以及结构性心脏病介入治疗等关键场景的应用情况；总结当前主要的 SDM 实施策略；分析 SDM 实践中存在的挑战。

结果： 研究表明，SDM 在心脏介入领域能够有效提高患者满意度、治疗依从性、风险认知与知识水平，减少决策冲突与后悔，并有助于优化临床结局和资源利用。多种策略被证实有效，如组建多学科心脏团队、应用 PtDA 以及探索 AI 辅助决策等。然而，SDM 实践面临来自医务人员、患者、实践过程三方面的挑战。

结论： 尽管 SDM 在优化心脏介入治疗决策、改善患者体验和结局方面具有明确价值，但其系统化实践仍处于探索阶段，尤其在面临文化适应、政策支持、教育培训、服务体系构建等多重挑战的中国情境下。未来亟需构建符合本土医疗生态的 SDM 实施框架，包括强化认知与能力建设、完善政策制度支持、开发文化适配性工具、推广多学科协作、建立动态评估体系，以系统性突破壁垒，最终实现以患者为中心的精准决策目标。

零造影剂冠状动脉介入术后急性肾损伤（ZICE-AKI）研究 ——随机对照试验研究设计

陈再燕 毛琦 解力 肖寒 马弋力 赵茂宇 崔斌 王珂 李佑美 王英民 邱友竹 夏屿欧 晋军 聂凌 赵晓辉

陆军军医大学第二附属医院新桥医院

目的

造影剂诱导的急性肾损伤（CI-AKI）一直是冠状动脉介入手术中备受关注的问题，但其与造影剂的直接关联性问题仍未得到充分证实。究其原因是因为既往临床试验都缺乏不使用造影剂的空白对照组，因此，无法获得造影剂导致急性肾损伤的直接循证医学证据。本研究拟通过随机对照试验的设计，旨在阐明中重度慢性肾脏病患者造影剂使用与否与冠状动脉介入术后急性肾损伤(AKI)之间的因果关系。

方法

零造影剂冠状动脉介入术（ZICE-AKI）试验是一项由研究者发起的多中心、平行组、前瞻性、随机对照、开放标签试验。该试验计划在陆军军医大学第二附属医院及国内多家三级甲等医院开展，拟招募 266 例受试者，分为试验组和对照组，每组各 133 例，各中心样本量通过竞争方式确定。研究将纳入基线估算肾小球滤过率（eGFR）处于 15 至 59 ml/min/1.73 m² 区间、且计划接受冠状动脉介入手术的患者。入组的患者，将依据 eGFR ，分为 45~59 ml/min/1.73 m² 和 15~44 ml/min/1.73 m² 两个层级。通过中央随机系统以 1:1 的比例，随机分配至造影剂组或零造影剂组。零造影剂组将运用血管内超声（IVUS）联合冠状动脉血流储备分数技术实施介入手术。本试验的主要研究终点为对比两组患者术后 AKI 的发生率差异，目前已在中国临床试验注册中心（www.chictr.org.cn）完成注册，注册号为 ChiCTR2500099095。

结果

在国内计划开展研究的多个中心中，目前已有 3 家通过医学伦理委员会审批，其中 1 家已启动受试者招募工作。首例受试者于 2025 年 5 月 7 日正式入组，截至 2025 年 7 月 12 日，研究累计入组 38 例，目前有 1 例受试者出现 AKI。

结论

ZICE-AKI 试验将为阐明造影剂与冠状动脉介入术后 AKI 之间的关系提供高质量证据。此项研究有望解决介入心脏病学领域的关键争议——造影剂究竟是独立引发肾损伤的“元凶”，还是作为 AKI 的高危因素之一。

Machine Learning-Based Prediction of Myocardial Ischemia/Reperfusion Injury in Acute Myocardial Infarction Patients Following Emergency Percutaneous Coronary Intervention

Abstract

Objective: To develop and validate a machine learning (ML)-based predictive model for the risk of myocardial ischemia/reperfusion injury (MIRI) in patients with acute myocardial infarction(AMI) following emergency percutaneous coronary intervention (PCI).

Methods: A retrospective cohort study was conducted, analyzing 396 AMI patients aged 40-65 years who received emergency PCI treatment at the Affiliated Hospital of North Sichuan Medical College between January 1, 2021, and February 28, 2023. Patients were randomly divided into training (70%; n=277) and validation sets (30%; n=119). Univariate and multivariate logistic regression analyses were used to identify independent predictors of MIRI post-PCI. Five ML models (Logistic Regression [LR], Naive Bayesian [NB], Decision Tree [DT], Multilayer Perceptron [MLP], and Support Vector Machine [SVM]) were constructed using these predictors. Model performance was evaluated using the area under the receiver operating characteristic curve (AUC), sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), precision, accuracy, recall, and F1 Score. Finally, the optimal model was selected, and a nomogram was established to visually represent its clinical effectiveness. Calibration curves and decision curve analysis (DCA) assessed model calibration and clinical practical value, while, the Shapley Additive Explanations (SHAP) interpreted the best-performing model.

Results: Among 396 patients, the incidence of MIRI was 25%. Six variables including left ventricular ejection fraction (LVEF), neutrophil-to-lymphocyte ratio (NLR), platelet-to-lymphocyte ratio (PLR), cardiac troponin T (cTnT), lactate, and Killip classification were identified as independent predictors of MIRI post-PCI. After 5-fold cross-validation, the AUC values for Logistic Regression (LR), Naive Bayesian (NB), Decision Tree (DT), Multilayer Perceptron (MLP), and Support Vector Machine (SVM) models in the training set were 0.845, 0.818, 0.832, 0.827, and 0.844, respectively. The LR model achieved the highest AUC value, indicating superior predictive performance, whereas the NB model had the lowest AUC value. In the validation set, the LR model maintained optimal performance (AUC=0.838,95%CI:0.7662–0.9102).The nomogram, which incorporated the six identified predictors. The calibration curves showed strong agreement between the predicted and observed outcomes in both the training and validation sets. DCA confirmed the LR model’s clinical utility. SHAP analysis revealed that NLR, lactate, PLR, Killip classification, and cTnT were significant positive contributors to MIRI risk, whereas LVEF was protective.

Conclusion: The LR-based model exhibited the best performance in predicting MIRI post-PCI risk. The developed nomogram provides an intuitive and effective tool for identifying high-risk populations, demonstrating high discriminative power and clinical applicability. This model offers specific predictive value for MIRI risk in AMI patients following emergency PCI.

Keywords: acute myocardial infarction; percutaneous coronary intervention; ischemia/reperfusion injury; machine learning; predictive model.

心肌梗死并心衰患者 PCI 术后院内死亡的机器学习预测模型的构建

吕华胜 芦颜美

新疆医科大学第一附属医院

目的：构建并验证一个基于机器学习的预测模型，用于评估心肌梗死 (MI) 合并心力衰竭 (HF) 患者在经皮冠状动脉介入治疗 (PCI) 后的院内死亡风险。

方法：回顾性分析 2019 年 1 月至 2023 年 1 月在新疆医科大学第一附属医院就诊并接受 PCI 治疗的 MI 合并 HF 患者。收集患者的人口学特征、生命体征、实验室检查、影像学参数以及药物治疗情况，按 7 ： 3 的比例分为训练集和验证集。利用极限梯度提升 (XGBoost) 模型筛选对院内死亡有显著影响的变量，并采用 Shapley 加法解释 (SHAP) 模型评估变量重要性，通过单因素和多因素 Logistic 回归分析构建预测模型。模型性能通过受试者工作特征 (ROC) 曲线、曲线下面积 (AUC)、校准曲线和决策曲线进行评估，最终生成诺莫图用于直观评估风险。

结果：共纳入 1214 例 MI 合并 HF 患者数据，中位年龄为 64 岁，其中院内死亡 90 例，病死率为 7.41%。经过 XGBoost 模型特征选择，最终筛选出 10 个显著变量，包括年龄、肌红蛋白、白蛋白、空腹血糖、N 末端 B 型利钠肽原 (NT-ProBNP)、合并糖尿病、肌酐、胱抑素 -C、降钙素原和射血分数。基于这 10 个变量进一步建立 Logistic 回归模型，最终得出 7 个关键指标：年龄、合并糖尿病、肌酐、空腹血糖、胱抑素 -C、NT-ProBNP 和白蛋白。模型在训练集和验证集的 AUC 分别为 0.869(95% CI:0.84~0.89) 和 0.827(95% CI:0.79~0.85)，显示出较高的预测准确性。校准曲线显示预测概率与实际观察结果一致，决策曲线分析表明在不同决策阈值下，模型均具有较高的净收益。

结论：所构建的基于机器学习和 Logistic 回归的预测模型能够有效评估 MI 合并 HF 患者在 PCI 术后的院内死亡风险，并提供了一种直观的个体化风险评估工具（诺莫图）。该模型可辅助临床早期识别高危患者，优化干预策略，以改善患者预后。

Physiological and Metabolic Predictors of Adverse Outcomes One Year After Coronary Intervention: A Two-Tiered Approach

2. Dyslipidemia Group, Cardiovascular Disease Branch, Chinese Medical Association

Abstract

Background:

Despite advances in percutaneous coronary intervention (PCI) and secondary prevention strategies, long-term adverse cardiovascular events remain prevalent in patients with coronary artery disease (CAD). Conventional risk models often emphasize anatomical or procedural features, overlooking the functional and metabolic substrates that contribute to disease progression. Quantitative flow ratio (QFR), a non-invasive angiography-derived physiological index, enables assessment of residual coronary ischemia without pressure wires or hyperemia. Meanwhile, the triglyceride-glucose (TyG) index serves as a validated surrogate marker for insulin resistance and atherogenic metabolic dysfunction. Although both markers have been individually associated with adverse cardiovascular outcomes, the clinical utility of integrating coronary physiological status and metabolic profile for long-term risk prediction post-PCI has not been systematically investigated.

This study aimed to evaluate the prognostic significance of three-vessel QFR (3V-QFR) and the TyG index in patients one year after PCI, and to establish a two-tiered risk stratification model that incorporates both residual ischemia and metabolic risk for predicting 4-year major adverse cardiac events (MACEs).

Methods:

We retrospectively enrolled 546 patients who underwent successful PCI at our center and received angiographic follow-up with QFR assessment

approximately one year later. 3V-QFR was calculated as the sum of QFR values in the left anterior descending, left circumflex, and right coronary arteries. The TyG index was computed using the formula: ln[fasting triglycerides (mg/dL) × fasting glucose (mg/dL)/2]. The primary endpoint was a composite of cardiovascular death, myocardial infarction, and ischemia-driven revascularization over a 4-year follow-up period.

Restricted cubic spline (RCS) analysis was employed to determine optimal thresholds for 3V-QFR and TyG. Patients were stratified into four subgroups based on these thresholds. Kaplan–Meier survival analysis and multivariable Cox regression were used to examine associations with outcomes.

Results:

RCS modeling identified a 3V-QFR cutoff of 2.44 and a TyG index cutoff of 8.75. A 3V-QFR <2.44, indicative of residual functional ischemia, was associated with significantly higher 4-year MACEs ($p < 0.001$). In patients with complete revascularization (3V-QFR ≥ 2.44), a TyG index ≥ 8.75 independently predicted increased MACEs (HR = 1.51; 95% CI: 1.04–2.05; $p = 0.022$), mainly driven by ischemia-driven revascularization. However, in patients with 3V-QFR <2.44, the TyG index did not significantly correlate with adverse events ($p > 0.05$), suggesting the predominance of ischemia-related mechanisms in this subgroup.

Subgroup analyses confirmed that the TyG index was only prognostic in the absence of residual ischemia, supporting the hypothesis that metabolic risk becomes clinically relevant once functional revascularization is achieved. Kaplan–Meier curves demonstrated clear separation of event-free survival across the four stratified groups, and calibration plots showed good concordance between predicted and observed event rates.

Conclusions:

Both residual coronary ischemia and metabolic dysfunction independently contribute to long-term cardiovascular risk after PCI. Importantly, the prognostic value of metabolic profiling using the TyG index is modulated by the underlying physiological status of the coronary vasculature. Based on these findings, we propose a novel two-level risk stratification model:

Level 1 – Physiological Assessment: Use 3V-QFR to determine physiological completeness of revascularization. A 3V-QFR <2.44 identifies patients with residual ischemia who may benefit from intensified surveillance or further revascularization.

Level 2 – Metabolic Profiling: In patients with 3V-QFR ≥ 2.44, assess the TyG index to identify high-risk metabolic phenotypes (TyG ≥ 8.75) that may warrant aggressive risk factor modification.

This physiological-metabolic framework may enhance post-PCI risk prediction and guide individualized long-term management strategies.

A Novel Integrated Score Combining Physiological and Metabolic Parameters for Predicting Long-Term Outcomes After Percutaneous Coronary Intervention: Development and Prospective Validation

Yuxiang Chen[1], Jiaxin Zhong[1], Beilei Li[1], Ruijin Hong[1], Hui Chen[1], Yuanming Yan[1], Lianglong Chen[1], Qin Chen[1,2], Yukun Luo[1]

1. Fujian Medical University Union Hospital

2. Dyslipidemia Group, Cardiovascular Disease Branch, Chinese Medical Association

Background:

Accurate risk stratification following percutaneous coronary intervention (PCI) remains a cornerstone of secondary prevention in cardiovascular care. Despite advances in revascularization techniques and pharmacological therapies, a substantial proportion of patients continue to experience major adverse cardiovascular and cerebrovascular events (MACCE) during long-term follow-up. Conventional risk models, predominantly based on anatomical or clinical parameters, often fail to capture the intricate interplay between coronary physiological impairment and systemic metabolic dysfunction—two distinct yet synergistic contributors to atherosclerotic disease progression.

The quantitative flow ratio (QFR), a non-invasive angiography-based surrogate for fractional flow reserve (FFR), allows for functional assessment of coronary lesions without the need for pressure wires or pharmacologic hyperemia. Summing QFR values from the three major epicardial arteries—referred to as three-vessel QFR (3V-QFR)—may offer a comprehensive metric of global coronary physiological burden, which has been increasingly associated with long-term cardiovascular risk. Concurrently, metabolic abnormalities such as insulin resistance, elevated triglycerides, and dyslipidemia have shown prognostic value independent of coronary anatomy. The triglyceride-glucose (TyG) index and the atherogenic index of plasma (AIP) are widely validated markers of metabolic dysfunction; their combination into a composite TyG-AIP index may more robustly reflect systemic vascular injury.

To date, no prognostic tool has simultaneously incorporated 3V-QFR and TyG-AIP into a unified risk stratification framework. This study aimed to develop and externally validate a novel risk score that integrates these physiological and metabolic markers to predict MACCE in patients undergoing PCI.

Methods:

A retrospective derivation cohort of 585 patients (1,755 vessels) who underwent PCI in 2017 was followed for 5 years. The primary endpoint was MACCE, defined as a composite of cardiac death, non-fatal myocardial infarction, ischemia-driven revascularization, and stroke. Physiological status was assessed by 3V-QFR, calculated as the sum of QFR values from the three main coronary arteries. Metabolic status was quantified using the TyG-AIP index, calculated as the product of the TyG index [ln(-fasting triglycerides × glucose / 2)] and the AIP [$\log_{10}$ (TG/HDL-C)].

Cutoff values for 3V-QFR and TyG-AIP were identified using ROC analysis and restricted cubic spline (RCS) modeling. Independent predictors of MACCE were determined by multivariable Cox regression, and a weighted risk score was constructed using the scaled regression coefficients. Optimal stratification thresholds for the composite risk score were determined using RCS modeling and the "surv_cutpoint" function from the R package "survminer", selecting cutpoints that maximally distinguished survival curves. Model performance was assessed using time-dependent ROC curves, Harrell's C-index, calibration plots, and Kaplan–Meier analysis.

External validation was performed in a prospective cohort of 1,573 patients (4,719 vessels) who underwent PCI between January 2021 and September 2022, with a 2-year follow-up. The same analytical approach was applied.

Results:

Cutoff values of <2.74, TyG-AIP ≥ 1.5, and diabetes as independent predictors. A risk score equation was derived based on the scaled beta coefficients: RISK_SCORE = 0.46 × (3V-QFR

Patients were stratified into low- (≤ 0.30), intermediate- (0.30–0.54), and high-risk (>0.54) groups. The model showed good discriminatory ability in the derivation cohort (AUC = 0.714; C-index = 0.692), with time-dependent AUCs of 0.737, 0.694, and 0.708 at 12, 24, and 36 months, respectively. MACCE incidence increased significantly across risk categories (p

In the validation cohort, which had an overall MACCE rate of 12.08%, the model retained robust performance (AUC = 0.691; C-index = 0.666). Compared to the low-risk group, the intermediate- and high-risk groups exhibited significantly higher MACCE risk, with hazard ratios of 2.08 (95% CI: 1.42–3.04) and 3.22 (95% CI: 2.29–4.53), respectively (p

Based on Kaplan–Meier curves, hazard ratios, and current clinical guidelines, the following risk-based management strategies are proposed:

Low-risk (RISK_SCORE ≤ 0.30): No risk factors or only one low-impact factor (diabetes or TyG-AIP ≥ 1.5)

 Recommended management: Annual follow-up + Standard secondary prevention

Intermediate-risk (RISK_SCORE 0.30–0.54): Isolated 3V-QFR

 Recommended management: Follow-up every 6 months + Intensified lipid/glucose monitoring

High-risk (RISK_SCORE >0.54): Presence of 3V-QFR

 Recommended management: Follow-up every 3 months + PCSK9 inhibitors + GLP-1 analogues + Coronary reassessment.

Conclusions:

This study developed and externally validated an integrated risk score incorporating physiological and metabolic parameters for long-term outcome prediction after PCI. The model not only identifies patients at elevated risk but also offers tailored follow-up and treatment strategies based on individual risk profiles. This two-dimensional framework may enhance precision medicine and improve post-PCI management.

集冠状动脉功能学与代谢学指标为一体的新型综合评分用于预测经皮冠状动脉介入术后长期预后：模型建立与前瞻性验证研究

陈于祥 钟嘉鑫 李蓓蕾 洪瑞进 陈卉 颜远铭 陈良龙 陈琴 罗育坤

福建医科大学附属协和医院

目的：

经皮冠状动脉介入治疗（PCI）后如何准确评估患者的长期心血管风险，是心血管疾病二级预防的关键。目前仍有相当比例患者在远期随访中发生主要不良心脑血管事件（MACCE）。现有风险模型多以解剖或临床参数为基础，未能同时整

合冠脉功能状态与代谢异常这两个相互独立但协同作用的病理机制。

定量血流分数（QFR）是一种基于冠脉造影的无创生理指标，可评估冠脉病变的功能严重性。将三条主要冠状动脉的 QFR 值相加，形成三支血管 QFR（3V-QFR），可反映全冠脉的功能负担，具有较高的预后预测价值。另一方面，甘油三酯 - 葡萄糖指数（TyG）及其与动脉粥样硬化指数（AIP）的组合 TyG-AIP 指数，是代谢紊乱和胰岛素抵抗的重要标志，与心血管事件密切相关。

本研究旨在建立并前瞻性验证一个整合 3V-QFR 和 TyG-AIP 的风险评分模型，用于预测 PCI 术后长期 MACCE 风险，并提出基于风险评分的个体化随访与干预建议。

方法：

研究回顾性纳入 2017 年接受 PCI 的 585 例患者随访 5 年。主要终点为 MACCE，包括心源性死亡、非致死性心肌梗死、缺血驱动的血运重建及卒中。TyG-AIP 指数为 TyG 指数与 AIP 的乘积。

使用 ROC 曲线与限制性立方样条（RCS）确定 3V-QFR 与 TyG-AIP 的最佳截断值。通过多因素 Cox 回归识别 MACCE 的独立预测因子，并依据回归系数构建加权风险评分方程。风险分层通过 R 语言 survminer 包的 surv_cutpoint 函数与 RCS 分析确定最佳阈值。模型性能评估包括时间依赖性受试者工作曲线（ROC）曲线、Harrell's C-index、校准图及 Kaplan–Meier 分析。随后在一项 2021 至 2022 年间的前瞻性验证队列（1573 例患者）中开展 2 年随访以进行外部验证。

结果：

根据 RCS 及多因素 Cox 分析显示：3V-QFR <2.74、TyG-AIP ≥ 1.5 及糖尿病为 MACCE 的独立危险因素。据此构建风险评分方程为：

RISK_SCORE = 0.46 ×（3V-QFR <2.74）+ 0.30 ×（糖尿病）+ 0.24 ×（TyG-AIP ≥ 1.5）

患者按评分值分为低危、中危及高危三组。该模型在建模队列中表现良好（AUC = 0.714; C-index = 0.692），12、24、36 个月时的时间依赖性 AUC 分别为 0.737、0.694 与 0.708，MACCE 发生率随风险等级显著递增（p <0.001）。

验证队列中 MACCE 发生率为 12.08%，模型保持稳健性能（AUC = 0.691; C-index = 0.666）。与低危组相比，中危与高危组的 MACCE 风险分别显著升高。校准图显示模型预测与实际发生率高度一致。

根据上述研究成果及当前指南建议，提出如下分层管理策略：

低危：无危险因素或仅存在糖尿病 /TyG-AIP ≥ 1.5 之一

建议：每年随访 + 标准二级预防

中危：仅存在 3V-QFR <2.74 或同时合并糖尿病与 TyG-AIP ≥ 1.5

建议：每 6 个月随访 + 强化血脂与血糖监测

高危：存在 3V-QFR <2.74，且合并糖尿病或 TyG-AIP ≥ 1.5 中至少一项

建议：每 3 个月随访 + 联合使用 PCSK9 抑制剂、GLP-1 受体激动剂 + 冠脉再评估

结论：

本研究建立并前瞻性验证了一个融合冠脉功能与代谢状态的新型风险评分系统，能够有效预测 PCI 术后患者的长期 MACCE 风险。该模型结构简明、预测能力稳定，可辅助个体化随访和治疗策略优化，为实现精准心血管预防提供有力工具。

三尖瓣介入治疗策略：麻醉管理的临床实践视角

林栓同

上海上实东滩疗养院

三尖瓣反流（tricuspid regurgitation, TR），是右心衰竭进展的关键因素，其病因可分为原发性、继发性及心脏植入设备相关性反流。传统外科手术虽为根治手段，但因患者常合并右心室功能储备受损、肺动脉高压及多器官功能障碍，导致高龄与高风险人群手术禁忌率显著升高。经导管三尖瓣置换术（transcatheter tricuspid valve replacement, TTVR）与经导管三尖瓣修复术（transcatheter tricuspid valve repair, TTVr）等经导管三尖瓣介入治疗（transcatheter tricuspid valve intervention, TTVI）技术作为治疗三尖瓣疾病的重要手段，通过微创路径实现解剖矫正，已成为外科禁忌患者的有效替代策略。此类手术麻醉医师需直面三大核心挑战：右心系统对前负荷的敏感性、循环崩溃高风险（尤其功能性 TR 合并右心室失代偿）以及术中经食管超声心动图（transesophageal echocardiography，TEE）与血流动力学监测的精准整合，需深度掌握 TR 的病理分期、器械植入的影像引导要点及循环崩溃的预判指标。提高麻醉医师对三尖瓣疾病的认识，对右心功能的理解以及对 TTVI 的流程的管理能力，对于改善患者预后具有重要价值。本文拟从术前量化评估、麻醉技术选择、术中危机处理、术后监护重点以及未来发展方向等方面系统阐述 TTVI 围术期管理的标准化路径，旨在建立以右心保护为核心的围术期管理范式，最终降低心血管相关并发症发生率及全因死亡率。

Investigation of the safety and effectiveness of a novel steerable guiding catheter in coronary intervention

Feng Gao, Tang-Gang Gao

Zhongshan Hospital of Xiamen University

Objective: Percutaneous coronary intervention (PCI) is an effective therapy to improve coronary artery stenosis. However, in complex coronary artery lesions, guiding catheters may be difficult in coronary cannulations or be replaced frequently. This study aims to evaluate the effectiveness and safety of a novel steerable guiding catheter in PCI.

Methods: This was a single center, retrospective, single arm study. Patients who underwent PCI using a novel steerable guiding catheter in the Department of Cardiology, Xiamen University's Zhongshan Hospital from January 2021 to December 2023 were included. The novel steerable guiding catheter comprises a sheath tip, a handle with an adjustable knob, a tube body, and a soft catheter tip. By rotating the knob on the handle, the curvature of the catheter tip can be modified, enabling rapidly alignment with either the left or right coronary artery ostium. The steps for cannulating the left coronary artery: The steerable guiding catheter reach the aortic root along the angiographic guidewire. The catheter can be carefully curved clockwise or counterclockwise using the knob of the handle, based on the morphology of the aortic sinus. By adjusting the catheter, it can be directed toward the left coronary sinus. After positioning, fine-tuning its height and rotating it left or right ensures optimal engagement. During right coronary artery interventions, the ostium of the right coronary artery is typically positioned lower than that of the left. When the catheter tip is slightly below the left coronary ostium, it should be carefully curved clockwise or counterclockwise using the knob of the handle. This adjustment orients the catheter toward the right sinus, shaping it similarly to a JR/MPA catheter. Once positioned, fine adjustments—such as pushing, pulling, and rotating—help achieve stable engagement, allowing for successful completion of most right coronary interventions. The patients' clinical and operational information were collected. The efficacy endpoints were catheterization success rate. The safety endpoints included the incidence of coronary artery no-reflow, dissection, catheter-related vascular embolism, coronary artery perforation, and severe arrhythmias.

Results: A total of 104 patients who consented to undergo PCI using a novel steerable guiding catheter were included. The radial artery was used as the access site in 99 patients (95.2%), while the femoral artery was used in 5 patients (4.8%). Coronary angiography revealed isolated left coronary artery lesions in 40.4% of cases, isolated right coronary artery lesions in 20.2%, and combined left and right coronary artery lesions in 39.4%. The catheterization success rate was 98.1%. In the two failed cases, intraoperative conversion to a different guiding catheter was required. Both involved chronic total occlusion (CTO) of the left anterior descending (LAD) artery. In one case, even after switching to an Amplatz Left (AL) guiding catheter, the guidewire was unable to cross the lesion. The steerable guiding catheter was used for simultaneous intervention in two vessels in 39.4% of cases and in three or more vessels in 12.5%. Among 21(10.3%) patients with severe coronary calcification, 6(5.8%) underwent rotational atherectomy and 15 were treated with a cutting balloon. 14(6.9%) patients had chronic total occlusion (CTO) lesions, one of whom received cutting balloon therapy. The operation time for severe calcification lesions, chronic total occlusion (CTO), and simple lesions were 112.57±27.31min, 125.50 ± 31.45min and 99.42±58.03min, respectively. The radiation doses were 732.75(438.50, 1038.75) mgy, 900(617.75,1850.00) mgy and 550.00(325.00,1194.25) mgy, respectively. The contrast volume was 191.25 (180.63, 197.25) ml, 280.00 (250.00, 280.00) ml, and 145.00 (111.25, 148.75) ml, respectively. One case of coronary no-reflow and one case of coronary artery dissection were reported. No other catheter-related adverse events—such as vascular embolism, coronary perforation, or significant arrhythmias—occurred during the procedure or hospitalization.

Conclusion: The steerable guiding catheter demonstrates good efficacy and safety in the treatment of CTO lesions, severe calcified lesions, and simple lesions in both the left and right coronary arteries.

降钙素基因相关肽调节平滑肌细胞表型改变对动脉损伤后新生内膜增生的作用

赵然尊

遵义医科大学附属医院

目的：通过降钙素基因相关肽 (CGRP) 干预体外培养的血管平滑肌细胞 (VSMC) 和体内颈动脉损伤大鼠模型，探讨其对 VSMC 表型改变和动脉损伤后新生内膜增殖的影响。

方法：取大鼠胸主动脉，以组织块贴壁培养法获得 VSMC，给予血小板源生长因子 (PDGF，终浓度为 2.0×10-8 mol/L) 和 (或)CGRP(终浓度为 3.5×10-7 mol/L) 处理，利用 Western blot 法检测细胞表型改变，噻唑蓝法和流式细胞仪检测细胞增殖，细胞划痕实验检测细胞迁移能力；同时建立颈动脉损伤大鼠模型，并分为对照组和 CGRP 组，通过 HE 染色观察新生内膜形成情况，Western blot 法检测损伤动脉中 VSMC 表型改变和信号转导通路细胞外信号调节激酶 (ERK) 激活情况。

结果：PDGF 明显诱导体外培养的 VSMC 表型改变；而 CGRP 处理则显著抑制 PDGF 诱导的细胞表型转换，降低细胞增殖 [48h：CGRP 组 (0.20±0.03)×105 比 PDGF 组 (0.67±0.08)×105，P<0.05；72h：CGRP 组 (0.17±0.04)×105 比 PDGF 组 (1.42±0.11)×105 比对照组 (0.45±0.05)×105，P<0.05] 和迁移能力 [24h：CGRP 组 (2.12±0.21)% 比 PDGF 组 (5.04±0.52)% 比对照组 (4.87±0.44)%，P<0.05；48h：CGRP 组 (2.84±0.43)% 比 PDGF 组 (5.78±0.74)% 比对照组 (5.50±0.37)%，P<0.05]；CGRP 降低新生内膜形成，伴随着损伤动脉中 VSMC

合成表型标志蛋白骨桥蛋白表达减少，并抑制细胞外信号激活途径 ERK 的激活。

结论：CGRP 可能通过抑制 ERK1/2 信号途径激活而调节 VSMC 表型，抑制细胞增殖和迁移，从而降低动脉损伤后新生内膜形成。

骨髓间充质干细胞源外泌体对大鼠颈动脉球囊损伤后 lncRNAs 表达的影响

石蓓

遵义医科大学附属医院

目的：探讨骨髓间充质干细胞（bone marrow mesenchymal stem cells，BMSCs）源外泌体（exosomes）对大鼠颈动脉球囊损伤后内膜增生的调控作用及其长链非编码 RNA（long non-coding RNAs，lncRNAs）表达的影响。

方法：采用差速超速离心法提取大鼠 BMSCs 源外泌体，并通过 Western blot 和透射电镜对其进行鉴定。SD 大鼠分为 3 组：（1）假手术组（只分离左颈总动脉血管）；；（2）损伤组（左颈总动脉采用球囊损伤）；（3）外泌体组（建立大鼠颈动脉球囊损伤模型后原位注射 0.25μg/μL 外泌体 400μL），14 d 后采用 HE 染色观测颈动脉内膜 / 中膜面积比（intima/media，I/M）、免疫组化检测 PCNA 表达、Western blot 检测血管内膜增殖及表型转化相关指标的变化。采用 lncRNA-mRNA 共表达谱芯片表达变化及其生物信息学分析筛查假手术组和损伤组大鼠颈动脉组织中差异表达的 lncRNAs 和 mRNAs，对其潜在分子机制进行探讨。采用 qRT-PCR 检测各组颈动脉组织中候选 lncRNAs 的表达。

结果：电镜结果显示 BMSCs 源外泌体呈现 " 茶杯垫样 " 改变，Western blot 结果显示所提取的外泌体中 CD63、Alix、HSP70 蛋白表达阳性。与损伤组相比，经 BMSCs 源外泌体处理后大鼠颈动脉 I/M 显著减少（P<0.05），增殖相关蛋白 PCNA、Cyclin D1 表达下调（P<0.05）。lncRNA-mRNA 共表达谱芯片检测结果，与假手术组相比，损伤组有 1 083 个 lncRNAs 表达上调，629 个 lncRNAs 表达下调，2 004 个 mRNAs 表达上调，2 487 个 mRNAs 表达下调（Fold Change>2.0，P<0.05）。GO 和 KEGG 通路分析结果显示，多条 lncRNAs 与 mRNAs 相互关联，通过调控相应的靶 mRNAs，参与血管平滑肌收缩、肌动蛋白细胞骨架调节和细胞周期等多种生物学过程，与球囊损伤后血管再狭窄的机制有关。结合生物信息学分析，采用 qRT-PCR 检测 3 组大鼠颈动脉组织中上述差异性表达最为显著的 7 个 lncRNAs，结果表明，与损伤组相比，外泌体组 XR593268 上调（P<0.05），XR602080、XR602012、XR591017 均下调（P<0.05）。

结论： BMSCs 源外泌体抑制大鼠颈动脉球囊损伤后内膜增生，其潜在机制可能与 XR602080、XR591017 通过 Gsk3b、Cdkn2b、Ccna2 等分子调控平滑肌细胞周期变化有关。

缺氧预处理外周间充质干细胞对兔血管成形术后再狭窄的影响

赵然尊

遵义医科大学附属医院

目的：探讨经骨髓动员后外周血分离的间充质干细胞 (MSCs) 移植对动脉粥样硬化模型兔颈动脉球囊成形术后再狭窄的防治作用及可能机制。

方法：粒细胞集落刺激因子 (G-CSF) 动员、外周血分离体外扩增获得 MSCs，增强型绿色荧光蛋白 (EGFP) 报告基因标记备用。建立兔动脉粥样硬化狭窄模型，随机分为缺氧预处理 MSCs 移植组 (HP)、非缺氧预处理 MSCs 移植组 (NHP) 及对照组 (C)，再于球囊成形术后立即耳缘静脉内分别注入标记的缺氧处理、非处理 MSCs 或培养液。术后 7 d、14 d、28 d 采集外周血用 ELISA 法检测血管内皮生长因子 (VEGF) 水平；术后 28 d 处死动物留取血管标本通过 Weigert 弹力纤维染色及免疫组化染色进行形态学分析、归巢 MSCs 分析、再内皮化程度分析。

结果：HP 组、NHP 组术后各时点 VEGF 水平均显著高于 C 组 (P<0.01)；术后 7d、14 d HP 组显著高于 NHP 组 (P<0.05)，28 d 则差异无显著。术后 7 d 血管组织中仅 HP 组、NHP 组血管组织中有 EGFP(+) 细胞分布；术后 28 d HP 组内膜增殖程度、再狭窄率明显低于 NHP 组 (P<0.05)，而该 2 组均显著低于 C 组 (P<0.01)；再内皮化程度 HP 组明显优于 NHP 组 (P<0.05)、同时该 2 组又均显著优于 C 组 (P<0.01)。

结论：MSCs 移植能够抑制模型兔颈动脉球囊成形术后内膜增生、促进损伤血管快速内皮化从而降低再狭窄率，移植经缺氧预处理的 MSCs 可增强上述作用，可能与缺氧应激诱导 MSCs 分泌细胞因子功能增强有关。

经食管超声心动图引导下经皮房间隔缺损封堵术中导丝成袢技术的安全性和有效性研究

华慧品 [1] 苗芃 [1] 张洵 [1] 徐书灿 [2] 邵峻 [1]

1. 南京医科大学第二附属医院

2. 滨海县人民医院

目的：探讨导丝成袢法在单纯食道超声心动图引导下经皮房间隔缺损封堵术的安全性和有效性。

方法：回顾性分析 2022 年 9 月至 2024 年 12 月在南京医科大学第二附属医院心血管外科行食道超声引导下经皮房间隔缺损封堵术的患者的临床资料。根据术中 Amplatze 导丝头端定位方式，将患者分为研究组（导丝成袢组，即导丝头端左心房盘绕成环）和对照组（导丝头端进入左上肺静脉），共纳入 137 例继发孔型房间隔缺损患者，男性 55 例，女性 82 例，年龄范围为 2 至 71 岁。其中，研究组包含 78 例患者，对照组 59 例患者。比较两组患者的手术成功率、手术时间、新发心律失常、心包积液、术后封堵伞位置及形态、残余分流、穿刺点血肿、外周血管损伤等临床指标。

结果：两组患者的性别、年龄、房间隔缺损直径、手术时间、随访时间无统计学意义（P > 0.05）。137 例患者均成功完成手术，手术成功率 100%。其中研究组有 4 例术后新发心房心律失常，其中心房早搏 2 例，右束支不完全性阻滞 2 例。对照组 1 例患者因导丝进入左上肺静脉困难，采用研究组的导丝成袢技术，完成手术；1 例新发心包积液，观察 1 周后减少，随访 3 个月完全消失；1 例穿刺部位血肿，加压包扎后改善；术后新发心房心律失常 3 例，均诊断为不完全性右束支传导阻滞。两组患者完成 3~15 个月随访，未发生封堵器脱落或移位，外周血管损伤等并发症，房间隔水平无残余分流，各瓣膜及腔静脉回声无受阻改变。

结论：导丝成袢法经食道超声导引下经皮房间隔缺损修补手术是一种既安全又可行的术式，且能降低手术学习曲线，降低手术难度。

Non-target lesion Progression：Unveiling critical Predictors and outcomes in Patients with in-stent restenosis

bei Shi

Affiliated Hospital of Zunyi Medical University

Percutaneous coronary intervention (PCI) has transformed the treatment paradigm for coronary artery disease (CAD), efficiently relieving symptoms and enhancing patient outcomes by re-establishing blood flow in stenosed or occluded target vessels. Nevertheless, the long-term efficacy of PCI is significantly constrained by complications, with in-stent restenosis (ISR) being a prominent challenge that frequently necessitates repeat interventions. Beyond the treated vessel, the progression of non-target vessel plaques has emerged as a pivotal factor determining adverse cardiovascular events. These plaques can undergo destabilization over time, potentially leading to severe consequences such as myocardial infarction, heart failure, or even death. Despite its clinical significance, the impact of non-target lesion progression (N-TLP) on the prognosis of patients who undergo PCI for ISR—especially those with multivessel disease—remains under-investigated. This knowledge gap hinders accurate risk stratification and optimal therapeutic decision-making.

This study sought to elucidate the predictive factors of N-TLP and explore its association with clinical outcomes, including non-culprit vessel-related major adverse cardiovascular events (NCV-MACE) and pan-vascular disease-related clinical events (PVD-CE), in patients with ISR and multivessel disease. A total of 195 patients who successfully underwent PCI with drug-eluting stent (DES) implantation for ISR were enrolled. Intraoperative optical coherence tomography (OCT) was employed to meticulously assess the baseline morphological characteristics of the culprit stent. Subsequently, all patients underwent serial coronary angiography to monitor plaque progression, enabling classification into the N-TLP group (patients with significant progression in non-target vessels) and the no-N-TLP group.

The analytical approach centered on identifying baseline factors associated with N-TLP and evaluating its impact on long-term prognosis. Multivariate logistic regression analysis identified four independent predictors of N-TLP: diabetes mellitus (odds ratio [OR] 3.616, 95% confidence interval [CI]: 1.735–7.537; P = 0.001), elevated uric acid levels (OR 1.005, 95% CI: 1.001–1.009; P = 0.006), in-stent neoatherosclerosis (ISNA) (OR 1.334, 95% CI: 1.114–1.985; P = 0.047), and heterogeneous neointima morphology (OR 2.48, 95% CI: 1.18–5.43; P = 0.019). These findings collectively underscore the critical roles of metabolic dysregulation (manifested as diabetes and hyperuricemia) and local vascular pathology (characterized by ISNA and neointimal heterogeneity) in promoting non-target plaque progression.

From a clinical perspective, N-TLP was strongly correlated with suboptimal outcomes. Patients with N-TLP demonstrated a significantly higher incidence of NCV-MACE (19.4% vs. 6.9%, P = 0.009) compared to those without N-TLP, indicating that non-target vessel progression directly contributes to ischemic events in previously untreated coronary arteries. Moreover, PVD-CE, which encompasses systemic vascular complications such as stroke, peripheral artery disease, or aortic aneurysm, was more prevalent in the N-TLP group (83.9% [95% CI: 79.7%–88.3%] vs. 93.1% [95% CI: 88.4%–98.0%], P = 0.038), highlighting the systemic nature of vascular disease progression in this patient cohort.

These results underscore that N-TLP is not a passive phenomenon but an active contributor to adverse outcomes in ISR patients following PCI. The identification of diabetes, uric acid levels, ISNA, and heterogeneous neointima as predictive factors facilitates more accurate risk stratification, empowering clinicians to implement targeted interventions—such as stringent metabolic control and intensified anti-plaque therapies—for high-risk individuals. By addressing N-TLP, it may be possible to reduce the incidence of NCV-MACE and PVD-CE, ultimately improving the long-term prognosis of this vulnerable patient population. Future research is essential to validate these predictors and develop targeted strategies to impede N-TLP progression.

高龄高危急性非 ST 段抬高型心肌梗死患者不同治疗策略的比较研究

张亮 关韶峰 史凯雷 孔令冉 章亚萍 曲新凯

复旦大学附属华东医院

目的： 本研究旨在比较急诊介入、延迟介入及保守治疗三种策略在≥ 75 岁高危 NSTEMI 患者中的临床效果与安全性。方法： 连续纳入 2018 年 1 月至 2023 年 12 月本院收治的 263 例年龄≥ 75 岁 Grace 评分 > 140 分的 NSTEMI 患者，根据治疗策略分为三组：急诊介入组 (n=89)：入院 24 小时内完成冠状动脉造影和

介入治疗（PCI），延迟介入组 (n=94)：入院 24 小时至一周内完成冠状动脉造影及干预。保守治疗组 (n=80)：以指南指导的优化药物治疗（OMT）为主的干预。主要终点为 6 个月内主要不良心血管事件（MACE），包括：全因死亡、再发心肌梗死、因心力衰竭再入院。次要终点包括：30 天全因死亡率、大出血事件（BARC ≥ 3 级）、住院时长、6 个月内因心绞痛再住院率。结果：主要终点三组发生率存在显著差异（P<0.001），与保守治疗组相比，急诊介入组显著降低 MACE 风险（调整后风险比 [aHR]=0.39, 95%CI：0.23-0.65），延迟介入组亦降低风险（aHR=0.55, 95%CI：0.33-0.91）。急诊介入组 vs 延迟介入组： 急诊介入有进一步降低 MACE 的趋势，尤其在降低再发心绞痛再入院（7.9% vs 13.8%，P=0.041）方面优势显著。次要终点：30 天全因死亡率： 急诊介入组 vs 保守治疗组 (3.4%vs 11.3%, P=0.018），大出血（BARC ≥ 3 级）： 三组间无显著差异（急诊：6.7%， 延迟：7.4%， 保守：5.0%, P=0.622）， 保守治疗组 6 个月因心绞痛再住院率（26.3%）显著高于急诊介入组（8.9%）和延迟介入组（15.9%，P=0.002），急诊介入组中位住院时间最短（6.8 天），延迟介入组次之（8.2 天），保守治疗组最长（9.6 天，P<0.001）。结论：早期侵入性干预（尤其 24 小时内急诊介入）相较于延迟介入或保守治疗，可显著降低 6 个月 MACE 风险（包括死亡、再梗死）、30 天死亡率和因心绞痛再入院率，并缩短住院时间。延迟介入策略虽优于纯保守治疗，但未达到急诊介入的优化效果。急诊介入大出血风险并未显著增加，因此，对于具备手术条件的高龄高危 NSTEMI 患者优先推荐入院 24 小时内完成的急诊介入策略。

冠脉内靶向注射替奈普酶对急性 ST 段抬高型心肌梗死患者微循环及心脏预后的影响

范海

马鞍山市人民医院

目的：探讨在急性 ST 段抬高型心肌梗死（ST-elevation myocardial infarction，STTMI）患者中，冠脉内靶向注射替奈普酶（Tenecteplase，TNK）联合急诊经皮冠状动脉介入治疗术（percutaneous coronary intervention,PCI）对患者冠脉微循环及心脏预后的影响。**方法：**本研究纳入 2023 年 11 月至 2024 年 11 月在马鞍山市人民医院心内科住院的 STEMI 并行急诊 PCI 的患者 60 例，随机分为对照组 30 例（单纯急诊 PCI）及治疗组 30 例（冠脉内注射 TNK 联合急诊 PCI）。通过观察比较两组患者的定量血流分数（Quantitative Flow Ratio，QFR）、支架术后 TIMI 血流分级、TIMI 帧数、TIMI 心肌灌注（TIMI myocardial perfusion，TMP）分级、ST 段两小时回落比例等指标评估患者冠脉微循环情况，肌酸激酶同工酶达峰时间、肌钙蛋白及肌酸激酶同工酶峰值等间接评估冠脉微循环情况，比较两组患者 BNP、LVEDD、LVEF 等指标进而评估患者心功能情况。两组患者均随访 6 个月，观察两组患者主要心血管不良事件发生比例（包括心肌梗死再住院、心衰再住院、恶性心律失常、出血及心源性猝死等）。**结果：**1、在改善冠脉微循环方面：术后立即测两组患者 QFR，治疗组 QFR 明显高于对照组，差异具有统计学意义（P < 0.005）；TIMI 帧数则是治疗组显著低于对照组，差异具有统计学意义（P < 0.001）；TMP 分级在术前两组患者差异无统计学意义（P > 0.005），均为 TMP0-2 级，无 TMP3 级，但在术后 TMP3 级比例治疗组明显高于对照组，差异具有统计学意义（P < 0.005）；肌酸激酶同工酶峰值治疗组明显低于对照组，差异具有统计学意义（P < 0.005）；最后对两组患者的两小时 ST 段回落率进行比较，其回落率≥ 70% 的人数分别为治疗组 25 例（83.3%），对照组 18 例（60%），提示治疗组 ST 段回落情况明显优于对照组，差异具有统计学意义（P < 0.005）。以上数据表明冠脉内注射 TNK 联合急诊 PCI 组的微循环改善情况明显优于单纯急诊 PCI 组。2、在改善心功能方面：术后 24 小时的心脏彩超两组 LVEF 差异无统计学意义，但在出院后 6 个月门诊复查中治疗组明显高于对照组，差异具有统计学意义（P < 0.005）。2 组患者的 TIMI 血流分级、肌酸激酶同工酶达峰时间、肌钙蛋白、BNP、LVEDD，差异无统计学意义（均 P > 0.05）。3、6 月后主要心血管不良事件方面：单纯急诊 PCI 组发生率明显高于冠脉内注射 TNK 联合急诊 PCI 组，差异具有统计学意义（均 P > 0.05）。在其安全性的评估方面，两组均未发生危及生命的大出血，且小出血事件的发生率为治疗组（6 例，20%）对照组（3 例 ,10%），差异不具有统计学意义（P > 0.05）。这表明在改善微循环及心脏预后方面治疗组具有更加明显的优势，且其出血事件较对照组未见明显增多。

结论：冠脉内靶向注射 TNK 联合急诊 PCI 可以明显改善 STEMI 患者微循环情况及心脏预后。

心理护理干预对冠心病患者焦虑抑郁情绪及治疗依从性的影响

张宁

中国人民解放军北部战区总医院

目的： 探讨心理护理干预对冠心病患者焦虑抑郁情绪改善及治疗依从性的影响，特别是对 PCI 术后患者治疗依从性的提升作用。

冠心病（CHD）作为一种严重威胁人类健康的心身疾病，不仅带来生理上的痛苦，更常伴随显著的焦虑、抑郁等负性情绪。尤其对于经历经皮冠状动脉介入治疗（PCI）的患者，手术本身、对预后的担忧、生活方式的巨变以及对长期药物治疗的依赖，极易诱发或加重其心理负担。这些不良情绪不仅直接降低患者的生活质量，更成为阻碍其坚持规范治疗（治疗依从性）的关键因素。因此，探讨心理护理干预在此类患者中的应用及其效果显得尤为重要。

本研究旨在探讨的心理护理干预流程，核心在于“身心同治”，主要涵盖以下环节：

健康教育赋能： 运用通俗易懂的语言，系统讲解冠心病知识、PCI 手术原理、术后康复要点、药物作用及必要性、生活方式调整（戒烟限酒、合理饮食、规律运动）的重要性，旨在消除恐惧，建立正确认知基础。

认知行为干预（CBT）应用： 引导患者识别并修正对疾病、手术及预后的灾难化或悲观认知（如“手术无效”、“药物危害大”），协助其建立积极、现实的疾病观和康复信念。

情绪疏导与支持： 营造安全信任的环境，鼓励患者表达内心恐惧、担忧与挫折。通过倾听、共情、支持性心理技术提供情感支持，减轻孤独无助感，并教授放松技巧（如深呼吸、渐进性肌肉放松）缓解急性焦虑。

社会支持系统构建： 积极引导家属参与，指导其提供有效情感支持与行为监督（如服药提醒、复诊陪伴、共建健康生活）。必要时链接社区或病友团体资源，扩展社会支持网络。

PCI 术后专项心理支持： 针对性处理患者对支架的误解（如“一劳永逸”或“支架移位”）、对再狭窄 / 复发的恐惧、对抗血小板治疗出血风险的过度担忧，以及术后活动受限引发的挫败感。重点强调术后规律用药、定期复查及坚持康复的极端重要性，并提供专业心理疏导。

探讨结果显示，实施上述心理护理干预流程能显著改善冠心病患者的心理状态并提升其治疗依从性。

有效缓解焦虑抑郁： 干预后，患者的焦虑抑郁情绪得到显著缓解，积极应对态度增强，主观幸福感提升。心态的改善有助于稳定心率、血压，间接促进心脏康复。

显著提高治疗依从性： 此效果在 PCI 术后患者中尤为突出：

用药依从性提升： 患者对抗血小板药（阿司匹林、氯吡格雷）、他汀、β 受体阻滞剂等的必要性和重要性理解加深，能主动坚持按时按量服药，显著减少自行停药、减量或漏服，保障 DAPT 完成度，降低血栓风险。

复诊依从性增强： 认识到定期复查（血脂、血糖、心电图等）对监测病情、调整方案的关键作用，能主动预约并按时复诊。

生活方式改善落实： 在心理干预支持下，患者更有动力和毅力坚持戒烟、健康饮食（低盐低脂）、适度运动（如心脏康复），有效控制体重及血压、血糖、血脂。

症状报告更及时： 对胸痛等不适症状的警觉性提高，能及时报告，利于早期干预。

结论：

冠心病，尤其是 PCI 术后患者普遍存在的焦虑抑郁情绪，是导致治疗依从性不佳的核心因素之一。探讨表明，将规范化的心理护理干预流程（包括认知教育、情绪疏导、社会支持及术后专项支持）整合入常规护理，能有效改善患者负性情绪。更重要的是，通过优化认知、增强信心、改善应对方式，心理护理能显著驱动患者行为改变，提升其对药物治疗、生活方式调整、定期复诊等关键措施的依从性。对于 PCI 术后患者，依从性的提升直接关系到手术长期效果、心血管事件再发风险的降低及生存质量的保障。 因此，深化护理人员心理护理能力，将心理干预贯穿冠心病全程管理，是实现优质护理和促进患者全面康复的重要方向。

分叉病变介入治疗中对比药物球囊与非药物球囊行边支保护疗效 meta 分析

庞旭尧 张飞飞

河北省人民医院

目的：探讨评价冠脉介入治疗中对比药物球囊 (DCB) 与非药物球囊行边支保护疗效。

方法：检索 PubMed、Embase、Cochrane 图书馆、Web of science、中国期刊全文数据库（CNKI）、万方数据库（Wanfang database）、中国生物医学文献数据库（CBM），同时查阅心血管专业相关网站。检索时间均为从建库至 2024 年 6 月相关临床研究。按照入排标准筛选文献，随机对照研究应用 Cochrane 风险偏倚工具评价，非随机对照研究应用纽卡斯尔 - 渥太华量表评价。提取相关数据，应用 Revman 5.2 进行统计学分析。

结果：共纳入 10 篇文献，其中随机对照 4 篇，非随机对照 6 篇，总例数 1720 例。Meta 分析结果：与非药物球囊相比，DCB 组分支血管晚期管腔丢失优于非 DCB 组（MD=-0.17，95%CI -0.26~-0.08，P < 0.01），而靶病变血运重建，非致死心梗心肌梗死，MACE 无统计学差异。亚组分析中非随机对照研究显示与非药物球囊相比，DCB 组分支血管晚期管腔丢失、靶病变血运重建、MACE 优于非 DCB 组（MD=-0.2，95%CI -0.31~-0.09，P < 0.01）、（OR=0.44，95%CI 0.24~0.81，P < 0.01）、（OR=0.47，95%CI 0.27~0.79，P < 0.01）。

结论：在冠状动脉原发分叉病变介入治疗中，与非 DCB 相比，DCB 可能改善晚期管腔丢失，减少 TLR 及 MACE 发生。但仍然需要更多大样本的随机对照研究验证。

经导管主动脉瓣置换术后 Venus-A 瓣膜的连合和冠状动脉对齐：一项回顾性横断面研究

经导管主动脉瓣置换术 （TAVR） 是一种公认的微创技术，适用于严重主动脉瓣狭窄 （AS） 患者。随着 TAVR 技术在过去十年中日趋成熟，与外科主动脉瓣置换术 （SAVR） 相比，TAVR 的适应症进一步扩大 。TAVR 已逐渐在年轻患者中进行，这意味着 TAVR 后的预期寿命延长和冠状动脉疾病更普遍。与 SAVR 不同，在 SAVR 中，手术瓣膜连合可以与天然瓣膜连合完全对齐，而 TAVR 期间的连合对齐并不容易实现，因为经导管心脏瓣膜 （THV） 总是随机植入 。既往研究表明，THV 的新连合方向可影响 TAVR 期间的冠状动脉阻塞、THV 的长期耐久性和 TAVR 后再次介入的冠状动脉入路。Evolut R/Pro 和 Acurate Neo 主动脉瓣的特定初始方向可改善连合对线。然而，实现与 Venus-A 瓣膜的连合对线的方法仍然未知。因此，本研究旨在评价使用标准系统输送技术进行 TAVR 后 Venus-A 自膨式瓣膜的连合和冠状动脉对准程度。开展回顾性横断面研究，在入组时，选择使用第二代 64 排多探测器扫描仪进行术前和术后心电图门控对比增强 CT 的

患者进行研究。连合对线分为对线（角度偏差 0-15°）、轻度（15-30°）、中度（30-45°）或重度（45-60°）连合错位（CMA）。冠状动脉排列分为无冠状动脉重叠（CO）（>35°）、中度 CO（20-35°）或重度 CO（≤ 20°）。结果以比例表示，以评估连合和冠状动脉对齐的程度。45 例 TAVR 患者最终纳入分析。THV 被随机植入：20.0% 的 THV 对齐，33.3% 有轻度 CMA，26.7% 有中度 CMA，20.0% 有重度 CMA。左冠状动脉主干重度 CO 发生率为 24.4%，右冠状动脉为 28.9%，双冠状动脉为 6.7%，单支或双支冠状动脉为 46.7%。结果表明，使用标准系统输送技术，Venus-A 瓣膜无法实现连合或冠状动脉对线。因此，需要确定与 Venus-A 瓣膜对齐的具体方法。

双侧冠状动脉口和主动脉瓣连合相对于主动脉弓的解剖空间分布

奚思宇 [1] 高原 [1] 张海山 [1] 陈昕 [2] 谭文飞 [3] 郭亮 [1] 孙英贤 [1]

3. 中国医科大学第一医院麻醉科

经导管主动脉瓣置换术（TAVR）是治疗重度主动脉瓣狭窄（AS）患者的公认微创技术。随着 TAVR 技术在过去十年中的发展，与外科主动脉瓣置换术（SAVR）相比，TAVR 的适应症已经扩展到年轻患者，这增加了预期寿命和冠状动脉疾病的患病率。与外科瓣膜接合处可与自体瓣膜接合处完全对准的 SAVR 不同，TAVR 期间的接合处对准不容易实现，因为经导管心脏瓣膜（THV）始终沿随机轴向植入。既往研究表明，THV 的新连合方向影响 TAVR 期间的冠状动脉阻塞、THV 的长期耐久性以及 TAVR 后需要再次介入时的冠状动脉入路。连合对线还增加了人工生物瓣膜或自体主动脉撕裂的可行性，以防止因 THV 植入失败而进行 TAVR 的病例中的医源性冠状动脉阻塞。Tang 等人发现，Evolut R/Pro（Medtronic，Minneapolis，Minnesota） 和 ACURATE Neo（Boston Scientific，MA，USA）主动脉瓣的特定初始方向可改善连合对线。TAVR 术中透视下观察双侧冠状动脉口，发现冠状动脉与主动脉弓内曲（IC）有一定的解剖关系。既往研究表明，在 TAVR 期间实现连合对线的重要性。然而，双侧冠状动脉口和主动脉瓣连合相对于主动脉弓的解剖空间分布仍然未知。本研究通过设计了一项回顾性横断面研究来评价这种解剖关系。使用第二代双源 CT 扫描仪进行术前心电门控计算机断层扫描（CT）血管造影的患者入组本研究。进行三维重建，并定义主动脉弓的内曲线（IC）。测量冠状动脉或主动脉瓣连合与 IC 的夹角。80 名患者被纳入分析。IC 与左主干（LM）的夹角为 48.0° ±17.5°，IC 与右冠状动脉（RCA）的夹角为 172.6° ±15.2°。IC 至非冠状动脉瓣尖（NCC）/ 左冠状动脉瓣尖（LCC）连合的中位角为 – 12.8°，四分位距（IQR）为 – 21.5° 至 – 2.2°，IC 至 LCC/ 右冠状动脉瓣尖（RCC）连合的角为 102.4° ±15.1°，IC 至 RCC/NCC 连合的角为 219.9° ±13.9°。本研究发现冠状动脉口或主动脉瓣连合与主动脉弓 IC 之间存在固定的角度关系，这种关系有助于建立个体化植入方法，从而在 TAVR 中实现连合与冠状动脉对齐。

Efficacy of Oral Hydration in the Prevention of Contrast-induced Acute Kidney Injury in Patients Undergoing Coronary Intervention

Yang Meng, Jin-Qing Yuan

Fuwai Hospital, Chinese Academy of Medical Sciences

Efficacy of Oral Hydration in the Prevention of Contrast-induced Acute Kidney Injury in Patients Undergoing Coronary Intervention

Abstract

Background: Contrast-induced acute kidney injury (CI-AKI) is the third leading cause of hospital-acquired acute kidney injury (AKI) and is strongly linked to increased long-term morbidity and mortality [1-3]. With the rising frequency of coronary angiography (CAG) and percutaneous coronary intervention (PCI) globally, the incidence of CI-AKI has increased in parallel, emphasizing the need for effective preventive strategies. Intravenous (IV) volume expansion with isotonic saline and minimizing contrast media (CM) exposure are currently the only validated methods to reduce CI-AKI risk. However, the role of oral hydration remains unclear. Oral hydration offers potential advantages, including lower healthcare costs, reduced nursing workload, avoidance of IV cannulation-related risks (e.g., infection, phlebitis), and improved patient comfort. Despite these benefits, its efficacy compared to IV hydration has not been conclusively established, creating a critical knowledge gap in clinical practice. This study aimed to compare the effectiveness of oral hydration versus IV volume expansion in preventing CI-AKI in patients undergoing PCI. **Methods:** This prospective randomized study included 345 consecutive patients (aged ≥ 18 years) with normal renal function or stage 1–3 chronic kidney disease (estimated glomerular filtration rate [eGFR] ≥ 30 ml/min/1.73 m^2) who underwent PCI between December 2023 and February 2024. Exclusion criteria included CM hypersensitivity, recent CM exposure (≤ 7 days), nephrotoxic drug use (≤ 7 days), and inability to consume oral fluids. Patients were randomized to either the oral hydration group (n=167), instructed to consume ≥ 1000 mL of pure water within 12 hours post-procedure, or the IV hydration group (n=178), receiving 1000 mL of 0.9% NaCl at 1 mL/kg/h starting 1 hour before CM administration. Adjustments were made for heart failure (IV rate reduced to 0.5 mL/kg/h; oral intake reduced). CI-AKI was defined as a ≥ 25% relative increase or ≥ 0.5 mg/dl absolute increase in serum creatinine (SCr) within 72 hours of CM exposure, with additional analyses using alternative definitions (e.g., ≥ 0.3 mg/dl increase per KDIGO guidelines). Secondary outcomes included 30-day mortality and dialysis need. Statistical analyses used Pearson's χ^2 test, Fisher's exact test, ANOVA, and logistic regression, with p<0.05 considered significant. **Results:** Of 355 enrolled patients, 10 withdrew (4 voluntary, 6 due to medical changes), leaving 345 for analysis. Baseline characteristics were mostly balanced, though the oral group was younger (58 vs. 61 years, p=0.002), heavier (75 vs. 71.5 kg, p=0.000), and had higher eGFR (100.81 vs. 96 ml/min/1.73 m^2, p=0.005). CI-AKI occurred in 0.6% (1/167) of the oral group and 2.8% (5/178) of the IV group (p=0.117), with no significance across alternative definitions. The oral group consumed a mean 1757 mL water with good tolerance. No 30-day deaths or dialysis occurred. Subgroup analysis showed non-hypertensive patients had higher CI-AKI risk (p=0.01), and preoperative eGFR was a significant predictor (p=0.020). **Conclusions:** Oral hydration is as effective as IV hydration in preventing CI-AKI in PCI patients with normal or mildly impaired renal function. Its comparable efficacy, ease of use, cost-effectiveness, and patient comfort support broader clinical adoption. Further studies in advanced CKD are needed to generalize findings.

不同年龄段女性急性 ST 段抬高型心肌梗死患者 PPCI 临床疗效分析

刘美丽 黄光华 李娜 马蕊 刘海伟 徐凯 王斌

中国人民解放军北部战区总医院

目的： 探讨接受直接经皮冠状动脉介入治疗 (PPCI) 治疗的女性急性 ST 段抬高心肌梗死（STEMI）患者不同年龄组与院内死亡发生率的关系。

方法: 本研究资料来自全军心血管介入诊疗管理系统，入选标准: 女性 STEMI 患者，年龄 18-85 岁，所有患者均接受 PPCI 术。连续入选了接受 PPCI 治疗的 1741 例 STEMI 女性患者，根据患者不同的发病年龄将患者分为对照组（年龄≤ 65 岁）和观察组（年龄 >65 岁），两组分别为 664 例和 1077 例；比较两组患者院内死亡事件及其它临床心脏不良事件的发生率。

结果： 观察组患者 Killip III 级、三支病变比例均分别明显高于对照组 (3.8% 比 2.1%，P=0.049；43.5% 比 36.6%，P=0.005)。同时，分析门槛到球囊（D2B）时间显示，在观察组患者中明显低于对照组（1.21±1.20 比 1.60±4.07，P=0.016）。观察组较对照组院内死亡发生率明显增高 (6.4% 比 2.4%，P=0.000)，尽管术中死亡发生率两组无显著差异（0.9% 比 0.5%，P=0.262），但观察组术后死亡发生率明显高于对照组（5.5% 比 2.0%，P=0.000）。

结论：，年龄 65 岁以上女性 STEMI 患者 PPCI 院内死亡率增高，且主要表现为术后死亡的发生率明显增加，故针对高龄女性 STEMI 患者 PPCI 救治应进一步强化，以期降低院内死亡率，改善预后。

危险因素数量对直接经皮冠状动脉介入治疗术后 STEMI 患者长期预后的影响

支雪涵 [1,2] 王兆丰 [2] 赵巍 [2] 康正松 [1,2] 徐凯 [2] 李洋 [2] 关绍义 [2] 刘海伟 [2]

1. 锦州医科大学北部战区总医院研究生培养基地

2. 中国人民解放军北部战区总医院

目的: 本研究旨在评估危险因素的不同数量对行直接经皮冠状动脉介入（primary percutaneous coronary intervention，PPCI）治疗的 ST 段抬高型心肌梗死（ST-segment elevation myocardial infarction，STEMI）患者预后的影响。**方法:** 本研究回顾性分析了 2016 年 3 月至 2022 年 3 月在北部战区总医院心血管内科接受 PPCI 治疗的 STEMI 患者 5516 例，根据纳排标准并筛选出 1 年随访资料完整的患者 5125 例。根据患者合并的危险因素（包括高血压、糖尿病、卒中或肾功能不全等常见的危险因素）的数量分为三组：A 组（无危险因素，n=473）、B 组（1-2 个危险因素，n=3816）、C 组（3-4 个危险因素，n=836）。记录并分析各组患者住院期间的临床特点，绘制生存曲线，对交叉曲线进一步进行 Landmark 曲线，并采用多因素 COX 回归分析三组患者主要不良心血管事件（major adverse cardiovascular events，MACE）的发生情况。**结果：** 三组临床基线指标分析显示，年龄、收缩压、心力衰竭史及慢性肾病史等有统计学差异（P < 0.05）。对比分析住院期间用药及实验室化查：左心室射血分数、血脂、抗心律失常药物及 SGLT-2 抑制剂等指标有统计学差异（P < 0.05）。三组间 GRACE 评分和心原性休克存在明显的统计学差异（P < 0.001）。在随访指标中，A、C 组 1 年内全因死亡率及 MACE 发生率均明显高于 B 组，C 组在三组中 1 年内全因死亡及 MACE 事件最高（HR=0.402 Vs HR=0.494，HR=0.373 Vs HR=0.429）。

结论： 在行 PPCI 的 STEMI 患者中，合并有 1-2 个危险因素的预后优于无危险因素患者，这可能与患有 1-2 个危险因素的患者更易建立侧支循环及依从性较好有关，此外 2 个以上的危险因素的 STEMI 患者预后最差，因此需要重视此类患者的治疗策略，改善其预后。

风湿性主动脉瓣狭窄患者行经导管主动脉瓣置换术后临床疗效分析

王茂德 王勇 李春 晋军 于世勇

中国人民解放军陆军军医大学第二附属医院

背景：风湿性主动脉瓣狭窄（rheumatic aortic valve stenosis，RAS）患者因瓣膜钙化轻、多瓣膜受累及年轻化特点，传统上被视为经导管主动脉瓣置换术（transcatheter aortic valve replacement，TAVR）的相对禁忌。中国 RAS 患者基数大，但其 TAVR 疗效与安全性证据匮乏。本研究旨在评估 TAVR 在 RAS 人群中的应用效果。

方法：纳入 2017 年 10 月至 2024 年 8 月于陆军军医大学第二附属医院接受 TAVR 的 359 例重度主动脉瓣狭窄患者，根据 World Heart Federation 风湿性心脏病诊断指南结合 CT 影像（排除钙化干扰）分为 RAS 组（n=71）与非 RAS 组（n=288）。所有患者使用 VenusA 自膨式瓣膜。主要终点包括技术成功率、器械成功率、一月早期安全率、1 年复合结局，并分析短期并发症及主动脉根部

解剖结构差异。

结果：**基线特征**：RAS 组 NT-pro BNP、Society of Thoracic Surgeons（STS）评分更高，eGFR 更低，合并房颤比例更高（均 P<0.05）；心脏扩大更显著，主动脉瓣压差、流速更低，二尖瓣反流更重（P<0.05）。**解剖结构**：RAS 组二叶瓣比例低（4.2% vs 15.6%）、钙化积分低（P<0.05），瓣环更趋椭圆形，左室流出道（left ventricular outflow tract, LVOT）/ 瓣环面积比更大（P<0.05）。**术中决策**：RAS 组假体定位 (0.9mm vs 3.0mm) 高、oversize 率 (9.2% vs 6.0%) 更大 (P<0.05)。**结局**：两组技术成功率（84.5% vs 79.2%）、器械成功率（67.6% vs 62.0%）和一月早期安全 (71.4% vs 72.1%) 无差异（P>0.05）。RAS 组起搏器植入率更高（19.7% vs 10.1%，P<0.05），假体移位风险更高（P<0.05），但其他相关并发症无差异，1 年复合结局事件率（包含全因死亡、卒中、心梗、出血、心脏或 TAVR 相关在住院）无差异（HR=0.600, 95%CI:0.270–1.330,P=0.208）。

结论：TAVR 治疗 RAS 安全有效，但 RAS 患者解剖特征（低钙化、椭圆瓣环、锥形 LVOT）增加假体移位及起搏器植入风险。采用高位释放策略与适度 oversize 可部分缓解移位风险。

Radial Artery Hemostatic Device applied in trans-brachial coronary intervention

Ning Wang, Wen-Chao Zhang

Peking University International Hospital

Abstract Objective: To investigate the safety and efficacy of the radial artery hemostatic device in trans-brachial coronary intervention, and assess its effectiveness. **Methods:** A retrospective analysis was conducted on patients who underwent trans-brachial coronary intervention at Peking University International Hospital from January 1, 2018 to December 31, 2023. The patients were divided into the radial artery hemostatic device group (170 cases) and the conventional compression group (100 cases) based on the postoperative hemostasis method, and the incidence of complications and clinical characteristics were compared between the two groups. **Results:** A total of 270 patients underwent trans-brachial coronary intervention, with 18 complications occurring. Among the patients who underwent brachial artery puncture, 18 cases of complications occurred. Among them, 17 cases had bleeding around the puncture site, and 1 case had transient injury of the median nerve. There were no pseudoaneurysms or arteriovenous fistulas. The overall complication rate was 6.7%, and the incidence of bleeding around the puncture site was 6.3%. Among the bleeding patients, 16 patients had mild bleeding and were not given special treatment. After observation, they improved. One patient had severe bleeding, with local hematoma and a decrease in hemoglobin of more than 3 g/dl. The patient was treated with blood transfusion. The patient was a 78-year-old female who was admitted due to unstable angina pectoris. At admission, she had mild anemia, with Hb 102 g/L. During coronary intervention, the right radial puncture failed, and the right brachial artery approach was chosen. During the operation, the right coronary lesion was treated, and routine compression method was used after the operation. After the operation, a hematoma occurred at the puncture site of the right brachial artery of the patient, and the duration of extended and pressurized bandaging was increased. The hemoglobin level decreased significantly, reaching the lowest 68 g/L, and the patient was treated with blood transfusion and supplementation of hematopoietic raw materials. During the subsequent follow-up, the hematoma basically absorbed, and the hemoglobin level returned to the baseline level. The incidence of bleeding around the puncture site in the radial artery hemostasis device group was 5.9%, and that in the conventional compression group was 7.0%. The incidence of bleeding in the hemostasis device group was slightly lower than that in the conventional compression group, and there was no statistical difference between the two groups (P = 0.72). Multivariate regression analysis indicated that female was an independent risk factor for hemorrhage around the puncture site [OR=4.57, 95%CI (1.40, 14.96), P=0.01]. With the accumulation of technology, the application of trans-brachial access and radial artery hemostatic devices increased year by year (P<0.01). Radial artery hemostasis device method: After coronary intervention, place the knob-type radial artery hemostasis device upside down above the puncture point of the brachial artery, tighten the fixation strap. Rotate the knob to the appropriate pressure, remove the sheath, and observe that there is no bleeding or swelling around the puncture site. Place a piece of cardboard below the elbow joint and fix the hemostasis device and the cardboard with elastic bandages to achieve elbow joint immobilization. Cross the elastic bandages to fix the hemostasis device. Observe the color and blood return of the forearm and hand, and appropriately adjust the knob. Regularly loosen the knob to reduce the compression force after the operation. The hemostasis device and the bandage can be removed 6-8 hours later. For obese patients or those with a thicker upper arm circumference, connect the fixation straps of the two hemostasis devices to ensure a firm attachment.**Conclusion:** The radial artery hemostatic device effectively controls bleeding in trans-brachial coronary interventions and demonstrates satisfactory safety. Its simplicity and efficacy provide a new strategy for hemostatic management in percutaneous trans-brachial access, which may gradually become the new standard in the future.

合并心功能不全急性 ST 段抬高型心肌梗死患者 PPCI 的临床疗效分析

刘美丽 黄光华 李娜 马蕊 刘海伟 徐凯 王斌

中国人民解放军北部战区总医院

【目的】：本研究探讨心功能不全对直接经皮冠状动脉介入术（PPCI）治疗急性 ST 段抬高型心肌梗死（STEMI）患者院内疗效的影响。

【方法】：本研究资料来自全军心血管介入诊疗管理系统，入选标准：急性 ST 段抬高型心肌梗死伴心功能不全的患者，年龄 18-85 岁，所有患者均接受 PPCI 术。连续入选了接受 PPCI 治疗的 8853 例 STEMI 患者。心功能不全判断指标：行 PPCI 前 KILLIP II 级及以上（即 KILLIP II ～IV级）。根据 STEMI 患者有无合并心功能不全将患者分为对照组（KILLIP Ⅰ级）和观察组（KILLIP II ～IV级），两组分别为 7787 例和 1066 例；比较分析两组患者救治时间诸指标、院内死亡事件及其他临床心脏不良事件。

【结果】：比较两组患者介入诊治门槛到球囊（D2B）时间显示，观察组明显高于对照组（1.44±3.49 比 1.23±1.59，P=0.058）。观察组的院内死亡发生率明显高于对照组 (6.4% 比 2.3%，P=0.000)，进一步分析显示，无论术中还是术后死亡的发生率，在观察组均明显高于对照组（分别为 1.3% 比 0.5%，P=0.001; 5.1% 比 1.8%，P=0.000）。采用二元 logistic 逐步回归法进行多因素分析发现，年龄、高血压病及 D2B 时间是 STEMI 患者发生心功能不全的独立危险因素（P < 0.05）。

【结论】：合并心功能不全的 STEMI 患者 PPCI 院内死亡率增高，而年龄、高血压及 D2B 时间是 STEMI 患者发生心功能不全的独立预测因子，故针对存在上述独立危险因素的 STEMI 患者应积极优化围术期救治策略，减少心功能不全的发生，以期降低患者院内死亡发生率，改善长期预后。

同型半胱氨酸对急性冠状动脉综合征合并 2 型糖尿病患者经皮冠状动脉介入治疗术后远期预后影响

刘美丽 裘淼涵 张莉莉 刘韵情 马颖艳

中国人民解放军北部战区总医院

目的 探讨同型半胱氨酸（Hcy）对急性冠状动脉综合征（ACS）合并 2 型糖尿病（T2DM）患者经皮冠状动脉介入治疗（PCI）术后远期预后的影响。**方法** 选取北部战区总医院 2021 年 1–12 月收治的 2 820 例 ACS 合并 T2DM 患者为研究对象。根据 Hcy 水平将患者分为高 Hcy 组（Hcy ≥ 12.09 μmol/L，n = 943）、中 Hcy 组（9.56 μmol/L ≤ Hcy < 12.09 μmol/L，n = 945）和低 Hcy 组（Hcy < 9.56 μmol/L，n = 932）。比较并比较 3 组患者的临床基线资料、介入基线资料及术后 1 年临床事件。主要结局事件：出院后 1 年缺血事件（包括心原性死亡、心肌梗死、卒中的复合终点）；次要结局事件：出院后 1 年的全因死亡。**结果** 1）相较于其余两组患者，高 Hcy 组患者既往高血压、陈旧心肌梗死、卒中、PCI、外周血管疾病、吸烟及贫血史比例明显增高，有统计学差异（P < 0.05）；高 Hcy 组患者急性心肌梗死患者比例较高，包括 NSTEMI 及 STEMI 患者，有统计学差异（P < 0.05）；同时左心室射血分数明显降低，均有统计学差异（P < 0.05）。2）高 Hcy 组患者支架总长度、血管紧张素转换酶抑制剂 / 血管紧张素 II 受体拮抗剂（ACEI/ARB）用药比例均增高，差异有统计学意义（P < 0.05）。3）高 Hcy 组患者出院后 1 年缺血事件发生率高于低 Hcy 组，差异有统计学意义（P < 0.05）。高 Hcy 组患者出院后 1 年全因死亡发生率高于低 Hcy 组，差异有统计学意义（P < 0.05）。**结论** Hcy 与 ACS 合并 T2DM 患者 PCI 术后 1 年缺血事件及全因死亡发生率有关。

冠状动脉定量血流分数对冠脉串联病变的指导价值研究

关韶峰 干倩 曲新凯

复旦大学附属华东医院

目的：评价冠状动脉定量血流分数（QFR）在冠脉串联病变的指导价值。

方法：冠脉造影时同一支冠脉血管具有两个独立的病变（狭窄 50-90%，两个病变距离 >10mm）行血流储备分数（FFR）、QFR 和定量冠脉造影（QCA）测定，以 FFR 为处理策略金标准，FFR ≤ 0.80 的患者处理压力梯度更大的病变，其后行第二次 FFR 和 QFR 检查，第二次 FFR ≤ 0.80 则处理剩余病变，比较两次检查 QFR、QCA 与 FFR 的一致性。

结果：共入选 54 例患者，患者平均年龄 (72.3±7.2) 岁，其中男性 76%，共计 61 条血管具有串联病变，QCA 测定近、远端血管狭窄为 47.7±10.4% 和 47.2±11.2，共计 44 个 (72.1%) 串联病变测得 FFR ≤ 0.80, 对压力梯度大的病变行介入处理，植入第一个支架，14 个 (22.9%) 串联病变植入了第二个支架，靶病变 67% 为 LAD，QFR 预测压力梯度大的病变的准确率为 100.0%，对第一个病变的显著程度的诊断能力，QFR 明显优于 QCA(近端病变 AUC 0.96 vs. 0.60; 差异：0.36; p < 0.001；远端病变 0.96 vs. 0.75; 差异：0.19; p < 0.01), 对第二个病变的显著程度的诊断能力，QFR 亦优于 QCA (0.92 vs. 0.70; 差异：0.22; p < 0.01).。

结论：冠状动脉定量血流分数在指导冠脉串联病变决策时优于定量冠脉造影，可用于指导临床决策。

对比分析不同门球时间对 STEMI 患者长期预后的影响

王子琛 [1,2] 支雪涵 [2] 刘毓 [2] 王兆丰 [2] 赵巍 [2] 康正松 [2] 徐凯 [2] 刘海伟 [2]

1. 中国医科大学北部战区总医院研究生培养基地

2. 中国人民解放军北部战区总医院

目的：在接受直接经皮冠状动脉介入术（PPCI）的急性 ST 段抬高型心肌梗死（STEMI）患者中，探讨不同的门球时间（DTB）对 STEMI 患者住院期间死亡、术后 1 年、3 年全因死亡及主要不良心血管事件发生的影响。

方法：本研究回顾性分析了 2016 年 3 月至 2022 年 3 月期间，在中国人民解放军北部战区总医院心内科接受 PPCI 治疗的 STEMI 患者 5516 例，根据纳排标准

筛选出具有完整病历资料及术后 3 年完整随访资料的患者 4513 例。根据 DTB（≤ 60 分钟、61-90 分钟、> 90 分钟）对患者进行分组，采用 Kaplan-Meier 生存曲线比较不同 DTB 对患者住院期间死亡、术后 1 年、3 年全因死亡及主要不良心血管事件（MACE，包括：全因死亡，非致死性心肌梗死、非致死性缺血性脑卒中）MACE 事件发生风险之间的关系，进一步采用 Logistic 回归模型及 Cox 回归模型分析 DTB 对患者住院期间死亡、术后 1 年、3 年内全因死亡及 MACE 发生风险的影响。

结果：在 4513 例接受 PPCI 的 STEMI 患者中，DTB 中位数为 61（50，78）分钟，2196 例（48.66%）患者 DTB ≤ 60 分钟，1645 例（36.45%）患者 30 分钟 < DTB ≤ 60 分钟，672 例（14.89%）患者 DTB > 90 分钟。DTB ≤ 60 分钟、61-90 分钟、> 90 分钟的住院期间死亡率分别为 0%、1%、0.8%(p<0.001)；DTB ≤ 60 分钟、61-90 分钟、> 90 分钟的 1 年死亡率分别为 2.8%、3.5%、9.7%(p<0.001)；DTB ≤ 60 分钟、61-90 分钟、> 90 分钟的 1 年 MACE 事件发生率分别为 14.7%、15.6%、22.3%(p<0.001)；DTB ≤ 60 分钟、61-90 分钟、> 90 分钟的 3 年死亡率分别为 4.6%、6.7%、12.2%(p<0.001)；DTB ≤ 60 分钟、61-90 分钟、> 90 分钟的 3 年 MACE 事件发生率分别为 19.7%、22.7%、27.7%(p<0.001)，均有显著统计学差异。多因素 Logistic 回归分析结果显示，DTB 在 61-90 分钟的患者相比于 DTB > 90 分钟的患者，住院期间死亡率降低了 0.9%（OR=0.009，95%CI:0.001~0.076，P < 0.001）；多因素 Cox 比例风险回归分析结果显示，DTB > 90 分钟是预后不良的独立预测因子，1 年死亡率（HR=2.192，95%CI:1.494~3.215，P < 0.001）、1 年 MACE 事件发生率（HR=1.466，95%CI:1.199~1.793，P < 0.001）、3 年死亡率（HR=1.869，95%CI:1.368~2.555，P < 0.001）和 3 年 MACE 事件发生率（HR=1.313，95%CI:1.099~1.569，P=0.003）；但 DTB ≤ 60 min 和 61-90 分钟（P < 0.05）之间没有显著统计学差异。

结论：本研究结果与国内外指南推荐意见保持一致，即 DTB ≤ 90（含 60 < DTB ≤ 90）分钟是 PPCI 的关键标准；而 DTB > 90 分钟是预后不良的关键点，延迟的 DTB 显著增加住院期间死亡风险及长期死亡 /MACE 风险，因此，需要设法减少 STEMI 患者 PPCI 救治的延迟。

缩短门球时间对不同危险分层 STEMI 患者预后的影响

王子琛 [1,2] 支雪涵 [2] 刘毓 [2] 王兆丰 [2] 赵巍 [2] 康正松 [2] 徐凯 [2] 刘海伟 [2]

1. 中国医科大学北部战区总医院研究生培养基地

2. 中国人民解放军北部战区总医院

目的：在接受直接经皮冠状动脉介入术（PPCI）的急性 ST 段抬高型心肌梗死（STEMI）患者中，探讨更短的门球时间（DTB，≤ 60 分钟）对不同风险（GRACE 评分风险分层）的 STEMI 患者住院期间死亡、术后 1 年、3 年全因死亡及主要不良心血管事件发生的影响。

方法：本研究回顾性分析了 2016 年 3 月至 2022 年 3 月期间，在中国人民解放军北部战区总医院心内科接受 PPCI 治疗的 STEMI 患者 5516 例，根据纳排标准筛选出具有完整病历资料及术后 3 年完整随访资料的患者 4513 例。基于 GRACE 评分进行风险分层（高危 > 140 分 vs 低危≤ 140 分），采用 Kaplan-Meier 生存曲线比较 DTB ≤ 60min 对患者住院期间死亡、术后 1 年、3 年全因死亡及主要不良心血管事件（MACE，包括：全因死亡，非致死性心肌梗死、非致死性缺血性脑卒中）事件发生风险之间的关系，进一步采用 Logistic 回归模型及 Cox 回归模型分析缩短的 DTB 对不同风险分层 STEMI 患者预后影响的差异。

结果：在 4513 例接受 PPCI 的 STEMI 患者中，有 2526 例（56.0%）符合高危标准（HR-STEMI），其中 1170 例（46.3%）HR-STEMI 患者 DTB ≤ 60min。另外 1987 例（44.0%）患者符合低危标准（LR-STEMI），1026 例（51.6%）患者的 DTB ≤ 60min。HR-STEMI 患者的中位 DTB 时间为 63（50，81）min，DTB ≤ 60min 和 DTB > 60min 之间的住院期间死亡率（0 vs 2.4，P < 0.001）、1 年死亡率（4.3 vs 7.6，P < 0.001）、1 年 MACE 事件发生率（17.3 vs 21.7，P=0.005）、3 年死亡率（6.6 vs 11.9，P < 0.001）、3 年 MACE 事件发生率（22.3 vs 29.4，P < 0.001）均有显著统计学差异。多因素 Cox 比例风险回归分析结果显示，DTB ≤ 60 分钟的患者与 DTB > 60 分钟的患者相比，出院后 1 年死亡发生风险及 1 年 MACE 事件发生风险均无显著统计学差异、但 3 年死亡发生风险明显增加（HR=1.401，95%CI:1.052~1.865，P=0.021）、3 年 MACE 事件发生风险明显增加（HR=1.195，95%CI:1.017~1.404，P=0.03）；在 LR-STEMI 患者的中位 DTB 时间为 60（48，76）min，且 DTB > 60min 的患者仅在出院死亡率高于 DTB ≤ 60min 的患者（0 vs 0.7，P=0.006），在 1 年死亡率（1.2 vs 2.0，P=0.147）、1 年 MACE 事件发生率（11.7 vs 11.7，P=0.977）、3 年死亡率（2.3 vs 3.3，P=0.182）、3 年 MACE 事件发生率（16.7 vs 16.8，P=0.959）均无统计学意义。多因素 Logistic 回归分析及多因素 Cox 比例风险回归分析结果均提示，DTB 与 LR-STEMI 患者住院期间死亡、术后 1 年、3 年全因死亡及 MACE 事件发生风险无独立相关性。

结论：DTB ≤ 60min 与高、低危 STEMI 患者短期预后、高危 STEMI 患者长期预后改善相关。但在调整混杂因素后，LR-STEMI 患者，DTB 对其结局无显著影响；而对于 HR-STEMI 患者，DTB > 60min 与 3 年全因死亡及 MACE 事件发生风险相关。

Nine month clinical, angiographic and intravenous ultrasound (IVUS) results of FIREHAWK® abluminal groove-filled biodegradable polymer sirolimus-eluting stent in treating de novo coronary artery disease: single center data from the TARGET I trial

Ji-Wei Yu, Zheng-Bin Zhu, Rui-Yan Zhang

Rui Jin Hospital, Shanghai Jiao Tong University School of Medicine

Title: Nine month clinical, angiographic and intravenous ultrasound (IVUS) results of FIREHAWK® abluminal groove-filled biodegradable polymer sirolimus-eluting stent in treating de novo coronary artery disease: single center data from the TARGET I trial

Background

The FIREHAWK stent represents an innovative drug-eluting stent (DES) technology featuring **abluminal groove-filled biodegradable poly-lactic acid (PLA) polymer coatings** loaded with sirolimus. This design enables targeted drug release exclusively toward the vessel wall while minimizing polymer exposure to the bloodstream, thereby potentially reducing inflammatory responses and late thrombotic risks18. Prior multicenter randomized trials (e.g., TARGET I) have established its non-inferiority against the durable-polymer XIENCE V everolimus-eluting stent in simple de novo coronary lesions, evidenced by comparable 9-month in-stent late lumen loss (LLL) (0.13±0.24 mm vs. 0.13±0.18 mm, P=0.94) and 5-year target lesion failure (TLF) rates (6.0% vs. 6.7%, P=0.77)367. However, **single-center validation integrating quantitative coronary angiography (QCA) and intravascular ultrasound (IVUS) functional assessments** remains limited. This study aimed to supplement existing evidence with granular imaging and clinical outcomes from a single institution, including exploratory data on long-lesion efficacy.

Methods

A prospective, single-center cohort was divided into two substudies:

1.Randomized Controlled Trial (RCT): 29 patients with single de novo coronary artery lesions were randomized 1:1 to FIREHAWK (*n*=14-15) or XIENCE V (*n*=14-15).

2.Long-Lesion Cohort: 10 consecutive patients with diffuse coronary disease (lesion length >24 mm) received FIREHAWK exclusively4.

Primary endpoints assessed at 9 months included:

1.QCA-derived in-stent LLL (defined as the reduction in minimal lumen diameter from post-procedure to follow-up)

2.IVUS-quantified intimal hyperplasia volume (neointimal tissue proliferation within the stent)

Secondary endpoints encompassed:

1.Procedural success metrics: Device success (successful stent deployment), lesion success (residual stenosis <30%), and clinical success (composite of device/lesion success without periprocedural major adverse events)49.

2.Clinical outcomes: Restenosis rate (diameter stenosis ≥ 50% at follow-up), TLF (cardiac death, target-vessel myocardial infarction, or ischemia-driven target lesion revascularization), patient-oriented composite endpoints (PoCE: all-cause death, any MI, any revascularization), and definite/probable stent thrombosis (ARC criteria)

Rusults

Follow-up completion rates were 82.6% (*n*=24/29) in the RCT arm and 100% (*n*=10) in the long-lesion cohort. Key findings included:

1.Procedural Efficacy: Both groups achieved 100% device and clinical success, with no intraprocedural complications

2.Imaging Outcomes: In-stent LLL (QCA): Comparable between FIREHAWK and XIENCE V No significant intergroup difference (P>0.05).

3.Intimal hyperplasia volume (IVUS): No significant intergroup difference (P>0.05) Restenosis rates: quivalent across groups.

All outcomes met non-inferiority margins (P>0.05 for all comparisons)49.

1.Long-Lesion Performance: FIREHAWK exhibited consistent safety/efficacy in extended lesions (mean length: 35.2 mm), with 0% TLF and no binary restenosis

Conclusions

This single-center study confirms the **9-month non-inferiority of FIREHAWK versus XIENCE V** across clinical, QCA, and IVUS endpoints for de novo coronary lesions. The abluminal groove design–delivering 85% less drug load than conventional DES–maintains efficacy while potentially enhancing long-term biocompatibility8. Notably, FIREHAWK demonstrates **exceptional performance in long lesions**, a high-risk subgroup often associated with elevated restenosis rates. These findings align with larger trials (TARGET I/II), supporting FIREHAWK as a safe and effective option for diverse coronary anatomies, including complex diffuse disease39. Future studies should address long-term (>5-year) polymer resorption effects and outcomes in diabetic populations.

Association of thyroid-stimulating hormone with contrast-associated acute kidney injury and adverse prognosis in percutaneous coronary intervention patients

Ji-Lang Zeng[1,2], Li-Tao Wang[1], Rui-Min Pan[1], Kai-Yang Lin[2], Liang-Long Chen[1]

1. Fujian Medical University Union Hospital

2. Shengli Clinical Medical College of Fujian Medical University, Fujian Provincial Hospital.

Objectives: It is well established that thyroid function plays a crucial role in regulating multiple organ systems, particularly the cardiovascular and renal systems. Emerging evidence further suggests that fluctuations in thyroid hormone (TH) levels, even within the normal reference range, may be associated with an increased risk of adverse cardiovascular and renal events. However, the relationship between thyroid-stimulating hormone (TSH) levels and the risk of contrast-associated acute kidney injury (CA-AKI) and poor outcome in euthyroid patients undergoing elective percutaneous coronary intervention (PCI) has not been fully elucidated.

Methods: We retrospectively analyzed 3,116 euthyroid patients who underwent elective PCI at a tertiary medical center between January 2012 and December 2018. Euthyroidism was defined as serum levels of TSH, free triiodothyronine (FT3), and free thyroxine (FT4) within the normal range at admission. The primary endpoint was CA-AKI, defined as a 0.3 mg/dL or 50% increase in serum creatinine (SCr) within 48 hours following contrast medium exposure. The second outcome was all-cause mortality. Receiver operating characteristic (ROC) analysis was performed to evaluate the diagnostic performance of TSH for predicting CA-AKI. Restricted cubic spline (RCS) analysis was employed to investigate potential nonlinear relationships between TSH levels and the risk of CA-AKI. Multivariable logistic and COX regression models were subsequently applied to assess the association between TSH levels and CA-AKI risk, respectively. Survival was analyzed through the Kaplan-Meier curve.

Results: A total of 160 patients (5.13%) developed CA-AKI during hospitalization. RCS modeling and ROC analysis indicated a linear inverse relationship between TSH levels and the risk of CA-AKI (P for nOnlinearity= 0.1523), with TSH demonstrating good discriminatory power [area under the curve (AUC) 0.648, 95% confidence interval (CI) 0.603-0.693; Cut-off point, 1.585 mIU/L]. In multivariable logistic regression analysis, each one standard deviation (SD) decrease in TSH was associated with a 1.29-fold increase in the risk of CA-AKI [fully adjusted odds ratio (OR), 1.29; 95% CI, 1.06-1.56, P = 0.013]. Moreover, patients in the low TSH group (TSH < 1.585 mIU/L) had a significantly higher incidence of CA-AKI compared with those in the high TSH group (TSH ≥ 1.585 mIU/L) (fully adjusted OR: 1.95, 95% CI: 1.37-2.77, P < 0.001). Variance inflation factor (VIF) analysis confirmed that there was no significant multicollinearity among the covariates (all VIFs < 5). Subgroup analyses consistently demonstrated the robustness of the relationship between TSH and CA-AKI, with no significant interaction effects observed across subgroups (all P for interaction > 0.05). As for the secondary endpoint, during a median follow-up of 2.76 years, 213 patients (7.10%) died. Multivariable Cox proportional hazards analysis also demonstrated that lower TSH levels were independently associated with an increased risk of all-cause mortality. Patients in the low TSH group had a 1.69-fold higher risk of death compared to those in the high TSH group [adjusted hazard ratio (HR): 1.69, 95% CI, 1.25-2.29, P = 0.001]. Kaplan–Meier survival curves further confirmed a significant difference in survival between the two groups (log-rank test, P < 0.001).

Conclusions: Among euthyroid patients undergoing elective PCI, lower TSH levels were independently associated with a higher risk of CA-AKI and. TSH may serve as a useful biomarker for identifying individuals at elevated risk of CA-AKI in this population.

基于光学相干断层显像评价药物球囊在急诊冠脉介入诊疗中的临床疗效

张飞飞 党懿 齐晓勇

河北省人民医院

目的 基于光学相干断层显像对比药物涂层球囊与药物洗脱支架在急诊冠脉介入中的临床疗效。

方法 2022 年 2 月至 2024 年 12 月于河北省人民医院心血管内科就诊行急性冠脉介入诊疗患者。研究纳入标准：（1）发病 12 小时以内行急诊冠脉介入诊疗 STEMI 患者；（2）行急诊冠脉介入诊疗的 NSTEMI 患者；（3）术中行光学相干断层显像检查患者；（4）介入术中接受 DES 或 DCB 单一治疗患者；（5）完成临床随访患者。依据患者介入术中接受治疗的方法分为 DCB 组（n=15）和 DES 组 (n=40)。术前及术后完成 OCT 检查并进行定性及定量指标测定。OCT 影像使用 ILUMIEN OPTIS 成像系统与目测相结合进行分析。记录术中冠状动脉夹层的发生情况及术后梗死相关血管 TIMI 血流分级；随访术后主要不良心血管事件（MACE）包括心源性死亡、再发急性心肌梗死、靶血管再重建术及出血事件。

结果 本研究共入选 55 例患者，其中男性 46 例，平均年龄为 53.01±11 岁。DCB 组与 DES 组患者的年龄、支架置入时间、LDL-C、LVEF 及性别、高血压、2 型糖尿病、吸烟、不稳定心绞痛、药物治疗比率相比，差异无统计学意义。（P > 0.05）。两组患者冠脉造影示靶血管、术前、术后 TIMI 血流分级、器械直径及长度相比均无统计学差异（P > 0.05），OCT 结果提示 DCB 组最小管腔面积小于 DES 组，DCB 组残余血栓负荷、夹层发生率高于 DES 组（P < 0.05）。DCB 组患者随访时间为 28 (18-29.5) 月，DES 组患者随访时间为 22.5 (9-30) 月，随访期内，DCB 组 1 例患者再发心肌梗死，行靶血管再次血运重建；DES 组两组 4 例患者行靶血管再次血运重建。两组患者均无心源性死亡、出血事件发生。与非 MACE 事件人群相比，MACE 事件人群术后残余血栓负荷较高（7.92±3.741 vs 17.6±3.209）、夹层（14%vs 80%）、壁内血肿 (4%vs 80%) 发生率高（P < 0.05），DES 或 DCB 两种治疗方式无差异。

结论 在急诊冠脉介入治疗中，DCB 可安全有效地用于充分预处理后的病变治疗。

冠状动脉支架置入策略对左主干分叉病变患者介入术后一年主要不良心血管事件的影响

尼录帕尔·阿不来克木

新疆维吾尔自治区人民医院

目的：本研究旨在分析不同双支架置入策略对左主干分叉病变术后一年主要不良心血管事件（Major Adverse Cardiovascular Events，MACE）的影响。**方法：**采用回顾性研究设计，收集 2011 年 1 月至 2023 年 4 月在我院行经皮冠状动脉介入治疗的左主干分叉病变患者 239 例。根据术中采取的介入策略，分为 Crush 技术组与 Culotte 技术组，比较 Crush 技术策略组和 Culotte 技术策略组患者基线资料，所有患者均接受为期一年的随访并记录患者手术后一年 MACE 发生情况，主要观察重点为患者术后一年 MACE 的发生情况，次要观察终点为支架内再狭窄（In-stent Restenosis，ISR）发生情况。应用 Kaplan-Meier 生存分析法分别绘制 Crush 技术和 Culotte 技术组患者发生 MACE 与 ISR 的累积生存曲线，并通过 log-rank 检验比较两组间的生存率差异。以 P<0.05 作为判断统计学差异的标准。**结果：**主要结局指标是术后一年 MACE 的发生率，次要结局为 ISR 的发生率。结果显示为 Crush 技术组 MACE 发生率高于 Culotte 技术（28.0% vs 14.4%），差异具有显著统计学意义（P<0.05）；Crush 技术组 ISR 发生率高于 Culotte 技术组，差异具有显著统计学意义（P<0.05）。生存分析显示，Crush 技术组 ISR 累积无事件生存率高于 Culotte 技术组，并且差异具有显著统计学意义（P<0.05）；Crush 技术组较 Culotte 技术组 MACE 累积无事件生存率高，差异具有统计学意义（P<0.05）。Cox 比例风险回归模型分析表明，支架置入策略 [HR 0.470，95%CI（0.264-0.835），P = 0.010]、年龄 [HR 0.033，95%CI（1.001-1.066），P = 0.040]、高血压 [HR 0.716，95%CI（1.126-3.718），P = 0.019]、糖尿病 [HR 0.671，95%CI（1.116-3.429），P = 0.019]、糖化血红蛋白 [HR 0.226，95%CI（1.062-1.480），P = 0.008] 是左主干分叉病变患者术后随访期间发生 MACE 的影响因素。**结论：**相较于 Crush 技术，对左主干分叉病变患者中采用 Culotte 技术策略进行治疗，对 MACE 的发生有更显著的保护作用，具有更低的 ISR 发生率。

Comparison of Spherical Tip Versus Regular Noncompliant Balloons for Crossability in Tortuous Coronary Artery Post-dilatation

Guo-Zhe Sun, Chang Wang, Li Zhang, Cai-Yu Zhang, Chen-Hua He

Department of Cardiology, First Hospital of China Medical University, Shenyang 110001, Liaoning Province, China.

Comparison of Spherical Tip Versus Regular Noncompliant Balloons for Crossability in Tortuous Coronary Artery Post-dilatation

Guozhe Sun, Chang Wang, Li Zhang, Caiyu Zhang, Chenhua He

Department of Cardiology, The First Hospital of China Medical University, Shenyang, Liaoning, China.

Abstract

Background and Aims:

Coronary artery tortuosity (CAT) is a common anatomical challenge encountered during percutaneous coronary intervention (PCI), often associated with reduced device deliverability, procedural failure, and higher rates of both early and late major adverse cardiovascular events (MACE). Achieving optimal lesion preparation through effective post-dilatation is critical to procedural success, particularly in tortuous or calcified vessels. Traditional regular non-compliant balloons (RegNCs) may face resistance or failure to cross severely angulated or stenotic segments, resulting in longer procedure times and increased complication risk. A novel device, the spherical-tip non-compliant balloon (SphNC), has been designed to enhance crossability by reducing tip resistance while maintaining inflation pressure characteristics. This study aimed to evaluate the first-pass crossability, overall procedural efficiency, and safety of SphNC compared to conventional RegNC in patients with tortuous coronary artery lesions undergoing PCI.

Methods:

We conducted a multicenter, randomized, controlled, single-blind trial across six PCI centers in Liaoning Province, China. Eligible patients were adults with de novo coronary lesions requiring post-dilatation after stent deployment, and who presented with moderate-to-severe vessel tortuosity (defined as ≥ 2 bends ≥ 90° , or ≥ 1 bend ≥ 120°) on angiography. Participants were randomly assigned in a 1:1 ratio to receive either the SphNC (intervention) or RegNC (control) post-dilatation balloon. Operators were blinded to group allocation until the moment of device preparation. The primary endpoint was the first-attempt crossability, defined as successful balloon passage through the lesion without device change, additional guidewire support, or deep intubation. Secondary endpoints included final crossability rate (after adjunctive measures if needed), number of crossing attempts, crossing time (seconds), and any procedural or device-related complications. To address missing data and potential confounders, a sensitivity analysis was conducted using multiple imputation, propensity score modeling, and inverse probability weighting (IPW). Subgroup analyses explored consistency across patient age, lesion location, calcification, and other baseline characteristics.

Results:

Between February 2023 and August 2024, 250 patients were enrolled,

with 124 in the intervention group and 119 in the control group. The intervention group had significantly higher first-attempt (91.1% vs 52.9%; P < 0.001) and final crossability (96.0% vs 60.5%; P < 0.001) rates, and shorter crossing times (8.3 sec vs 19.7 sec; P < 0.001). Subgroup analyses showed consistent results across various demographics and lesion characteristics. Sensitivity analyses using IPW-adjusted models confirmed the robustness of the findings, yielding similar effect sizes and significance levels. No device-related adverse events were reported, except for balloon retraction resistance (6/124 vs 4/119; P = 0.562). One non-device related cardiovascular death occurred in the intervention group.

Conclusions:

In patients with tortuous coronary lesions requiring post-dilatation, the novel spherical-tip non-compliant balloon (SphNC) demonstrated significantly higher first-attempt and final crossability rates, faster crossing times, and reduced procedural complexity compared to regular non-compliant balloons. These procedural advantages were achieved without increasing adverse events, underscoring the safety and potential utility of the SphNC in complex PCI cases. The robustness of results across multiple sensitivity analyses strengthens the generalizability of the findings. SphNC may represent a valuable advancement in interventional cardiology, particularly in challenging anatomical settings.

预见性护理联合 PDCA 循环在减少急性心肌梗死介入诊疗并发症中的应用

伍洪令 谢国锋 龙雄

贵州医科大学大学城医院

背景与目的：

急性心肌梗死（AMI）患者行急诊经皮冠状动脉介入治疗（PCI）后，仍面临出血、对比剂肾病、心律失常等并发症风险。传统护理模式以被动应对为主，效果有限。本研究探讨预见性护理联合 PDCA 循环在减少 AMI 介入诊疗并发症中的应用效果，旨在优化护理流程，提高患者安全性。

方法：

选取 2023 年 1 月至 2024 年 6 月在本院接受急诊 PCI 的 AMI 患者 200 例，随机分为对照组（n=100，常规护理）和观察组（n=100，预见性护理 +PDCA 循环）。预见性护理包括：①术前风险评估（CRUSADE 出血评分、Mehran 对比剂肾病评分）；②术中动态监测（生命体征、ACT 值）；③术后早期干预（穿刺部位观察、水化治疗）。PDCA 循环通过计划（Plan）- 实施（Do）- 检查（Check）- 处理（Act）四个阶段持续改进护理质量，如优化止血方案、规范术后监测流程。比较两组术后并发症发生率、住院时间及护理满意度。

结果：

观察组并发症总发生率显著低于对照组（9.0% vs. 22.0%，P<0.05），其中穿刺部位出血（2.0% vs. 8.0%）、对比剂肾病（1.0% vs. 6.0%）及心律失常（4.0% vs. 7.0%）差异均具有统计学意义。观察组平均住院时间更短（5.5±1.2 天 vs. 7.3±1.6 天，P<0.05），护理满意度评分更高（95.2±2.8 分 vs. 87.6±3.9 分，P<0.05）。

结论与意义：

预见性护理联合 PDCA 循环可有效降低 AMI 患者介入诊疗并发症发生率，缩短住院时间并提升护理质量。其优势在于通过前瞻性风险识别和闭环管理实现护理流程的持续优化，为临床实践提供科学依据。本研究成果可为 AMI 介入治疗的护理标准化提供参考，值得推广。

血红蛋白水平与接受 PCI 治疗的 NSTE-ACS 患者预后的相关性

鲍丹 韩雅玲

中国人民解放军北部战区总医院

目的：本研究旨在探讨血红蛋白水平与接受经皮冠状动脉介入治疗的非 ST 段抬高型急性冠状动脉综合征患者预后的相关性，明确不同血红蛋白水平对患者长期预后的影响。

方法：研究纳入 2017 年 1 月至 2019 年 3 月间住院接受经皮冠状动脉介入治疗的非 ST 段抬高型急性冠状动脉综合征患者 9280 例。分析入院首次血红蛋白、住院期血红蛋白最小值、血红蛋白相对变化、血红蛋白绝对变化对于预后的预测价值。研究的主要结果为出院后 1 年的全因死亡事件。

结果：全部的患者，入院首次血红蛋白值的均值和标准差为 138.32±14.86 g/L，中位数和四分位数为 139.0 （129.0-149.0）g/L。住院期血红蛋白最小值的均值和标准差为 129.18±14.74 g/L，中位数和四分位数为 130.0（120.0-139.0）g/L。血红蛋白相对变化均值和标准差为 -6.50%±5.75%，中位数和四分位数为 -5.66%（-10.06% to -1.48%）、血红蛋白绝对变化均值和标准差为 -9.14±8.20 g/L，中位数和四分位数为 -8.0（-14.0 to -2.0）g/L。全部的患者出院后 1 年全因死亡发生率为 1.4%。在预测患者出院后 1 年全因死亡上，住院期血红蛋白最小值的曲线下面积为 0.67 （95% 置信区间：0.61-0.72）、入院首次血红蛋白的曲线下面积为 0.64（95% 置信区间：0.59-0.69）、血红蛋白绝对变化的曲线下面积为 0.59（95% 置信区间：0.54-0.64）。与入院首次血红蛋白、血红蛋白绝对变化、血红蛋白相对变化的预测价值相比，住院期血红蛋白最小值的曲线下面积显著更高，P 值均小于 0.05。

结论：在接受经皮冠状动脉介入治疗的非 ST 段抬高型急性冠状动脉综合征患者中，住院期血红蛋白最小值能够更好的预测出院后 1 年全因死亡事件。

完全生物可降解封堵器闭合膜周部室间隔缺损合并金属封堵器闭合动脉导管未闭一例

周田 周清

蚌埠医学院第一附属医院

目的：探讨复杂结构性心脏病同时采取完全可吸收封堵器与金属封堵器同时应用效果分析。

方法：我们报道了一名有心力衰竭症状的 38 岁男性同时经导管封堵膜周室间隔缺损和动脉导管未闭。患者，男性，38 岁，“反复胸闷半年，加重 1 周” 入院，主要表现为轻微活动即感胸闷气促，并伴有下肢水肿。听诊时发现胸骨左缘第二、第三、第四肋间均可闻及 III 级收缩期杂音。肺部 CT 显示肺动脉增宽，两肺轻度肺血异常；两肺慢性炎性病变可能；左心增大；心电图检查显示窦性心律、左心增大；心脏彩超示：室间隔缺损伴膜部瘤形成（基底部约 13mm，顶部破口 10mm，瘤体深度约 14mm），室水平左向右分流；动脉导管未闭（内径 9mm，长度约 10mm），动脉水平左向右分流；右室流出道狭窄；左室收缩及舒张功能正常。术中采用完全生物可降解室间隔缺损封堵器及金属封堵器完成对复杂结构性心脏病治疗，患者术后出现大量血尿，治疗上给予大量补液、应用激素稳定细胞膜、碱化尿液等处理，持续一周后，尿液颜色转为无色，复查尿常规尿潜血阴性，稳定三天后出院，院外口服氯吡格雷 12 月，因患者高血压，常规口服沙库巴曲缬沙坦降压及改善心肌重构，同时口服少量利尿药物减轻心脏负荷。

结果：患者胸闷乏力显著改善，分别于 1/12 个月进行超声心动图随访发现，封堵器位置正常、形态良好，左室舒张末期容积及左房较前明显减小，封堵处无残余分流，无新发瓣膜反流、无赘生物及血栓形成、无心包积液，期间心电图检查无房室传导阻滞等出现。

结论：采用完全生物可降解封堵器闭合膜周部室间隔缺损合并金属封堵器闭合动脉导管未闭术后，患者未再出现血尿，胸闷乏力感显著减轻，活动耐力改善，下肢无水肿。门诊复查超声心动图显示封堵器位置正常、形态良好，左室舒张末期容积及左房较前明显减小。封堵处无残余分流，无新发瓣膜反流、无赘生物及血栓形成、无心包积液、无房室传导阻滞等出现。证明完全生物可降解封堵器联合金属封堵器闭合复杂结构性心脏病效果良好，完全可吸收封堵器具有潜在的替代部分金属封堵器的选组，其长期又是需大规模研究验证。

左主干冠状动脉疾病合并贫血行冠状动脉介入治疗患者临床特征及预后分析

鄢华 刘道权 宋丹 刘华云 郭卉 王炜 易东

武汉亚洲心脏病医院

目的 分析贫血对血管内超声 (IVUS) 指导下经皮冠状动脉介入治疗（PCI）的左主干冠状动脉疾病 (LMCAD) 患者临床特征及预后。

方法 回顾性分析 2017 年 1 月至 2020 年 12 月武汉亚洲心脏病医院心血管内科收治的 LMCAD 行 IVUS 指导的 PCI 术患者。根据是否合并贫血分为贫血组和非贫血组。通过电子病理系统收集患者的临床资料，对比患者在临床特征和预后方面的差异，随访终点为主要不良心血管事件 (MACE，定义为全因死亡、心肌梗死、卒中的复合终点)。

结 果 共 纳 入 LMCAD 患 者 325 例，平 均 年 龄（62.56 ± 9.86）岁，男 性 73.54%，其中贫血组 98 例（30.15%），中位随访 5 年。与非贫血组相比，贫血组患者年龄更大（P < 0.001），慢性肾脏病比例更高（均 P < 0.01）。贫血组患者冠脉造影合并三支病变比例、IVUS 测量左主干病变钙化度数和 SYNTAX II 评分更高（均 P < 0.05）。贫血组患者全因死亡率和 MACE 显著增加（均 P < 0.001），校正年龄和估算肾小球滤过率（eGFR）后，贫血与 MACE 和再发心肌梗死独立相关。

结论：合并贫血的 LMCAD 患者年龄更大，CKD 患病率更高，病变累及范围更广泛，钙化程度更严重，远期预后更差。

Feasibility of Distal Radial Artery Access and the Influence of Arterial Diameter on Puncture Difficulty

Yuan Du, Huan-Huan Wang, Ming-Hao Liu, Li-Jian Gao

Fuwai Hospital Chinese Academy of Medical Sciences and Peking Union Medical College

Background: Recent years, the distal radial artery (DRA) access has emerged as a novel alternative arterial access for percutaneous procedures. Using the anatomical snuffbox as puncture site, DRA access for coronary procedures achieves similar percutaneous coronary intervention (PCI) success rates to conventional radial artery access, while offering significant advantages such as a lower risk of radial artery occlusion, shorter compression times, and improved patient comfort. The feasibility and safety of DRA access have been extensively evaluated in clinical studies. However, its widespread adoption has been limited by the relatively higher puncture difficulty compared to conventional radial artery access.

Method: A total of 733 patients proposed for DRA access were enrolled at the Department of Cardiology, Fuwai Hospital, between 2021 and 2024. All patients underwent preoperative ultrasound evaluation to

measure the radial artery diameter at the snuffbox, and at 5 cm, 10 cm, and 15 cm proximal to the styloid process of the radius. The primary outcome was DRA difficult puncture, defined as puncture time exceeding 3 minutes. Univariate and multivariate logistic regression analyses were conducted to evaluate the impact of various factors on difficult puncture. Segmented logistic regression was applied to identify threshold values associated with a high likelihood of difficult puncture. Restricted cubic spline (RCS) analysis was performed to assess potential nonlinear associations between the radial artery diameter at the snuffbox and puncture outcomes, and to determine an optimal cutoff value.

Results: The overall DRA puncture success rate among these patients was 96.59%. PCI was performed in 74.0% of cases, with a procedural success rate of 92.7%. The mean puncture time was 2.77 ± 2.62 minutes, with an average of 1.41 ± 0.78 puncture attempts. Radial artery ultrasound findings showed that the pre-puncture diameters of the radial artery at snuffbox, and at 5 cm, 10 cm, and 15 cm proximal to the styloid process of the radius were 2.34 ± 0.43 mm, 2.62 ± 0.47 mm, 2.78 ± 0.50 mm, and 2.92 ± 1.07 mm, respectively. Radial artery occlusion and arteriosclerosis were observed in 7 (1.0%) and 8 (1.1%), respectively. Univariate logistic regression analysis showed that the diameters of the radial artery at the snuffbox (OR, 0.61; 95% CI, 0.40-0.94), and at 5 cm (OR, 0.61; 95% CI, 0.41-0.90), 10 cm (OR, 0.51; 95% CI, 0.36-0.74), and 15 cm (OR, 0.49; 95% CI, 0.34-0.70) proximal to the radial styloid process were significantly associated with difficult puncture. After adjusting various variables, DRA diameter at the snuffbox was still significantly associated with difficult puncture (OR, 0.62; 95% CI, 0.40-0.97). Notably, the RCS curve demonstrated that when the artery diameter at the snuffbox was below 2.4 mm, the risk of difficult puncture increased as the diameter decreased. Furthermore, segmented logistic regression analysis revealed that the likelihood of difficult puncture decreased significantly as the radial artery diameter at the snuffbox increased when the diameter was below 2.1 mm, but showed a slight increase when the diameter exceeded 2.1 mm.

Conclusion: The safety and feasibility of DRA access were confirmed in our study, with puncture success primarily associated with the DRA diameter. This finding offers an important anatomical criterion for patient selection and provides valuable guidance for clinicians when considering DRA access in future interventions.

Risk factors for no spontaneous reperfusion of ST-segment elevation myocardial infarction: A case-control study

-Xue Jiang

兰州大学第一医院

Background: Up to 30% of patients with STEMI have spontaneous reperfusion (SR) before PCI, and the myocardial infarct (MI) size after SR is smaller than those with no SR, and their clinical prognosis is better. Understanding the factors influencing the occurrence of SR could help improve STEMI management. To evaluate the risk factors for no spontaneous reperfusion (SR) in patients with ST-segment elevation myocardial infarction (STEMI).

Methods: This case-control study included patients diagnosed with STEMI who underwent emergency coronary angiography at First Hospital of Lanzhou University between January 2023 and December 2024. This retrospective case-control study included patients with STEMI who underwent emergency coronary angiography in the First Hospital of Lanzhou University between January 2023 and December 2024.The inclusion criteria were 1) patients with STEMI duration <12 h, and 2) emergency coronary angiography showed coronary stenosis or occlusion with abnormal wall motion. The exclusion criteria were 1) the final diagnosis was non-ST-segment elevation myocardial infarction (NSTEMI), unstable angina pectoris, Takotsubo myocardium disease, myocarditis, or cardiogenic shock requiring mechanical assist devices, or 2) patients with missing clinical or follow-up data. The STEMI diagnostic criteria were based on the presence of symptoms of myocardial ischemia, elevated serum biomarker (troponin), and ST-segment elevation of ≥ 1 mm in ≥ 2 consecutive associated leads. SR was defined as culprit vessel TIMI flow grade 3 at the first injection of contrast. No SR was defined as TIMI grade 0-2 flow in the culprit vessel before PCI.All patient follow-up data were obtained from the database of the authors' department's follow-up center.Multivariate logistic regression analysis was used to identify the factors independently associated with no SR.

Results: Of the 660 patients with STEMI, 264 (40.0%) showed SR, and 396 (60.0%) showed no SR. There were no significant differences between the two groups in age, sex, smoking, diabetes, hypertension, stroke, history of angina pectoris in the past 1 month, and location of MI (all P>0.05). Compared with the SR group, the no SR group had significantly higher BMI (24.4±3.0 vs. 23.8±4.1 kg/m^2, P=0.025), proportion of MS (39.7% vs. 31.4%, P=0.032), and proportion of Killip 3-4 (6.6% vs. 3.0%, P=0.044), and significantly lower frequency of single-vessel lesion (45.2% vs. 59.5%, P<0.001). Additionally, the blood routine test results indicated that the white blood cell count (8.71±3.39 ×10^9/L vs. 7.63±2.75 ×10^9/L, P<0.001) and AST levels (100.2±136.1 U/L vs. 80.1±98.7 U/L, P=0.041) in the no SR group were significantly higher than that of in SR group.Multivariate logistic regression showed that the MS (OR=1.48, 95%CI: 1.05-2.09, P=0.025), white blood cell count (OR=1.11, 95%CI: 1.05-1.18, P<0.001), and single-vessel disease (OR=0.56, 95%CI: 0.40-0.78, P=0.001) were independently associated with no SR in patients with STEMI .The results of echocardiography within 24 h showed that compared with the SR group, the patients with no SR had a lower LVEF (52.9±8.5% vs. 55.0±9.3%, P=0.003) and larger LVEDV (126.2±68.9 vs. 116.6±40.7 ml, P=0.045) and LVESV (59.7±30.8 vs. 53.9±30.7 ml, P=0.020). There were no significant differences in all-cause mortality between the two groups after a mean follow-up of 28 months (4.6% vs. 3.8%, P=0.882). After a mean follow-up of 28 months, the all-cause mortality of STEMI with MS was significantly higher than that without MS .

Conclusions: MS, single-vessel disease, and white blood cell count were independently associated with no SR in patients with STEMI.This study was a single-center, retrospective study, so there may be a risk of data analysis bias, and the findings need to be validated. Nevertheless, this study can provide a reference for large-scale analytical studies or experimental studies.

Abstract Objective Acute coronary syndrome (ACS) is a critical and life - threatening cardiovascular condition that poses a significant challenge to global health. It encompasses a spectrum of clinical manifestations, from unstable angina to ST - segment

Xue-Fei Mu

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Abstract

Objective

Acute coronary syndrome (ACS) is a critical and life - threatening cardiovascular condition that poses a significant challenge to global health. It encompasses a spectrum of clinical manifestations, from unstable angina to ST - segment elevation myocardial infarction (STEMI) and non - ST - segment elevation myocardial infarction (NSTEMI). Percutaneous coronary intervention (PCI) has emerged as a cornerstone in the treatment of ACS, effectively restoring blood flow to the ischemic myocardium and improving short - term outcomes. However, patients who undergo PCI often still face the risk of post - PCI ischemic events, which can significantly impact their long - term prognosis and quality of life.

This study aimed to investigate the prognostic value of high - sensitivity cardiac troponin T (hs - cTnT) levels and diabetes mellitus (DM) on ischemic events within 12 months after PCI in ACS patients. Hs - cTnT is a highly sensitive biomarker that can detect even minor myocardial injury, while DM is a well - known risk factor for cardiovascular disease. Understanding the relationship between these factors and post - PCI ischemic events can provide valuable insights for clinicians, enabling them to optimize patient management, stratify risk more accurately, and improve patient outcomes.

Methods

This was a retrospective cohort study conducted at the General Hospital of the Northern Theater Command. A total of 14,173 consecutive ACS patients who underwent PCI between March 2016 and March 2022 were included in the study. The primary outcome was the occurrence of ischemic events within 12 months after PCI, which was defined as a composite of cardiac death, non - fatal myocardial infarction (MI), and/or stroke. These events are not only associated with high morbidity and mortality but also impose a substantial burden on the healthcare system.

Secondary outcomes included all - cause mortality at 12 months and the individual components of the primary outcome. To ensure the accuracy of the analysis, multiple covariates such as age, gender, comorbidities (e.g., hypertension, hyperlipidemia), and previous cardiovascular history were carefully considered. By adjusting for these confounding factors, we could more precisely evaluate the independent effects of hs - cTnT levels and DM on post - PCI outcomes.

Results

During the 12 - month follow - up period, the overall incidence rates of ischemic events, cardiac death, MI, stroke, and all - cause mortality were 2.19%, 1.12%, 0.58%, 0.59%, and 1.55% respectively. Elevated hs - cTnT levels were significantly associated with increased risks of ischemic events (adjusted HR: 1.91, 95% CI: 1.19 - 3.09), cardiac death (adjusted HR: 2.00, 95% CI: 1.08 - 3.71), and all - cause mortality (adjusted HR: 2.78, 95% CI: 1.62 - 4.76).

In diabetic patients, when hs - cTnT levels reached ≥ 5×URL (upper reference limit), the risks were notably more prominent. Interaction analyses indicated that there was no significant interaction between hs - cTnT levels and diabetes status regarding ischemic events (P = 0.78), suggesting that the effects of hs - cTnT and DM on ischemic events are independent. However, there was a significant interaction for all - cause mortality (P = 0.01), indicating that the impact of hs - cTnT on mortality is more complex in diabetic patients.

Conclusions

The findings of this study suggest that elevated hs - cTnT levels and the presence of DM are independently associated with an increased risk of ischemic events and all - cause mortality after PCI in ACS patients. The impact of hs - cTnT on mortality is more pronounced in diabetic patients, highlighting the need for more aggressive management strategies in this high - risk population.

These results emphasize the importance of routine hs - cTnT monitoring in ACS patients, especially those with DM. Clinicians should take these factors into account when formulating individualized treatment and follow - up plans. By better understanding the prognostic value of hs - cTnT and DM, we can potentially reduce the incidence of post - PCI adverse events and improve the long - term prognosis of ACS patients, ultimately leading to better patient outcomes and a more efficient use of healthcare resources.

Protamine-Facilitated Same-Day Discharge Following Distal Transradial Angiography

Yan Chen, Ming-Hao Liu, Huan-Huan Wang, Li-Jian Gao

Fuwai hospital

Background: Despite growing adoption of distal transradial approach (dTRA), data on same-day discharge with protamine-assisted hemostasis following coronary angiography (CAG) remain limited. This pilot study prospectively assessed the safety and feasibility of adjunctive protamine administration with dTRA to facilitate early discharge after CAG.

Methods: From January 2022 to September 2024, a total of 34 patients who were discharged on the same-day after elective CAG via dTRA in our center were included, as well as 34 matched patients who underwent CAG via standard transradial approach (sTRA) during the same period. Exclusion criteria included (1) patients with diagnosis of acute myocardial infarction, and (2) patients with comorbidities that may lead to extra treatment or prolonged hospital stay, such as severe liver or renal dysfunction. After procedure, patients in sTRA group received hemostatic compression devices, whereas patients in dTRA group underwent elastic bandage and gauze pads compression with immediate protamine administration to reverse heparin anticoagulation. Patent hemostasis (pulse oximetry-confirmed) was employed universally. The nurse checked whether the compression site had stopped bleeding every hour. If no bleeding or hematoma was found, the compression device or bandage was released. If the access site had bleeding or a mild hematoma, the site was pressed for another 30 to 60 minutes. Multivariable regression models were conducted to analyses the correlation between different radial artery accesses and clinical variables. The primary endpoint was time to hemostasis, and secondary endpoints were costs and procedure duration. The safety endpoints were the incidences of bleeding-related complications.

Results: The mean age of patients was 58.5 years and 64.7% were male. No significant differences were found in age, height, body mass index or traditional CAD risk factors between the two groups. A total of 7 patients (20.6%) in the dTRA group and 15 patients (44.1%) in the sTRA group had a history of percutaneous coronary intervention, respectively. A comparable proportion of patients presented with stable angina(52.9% vs 58.8%, P = 0.625). All patients underwent CAG with successful insertion of a 6F sheath in both groups. There was no significant difference in the average number of punctures (1.5 vs 1.7, P = 0.229) and puncture duration between two groups. Upper extremity angiography was performed in all dTRA patients (34/34) versus 8.8% (3/34) of sTRA patients. 4 patients in the dTRA group and 5 patients in the sTRA group received intracoronary imaging or Coronary Functional examination. 4 patients in the dTRA group and 5 patients in the sTRA group received intracoronary imaging or Coronary Functional examination. Compared with the sTRA group, the dTRA group had a significantly shorter hemostasis time (1.3h vs. 5.9h, P < 0.001) and a lower hospital cost (12.8 vs. 14.6(CNY $\times 10^3$), P = 0.020). Procedure duration didn't differ between the two groups. No major hematoma, access-site bleeding, arteriovenous fistula or pseudoaneurysm was recorded. 5 cases of self-reported numbness of extremity on the access site were recorded in the sTRA patients, compared no cases in dTRA patients. There were 2 cases of radial artery occlusion in dTRA group and 3 cases in sTRA group one month after discharge, with no significant difference (P = 0.642). Multivariable regression analysis showed that dTRA significantly shortened hemostasis time (β -3.1, 95% CI -3.8 ~ -2.3, P < 0.001) with a reduction in costs[β -3.3, 95% CI -5.400 ~ -1,200, P = 0.004, (CNY $\times 10^3$)]. No relationship of access approach with procedure duration was found.

Conclusions: Same-day discharge after dTRA CAG with protamine was feasible and safe, achieving significantly reduced hemostasis time and costs compared to sTRA.

Predictive Value of Coronary Radial Wall Strain Combined with Angiographic Parameters for Myocardial Infarction and Unplanned Revascularization: A Case-Control Study

Si-Da Jia[1], Ying Song[1], Yu-Ming Ren[2], Zhi-Qing Wang[3,4], Sheng-Xian Tu[3,4], Jin-Qing Yuan[1]

1. Fuwai Hospital CAMS & PUMC

2. Shanghai Pulse Medical Technology, Inc.

3. Department of Cardiology, Huadong Hospital, Fudan University

4. Biomedical Instrument Institute, School of Biomedical Engineering, Shanghai Jiao Tong University

Background

Radial wall strain (RWS), a biomechanical marker quantifying local coronary deformation during cardiac cycles, has emerged as a promising tool for plaque vulnerability assessment. Prior studies indicate RWS correlates with high-risk plaque features and predicts myocardial infarction (MI) by reflecting endothelial shear stress distribution. However, its role in forecasting unplanned revascularization—a critical endpoint often driven by progressive atherosclerosis or restenosis—remains unexamined. Conventional angiographic parameters (e.g., QFR, lesion length) lack sensitivity to early biomechanical dysfunction, which may precede anatomical stenosis. This gap is significant given that biomechanical alterations in coronary walls precede acute events and may serve as earlier intervention triggers. We thus aimed to evaluate RWS alongside conventional indicators for predicting composite MI/unplanned revascularization events, addressing a pivotal unmet need in precision cardiology.

Methods

In this single-center case-control study, we included 241 patients (264 lesions) from a cohort of 10,724 patients with CAD underwent PCI in Fuwai Hospital from Jan 2013 to Dec 2013. The event group (n=132 lesions) comprised patients who required repeat hospitalization for either myocardial infarction (MI) or unplanned revascularization post-PCI, which were propensity matched 1:1 with control group lesions (n=132) from patients without such events based on demographic characteristics (including age, sex, low density lipoprotein level and hypertension) and lesion localization (Figure 1). Key angiographic parameters assessed included RWS maximum value (RWSmax), baseline quantitative flow ratio (QFR), resting and simulated hyperemic Angiography-derived Microcirculatory Resistance (AMR), among other morphological characteristics. Predictive performance was evaluated through receiver operating characteristic (ROC) curve analysis, while logistic regression models identified independent predictors for MI/unplanned revascularization.

Results

Baseline patient characteristics demonstrated comparability between the event group (post-PCI MI/unplanned revascularization) and controls, except for significantly higher diabetes incidence in the event group (32.4% vs. 19.2%, P < 0.05). Lesion-level analysis revealed that event-associated lesions exhibited markedly elevated RWSmax (P < 0.001), increased stenosis severity (P = 0.002), and prolonged lesion lengths (P < 0.001), alongside reduced baseline QFR (P < 0.001). ROC analysis identified RWSmax (AUC = 0.671, 95% CI: 0.584–0.758), baseline QFR (AUC = 0.699, 95% CI: 0.619–0.779), simulated hyperemic AMR (AUC = 0.696, 95% CI: 0.612–0.780), and lesion length (AUC = 0.687, 95% CI: 0.603–0.771) as strong predictors of composite events. The integration of these parameters into a combined model significantly enhanced predictive accuracy (AUC = 0.764, 95% CI: 0.692–0.836) (Figure 2). Subsequent multivariate logistic regression adjusted for clinical and angiographic confounders demonstrated that RWSmax exceeding 13.00% (adjusted OR = 2.699, 95% CI: 1.315–5.540, P = 0.007) and lesion length greater than 28.11 mm (adjusted OR = 2.597, 95% CI: 1.348–5.001, P = 0.004) remained independently associated with event risk. Biomechanical and morphological parameters including resting AMR, and proximal/distal reference diameters showed no significant predictive value in fully adjusted models.

Conclusion

This case-control study identifies RWSmax >13% as an independent biomechanical predictor for post-PCI composite myocardial infarction/unplanned revascularization events, persisting after multivariable adjustment. When integrated with morphological parameters, it significantly enhances risk stratification, providing a novel biomechanical-morphological prognostic model. These findings suggest RWS implementation during routine angiography might refine PCI risk assessment and guide targeted surveillance protocols for vulnerable lesions, though prospective validation remains warranted before clinical adoption.

原发性与继发性自发性心肌梗死的差异：来自 ISCHEMIA 研究的启示

赵泽昊 曾勇

首都医科大学附属北京安贞医院

背景：根据病理生理机制，心肌梗死 (Myocardial Infarction, MI) 被分为五种类型。与第 4a 型和第 5 型不同，第 1 型、第 2 型、第 4b 型和第 4c 型与血运重建过程无关，被称为自发性心肌梗死。其中，第 1 型、第 4b 型和第 4c 型通常由冠状动脉新发病变或支架内再狭窄及血栓形成引起，而第 2 型则源于心肌氧供与需之间的不平衡。因此，这些类型可以区分为原发性自发性心肌梗死 (Primary Spontaneous Myocardial Infarction, PSMI) 和继发性自发性心肌梗死 (Secondary Spontaneous Myocardial Infarction, SSMI)。然而，PSMI 与 SSMI 在临床特征、预后以及预防策略上是否存在差异，尚不明确。

方法：本研究对 ISCHEMIA 和 ISCHEMIA-CKD 试验中公开数据进行了二次分析 (数据来源：BioLINCC，NHLBI；https://biolincc.nhlbi.nih.gov/)。在随机分组时收集了患者的基线特征，包括人口统计学信息、病史、动脉粥样硬化危险因素、主观心绞痛严重程度、缺血范围及冠状动脉病变严重程度，并比较了 PSMI 与 SSMI 患者之间的差异。使用冠状动脉 CT 血管成像计算的节段累及评分 (Segment Involvement Score, SIS)、病变狭窄评分 (Segment Stenosis Score, SSS) 和 DUCK 评分评估冠脉病变严重程度。采用 Cox 回归分析探讨不同类型心肌梗死对死亡风险的影响、冠状动脉狭窄对不同类型 MI 的影响，以及血运重建治疗是否可降低各类型 MI 的风险。

结果：SSMI 组血红蛋白水平较低 (13.8 [12.3;14.8] g/L, 12.7 [11.0;14.0] g/L, p <0.001) 及严重缺血比例较低 (36.6%, 56.6%, p = 0.001)，此外，两组在基线特征方面无显著差异。SSMI (HR 7.83 [5.53–11.08]) 和 PSMI (HR 4.16 [3.22–5.38]) 均显著增加后续死亡风险，且 SSMI 对死亡的影响更为显著。在 SSS、SIS 和 DUCK 评分中，SSS 评分，一项综合了病变部位和严重程度的评分，能够预测 PSMI 与 SSMI 的风险，提示冠状动脉病变的严重程度是两种类型 MI 的共同危险因素。然而，血运重建治疗仅能降低 PSMI 的风险 (HR 0.60 [0.47–0.76])，对 SSMI 的风险无显著影响 (HR 0.96 [0.66–1.40])。

结论：SSMI 对死亡风险的影响更为显著。冠状动脉狭窄程度影响 PSMI 与 SSMI 的发生风险，但只有 PSMI 的风险可通过靶向冠状动脉狭窄的治疗——血运重建加以降低。

使用 6F 桡动脉鞘管和 6.5F 桡动脉鞘管经桡动脉路径行冠状动脉造影及介入的对比分析

刘喜 赵磊

内蒙古鄂尔多斯市中心医院

目的：本文旨在通过使用 6F 桡动脉鞘管和 6.5F 桡动脉鞘管经右侧常规桡动脉穿刺途径行 CAG 及 PCI 术中及术后观察指标对比，评估使用 6.5F 桡动脉穿刺鞘管行 CAG 及 PCI 术中及术后的安全性。

方法：随机选取 2022 年 11 月至 2023 年 11 月使用 6F 桡动脉鞘管（迪玛克医疗器械有限公司）及 6.5F 桡动脉鞘管（埃普特医疗器械有限公司）行 CAG 及 PCI 的患者，依据《中国经皮冠状动脉介入治疗指南（2016）》的适应证行 PCI。分为对照组（迪玛克公司生产的 6F 桡动脉鞘管）和研究组（埃普特公司生产的 6.5F 桡动脉鞘管），统计两组患者的疼痛感、穿刺时间、穿刺成功率、手术时间、桡动脉痉挛（radial artery spasm,RAS）、术中造影剂用量、术者操作顺畅度评价、迷走反射发生情况、术中更换鞘管的比例、术后压迫止血时间，桡动脉出血、血肿、桡动脉闭塞（radial artery occlusion,RAO）、桡动脉血栓、假性动脉瘤的发生率，统计术前、术后 3 天、术后 1 个月两组患者的桡动脉血管内径，血流速度（PHILIPS 彩色多普勒超声评估）。使用 SPSS 24 版本进行统计学分析，检验水准 α=0.05。

结果：本次研究严格依据排纳标准共搜集了 165 例患者，其中 7 例患者失访，已排除，对照组患者 80 例，研究组患者 78 例（研究组与对照组中 PCI 数量都为 40 例），所纳入病历均已经完成各项数据的搜集及随访。（1）两组患者基本资料的比较：在年龄、性别、血脂、高血压病病史、吸烟史、心律失常、糖尿病病史或糖耐量异常、体重、家族史等方面进行比较，差异无统计学意义(P>0.05)。（2）两组患者在穿刺时间、穿刺成功率、术中造影剂用量、迷走反射发生情况方面差异无统计学意义（P>0.05），两组患者在疼痛感、手术时间、RAS、术者操作顺畅度、术后压迫止血时间方面进行比较，差异具有统计学意义（P<0.05），研究组患者疼痛感更轻、手术时间更短、RAS 发生概率更低、术者操作更顺畅、术后压迫止血时间更短。对照组与研究组在桡动脉出血、桡动脉血肿、术后血栓、假性动脉瘤发生方面，差异无统计学意义（P>0.05），对照组术后 RAO 发生率高于研究组，差异具有统计学意义（P<0.05）。（3）由重复测量方差分析结果可知：右侧桡动脉管腔内径的时间主效应影响显著（F=95.227，P < 0.05），组别主效应影响不显著（F=2.273，P > 0.05），时间 * 组别交互效应影响显著（F=27.083，P < 0.05）。由于交互效应影响显著，进一步进行简单效应可知，术前、术后 3 天、术后 1 个月对照组和研究组间右侧桡动脉管腔内径均差异不显著（P > 0.05）；对照组、研究组的右侧桡动脉管腔内径术前显著高于术后 3 天、术后 1 个月，术后 1 个月显著高于术后 3 天（P < 0.05）。右侧桡动脉血流速度时间主效应影响显著 (F=30.247, P < 0.05)，由多重比较结果可知，术后 3 天、术后 1 个月右侧桡动脉血流速度显著高于术前。组别主效应影响不显著 (F=0.016, P > 0.05)，时间 * 组别交互效应影响不显著（F=0.454，P>0.05）。

结论：以埃普特公司为代表生产的 6.5F 桡动脉薄壁鞘管作为新的穿刺器械在术中及术后是安全可行的，配合 6F 或 6.5F 导引导管可以完成绝大多数 PCI，为术者术前预规划提供了更多的器械选择，在降低穿刺相关并发症发生率的同时，提高了手术舒适度。

长鞘管在经桡动脉冠状动脉造影中的应用效果分析

崔翰斌

宁波大学附属第一医院

目的　分析长鞘管在经桡动脉途径冠状动脉造影（CAG）中的有效性和安全性。　方法　回顾性选择 2022 年 4 月至 2023 年 4 月在宁波大学附属第一医院诊断为可疑冠心病患者 1695 例。其中在 CAG 术中使用长鞘管患者 714 例（观察组），短鞘管患者 981 例（对照组），收集并比较两组患者的基本数据、导丝血管通过率、手术时间、射线时间、射线剂量、对比剂用量、更换导丝比例、更换左侧桡动脉比例、更换造影导管比例及手术并发症。采用多因素 logistic 回归分析导丝血管通过率的影响因素。　结果　观察组导丝血管通过率明显高于对照组（99.3% 比 93.4%），差异有统计学意义（P < 0.05），观察组手术时间、射线时间、射线剂量、对比剂用量、更换导丝比例、血管痉挛发生率、迷走反应发生率均低于对照组，差异均有统计学意义（均 P < 0.05）。两组患者血管夹层、前臂血肿、更换造影导管和更换左侧桡动脉比例比较，差异均无统计学意义（均 P > 0.05）。两组患者均无血管穿孔、纵隔血肿发生。多因素 logistic 回归分析结果发现年龄及长鞘管均是导丝血管通过率的影响因素(均P < 0.05)　结论　长鞘管相对短鞘管在经桡动脉入路 CAG 术中更有效且安全，值得临床推广应用。

First Evidence of Correlation Between Red Blood Cell Parameters and Angiography-Derived Coronary Microcirculatory Resistance: A New Insight into Coronary Microvascular dysfunction

Objective: to evaluate whether red blood cell parameters are correlated with the Angiography-Derived Coronary Microcirculatory Resistance in patients with intermediate lesions.

Methods: This retrospective cohort study evaluated the association between red blood cell (RBC) parameters and angiography-derived index of microcirculatory resistance (IMR) in patients with intermediate coronary artery disease (30%-70% stenosis). Data from 733 lesions were extracted from the First Affiliated Hospital of Xi'an Jiaotong University database. Patients were with angiographically assessable lesions suitable for monoplane quantitative flow ratio (mQFR) analysis. RBC parameters (RBC count, hemoglobin, hematocrit, etc.) were obtained during hospitalization prior to angiography. Coronary microcirculatory resistance (IMR) was derived using the AngioPlus mQFR system. Multivariable linear regression models adjusted for demographics, comorbidities, medications, and angiographic severity. Subgroup analyses assessed effect modification by diabetes status, and sensitivity analyses excluded hematocrit outliers, and analyses stratified by vessel (LAD, LCx, RCA). Statistical significance was set at *p* < 0.05 (two-tailed), with rigorous diagnostics for model validity.

Results: Higher RBC, Hct and Hgb were independently associated with elevated angio-derived IMR in multivariable analysis (RBC: β = 0.182, *p* < 0.001; Hct: β = 0.019, *p* < 0.001; Hgb: β = 0.006, *p* < 0.001) adjusted for other blood parameters, demographics, comorbidities and angiographic severity. Results were robust in sensitivity analyses excluding Hct outliers (β = 0.020, *p* < 0.001) and consistent across diabetic (*p* = 0.007) and non-diabetic subgroups (*p* = 0.012). The association was stronger in non-LAD vessels (Hct: β = 0.022, *p* < 0.001 for non-LAD vs. β = 0.008, *p* = 0.357 for LAD).

Association of Erythrocyte Indices (RBC Count, Hematocrit, Hemoglobin) with Microvascular Resistance: Results from Multivariable Linear Regression Models

Variable	Unadjusted β (95% CI)	Model 1 β (95% CI)	Model 2 β (95% CI)	Model 3 β (95% CI)	Model 4 β (95% CI)
RBC	.123 (0.048 to 0.198) **P=0.001**	.187 (0.105 to 0.269) **P<0.001**	.170 (0.075 to 0.265) **P<0.001**	.168 (0.073 to 0.263) **P<0.001**	.182 (0.090 to 0.274) **P<0.001**
Hct	.018 (0.010 to 0.027) **p<0.001**	.019 (0.010 to 0.027) **P<0.001**	.017 (0.007 to 0.027) **P<0.001**	.017 (0.007 to 0.027) **P<0.001**	.019 (0.009 to 0.028) **P<0.001**
Hgb	.006 (0.003 to 0.008) **p<0.001**	.006 (0.004 to 0.008) **P<0.001**	.006 (0.003 to 0.006) **P<0.001**	.006 (0.003 to 0.009) **P<0.001**	.006 (0.003 to 0.009) **P<0.001**

Model 1: Adjusted for other blood parameters.

*Model 2: Model 1 + (age, gender and BMI).

*Model 3: Model 2 + comorbidities (diabetes, hypertension, hypercholesterolemia and prior statins).

*Model 4: Model 3 + angiographic severity (DS%, lesion length).

Conclusion: This study confirms that higher RBC, hematocrit, and hemoglobin levels are independently associated with increased coronary microcirculatory resistance (IMR) in patients with intermediate coronary lesions, particularly in non-LAD vessels. These findings suggest that RBC parameters may serve as clinically relevant markers of microvascular dysfunction, warranting further investigation into their prognostic and therapeutic implications.

1 例经导管主动脉瓣置换术后合并瓣周漏诱发心衰行经导管封堵术患者的护理

李立博 吴黎莉 马燕 章盈盈

浙江大学医学院附属邵逸夫医院

【摘要】 本文总结 1 例中重度主动脉瓣狭窄伴轻度关闭不全患者，在行经导管主动脉瓣置换术术后发生中重度瓣周漏导致心源性休克并行经导管瓣周漏封堵术的护理经验。护理要点：术后超声监测联合连续肾脏替代治疗积极控制心衰；降低出血风险，谨防血栓形成；器械相关性溶血与血管夹层的及早发现与预防；精细化个体康复，提高患者舒适度，动态调整营养支持。手术顺利。在行经导管瓣周漏封堵术以及精细化护理后，患者瓣周反流得到改善，术后心衰得到控制，极大缓解患者胸闷胸痛的症状，患者活动耐力提高。住院期间未发生出血及血栓事件。术后第 46 天康复出院。

Investigating the Clinical Implications and Diagnostic Accuracy of the QFR Grey-Zone in Coronary Artery Disease: A Comprehensive Analysis of TVF Prediction

Objective: This study evaluates the clinical significance and optimal management strategy for coronary lesions in the quantitative flow ratio (QFR) "grey zone" (0.75–0.85), where functional assessment remains uncertain.

Methods: This retrospective study analyzed 297 coronary lesions with borderline QFR values (0.75–0.85). Patients were stratified by treatment (PCI vs. medication-only), with target vessel failure (TVF: cardiac death, target vessel MI, or ischemia-driven revascularization) as the primary endpoint. Baseline characteristics were compared using appropriate statistical tests. Time-to-event analysis used Kaplan-Meier curves and Cox proportional hazards models adjusted for clinical risk factors. To identify predictors of TVF within the grey zone, lesions were further stratified into QFR 0.75–0.80 and 0.81–0.85 subgroups, with interaction testing for variables significantly associated with TVF in the primary analysis.

Results: Among 297 grey-zone lesions (QFR 0.75–0.85), no significant difference in target vessel failure (TVF) was observed between PCI and medication groups (Kaplan-Meier log-rank *p*=0.760). However, in medication-treated patients, LVEF ≤ 45% significantly predicted TVF (adjusted HR 0.008, 95% CI 0.000–0.236, *p*=0.005), with a pronounced interaction between QFR ≤0.80 and LVEF ≤45% (Mantel-Haenszel OR 0.16, 95% CI 0.03–0.77, *p*=0.023). Elevated HbA1c independently increased TVF risk across all medically treated patients (HR 2.18, 95% CI 1.02–4.69, *p*=0.045).

Cox Regression Analysis of Predictors for Target Vessel Failure (TVF): PCI vs. Medical Therapy and Clinical Variables

Variables	B	SE	HR	95.0% CI Lower	95.0% CI Upper	P value

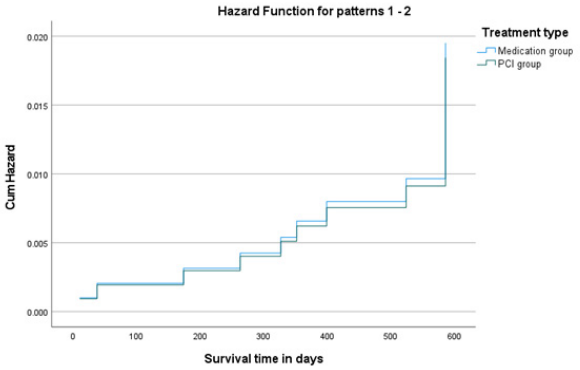
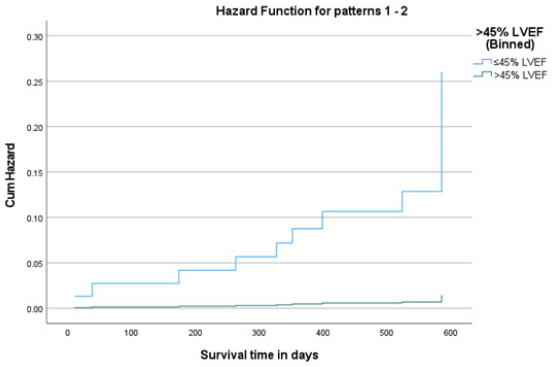
Length	0.007	0.027	1.007	0.954	1.062	0.810
Syntax I score	0.014	0.030	1.014	0.956	1.075	0.644
Treatment type	-0.056	0.828	0.945	0.187	4.787	0.946

Adjusted Hazard Ratio for PCI vs. Medical Therapy Predicting Target Vessel Failure (TVF)



Adjusted Hazard Ratio for LVEF ≤ 45% Predicting Target Vessel Failure (TVF)



Conclusion: In patients with coronary lesions in the QFR grey zone (0.75–0.85), treatment strategy (PCI vs. medication) did not significantly impact TVF rates. However, reduced LVEF (≤ 45%) and higher HbA1c identified subgroups at increased risk, suggesting potential utility of LVEF and glycemic control in guiding individualized management. These findings highlight the need for further prospective studies to refine QFR-based decision-making in borderline lesions.

急性心肌梗死早期活动护理对患者康复进程的观察

郑瑞玲

新疆维吾尔族自治区人民医院

摘要：研究观察急性心肌梗死患者接受早期活动护理对改善临床心功能及预后的价值。2024 年 2 月至 2025 年 2 月间收治 58 例急性心肌梗死患者，随机分为对照组 29 例和试验组 29 例；对照组：接受基本常规护理；试验组：在对照组护理的基础上实施早期活动护理，包括分期运动锻炼护理、规范化呼吸锻炼护理和情感心理护理，在 4 周的护理期中，观察对照组和试验组患者的 LVEF 情况、N-telopeptide-prob 型 B 型钠尿肽 (NT-proBNP) 指标和六分钟步行实验 (6MWD) 结果、SF-36 调查评估量表结果以及并发症发生率。试验组患者的试验后的 LVEF 提升较对照组明显，改善了左心室收缩功能；患者的 NT-proBNP 降低较明显，提示心脏负担得以减轻；试验组的 6MWD 的结果则比对照组提高，提示试验组患者较对照组具备更好的耐力及体能；试验组患者的生活质量评价值，较对照组提高，提示试验组患者在生活质量评价中获得较高的评分。患者的并发症发生率较低，且试验组患者的安全性较高，不存在较大的临床不良事件风险增加的情况。总之，早期活动护理有利于患者急性心肌梗死治疗，促进其心功能的恢复和运动能力的提高；有利于患者病情预后；应早日干预。

关键词：急性心肌梗死；早期活动护理；康复进程

1、资料与方法

1.1 一般资料

以 2024 年 2 月 ~ 2025 年 2 月于本院确诊并予以住院治疗的 58 例急性心肌梗死患者作为研究对象。按照随机数字表方法将其分成试验组 29 例、对照组 29 例。两组患者性别、年龄、患病时间、基础疾病等一般资料差异无统计学意义，具有可比性。所有患者均由冠状动脉造影确诊，符合急性心肌梗死相关诊断标准。所有患者均符合本研究纳入、排除标准，均签署知情同意。

1.2 方法

1.2.1 对照组

2、结果

2.1 对照组和试验组急性心肌梗死患者干预前后心功能指标的比较，详见下表：

表 1：各组心功能指标对比表

组别	例数	时间	LVEF（%）	NT-proBNP（pg/mL）	心率（次 / 分）	收缩压（mmHg）
对照组	29	干预前	42.1±3.5	1856.2±214.5	82.3±6.1	132.5±10.2
		干预后	45.8±4.2	1523.4±189.7	78.5±5.8	128.3±9.5
试验组	29	干预前	41.9±3.8	1849.1±208.9	81.7±5.9	131.8±11.0
		干预后	51.2±4.8	1102.5±156.3	72.1±5.1	122.6±8.8
t 值	-	-	5.281	8.927	4.326	3.815
P 值	-	-	<0.05	<0.05	<0.05	<0.05

3、讨论

急性心肌梗死属于一种发病率较高、残损率及死亡率较高的严重心血管事件，其临床救治的重要程度并不局限于药物治疗、手术操作，更有对病后恢复护理干预的方案与操作。目前治疗思路也在不断从以疾病为导向向以病人为导向发展，护理干预过程中加入的功能锻炼、心理安慰、个体化支持等更是治疗远期结局的重要因素 [1]。本研究在结合急性心肌梗死发生机制与治疗机制制定针对性早期活动护理干预，并与干预前后两组患者有关指标做比较分析基础之上，对该干预措施开展的临床意义与价值进行研析。

探究肺动脉球囊扩张成形术后靶血管再干预的预测因素

卢志辉 张臣 万钧 肖瑶 赵蕾 鹿冠玉 张洪博 马晓海

首都医科大学附属北京安贞医院

目的 探究慢性血栓栓塞性肺动脉高压 (CTEPH) 患者经肺动脉球囊扩张成形术 (BPA) 治疗后靶血管再干预的危险因素。

方法 回顾性纳入 2021 年 11 月至 2024 年 5 月于首都医科大学附属北京安贞医院介入诊疗科行 BPA 治疗的 CTEPH 患者 66 例。收集患者接受 BPA 治疗前的各项临床资料、血流动力学参数与肺动脉造影相关参数。其中临床资料包括患者年龄、性别、体重指数、药物治疗、WHO 心功能分级、6 分钟步行距离 (6MWD) 及血浆 N- 末端脑钠肽前体 (NT-prBNP)。血流动力学参数包括平均动脉压、平均右心房压、心指数、心输出量、肺血管阻力、肺动脉楔压及混合静脉血氧饱和度。肺动脉造影相关参数包括靶血管分布、病变类型、狭窄百分比、球囊 / 管径比、靶血管参考直径及靶血管血流分级。根据患者是否存在至少一只靶血管接受再干预治疗，将患者分为再干预组与非再干预组。采用单因素 / 多因素 logistic 回归分析评估靶血管 BPA 术后发生再干预的危险因素。

结果 66 例 CTEPH 患者共计行 163 次 BPA 治疗。其中，33 例患者及其 99 支靶血管为再干预组，33 例患者及其 244 支靶血管为非再干预组。两组年龄、性别、体重指数、药物治疗、WHO 心功能分级、6MWD 及 NT-prBNP 及血流动力学参数比较差异无统计学意义。再干预组靶血管环形病变比例及次全闭塞病变比例明显高于非再干预组，靶血管狭窄百分比明显高于非再干预组，肺动脉血流分级 3 级比例明显高于非再干预组，差异具有统计学意义。多因素 logistic 回归分析显示高水平基线肺动脉血流分级 (95% CI: 0.062-0.220, P<0.001) 为靶血管术后再干预的独立保护因素，高水平靶血管狭窄百分比 (95% CI: 1.942-1.983, P<0.001) 为靶血管术后再干预的独立危险因素。

结论 CTEPH 患者经 BPA 治疗后靶血管再干预的发生与多因素相关，高水平基线肺动脉血流分级为再干预的独立保护因素，高水平靶血管百分比为 CR 的独立危险因素。

Impact of Early Versus Delayed Permanent Pacemaker Implantation on Clinical Outcomes in Patients with Third-Degree Atrioventricular Block After Transcatheter Aortic Valve Replacement: A National Inpatient Sample Analysis

Baotong He

General Hospital of Ningxia Medical University

Background: Transcatheter aortic valve replacement (TAVR) has become a treatment option for patients with symptomatic severe aortic stenosis. However, due to the anatomical proximity of valve implantation to the cardiac conduction system, the conduction disorder requiring permanent pacemaker (PPM) implantation remains the most common complication of TAVR. Although there have been studies analyzing the clinical outcomes of PPM implantation in patients after TAVR, there is still controversy over the timing of pacemaker implantation and the factors that affect the timing of pacemaker implantation are not yet clear.

Methods: This study covers all hospitalizations of adults with third-degree AV block who were admitted to TAVR between January 2016 and December 2021 and underwent PPM implantation during the same hospitalization. Participants were divided into early PPM implantation (within 72 hours after TAVR) and delayed PPM implantation (more than 72 hours after TAVR) based on the time of implantation. The primary outcome of the study was all-cause death. Secondary outcomes included length of stay (LOS), hospital costs, and various in-hospital complications. Multivariable logistic regression was employed to calculate adjusted odds ratios (aOR) or adjusted beta (aβ).

Results: A total of 3,385 patients who underwent TAVR and PPM with third-degree AV block during the same admission between 2016 and 2021 were included, of which 2,487 (73.47%) were early implantation and 898(26.53%) were delayed implantation. Patients with delayed PPM implantation were on average older (mean age in women was 80.2 years vs. men 79.7 years, P = 0.008), less likely to be female (42.3% vs. 46.7%, P = 0.024), more often non-White race (15.7% vs. 11.6%, P < 0.001), likely to choose Medicare as a payment method (89.5% vs. 88.9%, P < 0.001). The early and delayed PPM implantation groups showed similar characteristics in terms of factors such as household income and teaching. In complications, delayed PPM implantation group exhibited a higher prevalence of certain conditions compared to early PPM implantation group, including congestive heart failure (76.5% vs. 70.4%, P < 0.001), coagulopathy (19.3% vs. 12.6%, P < 0.001), weight loss (6.9% vs. 1.7%, P < 0.001), anemia (8.6% vs. 4.3%, P < 0.001) and prior stroke (14.8% vs. 12.0%, P = 0.032). Conversely, the early implantation group had more incidence in obesity (26.7% vs. 22.7%, P = 0.018), smoking (40.1% vs. 34.9%, P = 0.006), prior percutaneous coronary intervention (22.6% vs. 17.9%, P = 0.003). The results showed that there was no significant difference in the incidence of mortality between patients with delayed pacemaker implantation and those with early pacemaker implantation (1.0% vs. 0.9%, P = 0.751). However, the incidence of hospitalization costs ($332968.9 ± 209628.5 vs. $248325.1 ± 146793.5%, P < 0.001) and length of stay (9.7 ± 7.1% vs. 3.5 ± 3.0%, P < 0.001) in the group with delayed pacemaker implantation is higher than that in the early group. Multiple regression analysis determined that delayed PPM is associated with anemia (OR, 2.1, 95%CI 1.6 - 2.9, P < 0.001), coagulation disorders (OR, 1.6, 95%CI 1.3 - 1.9, P < 0.001), congestive heart failure (OR, 1.4, 95%CI 1.2 - 1.6, P < 0.001), and chronic kidney disease (OR, 1.4, 95%CI 1.2 - 1.6, P < 0.001).

Conclusions: In this national cohort, our analysis found that the delayed implantation group exhibited longer hospital stays and increased hospitalization costs, but there was no significant difference in hospital mortality rates between the two groups. Correctable hematological and cardiorenal dysfunction independently associated with delayed implantation of PPM. In the future, standardized tools with unnecessary delays should be avoided as much as possible while ensuring safety, and optimization should be carried out for comorbidity management.

Construction and Validation an Interpretability Prediction model for In-Stent Restenosis based on Machine Learning

Bing-Bing Ke, Cheng-Ping Hu, Zheng Qin, Hui Chen, Hai Gao

Beijing Anzhen Hospital, Capital Medical University

Background: Issues surrounding in-stent restenosis (ISR) remain a barrier to improvements in cardiovascular intervention therapies, as the sensitivity and specificity of ISR prediction models tend to be poor.

Aims: This study aimed to construct and validate an explainable prediction model for ISR based on machine learning (ML).

Methods: Our study was conducted and validated in patients undergoing percutaneous coronary interventions. The derivation cohort, which included 1,421 patients seen between January 2013 and December 2020, was separated into a training cohort (80%) and an internal validation cohort (20%). ISR was defined as a stenosis diameter ≥ 50% that occurred in the segment inside the stent or a 5 mm of proximal or distal to the stent or absolute lumen loss exceeds 20% based on the original vascular stenosis at the time of follow-up angiography. We obtained 53 features and used five ML algorithms to establish prediction models. We generated five ML models to predict ISR development in patients with PCI. Among the five models, the RF model (AUC = 0.957) had the best predictive capacity for ISR, followed by the XGBoost model (AUC = 0.896) and the SVM model (AUC = 0.841). Our final model was identified during RF model feature reduction. the 54-feature RF model was significantly better at predicting ISR than the three-feature model (△ AUC = 0.077, P = 0.008) and the five-feature model (△ AUC = 0.057, P = 0.005), but was not significantly better than the four-feature model (△ AUC = 0.054, P = 0.432). The four-feature model had a good net benefit and a high threshold probability, which was also comparable to the 54-feature model. The AUC of the four-feature model's P-R curve was only marginally lower than that of the 54-feature model, suggesting that both models had similar and high clinical utility. we chose this four-feature RF model, which included age, blood glucose, Cr, and DBP, as the final model for further analysis. This model achieved an AUC of 0.903, with a sensitivity of 0.857, a specificity of 0.787, a PPV of 0.797, an NPV of 0.850, an accuracy of 0.822, and an F1 score of 0.826 for predicting ISR in patients with PCI.

the final model achieved mean AUCs of 0.960 ± 0.009 and 0.966 ± 0.014 in the five-fold and ten-fold cross-validations, respectively. The SHapley Additive explanation (SHAP) method was used for feature selection and model interpretation. We used demographic characteristics, vital sign measurements, and laboratory data collected from the EMR system. The main outcome was ISR, which was defined as a stenosis diameter ≥ 50% that occurred in the segment inside the stent or a 5 mm of proximal or distal to the stent or absolute lumen loss exceeds 20% based on the original vascular stenosis at the time of follow-up angiography

Results: Among the five models, the Random Forest model had the best predictive ability (AUC = 0.957). When the SHAP method was used to rank the importance of features and gradually reduce the number of features from 54 to two, there was no significant AUC change in the final model, which had four features (ΔAUC = 0.054, p=0.432). The SHAP method was also used to interpret the model. Finally, we established a convenient tool to facilitate the application of our model in clinical practice.

Conclusions:we successfully developed an explainable ML model to predict ISR risk in PCI patients based on clinical data extracted from EMRs. Our final RF model had an excellent ability to predict ISR. We also integrated our model into a web application that can be used by individual patients or clinicians. Further randomized controlled trials are required to determine whether our final prediction model can improve patient outcomes.

不同 eGFR 水平 UA 患者的 caFFR、caIMR 及平均中心动脉压的差异分析

石福天 李宁荫

上海市公共卫生临床中心 _ 复旦大学附属公共卫生临床中心

目的：研究不稳定性心绞痛（UA）患者估测肾小球滤过率（eGFR）与冠状动脉造影血流储备分数（caFFR）、冠状动脉造影微循环阻力指数（caIMR）及平均中心动脉压的关系，揭示不同 eGFR 水平的 UA 患者冠脉血管病变及微循环障碍程度的差异。

方法：90 例 UA 患者依据 eGFR 分为 3 组：Q1（eGFR > 99ml/min·1.73m^2, n=30）、Q2（84 < eGFR ≤ 99 ml/min·1.73m^2, n=30）、Q3（eGFR ≤ 84 ml/min·1.73m^2, n=30）。收集其一般基础资料、血常规、生化、肿瘤标志物、心脏彩超、caFFR、caIMR、平均中心动脉压等相关指标，分析三组数据得出结论。

结果：3 组患者年龄、性别、BMI、是否合并高血压、是否合并糖尿病均无显著性差异，三组患者左回旋支（LCX）caFFR 存在显著性差异，两两比较 Q2 大于 Q1（0.958±0.233 vs 0.936±0.088, P < 0.05）。相关性分析提示左室射血分数（LVEF）与 LCXcaFFR 呈正相关（r=0.253, P < 0.05），平均中心动脉压、BMI 与左前降支（LAD）caIMR 呈正相关（r=0.243, r=0.208, P < 0.05），BMI 与 LAD 血流速度呈负相关（r=-0.216, P < 0.05），平均中心动脉压与 LCX 血流速度呈正相关（r=0.240，P < 0.05），平均中心动脉压与右冠状动脉（RCA）血流速度呈正相关（r=0.336，P < 0.05），总胆固醇（TC）、低密度脂蛋白（LDL）与右冠状动脉（RCA）血流速度呈负相关（r=-0.216, r=-0.238, P < 0.05）。多因素线性回归分析提示 LCXcaFFR（OR=-107.814,95%CI: -203.713~-11.916, P < 0.05）、LCXcaIMR（OR=1.481, 95%CI: 0.361~2.601, P < 0.05）是影响 eGFR 的独立危险因素。

结论：在不同 eGFR 水平的 UA 患者中， LCXcaFFR 存在部分差异，LCXcaFFR、LCXcaIMR 可独立影响 UA 患者的 eGFR 水平。此外临床中可通过计算 eGFR 结合生化指标、心脏彩超、测定平均中心动脉压初步评估 UA 患者的冠脉血管病变及微循环障碍程度。

不同壁厚的聚乳酸可降解支架对血管内皮化的影响。

周昌颐 殷嘉晟 王瑞 沈霁 葛均波

复旦大学附属中山医院

目的：探究壁厚为 160um 的聚乳酸可降解支架（BRS）和新型薄壁聚乳酸可降解支架（薄壁 BRS）对血管内皮化影响。探究 BRS 支架内血栓形成的可能机制。

方法：取 24 只新西兰大白兔，随机分为对照组及实验组，每组各 12 只，对照组植入壁厚为 160um 的 BRS，实验组植入壁厚为 120um 的薄壁 BRS。家兔称重、麻醉后，由股动脉入路在 DSA 指引下于腹主动脉分别植入相应组别的血管支架。每组分别于植入支架后 45 天及 90 天通过复查血管造影以及光学相干断层成像（OCT）评估在体血管内皮覆盖情况，检测结束后将动物安乐死、取材，沿血管长轴将支架段血管截半，分别通过扫描电镜技术和 CD31/ 鬼笔环肽 /DAPI 免疫荧光染色观察支架血管段内皮覆盖情况。

结果：不同壁厚的 BRS 和薄壁 BRS 在植入即刻均扩张贴壁良好。45 天时，复查 OCT 提示，BRS 组和薄壁 BRS 组均未观察到贴壁不良及弹性回缩，薄壁 BRS 组内皮覆盖率显著大于 BRS 组，但尚未完成完全内皮化；BRS 组表面 CD31 荧光染色覆盖面积稍高，BRS 组表面 CD31 荧光染色覆盖面积较低，电镜结果亦显示 BRS 组表面内皮覆盖率显著低于新型 BRS 组，可见较大面积内皮下组织裸露及红细胞、血小板聚集。90 天时，复查 OCT 未见 BRS 组和薄壁 BRS 组贴壁不良及支架断裂，薄壁 BRS 组基本完成内皮覆盖，仍有部分支架梁裸露，BRS 组少数完成内皮覆盖，大部分支架梁仍裸露；CD31 荧光染色结果示薄壁 BRS 组血管表面仍有部分 CD31 荧光未覆盖，BRS 组血管表面部分 CD31 荧光覆盖，扫描电镜结果与以上结果相符，可观察到薄壁 BRS 组基本完成内皮覆盖，BRS 组部分支架梁完成内皮覆盖，其余支架梁表面见内皮下组织裸露。

结论：不同壁厚的聚乳酸可降解支架在动物模型中均未见支架断裂及贴壁不良，相较 160um 的 BRS，120um 的薄壁 BRS 植入后，家兔腹主动脉内皮化显著加快。支架内皮化延迟可能是除支架机械因素外 BRS 支架内血栓发生率增加的可能机制。

相同壁厚的金属药物洗脱支架和聚乳酸可降解支架对血管内皮化的影响。

周昌颐

复旦大学附属中山医院

目的：探究相同壁厚的金属药物洗脱支架 (DES) 和聚乳酸可降解支架 (BRS) 对血管内皮化影响。探究 BRS 支架内血栓形成的可能机制。

方法：取 24 只新西兰大白兔，随机分为对照组及实验组，每组各 12 只，对照组植入壁厚为 120um 的可降解涂层雷帕霉素 DES，实验组植入壁厚为 120um 的薄壁雷帕霉素 BRS。家兔称重、麻醉后，由股动脉入路在 DSA 指引下于腹主动脉分别植入相应组别的血管支架。每组分别于植入支架后 45 天及 90 天通过复查血管造影以及光学相干断层成像（OCT）评估在体血管内皮覆盖情况，检测结束后将动物安乐死、取材，沿血管长轴将支架段血管截半，分别通过扫描电镜技术和 CD31/ 鬼笔环肽 /DAPI 免疫荧光染色观察离体支架血管段内皮覆盖情况。

结果：相同壁厚的 DES 和 BRS 在植入即刻均扩张贴壁良好。45 天时，复查 OCT 提示，DES 组和 BRS 组均未观察到贴壁不良及弹性回缩，DES 组内皮覆盖率显著大于 BRS 组，但尚未完成完全内皮化；DES 组表面 CD31 荧光染色覆盖面积较高，BRS 组表面 CD31 荧光染色覆盖面积较低，电镜结果亦显示 BRS 表面内皮覆盖率显著低于 DES，可见较大面积内皮下组织裸露及红细胞、血小板聚集。90 天时，复查 OCT 未见 DES 组和 BRS 组贴壁不良及支架断裂，DES 组均完成内皮完全覆盖，BRS 组基本完成内皮覆盖，仍有部分支架梁裸露；CD31 荧光染色结果示 DES 组完成完全内皮化，BRS 组血管表面仍有部分 CD31 荧光未覆盖，扫描电镜结果与以上结果相符，可观察到 DES 组均已完成内皮覆盖，BRS 组部分完成内皮覆盖，少数部分支架梁表面见内皮下组织裸露。

结论：相同支架梁壁厚 DES 及 BRS 在动物模型中均未见支架断裂及贴壁不良，相较 DES，BRS 植入后家兔腹主动脉内皮化显著延迟。支架内皮化延迟可能是除支架机械因素外 BRS 支架内血栓发生率增加的可能机制。

造影剂液压分离再通技术开通冠脉慢性完全闭塞病变

何松原

首都医科大学附属北京安贞医院

目的：本研究尝试采用造影剂液压分离再通技术（HydroDynamic contrast Recanalization, HDR）开通慢性完全闭塞病变（CTO），提高 CTO 经皮冠状动脉介入治疗（PCI）成功率和手术效率。

方法：HDR 技术是基于对比剂微注射与亲水涂层导丝相配合的前向开通 CTO 病变的技术。本回顾性研究纳入了从 2024 年 12 月至 2025 年 5 月的适宜应用 HDR 技术的 CTO 患者（近段纤维帽明确且远端血管条件较好），主要终点为手术成功，次要终点为手术相关并发症。

结果：55 例患者共 55 处 CTO 病变接受 HDR-PCI 治疗。患者平均年龄 59.3±12.7 岁，J-CTO 评分 2.4±1.5。病变特征：CTO 病变分布：27.3%（15/55）LAD CTO，16.3%（9/55）LCX/OM CTO，56.3%（31/55）RCA CTO，50.9%（28/55）存在钝头 / 不明确的近端纤维帽，58.2%（32/55）病变长度≥ 20mm，36.4%（20/55）伴中重度钙化，58.2%（18/55）闭塞段成角≥ 45°。平均手术时间 75.0±30.6 分钟，手术策略转换：70.9%（39/55）全程采用 HDR 技术，5.5%（3/55）传统正向导丝技术，9.1%（5/55）ADR 技术，14.5%（8/55）逆向技术。手术成功率 82.1%（32/39），无手术并发症发生。手术失败原因分析：4 例因为微导管无法通过坚硬近端纤维帽，2 例因为硬导丝在内膜下走行过远，1 例因为 CTO 闭塞段内严重钙化。

结论：HDR 在特定解剖特征的 CTO-PCI 中展现出显著价值，是一种安全有效的前向 CTO- PCI 新技术，它的有效性及安全性尚需大规模前瞻性研究进一步验证。

一种新型的开通 CTO 的 ADR 导管：单中心病例系列报道

陈根锐

中国人民解放军空军军医大学第一附属医院（西京医院）

背景：正向治疗仍然是慢性完全闭塞病变（CTO）PCI 的主要技术之一。在正向治疗与正向夹层内重回真腔（ADR）技术中，Stingray 球囊和 ReCross 微导管有助于导丝进入远端真腔。然而，这些策略伴随着斑块外血肿的形成，由于血肿的抽吸受限，血肿会压缩真腔，从而降低重入真腔的成功率。为了解决这一难题，我们设计了一种新的 ADR 导管，其扁平尖端的两侧都有金属标记，以便更容易地看到“单轨标志”，实现定向穿刺，并具有专用的抽吸口来控制血肿。

目的: 评估这种新型 ADR 导管在 ADR 策略开通 CTO 病变方面的安全性和有效性。

方法：对 2024 年 1 月至 2025 年 5 月在西京医院使用新型 ADR 导管治疗的 CTO 患者进行分析。技术成功定义为使用这种新型 ADR 导管实现导丝重回远端血管真腔。观察手术相关并发症和院内主要不良心脏事件（MACE）。MACE 包括死亡、复发性心肌梗死、靶血管血运重建（TVR）。

结果：共有 26 例 CTO 患者使用该新型 ADR 导管，其中男性 21 例，女性 5 例，JCTO 评分为（3.01±0.42）分。在本次研究中 4 例患者 CTO 入口不清晰，BASE 后直接行新型 ADR 导管穿刺，均成功进入血管真腔；余 22 例正向技术失败后行补救性新型 ADR 导管穿刺术，其中 12 例成功，10 例失败，因此新型 ADR 导管穿刺术技术成功率为 61.5%（16/26）；10 例新型 ADR 导管穿刺术失败，其中 5 例用 Stingray-ADR 术补救成功；3 例采用 Stingray-ADR 术补救失败后通过逆向技术补救成功；1 例正向补救成功；1 例最终失败，手术成功率为 96.1%。5 例用 Stingray 补救成功的原因可能与术者对 Stingray-ADR 术熟练度相关；3 例 Stingray 补救失败的原因与血肿过大相关，其中 2 例 ADR 导管通过困难，1 例更换 Stingray 导管也无法通过，考虑与严重钙化相关，另一例则直接逆向补救。此种新型 ADR 导管 ADR 术有明显学习曲线，前 13 例成功率为 53.8%（7/13），

后 13 例成功率为 69.2%（9/13），随着术者例数的累积，成功率逐渐提高。所有患者均无冠脉穿孔、心包填塞及围手术期心梗发生。住院期间所有患者均无死亡、再发心肌梗死、靶血管重建等 MACE 事件发生。

结论：新型 ADR 穿刺导管通过在整个手术过程中定向穿刺和连续抽吸血肿的优势大大提高导丝安全有效地重新进入远端真腔的成功率。

关键词：经皮冠状动脉介入治疗； 慢性完全闭塞病变； 正向夹层再进入技术

Evidence-based construction of a postoperative upper extremity stasis pain management program for cardiovascular interventional patients and application research

Kun-Yan Peng

Zigong First People's Hospital

Introduction: Cardiovascular interventional access is mainly radial artery and femoral artery access, compared with the femoral artery, transradial artery path is less traumatic, postoperative recovery is faster, braking time is shortened, transradial artery access is widely accepted, but the radial artery is smaller or even tortuous, prone to spasm, bruising and pain in the upper limbs due to radial artery tear is the most common complication, and in severe cases, circulatory disturbances may occur due to localized pressure increase, and severe cases of Osteofascial compartment syndrome. It is particularly important to find out the best way to choose a treatment that is effective, simple to perform, safe, and less painful for the patient. Therefore, this study constructs an evidence-based management program for postoperative upper extremity stasis and pain in cardiovascular intervention patients and explores the application effects. **Methods:** Based on the evidence-based approach, through searching related literature and summarizing and analyzing and discussing with the subject group, the i-PARIHS framework was used as the theoretical basis to form a preliminary respiratory training program for cardiovascular patients. Two rounds of expert correspondence were conducted using the Delphi method, and the first draft was revised and improved based on the comments of 12 experts. Eight cardiovascular intervention patients were selected for the pretest, and the trial data were collected and analyzed to summarize the problems and shortcomings. Using the convenience sampling method, 66 post-interventional patients who met the inclusion and exclusion criteria in the cardiovascular internal medicine department of a tertiary-level A hospital in Zigong City from January 2024 to June 2024 were selected as the study subjects, and were divided into the control group (n=33) and the intervention group (n=33) according to the randomized number table method. Patients in the intervention group received a pain management program based on routine care compared to those in the control group. Pain Numeric Rating Scale scores at 24h and 72h postoperatively, general self-efficacy scale scores at 24h and 1 week postoperatively, satisfaction scores and incidence of postoperative complications were compared between the two groups. **Results:** The pain numeric rating scale score at 72h postoperatively in the intervention group was (2.24±0.84), which was lower than that of the control group (3.17±0.89), and the difference was statistically significant (p<0.001); At 1 week postoperatively, the general self-efficacy scale score of the intervention group was (22.13±1.71), which was higher than that of the control group (18.94±1.76), and the difference was statistically significant (p<0.001); The satisfaction score of the experimental group was (91.55±2.13), which was higher than that of the control group (89.27±2.14), and the difference was statistically significant (p<0.001). **Discussion:** The implementation of an evidence-based construction of a postoperative upper extremity stasis pain management program for cardiovascular interventional patients is conducive to alleviating postoperative upper extremity stasis pain in cardiovascular interventional patients, increasing satisfaction and self-efficacy, and improving the patient experience. However, this study is a single-center, small-sample study, and further multi-center, large-sample studies should still be conducted in the future to improve the generalizability of the study.

生物可吸收支架内膜愈合的随访观察及分析

余超 邢磊 刘华兴

哈尔滨医科大学附属第二医院

背景及目的：生物可吸收支架被认为可以改善血管反应并促进早期内膜愈合，但脂质斑块对支架内膜的影响尚未得到很好的验证。光学相干断层成像（OCT）分辨率高，对单个支架支柱具有良好的可视化，在支架植入时可以提供支架贴壁不良、支架边缘夹层等信息，同时能对血管大小、病变狭窄程度、斑块性质和负荷分布提供精准评估。本研究旨在利用 OCT 观察生物可吸收支架的内膜愈合情况，分析生物可吸收支架在不同类型斑块基础上支架内膜的覆盖情况。

方法：纳入 2020 年 10 月至 2022 年 10 月期间在我中心接受生物可吸收支架植入的 36 例冠心病患者（有 1 例发生了支架内晚期血栓形成致支架再狭窄，未入组），并进行术前、术后 1 年 OCT 随访，对患者的临床资料、手术资料、即刻光学相干断层扫描结果、新生内膜总体情况及在不同类型斑块基础上支架内膜的覆盖情况进行统计和分析。其中斑块按每 1mm 的截面进行分析，共扫描到 505 幅脂质斑块截面，240 幅纤维斑块截面。

结果：对入选的 36 名患者的新生内膜进行分析，发现支架内新生内膜面积为 1.55(1.06,1.87) mm^2，平均新生内膜厚度为 0.20(0.15,0.26) μm。罪犯病变支架血管按每 1mm 的截面进行 OCT 影像学定量分析，共扫描到 505 幅脂质斑块截面，240 幅纤维斑块截面，结果显示脂质斑块截面相较于纤维斑块截面，支架面积直径更小（5.94(4.79,7.64) 比 6.52(5.35,8.03)，P<0.001），平均新生内膜厚度更大（0.16(0.10,0.25) 比 0.08(0.06,0.12)，P<0.001），支架覆盖率更高（92.5% 比 78.7%，P<0.001）。支架内新生内膜异质性分析发现在脂质斑块截面和纤维斑块截面之间，均质 / 非均质 / 分层内膜的发生率均有统计学差异（63.2% 比 96.3%，P<0.001；27.3% 比 2.5%，P<0.001；9.5% 比 1.2%，P<0.001）。

结论：通过 OCT 观察，相较于纤维斑块，生物可吸收支架在脂质斑块上的支架截面面积直径更小，支架小梁上有着更厚的支架内膜覆盖和更多的支架小梁被完全包埋。与此同时，落在脂质斑块处的生物可吸收支架的支架小梁周围的内膜更多的呈现非均质性模式，这些非均质性的内膜可能造成支架愈合过程处于不稳定的状态。在入选的 37 例患者中，仅有 1 例发生了支架内晚期血栓形成致支架再狭窄。

药物涂层球囊治疗冠状动脉小血管原位病变的随访观察

毕静婷 邢磊 刘华兴

哈尔滨医科大学附属第二医院

背景及目的：在冠状动脉小血管病变的治疗中， DCB 的应用尚存争议，主要因为尚缺乏充足的有效证据来支撑其推荐的适用性。因此，本研究旨在研究紫杉醇药物涂层球囊在治疗冠状动脉小血管原位病变中的临床疗效并分析可能影响治疗失败的相关因素。

方法：纳入 2020 年 11 月至 2024 年 6 月，对 105 例患者进行回顾性分析，其中 70 例接受 DCB 治疗，35 例接受 DES 治疗，随访时间一年。使用冠状动脉定量测量分析（Quantitative Coronary Angiographic analysis，QCA）测量术前、术后即刻、一年后随访的相关数据：最小管腔直径（Minimum Lumen Diameter，MLD）、病变（支架）长度，计算管腔直径狭窄率（DS%）及晚期管腔丢失（Late Lumen Loss，LLL）。主要的临床随访内容包括血管完全闭塞、非闭塞再血管化治疗、再狭窄 > 50% 未再血管化治疗、血栓形成、严重出血等。

结果：选取 105 例患者随访 1 年，我们确定了 35 例植入 DES 小支架的患者，并对患者的病变进行了倾向评分匹配与药物球囊治疗的比例为 1:2，即 70 例行 DCB 治疗。通过使用年龄，性别，BMI，糖尿病，高血压，高脂血症，吸烟，药物治疗情况等这些变量作为匹配标准。临床资料中，DCB 组与 DES 组之间的患者在药物 β 受体阻滞剂使用差异上有统计学意义（P < 0.05）。在术后即刻 QCA 测量中，DCB 组：最小管腔直径 2.20±0.21mm、管腔直径狭窄率 16.65±2.58%、病变（支架）长度 16.4±6.6mm，与 DES 组：最小管腔直径 2.42±0.27 mm、管腔直径狭窄率 6. 7±1.86%、病变（支架）长度 19.8±3.7mm，DCB 组与 DES 组术后 MLD、管腔直径狭窄率、病变（支架）长度较术前具有统计学意义 (DCB 组 P<0.001，DES 组 P<0.001)。1 年随访 QCA 测量中，DCB 组：最小管腔直径 1.91±0.18mm、病变（支架）长度 16.4 ± 6.6mm、1 年晚期管腔丢失 0.29±0.05mm，与 DES 组：最小管腔直径 2.07±0.24mm、病变（支架）长度 20.8 ± 3.6 mm、1 年晚期管腔丢失 0.35±0.12 mm，DCB 组与 DES 组之间术后 1 年随访比较具有统计学差异（DCB 组 P<0.001，DES 组 P<0.001）。DCB 组管腔直径狭窄率 26.15±3.74%，DES 组管腔直径狭窄率 27.23±3.89%，两者比较无明显统计学差异（P = 0.423）。逻辑回归分析中发现体重指数、糖尿病、高脂血症、心肌梗死病史是影响小血管再血管化治疗失败的因素。

结论：1. 通过 DCB 处理原位（小）血管病变与 DES 小支架（直径 <2.25mm）植入临床应用回顾性对比发现，两者在临床诊断和罪犯病变分布及病变特征上没有明显差别。2.DCB 处理的原位病变在术后即刻的效果虽劣于 DES 小支架植入，但在 1 年后的冠状动脉造影随访中发现，DCB 处理的原位病变在管腔直径狭窄率（DS%）不劣于支架植入，且有着更小的晚期管腔丢失率。3．肥胖、糖尿病、高脂血症、心肌梗死病史可能是影响小血管再血管化治疗失败的影响因素。

P2Y12 抑制剂预处理对择期 PCI 患者围术期心肌损伤 / 梗死的影响

周祎哲 严研 聂绍平

首都医科大学附属北京安贞医院

择期经皮冠状动脉介入治疗（PCI）患者围术期心肌损伤 / 梗死发生率达 28.7%~52.8%，与无围术期事件的患者相比，发生围术期心肌损伤 / 梗死的患者预后不良。阿司匹林联合 P2Y12 抑制剂预处理可降低围术期血栓负荷，从而预防围术期心肌损伤 / 梗死的发生。目前不同 P2Y12 抑制剂预处理对择期 PCI 患者围术期心肌损伤 / 梗死及临床结局的影响证据不足。

本研究是基于北京安贞医院冠脉专病数据库的一项回顾性、单中心、观察性队列，依据纳排标准筛选北京安贞医院 2022-2024 年进行择期 PCI 治疗的患者，根据术前 P2Y12 抑制剂预处理的类型分为氯吡格雷组、替格瑞洛组，入组后收集患者住院期间资料，分析氯吡格雷及替格瑞洛预处理对围术期心肌损伤 / 梗死的影响。

研究表明：① 氯吡格雷组围术期心肌损伤发生率为 70.38%，围术期心肌梗死发生率为 39.32%；替格瑞洛组围术期心肌损伤发生率为 68.08%，围术期心肌梗死的发生率为 37.85%。② 氯吡格雷组与替格瑞洛组相比，围术期心肌损伤 / 梗死的发生率均无统计学差异。研究成果可为择期 PCI 患者术前 P2Y12 抑制剂预处理的选择提供证据支持。

冠状动脉介入治疗后血管造影微循环阻力的预后价值：来自 FAVOR III China 试验的启示

张洪亮 [1] 史文册 [1] 管常东 [1] 谢丽华 [1] 涂圣贤 [3] 宋雷 [1] 吴永健 [1]

1. 中国医学科学院阜外医院（国家心血管病中心）

2. 中国医学科学院北京协和医学院

3. 上海交通大学生物医学工程学院生物医学仪器研究所

背景：

经皮冠状动脉介入治疗（PCI）虽可有效解除大血管狭窄，但手术过程中的机械操作会释放微小碎屑及血管活性物质，导致医源性冠状动脉微循环功能障碍（CMD），不仅影响即刻灌注，也预测长期不良心血管事件风险。因此，精准评估冠脉微循环功能具有重要临床意义。

传统压力导丝下的微循环阻力指数（IMR）虽为评估金标准，但需使用压力 - 温度传感导丝及诱发充血，限制了其在日常临床中的普及。近年来，我们基于冠脉定量流量比（QFR）技术，开发了无需压力导丝和充血药物，仅通过常规冠脉造影计算获得的微循环阻力新指标——血管造影微循环阻力（AMR）。初步研究显示 AMR 与 IMR 高度相关，并在预测患者预后方面展现出潜力，但尚缺乏大规模临床验证。

目的：

评估 AMR 在接受经皮冠状动脉介入治疗（PCI）患者中的预后价值。

方法：

本研究为 FAVOR III China 试验中 3404 例接受 PCI 患者的事后分析。对目标血管在 PCI 术前及术后测量 AMR，并计算 AMRΔ%（[100*(术后 AMR- 术前 AMR)/ 术前 AMR]）。主要终点为 3 年主要不良心脏事件（MACE）风险，包括全因死亡、心肌梗死（MI）及缺血驱动的血运重建的复合终点。

结果：

AMRΔ% ≥ 85 组（23.7%）与 <85 组（76.3%）基线特征相似，但前者每位患者植入的支架数量更多且长度更长。总体 MACE 风险两组相当（14.8% vs 12.4%；HR 1.18，95%CI: 0.95-1.45）。然而，在术后 AMR ≥ 250 的患者中，AMRΔ% ≥ 85 者 MACE 风险显著增加（16.3% vs 10.8%；HR 1.52，95%CI: 1.14-2.04）；而当术后 AMR <250 时，两组间无显著差异（12.3% vs 13.4%；HR 0.89，95%CI: 0.63-1.25；交互作用 P=0.019）。

结论：

在 FAVOR III China 人群中，PCI 术后目标血管 AMR 显著升高（AMRΔ% ≥ 85）本身并不能预测预后，但对于术后 AMR ≥ 250 的患者，可识别出 3 年心血管风险升高的人群。

心血管病诊治的创新与转化医学研究

基于皮下植入 MSC 细胞球的新型心肌保护策略研究

刘益海

南京鼓楼医院

目的

本研究旨在探索间充质干细胞（MSCs）球体通过皮下腋下植入在缓解心肌缺血再灌注（I/R）损伤中的治疗潜力，解决传统 MSC 移植中细胞存活率低、旁分泌功能有限及操作复杂等问题，验证该方法在改善心功能、抑制心肌纤维化及炎症反应、调节氧化应激等方面的有效性，并深入挖掘其潜在机制。

方法

研究中采用三维水凝胶支架培养人脐带来源 MSCs 形成细胞球，并行形态学、电镜、免疫荧光等多维度鉴定。在小鼠心肌 I/R 模型中，将 MSC 细胞球植入右侧腋下皮下组织，并设立尾静脉注射 MSC 对照组。通过活体成像追踪细胞分布，超声心动图评估心功能，HE、Masson、免疫组化和免疫荧光分析心肌纤维化、氧化应激及炎症浸润；同时采集血清进行炎性因子流式检测，并通过定量蛋白质组学解析 MSC 球体分泌蛋白的变化及信号通路富集。

结果

MSC 细胞球在体内可稳定存在超过 4 周，部分细胞可进入循环。与尾静脉注射相比，皮下植入细胞球显著改善了 I/R 后心功能，4 周后左室射血分数（EF）及短轴缩短率（FS）提升更明显，同时伴有心室重构改善。组织学分析显示，MSC 细胞球能显著减少梗死面积、抑制心肌纤维化、减轻氧化应激和炎症细胞浸润，并促进新生血管形成。血清中 IL-1α、IL-6、TNF-α、MCP-1 等多种炎性因子水平显著下降。蛋白质组学分析显示 MSC 细胞球分泌蛋白显著富集于 HIF-1 信号通路，并高度分泌抗氧化蛋白 PRDX1、免疫调节因子 MIF 及基质重塑相关蛋白 TIMP1，主要以外泌体形式存在，呈持续释放特征。

结论

MSC 细胞球皮下植入是一种安全、稳定、非侵入性的新型干细胞治疗策略，可有效缓解心肌 I/R 损伤，改善心功能及心脏重构，其机制可能与分泌富含 HIF-1 通路活性的外泌体并调节氧化应激、炎症反应和基质重塑密切相关。本研究为临床 MSC 治疗心肌梗死等心血管疾病提供了新思路和可行的技术方案。

Hemodynamic Study of Plaque Progression and Regression Based on Coronary CTA Imaging using Computational Fluid Dynamics Method

changqing du

Zhejiang Hospital

Hemodynamic Study of Plaque Progression and Regression Based on Coronary CTA Imaging using Computational Fluid Dynamics Method

Abstract:

Objective: This study aims to retrospectively include patients who underwent two serial CCTA examinations, analyze the role of baseline hemodynamic parameters based on CCTA imaging in assessing plaque changes, and use logistic regression to analyze factors influencing plaque stability.to explore the use of coronary CTA imaging for computational fluid dynamics (CFD) analysis, combined with the geometric model features of plaques, to analyze the progression and regression of coronary atherosclerotic plaques, and identify hemodynamic parameters that can evaluate plaque changes. This study will provide new perspectives for understanding the mechanisms of coronary plaque progression or regression.

Methods: A retrospective analysis was conducted on 22 coronary artery disease patients (34 lesions) who underwent two consecutive CCTA exams at an interval of about two year between March 2018 and October 2021 at Zhejiang Hospital.The median interval between the two scans was 22 (11-32) months.Exclusion criteria were as follows: Coronary revascularization was performed between the two CCTA examinations; The presence of artifacts, a low signal-to-noise ratio in the coronary CTA images of either examination, which did not meet the requirements for three-dimensional vascular model reconstruction; The time interval between the two CCTA examinations was less than 1 year; The presence of other lesions such as aortic dissection, valvular lesions, and congenital heart diseases; Failure of CCTA plaque quantitative analysis and hemodynamic analysis. Based on the changes in rate of vessel stenosis，the lesions were divided into three groups: plaque progression group (ΔDS% ≥ 5%), plaque stable group (-5% < ΔDS% < 5%), and plaque regression group (ΔDS% ≤ -5%). Three-dimensional models of coronary arteries were constructed from CCTA images, and hemodynamic parameters were calculated. Logistic regression analysis was performed to identify factors affecting plaque stability by comparing the hemodynamic parameters between groups.

Results: A total of 22 patients were included in the study, with an average age of 62.77 ± 8.76 years, and 72.76% were male. The prevalence of hypertension and diabetes mellitus is 63.64%, and that of hypercholesterolemia is 77.27%. The plaque types were predominantly lipid plaques (41.18%), mixed plaques (26.47%), and calcified plaques (32.35%). Of the 34 lesions analyzed, 50% (17/34) were located from the left main to the left anterior descending artery (LAD), 21% (7/34) were located in the left circumflex artery (LCX), and 29% (10/34) were located in the right coronary artery (RCA). The minimum lumen area of the lesions was 5.24 ± 2.42 mm^2, and the average diameter stenosis was 20 ± 10%. The average distance from the coronary artery ostium to the minimum lumen area was 46.2 ± 18.3 mm, and the average lesion length was 15.3 ± 8.2 mm.Logistic regression analysis identified Min.FFR, Min.TAWSS, Ave Vorticity, and Max Helicity as the main factors influencing plaque progression (all P < 0.05), while Min.FFR, Min.TAWSS, Ave Vorticity, and Ave GON were the main factors influencing plaque regression (all P < 0.05). ROC curve analysis revealed the AUC values of the plaque progression and regression models were 0.86 (0.80-0.92) and 0.89 (0.82-0.97), respectively, suggesting these hemodynamic parameters have good predictive value for plaque stability.

Conclusion: This study analyzed plaque structure, properties, and hemodynamics through coronary CTA imaging and used logistic regression to analyze the factors affecting plaque stability. The results suggest that hemodynamic parameters significantly affect plaque progression and can serve as predictive tools for future plaque changes.

A new non-invasive detector for coronary microvascular dysfunction: Exercise stress high-frequency QRS electrocardiogram

Jianyuan Pan[1], Ming Liu[2], Dan Li[1]

1. The First Affiliated Hospital of USTC

2. First Affiliated Hospital of Xinjiang Medical University

3. The First Affiliated Hospital of An Hui Medical University

Abstract

Background: Coronary microvascular dysfunction (CMVD) is a clinical syndrome of acute or chronic myocardial ischemia caused by structural and functional abnormalities of small anterior coronary arteries (150-500μm), small arterioles (<100μm), and capillaries in response to atherogenic and non-atherogenic pathogenic factors. But due to the current inability to visually assess the coronary microvasculature, symptoms caused by its dysfunction are often mistakenly thought to be non-cardiogenic factors, leading to misdiagnosis and inadequate treatment. Some invasive tests, although highly accurate, are guidewire-dependent, complex, and less reproducible. At present, there is a lack of effective non-invasive examination methods to diagnose coronary microcirculation dysfunction. Exercise stress high-frequency QRS electrocardiogram (HFQRS) is a new clinical technology for detecting high-frequency signals. This study aimed to evaluate the diagnostic value of the exercise stress high-frequency QRS (HFQRS) electrocardiogram in coronary microvascular dysfunction.

Methods: We consecutively enrolled patients aged 20 years or older with chest pain between January 2022 and January 2024, all of them underwent HFQRS analysis and coronary angiography. We collected demographic characteristics (age, sex, history of smoking, history of alcohol consumption), history of previous diseases (coronary heart disease, hypertension, diabetes mellitus, hyperlipidemia), laboratory test indices, history of medications, and imaging data of these patients. All subjects also underwent the Pedal Upright Cycling Exercise Test according to the Bruce protocol.The examination process was divided into 3 phases: the first phase of resting , the second phase of the exercise , and the third phase of recovery. The sensitivity, specificity, and positive predictive value of HFQRS for predicting coronary microcirculatory dysfunction were calculated using caIMR ≥ 25.1 as the gold standard for determining coronary microcirculatory dysfunction. We used the area under the ROC curve (AUC) to evaluate the predictive accuracy of HFQRS and the diagnostic value of exercise HFQRS for CMVD.

Results: A total of 590 patients who underwent CAG were included in this study, After applying predetermined exclusion criteria, 139 patients were ultimately included for subsequent data analysis .Exercise stress HFQRS suggested that the number of positive leads was greater and statistically different in the caIMR ≥ 25.1 group compared to patients in the caIMR < 25.1 group (P <0.001). The maximal power of the caIMR ≥ 25.1 group during exercise stress HFQRS process was significantly lower than the caIMR < 25.1 group (8.29±3.07 vs 9.11±3.37, P=0.049). We also found a moderate correlation between the caIMR values and the number of positive HFQRS leads. (R=0.757, P<0.001). Multifactorial logistic regression analysis showed that the number of positive leads on the HFQRS was an independent predictor of caIMR (9.17 , CI 1.02-82.73, P=0.048). The area under the ROC curve for the prediction of caIMR by the number of positive HFQRS leads was 0.81 (95% CI 0.73-0.89). The sensitivity, specificity, negative predictive value, and positive predictive value of HFQRS for the prediction of coronary microcirculatory dysfunction were 0.686, 0.971, 0.986, and 0.500, respectively.

Conclusions: Our study found that exercise stress HFQRS is an important predictor of coronary microvascular dysfunction, that there was a correlation between the number of positive exercise stress HFQRS leads and Coronary microvascular resistance, and that exercise stress HFQRS is a noninvasive and reliable detector for the diagnosis of CMVD in clinical.

Deep Learning-Enhanced ECG Spatiotemporal Feature Analysis for Early HFpEF Detection: Integrating Speckle-Tracking Derived Myocardial Strain Patterns

Keywords: HFpEF, AI-ECG, deep learning, speckle-tracking echocardiography, early detection

Abstract

HFpEF's diagnosis is challenging and important. Previous studies have not integrated STE-derived LV-GLS classification with spatiotemporal ECG feature extraction for HFpEF phenotyping.We developed a CNN-LSTM hybrid model ,using STE-LV-GLS as a marker (classified into >18%, 16-18%, <16%).

The AI - ECG model achieved an AUC of 0.91, outperforming traditional ECG reading and H_2 FPEF scores. Key findings included that leads V2 - V3 contributed 42% of the weight, and late T - wave features correlated with HFpEF - specific repolarization abnormalities. The single - lead validity assessment showed that lead V3 alone exhibited 75.6% agreement with 12 - lead predictions, with an AUC of 0.804.

These show that AI-ECG spatiotemporal patterns can help timely HFpEF risk stratification.

Background:

Heart failure with preserved ejection fraction (HFpEF) constitutes over 50% of heart failure cases, yet its diagnosis remains challenging due to nonspecific symptoms (overlapping with COPD/obesity), complex workup (requiring echocardiography, natriuretic peptides, or invasive hemodynamics), and disease heterogeneity. While current ESC guidelines mandate three criteria for diagnosis - (1) HF symptoms/signs, (2) LVEF ≥ 50%, and (3) objective diastolic dysfunction evidence (E/e' >9, LAVi >34 mL/m^2) - echocardiographic parameters suffer from operator-dependent variability. Although H_2 FPEF and HFA-PEFF scores provide diagnostic frameworks, 40-50% of intermediate-score patients still require invasive confirmation. Notably, speckle-tracking echocardiography (STE)-derived LV global longitudinal strain (GLS) has emerged as a sensitive early marker of myocardial dysfunction in HFpEF (cutoffs: normal >18%, borderline 16-18%, abnormal <16%), reflecting subclinical ventricular impairment before overt diastolic dysfunction appears. The 2023 ASE guidelines recognize LV-GLS as a high-risk indicator. Recent advances in AI-ECG demonstrate that deep learning can decode electromechanical coupling information from standard 12-lead ECGs, with studies showing AUCs of 0.91 for detecting LV diastolic dysfunction - a core HFpEF feature. However, no study has yet integrated STE-LV-GLS classification with spatiotemporal ECG feature extraction for HFpEF phenotyping.

Methods:

We developed a CNN-LSTM hybrid model analyzing 712 ECGs from Peking University Third Hospital (2020-2024) of patients aged ≥ 60 with H_2 FPEF scores ≥ 2. Using STE-LV-GLS as a sensitive early functional marker (three-tier classification: >18%, 16-18%, <16%), we preprocessed 12-lead ECGs into grayscale images, then extracted:

1.Spatial features via dual-pathway CNNs (intra-lead 1×15 + inter-lead 12×1 kernels)

2.Temporal features via bidirectional LSTM with attention mechanisms

3.Fused outputs through gated weighting to generate risk probabilities (low:<0.3; intermediate:0.3-0.7; high: ≥ 0.7).

Statistical analyses included ROC curve comparisons (DeLong test with Bonferroni correction) and consistency assessments between single-lead (V3) and 12-lead predictions.

Results:

The AI-ECG model achieved superior performance (AUC:0.91, sensitivity:85.6%, specificity:89.3%) versus traditional ECG reading (AUC:0.65) and H_2 FPEF scores (AUC:0.83). Key findings included:

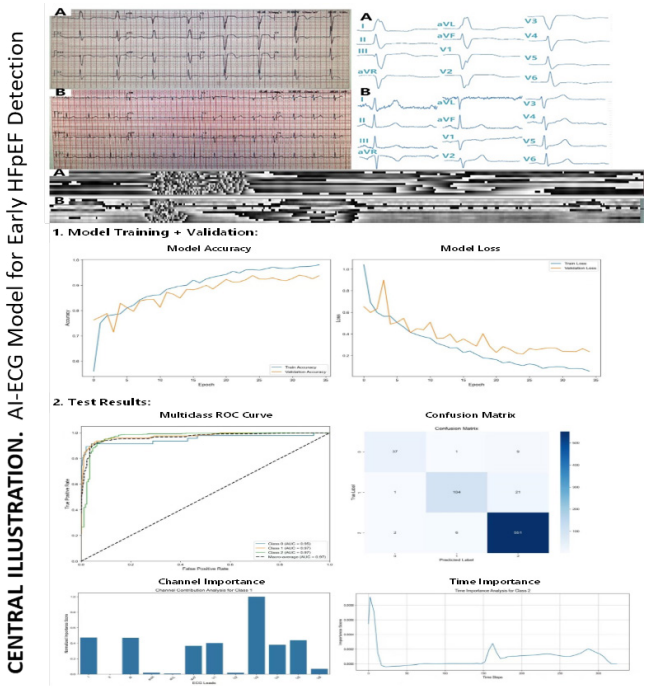
1.Lead contribution: V2-V3 accounted for 42% weight, reflecting atrial overload (P-wave abnormalities) and ventricular repolarization changes (ST-T alterations)

2.Time-phase importance: Late T-wave features (>60% weight) correlated with HFpEF-specific repolarization abnormalities

3.Single-lead validity: V3 alone showed 75.6% agreement with 12-lead predictions (AUC=0.804).

Conclusion:

This study demonstrates that ECG spatiotemporal patterns correlated with early STE-LV-GLS-defined myocardial dysfunction enable timely HFpEF risk stratification, particularly through V2-V3 repolarization features. The model's single-lead compatibility (V3) and cost-effectiveness ($50 vs. $500 for echocardiography) support its use in resource-limited settings, potentially enabling an "AI-ECG screening → echocardiographic confirmation" care paradigm. Future work should validate this approach for presymptomatic HFpEF detection via wearable devices.



支架术后 DAPT 期间桥接肝素实施外科非心脏手术的风险研究

薛远征

陆军军医大学第三附属医院大坪医院

摘要：

目的：本研究旨在评估在支架术后双联抗血小板治疗（Dual Antiplatelet Therapy, DAPT）期间，患者因不可抗力必须接受外科非心脏手术，通过肝素桥接对手术风险的影响，提供临床决策支持。

方法：回顾性分析 173 名接受支架术后 DAPT 治疗的患者，在术后 DAPT 期间因不可抗力必须进行非心脏外科手术，其中 78 名患者采用停用抗血小板药物桥接肝素进行抗凝管理，对照组则直接停用抗血小板药物。通过比较手术前后的出血事件、术后并发症（如血栓形成、感染等）以及住院时间，评估桥接肝素的安全性和有效性。采用统计学方法分析桥接肝素使用与手术风险的相关性。

结果：在桥接肝素使用的患者中，术后出血事件的发生率较高，而未使用桥接肝素的患者则显示较低的出血风险。然而，使用桥接肝素的患者术后血栓事件发生率较低。进一步分析表明，桥接肝素能够有效降低血栓形成的风险，但其增加了术后出血的可能性，特别是在高风险患者中。

结论：在支架术后 DAPT 治疗期间，桥接肝素的使用虽然能有效预防术后血栓事件，但也伴随较高的出血风险。对于需要进行外科非心脏手术的患者，应根据个体情况权衡出血与血栓的风险，制定个性化的桥接策略，以确保最佳治疗效果。

靶向心脏的脂质体递送外泌体 miRNA-185-5p 抑制剂缓解扩张型心肌病心肌细胞凋亡及铜死亡的作用机制研究

徐帅

苏州大学附属独墅湖医院

目的：探讨脂质体靶向递送外泌体 miRNA-185-5p 抑制剂（Lipo@miR-185-5p 抑制剂）对扩张型心肌病（DCM）心肌细胞凋亡及铜死亡（cuproptosis）的作用与机制，为 DCM 精准治疗提供新策略。

方法：超速离心法提取血浆来源外泌体，miRNA 试剂盒纯化获得 miRNA-

185-5p 抑制剂，以 DOTAP、DOPE、胆固醇、DMG-PEG-2000 及心脏靶向肽（APWHLSSQYSRT）制备脂质体。利用透射电子显微镜（TEM）、动态光散射（DLS）和 Zeta 电位表征脂质体特性。体外以 H9C2 心肌细胞和人类 iPS 诱导心肌细胞建立 DCM 细胞模型，应用 CCK-8、Western blot、免疫荧光及流式细胞术评估细胞凋亡、氧化应激及铜死亡蛋白表达变化。体内以 DCM 小鼠模型进行尾静脉注射，采用超声、HE、Masson、免疫荧光、Western blot、ELISA 及 qPCR 评价药效，利用荧光成像及生化指标检测药物靶向性及安全性。

结果：体外实验显示，Lipo@miR-185-5p 抑制剂显著降低心肌细胞凋亡、DNA 损伤及 ROS 水平，抑制铜死亡蛋白表达。体内实验显示，该治疗显著改善小鼠心功能，减少心肌纤维化及凋亡和铜死亡蛋白表达；荧光成像证实药物在心脏精准积聚，且未观察到明显毒性。

结论：靶向脂质体递送外泌体 miRNA-185-5p 抑制剂通过调控凋亡与铜死亡通路有效缓解 DCM 病程，为临床治疗提供了创新的精准治疗策略。

心肌梗死后成纤维细胞阶段极化特征及其靶向干预策略的研究

黎国兴 王伟

陆军军医大学西南医院老年科

背景：心肌梗死后心肌纤维化是心脏修复失衡的核心病理机制，其过度进展可导致室壁僵硬、电传导紊乱及心功能进行性恶化，最终引发心力衰竭和恶性心律失常，显著增加患者住院率与死亡率，是心血管疾病的重要负担。成纤维细胞（FB）作为纤维化的核心效应细胞，具有显著异质性：心梗早期活化的肌成纤维细胞（Myo-FB）通过维持梗死区室壁完整性发挥保护作用，过早干预易诱发心脏破裂；而晚期持续活化的基质成纤维细胞（ECM-FB）介导胶原过度沉积与交联，此时干预因基质固化难以奏效。临床患者异质性大，精准确定抗纤维化治疗时间窗困难，因此避开 Myo-FB 活化期、尽早靶向干预 ECM-FB 可能为更优策略。然而，成纤维细胞随时间的表型转换规律及驱动因素尚未明确，靶向抑制 ECM-FB 的有效方法仍待探索。

方法: 基于单细胞测序与空间转录组分析，结合病毒介导的基因表达调控（Csrp2、Crlf1 敲低）及心肌梗死模型构建，观察干预后 14 天内小鼠死亡率、心脏破裂发生情况（解剖验证胸腔血凝块及心脏破口），并通过超声心动图评估心功能（射血分数、左室大小），Masson 染色分析室壁厚度及胶原沉积。

结果：单细胞 - 空间转录组联合分析显示：①拟时序分析提示心梗后 3-5 天成纤维细胞经历一过性 Myo-FB 极化，随后逐渐被分泌细胞外基质的 ECM-FB 替代，两种表型转换呈错峰特征；②文献报道的促心脏破裂靶点在 Myo-FB 极化期上调，而改善纤维化的靶点在 ECM-FB 极化期上调；③免疫荧光验证：α-SMA（Myo-FB 标志）于梗死后第 3 天高表达，第 7 天维持，第 14 天消失；Cilp（ECM-FB 标志）于梗死后 1-3 天低表达，随后逐渐升高，第 14 天达显著水平，与生信分析一致；④敲低 Csrp2 或 Crlf1（心肌纤维化及心脏破裂中未报道的新基因）后建立心梗模型，结果显示两组均出现大量心脏破裂（解剖见胸腔血凝块及心脏破口），伴射血分数降低、左室扩大及室壁变薄。

结论：心肌梗死后成纤维细胞存在显著的阶段极化特征：早期以保护性 Myo-FB 为主，晚期转为致纤维化的 ECM-FB。抑制 Myo-FB 相关基因可能破坏室壁完整性诱发心脏破裂，而靶向抑制 ECM-FB 相关基因可在不增加破裂风险的前提下有效改善心肌纤维化，为心梗后纤维化治疗提供了基于时间窗的精准干预新策略。

心血管介入学员成对友谊关系对学业成就的影响作用：基于主客体互倚性模型的分析

春英 [1] 王蕊 [2]

1. 上海市第十人民医院（同济大学附属第十人民医院）

2. 上海市光华中西医结合医院

目的：本研究使用结构方程的方法建立主客体互倚模型，探索心血管介入学员成对友谊关系对介入学业成就的影响。方法：通过方便取样的方法，使用个人成就目标取向量化修订表，收集了 216 份有效问卷，进行 t 检验和相关分析，建立了主客体互倚模型。结果：（1）与男性学员相比，女性学员年龄偏大（35.03±2.34 岁 VS. 33.75±3.10 岁，p < 0.001），生育史占比高（69.4% VS. 40.7%，p < 0.001）。（2）女性学员在掌握目标取向（t=3.97,p < 0.001）和接近目标取向（t=4.02, p < 0.001）方面均显著高于男生。而男生的学业成就高于女生（t=11.53, p < 0.001）。（3）不论在掌握目标取向方面还是在接近目标取向方面，成对友谊关系中的两名介入成员都具有很高的相似性；在成就方面，两者也具有较高的相似性（ICC=0.668）。（4）个体学业成就稳定，主体效应大于客体效应，个体成就主要受自身的影响，朋友对具有相互的显著影响效应（k=-0.124）。结论：朋友对中的介入学员能够相互影响，增加了彼此在学业成就上的相似性。

Background

Thoracic aortic dissection (TAD) represents a life-threatening cardiovascular disorder with underlying endothelial dysfunction, yet the molecular interplay between genetic variants and metabolic dysregulation in TAD pathogenesis remains elusive. Methylenetetrahydrofolate reductase (MTHFR) orchestrates homocysteine metabolism, and the rs1801133-TT variant (C677T) compromises MTHFR activity. The variant is extremely common in populations, and those individuals suffered with homozygous mutation in this single nucleotide polymorphism (SNP) only have 30 % activity of normal enzyme function, finally accumulated homocysteine dramatically shapes the increasing risk for cardiovascular diseasesculminating. Although homocysteine-induced mitochondrial dysfunction and mitophagy disruption have been implicated in endothelial injury, direct evidence in human cellular models is lacking. Here, we aimed to investigate how MTHFR rs1801133-TT modulates homocysteine metabolism and endothelial pathophysiology via mitophagy regulation using patient-derived induced pluripotent stem cells (iPSCs).

Methods

1. Isogenic iPSC Model Establishment: Isogenic iPSC lines were established via CRISPR/Cas9-mediated correction of rs1801133-TT to wild-type (CC) in TAD patient-derived MTHFR-iPSCs, serving as genetically matched isogenic control cell lines.

2. Endothelial Differentiation and Characterization: Human iPSCs were differentiated into endothelial cells (iPSC-ECs) using a chemically defined protocol, validated by flow cytometry (CD144/CD31 expression), immunofluorescence staining, and functional assays (nitric oxide production, acetylated LDL uptake).

3. Cellular Toxicity Profiling: Homocysteine dose-response curves were generated via CCK-8 and Caspase-Glo assays. Cell apoptosis was quantified by Annexin V/PI staining followed by flow cytometry, while mitochondrial function was assessed using JC-1 staining (membrane potential) and MitoTracker Red (network morphology).

4. Mitophagy Flux Analysis: Mitophagy activity was evaluated using the pH-sensitive mt-Keima reporter and western blotting for key regulators (LC3, p62, PINK1).

5. Transcriptomic Profiling: Bulk RNA-seq was performed on homocysteine-treated iPSC-ECs to identify differentially expressed genes (DEGs), validated by qRT-PCR and western blotting.

6. Small Molecule Screening: A 96-compound Cherry pick-up library was screened to identify chemicals mitigating homocysteine toxicity caused by , with kaempferol validated through mitochondrial structure/function assays.

Results

1. MTHFR rs1801133-TT Does Not Impair Endothelial Lineage Commitment: Isogenic-iPSC-ECs and MTHFR-iPSC-ECs exhibited comparable differentiation efficiency and major endothelial marker expression (CD144 and CD31). Functional assays (nitric oxide response and TNFα-induced adhesion molecule expression) were indistinguishable under basal conditions.

2. MTHFR-TT Potentiates Homocysteine-Induced Cytotoxicity: MTHFR-iPSC-ECs displayed significantly lower IC50 (115.1 vs. 183.0 μM) and EC50 (110.5 vs. 196.7 μM) for homocysteine, accompanied by increased early apoptosis (24.33% vs. 9.34%) and reduced cell proliferation as measured by EdU assay.

3. Homocysteine Disrupts Mitochondrial Architecture and Mitophagy Flux: In MTHFR-iPSC-ECs, homocysteine induced mitochondrial fragmentation (such as 40% reduction in network junctions), depolarized the mitochondrial membrane (JC-1 monomer/aggregate ratio increased), and impaired mitophagy (mt-Keima ratio decreased, while little p62 accumulation).

4. LAMP3 Drives Homocysteine-Mediated Mitophagy Dysfunction: Bulk RNA-seq identified lysosomal-associated membrane protein 3 (LAMP3) as a top-upregulated DEG (fold change >2.8), confirmed by qRT-PCR and western blotting assay. LAMP3 co-localized with mitochondria, and genetic knockdown rescued mitochondrial integrity and reduced apoptosis (25.63% to 18.92% in homocysteine-treated endothelial cells).

5. Kaempferol Restores Mitochondrial Homeostasis: Kaempferol treatment normalized mitochondrial networks (35% increase in junctions), reinstated mitophagy flux (mt-Keima ratio recovery), and attenuated cell apoptosis (11.60% vs. 25.63% in homocysteine vs. DMSO controls).

Conclusions

This study elucidates that MTHFR rs1801133-TT impairs homocysteine

metabolism, triggering LAMP3-dependent mitophagy disruption and endothelial dysfunction. Kaempferol protects against homocysteine toxicity by restoring mitochondrial quality control, nominating mitophagy as a therapeutic target. These findings establish direct evidence of genetic variant and metabolic crosstalk in endothelial cell homeostasis and advocate for personalized approaches integrating genetic screening (such a s MTHFR variants) with metabolic intervention (homocysteine-lowering strategies or mitophagy activators) for patient stratification and vascular protection.

苯萸次碱对氧化应激诱导血管平滑肌细胞增殖和一氧化氮合酶的影响

赵然尊

遵义医科大学附属医院

目的：观察氧化应激对吴茱萸次碱作用血管平滑肌细胞增殖和一氧化氮合酶 (NOS) 的影响。

方法: 血管平滑肌细胞分空白组、二甲基亚砜组、药物 A 组 (吴茱萸次碱 0.4μmol/L)、药物 B 组 (吴茱萸次碱 1μmol/L)、药物 C 组 (吴茱萸次碱 4μmol/L)，后 4 组药物刺激 2h 后，加入过氧化氢诱导氧化应激损伤，24h 后检测细胞增殖率、活性氧、丙二醛、超氧化物歧化酶 (SOD)、内皮型 NOS(eNOS)、诱导型 NOS(iNOS)mRNA 和蛋白表达。

结果：与空白组比较，二甲基亚砜组细胞增殖率明显升高 [(104.48±4.89)%vs(94.58±1.87)%，P<0.05]，活性氧和丙二醛明显升高，SOD 明显下降 [(82.55±17.31)U/mg vs(111.76±18.25)U/mg， P<0.05]。与二甲基亚砜组比较，药物 A 组、药物 B 组、药物 C 组细胞增殖率、活性氧和丙二醛明显下降，药物 B 组、药物 C 组 SOD 明显升高 (P<0.05)；药物 A 组、药物 B 组、药物 C 组 iNOS mRNA 和蛋白表达明显下降，eNOS mRNA 和蛋白表达明显升高 (P<0.05)。

结论：吴茱萸次碱在氧化应激状态下能抑制平滑肌细胞增殖、抗氧化、维持 NOS 相对稳定。

银丹心脑通软胶囊对非酒精性脂肪肝的疗效及其机制探讨

赵然尊

遵义医科大学附属医院

目的：探讨银丹心脑通软胶囊治疗非酒精性脂肪肝的疗效及其可能机制。

方法：非酒精性脂肪肝患者 80 例，随机分为观察组与对照组，每组 40 例。所有患者入院后接受基础治疗与药物干预措施。观察组在此基础上口服银丹心脑通软胶囊治疗，对照组患者口服阿托伐他汀片治疗，治疗周期 3 个月。比较两组患者治疗后的疗效；血脂、炎症因子、肝功能及过氧化物酶体增殖物激活受体 (PPAR)-mRNA 表达变化情况。

结果：观察组治疗总有效率 95.00%，高于对照组的 70.00%，差异有统计学意义 (P<0.05)。治疗后，观察组患者 TC、TG、HDL-C、LDL-C、hs-CRP、IL-6、ALT、AST、CGT 的改善值高于对照组，差异有统计学意义 (P<0.05)。治疗后，观察组患者血清 PPAR-mRNA 表达量降低，与对照组比较，观察组治疗后血清 PPAR-αmRNA 表达变化值高于对照组，差异有统计学意义 (P>0.05)。

结论：银丹心脑通软胶囊治疗非酒精性脂肪肝，其对症状的改善效果较好；患者的血脂、肝功能及炎症因子降低；脂肪肝程度及胰岛素抵抗程度得以改善；下调患者血清 PPAR-αmRNA 的表达可能是其改善患者胰岛素抵抗，进而治疗非酒精性脂肪肝的作用机制之一。

Nanomedicine in cardiology: Precision drug delivery for enhanced Patient outcomes

Feng-Li Peng, Bei Shi

Affiliated Hospital of Zunyi Medical University

Cardiovascular diseases as a Primary driver of global morbidity and mortality . DesPite the array of theraPeutic avenues in clinical Practice , Predominantly Pharmaceutical and surgical interventions , they often fall short of fully addressing the clinical exigencies of cardiovascular Patients. In recent years, nanocarriers have shown great Potential in the treatment and diagnose of cardiovascular diseases. They can enhance drug targeting and bioavailability while reducing side effects. Additionally, by imProving imaging and detection technologies, they enhance early diagnosis and disease monitoring caPabilities. These advancements in technology offer new solutions for Precision medicine in cardiovascular diseases, advancing treatment efficacy and disease management. Crafted from biomaterials, metals, or their amalgamations, these nanocarriers aPProximate the dimensions of biologically active molecules like Proteins and DNA. Cardiovascular nanomedicine, in its infancy, has only recently burgeoned. Yet, with continual refinement in nanocarrier architecture, drug delivery mechanisms, and theraPeutic outcomes, the Potential of nanomedical technologies in clinical contexts becomes increasingly evident. This review aims to consolidate the strides made in nanocarrier research concerning the treatment and diagnose of cardiovascular diseases.

Multifunctional Nanosystems for Precision Diagnosis and Detoxification in Cardiovascular Diseases: From Multimodal Imaging of Myocarditis to Cardioprotective Chemotherapy

FAN YIN

Children's Hospital of Chongqing Medical University

Multifunctional Nanosystems for Precision Diagnosis and Detoxification in Cardiovascular Diseases: From Multimodal Imaging of Myocarditis to Cardioprotective Chemotherapy

Dan Yin, Mi Li, Min Zheng, Wenjing Yuan, Jiajin Li, Lingjuan Liu, Jie Tian

Background and Objective: Inflammatory and chemotherapy-induced cardiac injuries, including autoimmune myocarditis (EAM) and doxorubicin-induced cardiotoxicity (DIC), remain major clinical challenges with high morbidity and mortality. EAM, characterized by chronic inflammation and myocardial fibrosis, affects ~1–2% of the global population and lacks non-invasive, early-diagnostic tools. DIC, a dose-limiting toxicity of anthracycline chemotherapeutics (e.g., doxorubicin, DOX), occurs in 9–36% of cancer patients, leading to heart failure and treatment discontinuation. Current diagnostic methods (e.g., cardiac MRI, biopsy) are invasive, expensive, or lack sensitivity for early-stage lesions. Therapeutically, cardioprotective agents (e.g., dexrazoxane) often compromise antitumor efficacy or induce off-target toxicity.

Methods: (1) Diagnostic Nanoprobe (MM/NPs): Fabricated macrophage membrane (MM)-camouflaged phase-change nanoparticles via double emulsion and liposome extrusion, loaded with SPIO (T_2-MRI) and PFH (PA/US contrast agents).Isolated murine macrophage membranes (via Beyotime Membrane Protein Extraction Kit) were extruded through a lipid extruder (100 nm pore size) to coat PLGA cores, forming MM/NPs. Experimental autoimmune myocarditis (EAM) mice (C57BL/6, 8–10 weeks) were induced by subcutaneous injection of α-myosin heavy chain (MyHC-α, 100 μg/mouse) on days 0 and 7. Validated targeting specificity in EAM mice using confocal imaging, flow cytometry, and multimodal imaging. (2)Therapeutic Nanocomplex (PGPP/NPs): Engineered carrier-free self-assembled nanoparticles co-loaded with ginsenoside Rb1 (antioxidant), probucol (anti-inflammatory), and PI3Kγ inhibitor (autophagy enhancer), surface-functionalized with cardiomyocyte-targeting peptide (PCM). Evaluated cardioprotection in a 4T1 breast cancer model undergoing DOX chemotherapy, assessing cardiac function, serum biomarkers, and autophagic flux.

Results: (1) Diagnostic Performance: TEM confirmed uniform spherical morphology (200 ± 20 nm) with SPIO (dark dots) and PFH (phase-dense cores) encapsulated within PLGA, coated by a continuous macrophage membrane layer. Zeta potential (-28.5 ± 1.2 mV) ensured colloidal stability in DMEM, PBS, and serum. MM/NPs achieved high targeting efficiency in EAM myocardium ($p<0.05$), enabling simultaneous US/PA/MRI imaging with superior contrast to non-targeted controls. Multimodal imaging revealed inflammatory foci and myocardial damage, correlating with histopathological findings. (2) Therapeutic Efficacy: PGPP/NPs selectively accumulated in cardiomyocytes, reducing DOX-induced oxidative stress (ROS ↓), inflammation (TNF-α ↓ , IL-6 ↓), and apoptosis (caspase-3 ↓) while enhancing autophagy (LC3-II ↑). Cardiac function (LV-EF/LV-FS) and serum biomarkers (cTnI, BNP) normalized in PGPP/NP-treated mice. PGPP/NP treatment did not affect DOX antitumor activity–tumor volume in PGPP/NP + DOX group was comparable to free DOX, with no survival difference ($p > 0.05$; Figure 2G).

Conclusion: This study introduces a dual-functional nanomedicine platform that integrates precision diagnosis and cardioprotection. MM/NPs enable early, non-invasive detection of myocardial inflammation via SPIO/PFH-based multimodal imaging, addressing the unmet need for sensitive diagnostic tools in EAM.PGPP/NPs mitigate DIC through antioxidant, anti-inflammatory, and autophagy-modulating mechanisms while preserving DOX antitumor efficacy, overcoming the limitations of current cardioprotective agents. Collectively, these findings provide a transformative strategy for managing inflammatory and chemotherapy-induced cardiac injuries, with broad applicability to other cardiovascular diseases (e.g., viral myocarditis, heart failure). Future studies will focus on long-term toxicity assessment, clinical translation (e.g., phase I trials), and exploring combinatorial therapies with emerging immunotherapies.

Keywords: Nanoparticles, Myocarditis, Cardiotoxicity, Self-Assembly, Multimodal Imaging, Cardioprotection

秋水仙碱在心血管疾病中的治疗作用：基于 Web of Science 的文献计量学分析（2001-2024）

张世琳 [1] 杨庆 [1] 陈芬 [2] 刘禹彤 [1] 姚静 [1,2]

1. 南京中医药大学鼓楼临床医学院

2. 南京大学医学院附属鼓楼医院超声医学科

研究目的：秋水仙碱在减少心血管事件中的潜在作用备受关注。本研究采用文献计量学方法，系统剖析 2001–2024 年 Web of Science 核心合集收录的 455 篇相关文献，旨在揭示该领域的年度发文趋势、地域机构分布、核心作者群体及研究主题演化，为把握学科前沿与规划未来研究方向提供量化依据。

研究方法：采用 CiteSpace 与 VOSviewer 软件，对文献的发表年份、国家及地区、机构、作者、期刊进行统计分析；结合布拉德福定律筛选核心期刊；运用 VOSviewer 绘制作者合作网络与关键词分布图谱；基于期刊共被引分析构建学

科知识图谱；通过关键词共现聚类与突现词检测揭示研究主题演进。

研究结果：文献计量分析显示：455 篇文献源于 63 个国家 995 家机构的 2575 名作者，发表于 230 种期刊，年发文量呈三阶段演变——初期（2001-2010）缓慢增长（年均 5 篇），中期（2011-2020）快速上升（年均 17 篇），近期（2021-2024）爆发增长（年均 58.8 篇）。美国（160 篇）、意大利（70 篇）、澳大利亚（50 篇）、中国（50 篇）及加拿大（43 篇）主导区域研究，30 位核心作者（含 Imazio M、Brucato A）形成 4 个合作聚类，17 种核心期刊（如《Current Cardiology Reports》《American Heart Journal》）符合布拉德福分布。被引频次前三的期刊为《Circulation》（1669 次）、《The New England Journal of Medicine》（1342 次）、《Journal of the American College of Cardiology》（1068 次），高被引文献主题聚焦于“抗炎机制”、“心血管保护”与“心包疾病应用”。关键词聚类识别九大主题（含动脉粥样硬化、心包炎、精准医疗、药物递送系统），突现分析揭示研究轨迹演化：2001-2010 年聚焦“细胞骨架重构”与“心脏肥大”，2011-2020 年转向“心包疾病临床应用”及“房颤预防”，2021 年后深化“低剂量疗法”、“心血管二级预防”和“NLRP3 炎症小体 - 氧化应激”机制。

研究结论：秋水仙碱研究已从基础机制向临床精准治疗深化，未来需重点突破低剂量个体化治疗优化、心脏手术围术期炎症调控临床转化及纳米递送系统跨学科创新，以驱动“基础研究 - 临床应用”双向转化。

工程化外泌体在精准靶向修复缺血性心脏病中的功能及机制研究

柯 [1,2,3] 唐俊楠 [1,2,3]

1. 郑大第一附属医院

2. 河南省心脏损伤与修复重点实验室

3. 河南省心血管疾病临床研究中心

目的：缺血再灌注损伤（I/RI）对心肌梗死（MI）后的发病率和死亡率有显著影响，可能会加剧心脏重塑和心力衰竭。然而，目前仍然缺乏有效的治疗方法。血浆中的细胞外囊泡（EV）虽然具有治疗潜力，但是其在体内的靶向递送能力不足严重限制了其治疗效果。本研究旨在开发一种血小板膜（PNVs）修饰的工程化外泌体（PNV-EVs），通过负载 miRNA-210-3p 实现缺血心肌的精准靶向修复，并揭示其作用机制。

方法：通过挤压融合法构建 PNV-EVs。利用小 RNA 测序（miRNA-sequencing）筛选急性心梗患者血浆外泌体差异表达 miRNA（miR-210-3p）。体外实验验证 PNV-EVs 对内皮细胞迁移、侵袭、增殖和成管的影响。构建 I/RI 小鼠模型，通过超声心动图、Masson 染色、免疫荧光等评估 PNV-EVs-miRNA 对心脏功能与重塑的作用。通过小鼠成像系统动态追踪 PNV-EVs 在体内的靶向能力。

结果：在靶向能力方面，PNV 修饰显著增强 HUVEC 的对 EVs 的摄取，且 PNV-EVs 对损伤心脏的靶向能力强于未修饰 EVs，两者对损伤心脏的靶向能力均强于正常心脏。miRNA-210-3p 在急性心梗患者 EVs 中高表达，PNV-EVs-miRNA-210-3p 可以显著促进 HUVEC 的迁移、侵袭、增殖和成管。体内实验表明，PNV-EVs-miRNA-210-3p 显著改善 I/RI 的心脏功能，减轻心脏重塑。

结论：我们的研究发现，PNV 修饰的工程化外泌体递送系统增强了 EVs 在 I/RI 中的精准靶向修复，改善了 I/RI 的心脏功能，为缺血性心脏病提供了一种新型的精准靶向递送策略。

《从基础到临床：心血管病诊治创新成果的转化医学实践》

王宏研

哈尔滨医科大学附属第一医院

目的：心血管疾病作为全球致死率最高的疾病之一，其防治面临早期诊断难、治疗方案同质化、预后管理粗放等瓶颈。转化医学倡导“从实验室到病床”的精准医学理念，本研究聚焦心血管病诊治的关键痛点，通过整合多学科创新技术（人工智能、生物标志物、基因检测、数字诊疗工具等），构建“基础研究 – 技术转化 – 临床验证 – 规范推广”的全链条转化体系，旨在突破传统诊疗模式局限，提升心血管病的早期识别能力、个体化治疗效果及全周期管理水平，推动创新成果向临床实践的高效转化，为降低心血管病发病率、致残率和死亡率提供新路径。

方法：本研究在创新技术研发与转化路径设计上，基于代谢组学、蛋白组学技术，从 1000 例冠心病、心力衰竭患者及 500 例健康对照的血清样本中，筛选差异表达的生物分子，结合机器学习构建早期诊断模型（如心力衰竭风险预测模型）；整合电子病历、冠脉造影、心脏超声等多模态数据（纳入 3000 例患者数据），运用深度学习算法构建影像识别模型（如斑块易损性评估模型）和临床决策支持系统（CDSS），实现“影像分析 – 病因判断 – 方案推荐”的智能化闭环；针对家族性高胆固醇血症、缺血性心肌病等病种，开展基因测序与功能分析，探索靶向 PCSK9 的基因编辑技术及间充质干细胞移植的临床安全性与有效性。同时，通过回顾性分析（纳入 2018–2023 年 5000 例历史病例）与前瞻性多中心临床试验（覆盖 10 家三甲医院，入组 1200 例患者），验证创新技术的诊断效能、治疗安全性及预后改善效果，主要评价指标包括诊断准确率、治疗有效率、心血管事件发生率、患者生存质量（SF-36 评分）等。

结果：本研究取得了多方面的成果，在早期诊断技术上，筛选出包含 NT-proBNP、sST2、Galectin-3 的心力衰竭早期诊断组合，其 AUC 达 0.92（95% CI: 0.89-0.95），较单一指标提升 23%，可提前 3-6 个月预警无症状心力衰竭患者的病情恶化；斑块易损性评估模型对罪犯病变的识别准确率达 91%，较传统血管造影医生判读效率提升 40%，在急性冠脉综合征（ACS）急诊 PCI 术前规划中，将手术时间缩短 22 分钟 / 例，支架置入精准度提升 18%。在个体化治疗方案优化方面，针对携带 PCSK9 基因突变的家族性高胆固醇血症患者，基于基因分型的靶向药物（如依洛尤单抗）治疗使 LDL-C 水平降幅达 65%，较常规方案提升 30%，且用药不良反应发生率降低 25%。在全周期管理效能提升上，基于 AI 的随访系统在 200 例高血压合并冠心病患者中试点，实现血压控制达标率从 58% 提升至 81%，动态心电图异常事件识别响应时间缩短至 3 分钟 / 例，1 年内心血管事件（心梗、卒中等）发生率从 12% 降至 7%（HR=0.58, 95% CI: 0.39-0.86）。

结论：本研究通过转化医学理念驱动，实现了心血管病诊治技术从“单一手段”到“体系创新”的跨越。生物标志物组合、AI 诊疗平台及基因细胞治疗等创新成果，显著提升了心血管病的早期诊断精度（准确率↑ 20%-30%）、治疗个体化水平（疗效↑ 15%-25%）及管理智能化程度（事件风险↓ 20%-30%），具有明确的临床应用价值。代谢组学、AI 算法与临床医学的深度融合，验证了“数据驱动 + 机制解析”双轮驱动的转化模式有效性，为复杂疾病诊治提供了可复制的方法论。未来需进一步解决技术转化中的关键挑战，如生物标志物检测标准化等，同时加强医工协同、区域医疗数据共享及政策层面的创新技术准入支持，推动心血管病防治进入“精准化、智能化、一体化”新时代。

Study on the Rapid Screening of Non-ST Elevation Myocardial Infarction in Different Gender Patients Using the High-Sensitivity Cardiac Troponin I (hs-cTnI) 0h/1h Algorithm in the Chinese Population

Li Haoxi, He Yin, Yan Shufeng, He Xiaonan

Beijing Anzhen Hospital-Capital Medical University

“Study on the Rapid Screening of Non-ST Elevation Myocardial Infarction in Different Gender Patients Using the High-Sensitivity Cardiac Troponin I (hs-cTnI) 0h/1h Algorithm in the Chinese Population”

Yan Shufeng, He Xiaonan

Beijing Anzhen Hospital, Capital Medical University, Emergency and Critical Care Center

Abstract:

This study investigates the significance of the high-sensitivity cardiac troponin I (hs-cTnI) 0h/1h algorithm in the rapid screening of non-ST elevation myocardial infarction (NSTEMI) in patients of different genders, providing a reference for early diagnosis of acute myocardial infarction (AMI) in emergency settings.

Methods:

We enrolled 347 patients with suspected NSTEMI presenting with chest pain in the emergency department. Clinical data were collected, and hs-cTnI levels were measured at two time points (0h, 1h). The hs-cTnI 0/1h algorithm was established using the European Society of Cardiology (ESC) guidelines and adjusted for Chinese patients. Based on gender and final diagnosis (NSTEMI or non-AMI), we classified the patients and evaluated the diagnostic value of the hs-cTnI 0/1h algorithm using the receiver operating characteristic (ROC) curve to determine the best cutoff values.

Results:

For the female group (134 patients), the negative predictive value (NPV) for diagnosing NSTEMI was 99.01% (95% CI, 93.82–99.95%), with a sensitivity of 93.75% (95% CI, 66.71–99.67%). The algorithm identified 14.93% of patients as positive. For the male group (213 patients), the NPV was 99.23% (95% CI, 95.16–99.96%), with a sensitivity of 98.21% (95% CI, 89.19–99.91%). The algorithm identified 24.88% of male patients as positive.

Conclusion:

The Anzhen hs-cTnI 0h/1h algorithm, adjusted for Chinese data, demonstrates high safety and accuracy for diagnosing NSTEMI in patients of different genders.

Background:

Acute myocardial infarction (AMI) is one of the most common and severe cardiovascular diseases, which has been increasing with the improvement of living conditions. AMI is characterized by rapid onset, high severity, and high mortality, seriously affecting patients' quality of life and lifespan, while adding significant medical and economic burdens to society and families. In emergency clinical work, chest pain patients should be highly suspected of myocardial infarction, as non-ST elevation myocardial infarction (NSTEMI) often lacks typical electrocardiographic changes, making diagnosis easily delayed or missed. Furthermore, the prognosis for NSTEMI patients is poorer than that of acute ST-elevation myocardial infarction (STEMI) patients in both the short and long term. Therefore, early diagnosis and screening of NSTEMI are critical.

Cardiac troponin (cTn), a protein specific to myocardial fibers, is the preferred biomarker for myocardial injury and/or necrosis due to its high specificity and sensitivity, early appearance, and long diagnostic window. It is recommended as the “gold standard” for diagnosing AMI. However, gender-specific cutoff values for high-sensitivity cardiac troponin (hs-cTn) have not been widely applied in clinical practice, leading to lower diagnostic accuracy for NSTEMI. Accurately quantifying gender-based hs-cTn cutoff values can help develop more tailored treatment strategies, improve survival rates, and reduce healthcare costs. Recent studies have shown that hs-cTnI significantly increases the sensitivity of NSTEMI diagnosis, with a 20% higher detection rate compared to tradi-

tional cTn. Recent studies on hs-cTnI have found that gender is closely related to its concentration.

Research has also suggested that the hs-cTnI 0/1h algorithm is safer and more effective than the ESC-recommended 0/3h algorithm for ruling out AMI. The 2020 ESC NSTE-ACS guidelines recommend using the 0/1h algorithm as the primary method for rapid triage, and it has been validated in several large cohort studies. This study aims to analyze the best cutoff values and diagnostic performance of the hs-cTnI 0/1h algorithm for patients of different genders, providing further insights into the early diagnosis of NSTEMI.

Expression of Circadian Rhythm Genes in Atherosclerosis Complicated with Hypertension: A Study Based on Bioinformatics

Dan wang

Pidu District People's Hospital, Chengdu, Sichuan Province

Hypertension is a common cardiovascular disease that affects nearly 50% of adults. Hypertension has been proven to be a major co-existing condition with atherosclerosis since the 1970s. Atherosclerosis is a systemic chronic inflammatory disease that primarily affects muscular and elastic arteries. It is characterized by an autoimmune response to arterial wall injury, leading to the subintimal accumulation of lipids, immune cells, and smooth muscle cells (SMCs). Atherosclerotic disease, such as myocardial infarction and stroke, is the number one killer worldwide. Hypertension is an independent and controllable risk factor for atherosclerotic cardiovascular diseases (CVDs). Conversely, atherosclerosis hardens the arterial wall and raises arterial blood pressure. Atherosclerosis and hypertension have been prioritized as public health concerns by the World Health Organization owing to their substantial impact on cardiovascular diseases. Moreover, a diagnosis of multiple comorbidities presents additional challenges to the patient's health. Although considerable effort has been devoted to the pathogenesis of atherosclerosis with hypertension, the role of the circadian biological clock has been relatively neglected in past research.

The circadian biological clock is part of our body's natural internal rhythms that keep our bodies functioning properly by controlling a variety of physiological processes such as the sleep-wake cycle, thermoregulation, and hormone secretion. The realm of cardiovascular diseases, the interplay between circadian rhythm genes (CRGs) and conditions such as arrhythmia, hypertension, atherosclerosis, and myocardial infarction has attracted significant scholarly attention. Research suggests that the clock may influence the time-dependent incidence of cardiovascular events by controlling the integration of selective asynchronous stress responses with an underlying circadian rhythm in cardiovascular function. A study showed changes in CRGs expression may contribute to the pathogenesis of atherosclerosis. Aberrant circadian rhythms, increased pathological remodeling, vascular endothelial dysfunction, as well as attenuation of Akt and nitric oxide signaling have been found in the arteries of mice with Bmal1-deficiency and Clock mutation. Furthermore, the disruption of the molecular clock impairs lipid homeostasis and results in inflammation, which both promote atherogenesis. Collectively, these findings indicate that CRGs may modulate various mechanisms underlying atherosclerosis and hypertension development. Such insights provide novel avenues for prevention and treatment strategies against atherosclerosis and hypertension by suggesting that modulation of CRGs expression or leveraging rhythmic patterns could be beneficial in mitigating disease progression. Future investigations are warranted to further clarify the specific relationships between CRGs and atherosclerosis with hypertension while exploring innovative therapeutic approaches.

This study utilizes bioinformatics methods to screen CRGs through high-throughput expression data from microarrays, conducts functional enrichment analysis and protein network analysis, and finally verifies the selected genes by collecting a certain number of clinical samples and using quantitative real-time polymerase chain reaction (qRT-PCR) method. This study aims to provide scientific evidence for the potential value of CRGs as molecular markers for the diagnosis and treatment of atherosclerosis with hypertension. Through analysis, we identified 46 differentially expressed genes (DEGs), including 27 CRGs. Functional enrichment revealed their involvement in key processes such as epithelial cell migration, wound response, and the AGE-RAGE signaling pathway. Protein-protein interaction network analysis identified core hub genes (PLAT, FGF2, and TGFB2). qRT-PCR validation confirmed significant upregulation of PLAT, FGF2, and TGFB2 in patient blood samples ($P<0.05$), providing preliminary experimental support for their potential as diagnostic biomarkers. However, the clinical applicability of these findings requires further validation in larger cohorts due to the limited sample size (n=25 patients/20 controls) and lack of longitudinal data. Future studies should investigate the mechanistic roles of these genes in circadian-regulated vascular pathology and validate their utility in prospective cohorts.

心血管病诊治的创新与转化医学研究进展

张男奇 董增祥

哈尔滨医科大学附属第一医院

目的：心血管疾病作为全球致死率最高的疾病之一，其诊治模式的创新与转化是改善患者预后的关键。本研究旨在总结近年来心血管病领域在诊断技术、治疗策略及转化医学方面的突破性进展，探讨创新成果从基础研究到临床应用的转化路径，为优化诊疗流程、提升疗效提供理论与实践依据。

方法：通过系统检索 PubMed、Science Direct 等数据库中 2018-2024 年发表的相关文献，纳入涵盖基因编辑、人工智能（AI）辅助诊断、新型生物标志物、微创介入技术及转化医学平台建设的研究。采用循证医学方法分析创新技术的临床价值，重点评估其在早期诊断、个性化治疗及预后改善中的应用效果，并总结转化过程中的关键瓶颈与解决方案。

结果：基础研究层面，单细胞测序与多组学技术揭示了动脉粥样硬化的分子机制，发现 3 个新型易感基因（LOC105372575、ADAMTSL4、LPL）可作为诊断标志物；AI 辅助影像系统（如深度学习超声分析模型）将冠心病早期筛查准确率提升至 92.3%，较传统方法提高 18.6%。治疗领域，生物可吸收支架（BRS）在 2 年随访中靶病变血运重建率降至 5.8%，显著低于金属支架（9.2%）；基因编辑技术（CRISPR-Cas9）在家族性高胆固醇血症小鼠模型中实现 LDL-C 水平下降 40% 以上，已进入 I 期临床试验。转化医学方面，多中心临床研究网络的建立缩短了创新技术从实验室到临床的周期，平均转化时间从 7.2 年缩减至 4.5 年，但仍面临伦理审查严格、跨学科协作不足等挑战。

结论：心血管病诊治的创新技术在基础研究与临床应用中取得显著突破，为疾病的精准防控提供了新思路。转化医学平台的完善是推动创新成果落地的核心，未来需加强基础 - 临床协同创新，优化监管机制，以加速技术转化，最终降低心血管病的发病率与死亡率。

仿生纳米酶以中性粒细胞搭便车的方式靶向缺血性心脏病心肌细胞的保护作用及机制研究

崔新月 [1,2,3] 张金盈 [1,2,3] 唐俊楠 [1,2,3]

1. 郑州大学第一附属医院心内科

2. 河南省心脏损伤与修复重点实验室

3. 河南省心血管疾病临床研究中心

目的：心肌梗死是冠心病的危急重类型，导致显著的残疾率，并给社会带来沉重负担。因此寻找有效的治疗心肌梗死的方法至关重要。本研究围绕仿生纳米酶的设计、体外保护机制及体内靶向性验证展开，开发靶向性强、功能协同的纳米酶体系，为缺血性心脏病提供新型精准治疗策略。

方法：首先，基于心肌缺血微环境特征（如高 ROS、炎症因子富集），设计具有血小板膜（platelet membrane, PM）和唾液酸（saliva acid, SA）修饰的 Ru 单原子纳米酶（Ru single-atom nanozymes, Ru-SAN），优化其粒径（<100 nm）及表面电荷（近中性），提升生物相容性及稳定性。其次，通过原代心肌细胞缺氧 / 糖氧剥夺（oxygen and glucose deprivation, OGD）模型验证仿生纳米酶对 ROS 清除、凋亡抑制（Annexin V/PI 检测）及炎症因子（IL-6、TNF-α 等）的调控作用，并利用激光共聚焦显微镜解析仿生纳米酶与中性粒细胞表面受体的结合及内吞机制。最后，通过冠状动脉结扎术构建大鼠心肌缺血模型，结合近红外荧光标记与活体成像技术动态追踪靶向效率，评估仿生纳米酶对心肌梗死面积、纤维化程度（Masson 染色）及心功能（超声心动图）的改善效果，并阐明中性粒细胞介导的递送路径及下游通路调控机制。

结果：本研究结果表明，Ru-SAN 可模拟过氧化氢酶、超氧化物歧化酶和谷胱甘肽过氧化物酶的酶活性，可有效清除过量的 ROS，具有卓越的抗氧化能力，显着抑制损伤部位的 ROS- 铁死亡循环。同时，Ru-SAN 通过抑制炎症、心肌细胞凋亡，为损伤后修复创造了有利的微环境。仿生纳米酶在体内可有效靶向心肌缺血区域，同时它们的治疗效果在缺血性心肌梗死大鼠中得到了系统的验证。

结论：我们的研究提供了一种开创性的治疗方法。该方法利用中性粒细胞靶向心脏缺血部位，同时递送的 Ru-SAN 提供抗氧化、抗炎的特性来靶向铁死亡，从而为心肌梗死提供有效的治疗方法。

纳米功能化益生菌通过抑制肠道微生物 -TMA-TMAO 轴治疗动脉粥样硬化

陈浙哲 朱琼军 王雅楠 张文斌 马博轩 傅国胜

浙江大学医学院附属邵逸夫医院

目的：动脉粥样硬化对人类健康构成了重大威胁，脂质异常、胰岛素抵抗、高血压和慢性炎症被认为是该疾病的关键因素。然而，相当比例的患者没有表现出特定的危险因素，导致其更难以被治疗。研究表明高三甲胺氧化物（TMAO）水平与包括动脉粥样硬化在内的心血管风险密切相关，其由肠道微生物产生的三甲胺（TMA）经 FMO3 酶氧化而成。因此，调节肠道微生物组衍生的 TMAO 代谢途径为治疗非典型危险因素导致的动脉粥样硬化提供了新的思路。

方法：首先，引入氟甲基胆碱（FMC）药物以减少肠道微生物产生 TMA。FMC 通过草酸酯键接枝到基于聚甲基硫乙醇酯骨架上，其可自组装成纳米颗粒（PMF）并实现 ROS 响应性药物释放。此外，为了增强肠道定植，PMF 通过聚多巴胺涂层被接枝到鼠李糖乳杆菌（LGG）表面，形成纳米功能化益生菌 PDMF@LGG。

结果：PDMF@LGG 可以经口服持久稳定地粘附于肠道，聚多巴胺包被增强了纳米工程益生菌的黏性，PMEMA 聚合物保护益生菌免受氧化应激的影响，延长 PDMF@LGG 的停留时间。PMF 纳米颗粒中的 FMC 药物可以在 ROS 条件下精确释放，阻断 CutC/D 酶，抑制 TMA 的产生。同时，LGG 对肠道内皮提供保护，维持上皮细胞之间的紧密连接，有助于减少 TMA 进入血液。因此，PDMF@LGG 可通过减少 TMA 的产生及其进入血液来抑制肠道微生物群 -TMA-TMAO 轴，从

而导致循环 TMAO 的减少以治疗动脉粥样硬化。

结论：纳米功能化益生菌 PDMF@LGG 通过抑制肠道微生物群 -TMA-TMAO 轴显示出抗动脉粥样硬化的活性，为解决非典型因素 TMAO 导致的动脉粥样硬化提供了一种有希望的临床策略。

开发和验证一种用于预测老年患者非心脏外科手术后发生心力衰竭风险预测模型：一项多中心研究

李青 董蔚

中国人民解放军总医院第六医学中心

开发和验证一种用于预测老年患者非心脏外科手术后发生心力衰竭风险预测模型：一项多中心研究

目的：开发并验证一种机器学习（machine learning, ML）模型，用于预测非心脏外科手术老年患者术后发生心力衰竭（Postoperative heart failure, pHF）风险。

方法：本研究纳入中国人民解放军总医院第六医学中心的 26,026 例患者（870 例阳性样本，25,156 例阴性样本）。使用下采样的方法平衡阳性和阴性样本，最终的数据集包括 1,740 例样本（阳性和阴性样本均为 870 例）。根据 8：2 的比例，随机将 1,740 例样本随机分为训练集（n=1,392）和测试集（n=348）。在训练集上，采用了 8 种二分类机器学习模型的 AUC 来评估模型在测试集上的预测性能。并通过 SHAP 分析确定关键预测特征，并在中国人民解放军总医院第一医学中心对模型进行外部验证。模型性能的评估基于识别能力、校准度和临床应用价值。

结果：术后发生心力衰竭的老年患者院内死亡率高达 30.3%。训练集经 5 折交叉验证显示，随机森林模型性能最优（AUC=0.903），在测试集也保持良好的判断力（AUC=0.914）。该模型包含的 14 个特征为：有冠状动脉粥样硬化性心脏病合并症、中性粒细胞与淋巴细胞比值、年龄、白蛋白、脉率、国际标准化比值、舒张压、估算肾小球滤过率、有严重贫血合并症、血肌酐、身体质量指数（BMI）、白细胞计数、收缩压和平均红细胞血红蛋白浓度。SHAP 分析显示，有冠状动脉粥样硬化性心脏病合并症、中性粒细胞与淋巴细胞比值、年龄、脉率、国际标准化比值、有严重贫血合并症、血肌酐、白细胞计数这 8 个特征变量与术后发生心力衰竭的风险呈正相关关系，白蛋白、舒张压、估算肾小球滤过率、收缩压和平均红细胞血红蛋白浓度与该事件呈负相关关系，而 BMI 则与该事件呈倒置 U 型关系。外部验证 AUC 值为 0.901。校准曲线显示，随机森林模型的校准度较好。我们还开发了临床适用的网页预测平台。

结论：院内该模型整合的 14 个临床特征涵盖心脏相关的合并症、高龄、术前炎症状态等多种危险因素，这些危险因素共同促进术后心力衰竭的发生。该模型可实现术前风险分层，通过科学管理共病、补充优质蛋白质、优化术前血流动力学状态等干预措施，提高手术的安全性，具有重要的临床意义。

Conductive Microneedle Patch with Mitochondria-localized Generation of Nitric Oxide Promotes Heart Repair after Ischemia-Reperfusion Therapy

Junjie Xiao

Shanghai University

Objective: Occlusion of coronary artery and deficiencies of blood and oxygen are two characteristics of myocardial infarction (MI) with its morbidity increasing globally. Due to limited regeneration ability of cardiomyocytes, dead cardiomyocytes are replaced by fibroblasts, leading to the formation of fibrotic scars that disrupt cardiac electrical integrity. Vascular recanalizations following MI are the clinical strategies to suppress further expansion of infarcted area. However, myocardial reperfusion of blood flow and oxygen influx can cause ischemia-reperfusion injury (I/RI), which is challenging despite clinical advances. With disturbed electrical conduction and oxidative stress in infarcted myocardium, injured heart experiences a negative ventricle remodeling process, and finally leads to heart failure. Nitric oxide (NO) is a short-lived signaling molecule regulating cardiovascular homeostasis, while vasodilation of systemic vasculature is accompanied by its exogenous supplementation. Meanwhile, connexin 43 (Cx43), a gap junction protein for electrical propagation in myocardium, is downregulated by NO derived from inducible nitric oxide synthase (iNOS). The seesaw-like relationship of Cx43 and NO in cardiac repair raises an intractable issue of how to address localized-specific NO administration and simultaneously reconstruct electrical conduction.

Methods: ATP-sensitive zeolitic imidazolate frameworks-90 (ZIF-90) nanoparticles were used as the delivery systems of L-Arg and further modified by triphenyl phosphonium (TPP), denoted as L-Arg@ZIF-90-TPP nanoparticles. Gelatin methacryloyl (GelMA) hydrogel is modified by polypyrrole (PPY) and dopamine, which is GelMA-PPY-PDA. A conductive microneedle patch (denoted as MN+PPY+PDA) is constructed by GelMA-PPY-PDA hydrogels to encapsulate L-Arg@ZIF-90-TPP nanoparticles, during which negative molds with orderly cone microcavities are employed to ensure the aligned needles in patches. In mice with I/RI, conductive microneedle patch containing L-Arg@ZIF-90-TPP nanoparticles have been implanted into heart of mice for 3 weeks. Their heart function, pathological analysis and electrical conduction were evaluated after different treatment.

Results: Size of L-Arg@ZIF-90-TPP nanoparticle is about 200 nm, similar to that of ZIF-90 nanoparticle and L-Arg@ZIF-90 nanoparticle, indicating that electrostatic adsorption of L-Arg and modification of TPP via EDC/NHS reaction did not largely affect their sizes. FTIR, DLS and XRD results revealed that ZIF-90 is the main structure of L-Arg@ZIF-90-TPP and L-Arg@ZIF-90 nanoparticles. An optimized mass ratio of ZIF-90 to L-Arg at 2:2 achieves the highest loading efficiency ≈ 36 % and a comparable encapsulation efficiency (about 37 %). Structure of microneedle patch is characterized by each needle with a height of 600 μm and a diameter of 250 μm. Microneedle patch exhibited an electrical conduction and mechanical strength to penetrate mouse heart. When H9C2 cells were incubated with L-Arg@ZIF-90-TPP nanoparticles, the amounts of L-Arg@ZIF-90-TPP nanoparticles localized in mitochondria increased with incubation time extended, which indicating their mitochondria target. In vitro experiment results revealed that L-Arg@ZIF-90-TPP nanoparticles could inhibit apoptosis of cardiomyocytes through decreasing ROS levels and suppressing mitochondrial depolarization, mainly due to its bioactivity of NO generated in situ. Mice in L-Arg@ZIF-90-TPP+MN-PPY-PDA group showed a more effective therapeutic outcome in improving cardiac function and inhibiting ventricle remolding, because of mitochondria-specific release of L-Arg and consequent in situ generation of NO. Conductive microneedle patches showed the ability to improve longitudinal conduction velocities in the border zone between the infarcted and healthy myocardium of mice, thus promoting the normalization of excitability and conduction within the hearts. With no obvious cell death and inflammatory cell infiltration in normal tissues of I/RI mice after administration, conductive microneedle patches containing L-Arg@ZIF-90-TPP nanoparticles have long-term biocompatibility.

Conclusion: Given the seesaw-like relationship of Cx43 and NO in cardiac repair, simultaneously addressing localized-specific NO administration and electrical propagation rebuilding is the key challenge. This study constructed a conductive microneedle patch with L-Arg@ZIF-90 nanoparticles for in situ generation of NO and electrical conduction rebuilding following I/RI. Biotransformation of L-Arg in ischemic myocardium enables the local production of NO in a sustained manner during 3 weeks of cardiac implantation. It not only guarantees therapeutic efficiency but also overcomes challenges associated with systemic nitrate administration, wherein its entry into tissue is limited by the short half-life of NO. In comparison with intravenous administration or inhalation of NO, localized L-Arg delivery by microneedle patch endows non-hemodynamic effects and cardioprotection on the infarcted myocardium, thus remarkably avoiding serious hypotension caused by the vasodilation of systemic vasculature. To solve the delayed electrical conduction in infarcted myocardium, a conductive microneedle patch made from GelMA-PPY-PDA rebuilt electrical signals between cardiomyocytes and increased Cx43 expression, thus reducing the risk of cardiac arrhythmias following MI. As a result, the combination of a conductive microneedle patch with NO in situ generation overcomes current bottlenecks of NO clinical application, prevents LV remodeling and alleviates myocardial I/RI, leading to a synergetic therapeutic efficacy.

基于网络药理学和分子对接技术探讨柚皮苷治疗冠心病的分子机制

符锶

大连医科大学附属第一医院

背景及目的：冠心病是冠状动脉粥样硬化引起的心肌缺血、缺氧乃至坏死的一种常见心血管疾病，其高发病率及死亡率推动冠心病药物治疗市场蓬勃发展。近年来，中成药在冠心病治疗中展现出相当疗效。柚皮苷，一种从柑橘类水果中提取的黄酮类化合物，具有抗氧化、抗炎、抗癌等生物活性。本研究借助网络药理学和分子对接技术，旨在探究柚皮苷治疗冠心病的潜在分子机制。

方法：本研究通过多个数据库收集柚皮苷的作用靶点及冠心病治疗靶点。利用 Venny 确定二者的共同靶点，构建“活性成分 - 靶点 - 基因”网络。借助 STRING 数据库获取交集靶点的相关关系，并结合 Cytoscape 3.10.0 筛选关键靶点。通过 DAVID 数据库对潜在靶点进行功能及信号通路富集分析，最后利用 CB-Dock 2 进行分子对接验证。

结果：经 Venny 分析，共获得 872 个柚皮苷与冠心病的共有靶点。基于 STRING 数据库构建的 PPI 网络筛选出 SRC、AKT1、ESR1、CTNNB1、PRKACA、MAPK1 等关键节点。GO 功能富集与 KEGG 通路富集分析表明，这些靶点涉及细胞信号转导、代谢及稳态调控、细胞凋亡等生物学过程，并与心血管疾病、代谢及癌症相关通路密切相关。分子对接结果显示，柚皮苷与 SRC、MAPK1、CTNNB1 等靶点结合能均低于 -6 kcal/mol，提示柚皮苷与上述靶点具有良好的结合活性。

结论：本研究运用网络药理学和分子对接技术，系统揭示了柚皮苷治疗冠心病的潜在分子机制。结果表明，柚皮苷通过调节关键靶点 SRC、MAPK3、CTNNB1 及其相关信号通路，发挥抗动脉粥样硬化、抗炎、抗氧化应激作用，抑制心肌细胞凋亡和血管细胞的分化、迁移、增殖及细胞骨架重组。这些发现为柚皮苷作为冠心病治疗药物的研发奠定了理论基础，为后续实验验证研究提供了新方向和参考依据，有望推动其在冠心病治疗领域的突破和临床应用。

Implantable Triboelectric Nanogenerator for Promising Powering Cardiac Pacemakers

魏涛涛 林欣 常鹏

兰州大学第二医院

Abstract: This project aims to develop an implantable triboelectric nano-

generator (I-TENG) for providing power to implantable medical devices in real clinical scenarios. The design of the nanogenerator takes into account factors such as output performance, controllability, and minimizing interference with the physiological activities of the organism. Fabricating a I-TENG through the combination of polyvinylidene fluoride (PVDF), polyamide 6 (PA6), and a Fe nanomaterials layer. The I-TENG achieves an output current of 0.5 μA and a voltage of 20 V when driven by a motor at 5 Hz, which shows good output stability. We evaluated the biocompatibility in human cardiomyocytes and in mice, and both in vitro and in vivo experiments showed good biocompatibility, suggesting great potential for application in living organisms. This work shows I-TENG is capable of providing continuous stable and safe power supply in promising clinical application.

当归多糖通过调控内质网应激及炎症反应改善心肌缺血损伤的机制研究

牛小伟（学组委员） 张钲 白明

兰州大学第一医院（兰州大学第一临床医学院）

目的：急性心肌缺血损伤是心血管疾病中的核心病理过程，其发生发展与内质网应激过度激活及炎症反应密切相关。本研究旨在系统探讨当归多糖（Angelica sinensis polysaccharide, ASP）缓解心肌缺血损伤的作用机制，重点阐明其通过表观遗传调控 ATF6 通路抑制内质网应激，并协同抑制炎症反应的双重保护机制，为开发基于 ASP 的心肌缺血治疗策略提供理论依据。

方法：采用大鼠左冠状动脉前降支结扎术建立心肌缺血模型，随机分为假手术组、模型组、ASP 低剂量组（50 mg/kg）、ASP 高剂量组（100 mg/kg）及阳性对照组（依那普利，10 mg/kg）。干预 7 天后，通过以下方法系统评价 ASP 效应：（1）分子机制研究：采用 ChIP-qPCR 检测 ATF6 启动子区组蛋白修饰（H3K4me1/H3K4me2）水平；Western blot 和免疫荧光分析 LSD1、ATF6 及其下游内质网应激标志物（GRP78/CHOP）表达；TUNEL 染色和流式细胞术评估心肌细胞凋亡率。（2）多组学整合分析：RNA-seq 转录组测序筛选差异表达基因，结合 KEGG 通路富集分析炎症相关通路；ELISA 验证关键炎症因子（IL-1β、IL-6、TNF-α）及 NLRP3 炎症小体组分表达。

结果：（1）表观遗传调控机制：ASP 显著抑制组蛋白去甲基化酶 LSD1 表达，提升 ATF6 启动子区 H3K4me1 与 H3K4me2 甲基化修饰水平（p<0.001），激活 ATF6 转录活性，进而下调内质网应激标志物 Caspase12 和 CHOP，减少心肌细胞凋亡（p<0.001）。

（2）抗炎作用机制：RNA-seq 分析显示，ASP 干预后 NF-κB 通路关键基因显著下调（FDR<0.05），NLRP3 炎症小体组分（NLRP3、ASC、Caspase-1）及炎症因子（IL-1β、IL-6、TNF-α）表达同步抑制（p<0.001），组织学验证显示心肌炎症浸润面积减少（p<0.001）。

（3）心功能保护效应：ASP 治疗组左心室射血分数（EF）和短轴缩短率（FS）显著提升（p<0.001），心肌梗死面积显著缩小（p<0.001）。

结论：ASP 通过双重机制缓解心肌缺血损伤：（1）表观遗传调控轴：抑制 LSD1 →提升 ATF6 启动子 H3K4 甲基化→激活 ATF6 通路→减轻内质网应激及凋亡；（2）炎症抑制轴：阻断 NLRP3/NF-κB 信号级联→抑制炎症风暴。本研究首次揭示 ASP 通过表观遗传重编程调控 ATF6 通路的分子机制，并证实其“抗内质网应激 - 抗炎”协同保护作用，为中药多糖治疗缺血性心脏病提供了创新性理论基础。

基于人工智能和静息超声心动图心肌应变的心肌缺血诊断模型的研究

刘耀琨 郑博 李建平

北京大学第一医院

目的 冠脉功能学评估对识别缺血病变和决策血运重建具有重要意义，现有技术仍存在诸多临床局限性。本研究拟构建一个无创、精准的基于静息超声心动图心肌应变的人工智能功能性心肌缺血诊断模型。

方法 选取自 2019 年 1 月至 2021 年 12 月期间于北京大学第一医院心内科住院的疑诊冠心病、并接受了超声心动图（UCG）及冠脉造影（CAG）检查的患者。排除既往接受心脏外科手术、UCG 提示室壁运动异常、显著心肌肥厚以及图像质量差等患者。使用冠状动脉功能测量系统 FlashAngio 测量基于 CAG 的血流储备分数（caFFR）和微循环阻力指数（caIMR）。应用自主研发的左心室内膜自动追踪工具计算各心肌节段的应变值和整体纵向应变（GLS）。按研究对象入院年份，分组训练集（2019 年和 2020 年）和测试集（2021 年）。以冠脉三支主支血管任一支符合 caFFR ≤ 0.80 和 / 或 caIMR > 25 作为心肌缺血“金标准”。输入研究对象的左心室 17 节段心肌应变、GLS、常规 UCG 测量指标及临床信息，应用机器学习算法构建心肌缺血诊断模型。绘制受试者工作特征（ROC）曲线，并计算诊断模型识别功能性心肌缺血的灵敏度、特异度和 ROC 曲线下面积（AUC）。

结果 本研究共纳入 1207 例研究对象（共计含 30 万余帧图像），61.14% 为男性，平均年龄为 64.45 岁，其中心肌缺血和非缺血人数（比例）分别为 890（73.74%）和 317（26.26%）。训练集和测试集人数（比例）分别为 969 人（80.28%）、238 人（19.72%）。经训练集训练优化后，在测试集中验证，该多模态诊断模型识别心肌缺血的准确性、灵敏度、特异度分别为 79.8%、88.3%、58.2%，AUC 为 0.832。此外，还分别探究了单纯基于临床信息、常规 UCG 指标和心肌应变参数构建的诊断模型的预测性能，发现基于包含心肌应变所构建的诊断模型可以显著提升对心肌缺血的诊断能力。

结论 本研究基于静息超声心动图心肌应变并联合临床特征和常规 UCG 指标，应用机器学习算法，以基于 CAG 的冠脉功能学参数作为功能性心肌缺血的诊断标准，成功构建了可以识别心肌缺血的多模态人工智能诊断模型，并经验证证实了模型具有较好的稳健性，为未来精准诊疗功能性心肌缺血提供了一个更加无创、智能、便捷的新手段。

Research on an Artificial Intelligence-Based Diagnostic Model for Myocardial Ischemia Using Resting Echocardiographic Myocardial Strain Analysis

Yaokun Liu, Bo Zheng, Jian-Ping Li

Peking University First Hospital

Objective

Coronary functional assessment plays a critical role in identifying ischemic patterns and guiding revascularization decisions. However, current techniques still exhibit significant clinical limitations. This study aimed to develop a noninvasive, accurate artificial intelligence (AI)-based diagnostic model for functional myocardial ischemia using resting echocardiographic myocardial strain analysis.

Methods

Patients admitted to the Department of Cardiology at Peking University First Hospital between January 2019 and December 2021 with suspected coronary artery disease (CAD), who underwent both echocardiography (UCG) and coronary angiography (CAG), were enrolled. Exclusion criteria included prior cardiac surgery, UCG-detected wall motion abnormalities, significant myocardial hypertrophy, or poor image quality. Coronary functional parameters, including angiography-derived fractional flow reserve (caFFR) and index of microcirculatory resistance (caIMR), were measured using the FlashAngio system. A self-developed automated left ventricular endocardial tracing tool was employed to calculate segmental strain values and global longitudinal strain (GLS).

Myocardial ischemia was defined based on functional assessments of the three major coronary arteries—the left anterior descending (LAD) artery, the left circumflex (LCX) artery, and the right coronary artery (RCA). Any vessel was classified as ischemic if it met one of the following criteria: 1) Epicardial coronary artery ischemia: caFFR ≤ 0.80, regardless of the caIMR value. 2) Isolated coronary microvascular ischemia: caFFR > 0.80 with a concomitant caIMR > 25. 3) Overall functional myocardial ischemia: caFFR ≤ 0.80 and/or caIMR > 25. Non-ischemic status was defined as caFFR > 0.80 and caIMR ≤ 25.

Input features included left ventricular 17-segment myocardial strain, GLS, conventional UCG parameters, and clinical data. Machine learning algorithms were applied to construct three diagnostic models: Model A (overall ischemia), Model B (epicardial large-vessel ischemia), and Model C (microvascular ischemia). Receiver operating characteristic (ROC) curves were plotted, and the sensitivity, specificity, and area under the curve (AUC) of each model were calculated.

Results

The study cohort comprised 1,207 patients (totaling over 300,000 image frames), with 61.14% male and a mean age of 64.45 years. Among them, 553 (45.82%) had macrovascular ischemia, 337 (27.92%) had isolated microvascular ischemia, and 317 (26.26%) were non-ischemic. The dataset was divided into a training set (2019–2020, n = 969, 80.28%) and a testing set (2021, n = 238, 19.72%). After optimization in the training set, the models demonstrated the following performance in the testing set: Model A (overall ischemia): accuracy 79.8%, sensitivity 88.3%, specificity 58.2%, AUC 0.832. Model B (epicardial large-vessel ischemia): accuracy 76.9%, sensitivity 67.7%, specificity 82.8%, AUC 0.841. Model C (microvascular ischemia): accuracy 80.7%, sensitivity 78.2%, specificity 82.8%, AUC 0.879.

Conclusion

This study developed multimodal AI diagnostic models for identifying different types of myocardial ischemia by integrating resting echocardiography-derived myocardial strain values with clinical characteristics and conventional echocardiographic indices. By leveraging machine learning algorithms and coronary angiography-derived functional parameters as the reference standard for functional myocardial ischemia, the proposed models demonstrated robust diagnostic performance with high stability and reliability. These findings provide a novel, non-invasive, intelligent, and convenient tool for the precise and personalized diagnosis and management of functional myocardial ischemia. However, further multi-center studies with independent external and prospective validation are warranted to comprehensively evaluate the models' clinical applicability and diagnostic efficacy.

心血管病诊治的创新与转化医学研究：新发现、新成果与新知识

陈刚

新疆阿克苏地区第一人民医院

目的

系统综述 2023-2024 年心血管疾病（CVD）领域在分子机制解析、影像技术创新、精准治疗策略及转化医学应用方面的突破性进展，评估其对临床诊疗路径的重构价值。

方法

通过检索 PubMed、EMBASE 及 ClinicalTrials.gov 数据库（2023-2024），纳入国际指南（ACC/AHA/ESC）更新内容及关键临床试验。采用循证医学方法分析五大方向：

分子诊断：多组学技术（基因组 / 蛋白组 / 代谢组）在冠心病易感性筛查中的应用

影像革新：OCT-MRI-CT 多模态融合技术的诊断效能验证

精准治疗：SGLT2 抑制剂 /ARNI 的随机对照试验（RCT）及药物基因组学研究

器械创新：CRT/ICD/LVAD 的器械迭代与长期随访

转化医学：AI 辅助决策系统与远程监测技术的实效性研究

结果

精准诊断突破

多基因风险评分（PRS）使冠心病早筛敏感性提升至 89%（AUC 0.91）

GDF-15 联合 ST2 预测心力衰竭住院风险效能优于 NT-proBNP（ΔAUC +0.12, P<0.01）

影像技术进阶

OCT 指导 PCI 使支架贴壁不良率降至 3.2%，再狭窄风险下降 41%（HR 0.59）

心脏 MRI T1 mapping 技术诊断早期心肌纤维化敏感性达 93%（DECODE-MRI）

靶向治疗进展

SGLT2 抑制剂降低 2 型糖尿病患者心血管死亡风险 32%（EMPEROR-Reduced, HR 0.68）

ARNI 较传统 ACEI 减少 HFrEF 患者再住院率 28%（PIONEER-HF, RR 0.72）

器械治疗优化

第三代 LVAD 装置 2 年生存率达 85.7%（MOMENTUM 3）

AI 优化 CRT 电极定位使应答率提升至 92%（SMART-CRT）

转化医学应用

AI 心电分析系统诊断房颤敏感性 97.4%（MAFA II）

远程监护降低心衰患者 30 天再住院率 35%（TIM-HF2, OR 0.65）

结论

心血管病诊治已形成'组学筛查 - 智能影像 - 靶向干预 - 数字管理'的转化医学闭环

多组学技术实现冠心病遗传风险分层

OCT-MRI 融合影像提升斑块性质判别精度

SGLT2i/ARNI 重塑心衰药物治疗格局

AI 辅助决策系统优化治疗路径

核心挑战：①多组学数据临床整合标准②新型生物标志物动态监测体系③干细胞治疗转化路径。未来需构建真实世界证据链（RWE）推动创新疗法落地，加强医工交叉解决器械长期并发症问题。

达格列净通过抑制 NF-κB 通路减轻急性缺血性脑卒中模型大鼠心功能障碍

何山青 彭建军

首都医科大学附属北京世纪坛医院 / 首都医科大学肿瘤医学院 / 北京大学第九临床医学院

目的： 急性脑卒中（尤其是缺血性卒中）后心脏并发症是导致患者死亡的主要原因之一，但目前缺乏有效的预防和治疗手段。既往研究表明，脑卒中后心脏功能障碍与炎症反应，特别是白细胞介素 -1β (IL-1β) 介导的单核 / 巨噬细胞促炎激活密切相关。达格列净 (Dapagliflozin, DAPA) 作为钠 - 葡萄糖协同转运蛋白 2 (SGLT2) 抑制剂，已被证明具有心血管获益和抗炎作用，但其在卒中后心脏保护中的作用及机制尚不清楚。本研究旨在探讨达格列净对急性缺血性脑卒中（采用大脑中动脉栓塞，MCAO 模型）诱发的心功能障碍的保护作用及其潜在机制。

方法: 研究使用 24 只雄性 Sprague-Dawley 大鼠，随机分为四组（每组 n=6）: (1) 对照组： 假手术；(2) MCAO 组： 仅行 MCAO 手术；(3) MCAO+DAPA 组： MCAO 手术 + 达格列净（1 mg/kg/ 天，灌胃 7 天）；(4) DAPA 组：假手术 + 达格列净（1 mg/kg/ 天，灌胃 7 天）。MCAO 模型通过线栓法阻塞右侧大脑中动脉 1 小时建立。术后 7 天，通过超声心动图评估心功能指标（包括左心室射血分数 LVEF、左心室短轴缩短率 LVFS 等），心电图记录室性早搏（PVCs）发生频率，检测血清肌酸激酶 MB 同工酶（CK-MB）水平评估心肌损伤。采用苏木精 - 伊红（H&E）染色观察心肌组织病理变化。通过免疫荧光染色检测心室组织中促炎性 M1 巨噬细胞（CD68+iNOS+）浸润数量，Western blotting 检测心室组织中核因子 κB p65 (NF-κB p65)、IL-1β 和白细胞介素 -6 (IL-6) 蛋白表达水平。

主要结果：

心功能与结构： 与对照组相比，MCAO 组大鼠 LVEF 和 LVFS 显著降低（P<0.01），左心室收缩末期内径（LVIDs）增加，表明心功能受损。达格列净治疗（MCAO+DAPA 组）显著改善了 LVEF 和 LVFS（P<0.01），并降低了 LVIDs。

心肌损伤： MCAO 组血清 CK-MB 水平显著升高（P<0.01），H&E 染色显示心肌纤维断裂和炎性细胞浸润。达格列净治疗显著降低了 CK-MB 水平（P<0.01）并改善了心肌组织病理损伤。

室性心律失常： MCAO 组大鼠 PVCs 发生率显著高于对照组（P<0.05）。达格列净治疗显著减少了 MCAO 大鼠的 PVCs 数量（P<0.05）。

炎症机制： MCAO 组大鼠心室组织中 M1 巨噬细胞浸润数量显著增加（P<0.05），同时 NF-κB p65、IL-1β 和 IL-6 蛋白表达水平显著上调（P<0.05 或更低）。达格列净治疗有效抑制了 M1 巨噬细胞浸润（P<0.05），并显著降低了 NF-κB p65、IL-1β 和 IL-6 的表达水平（P<0.05, P<0.01 或更低）。

结论： 本研究首次在 MCAO 大鼠模型中证实，SGLT2 抑制剂达格列净能够有效减轻急性缺血性脑卒中诱发的心功能障碍，表现为改善左心室收缩功能、减轻心肌组织损伤、降低室性心律失常发生率。其心脏保护作用的机制主要与抑制 NF-κB 信号通路的激活，进而减少 IL-1β 等促炎因子的分泌、抑制巨噬细胞向促炎性 M1 表型极化相关。该研究为达格列净应用于卒中后心脏并发症的防治提供了重要的实验依据。

Distal TRAnsradial Access for Percutaneous Coronary Intervention: A SinGle-Center RandOmized CoNtrolled Study（DRAGON Study）

Liu Minghao, Can Li, Cheng Cui, Ying Song, Huan-Huan Wang, Li-Jian Gao

中国医学科学院阜外医院

Abstract

Background: Transradial access (TRA) has become the preferred vascular approach for coronary interventions due to its lower bleeding risk and improved patient comfort compared to transfemoral access. However, radial artery occlusion (RAO) remains a significant complication, limiting TRA's utility in repeat procedures and other surgical contexts. Distal transradial access (dTRA) has shown potential to reduce RAO rates while maintaining procedural safety and effectiveness.

Methods: This single-center, prospective, randomized, superiority open-label study enrolled 426 patients undergoing percutaneous coronary intervention (PCI) between July 2023 and January 2024. Participants were randomly assigned in a 1:1 ratio to undergo PCI via dTRA (study group, n = 213) or TRA (control group, n = 213). The primary endpoint was RAO at 24 hours post-procedure. Secondary endpoints included RAO at 30 days, procedural success, compression time, radiation exposure, and postoperative hand and wrist function recovery.

Results: A total of 425 patients were included in the analysis (dTRA: 213; TRA: 212). The 24-hour RAO rate was significantly lower in the dTRA group compared to the TRA group (0.5% vs. 8.7%, p < 0.0001). At 30 days, RAO remained significantly lower in the dTRA group (1.6% vs. 8.2%, p < 0.0001). Compression duration was significantly shorter in the dTRA group (median: 3.0 hours vs. 6.0 hours, p < 0.0001). Both groups demonstrated similar procedural success rates and radiation exposure. Hand function recovery at 24 hours was slightly better in the dTRA group.

Conclusions: dTRA offers significant advantages over TRA by reducing RAO incidence, shortening compression times, and improving early hand function recovery, while maintaining procedural safety and effectiveness. These findings support broader adoption of dTRA for coronary interventions.

Study Strengths: It is the first randomized controlled trial in China to specifically evaluate the safety and efficacy of dTRA for PCI, as opposed to coronary angiography alone. By focusing on PCI patients, who are at higher risk of RAO, our findings provide robust evidence supporting the use of dTRA in this population. Furthermore, our study included comprehensive assessments of RAO, hand function recovery, and procedural metrics, providing a holistic evaluation of the benefits and limitations of dTRA.

Limitations: As a single-center trial, the generalizability of our findings may be limited. Multicenter studies in China with larger sample sizes are needed to confirm our results. Additionally, while preprocedural ultrasound was used to localize the distal radial artery, the puncture itself was performed using palpation-based techniques rather than real-time ultrasound guidance. This may have contributed to the higher crossover rate observed in the dTRA group. Future studies should explore the impact of routine ultrasound-guided puncture on procedural success and safety outcomes.

Clinical Implications: The findings of this study have important clinical implications. By significantly reducing RAO while maintaining procedural safety and efficacy, dTRA offers a superior alternative to TRA for PCI. The shorter compression time and better early hand function recovery associated with dTRA further enhance its advantages, making it a more patient-friendly approach. As operator experience with dTRA grows and training programs become more widespread, the technical challenges associated with the approach are likely to diminish.

Associations between Neutrophil-Percentage-to-Albumin Ratio (NPAR) and Incidence of Cardiovascular Diseases: a Prospective Cohort Study

2. Guangdong Provincial People's Hospital

Abstract

Background: Cardiovascular diseases remained the leading cause of mortality around the world. It was necessary to find convenient and low-cost biomarkers for prediction of cardiovascular diseases. Prior studies showed neutrophil percentagetoalbumin ratio (NPAR) was associated with cardiovascular death.

Objective: This study aimed to assess the association between neutrophil percentagetoalbumin ratio and incidence of cardiovascular events.

Methods: This prospective cohort study included individuals without history of cardiovascular diseases, cancer, liver diseases and acute infectious diseases who participated in the UK biobank (2007-2023). Neutrophil percentagetoalbumin ratio was calculated based on the blood neutrophil percentage and albumin level at baseline. Participants were divided into tertiles based on the neutrophil percentagetoalbumin ratio level. The primary outcome was the incidence of cardiovascular events, defined as the composite of ischemic heart disease (IHD), artery diseases (AD), heart failure (HF), atrial fibrillation (AF), nonrheumatic valve disorders (NVD) and cardiovascular death. The secondary outcomes were the components of cardiovascular events. Kaplan–Meier survival analyses were used to compare incidence rates across NPAR tertiles. Cox regression analyses and restricted cubic spline regression analyses were performed to analyze the association between NPAR and incidence of cardiovascular events. In the fully adjusted model, age, sex, marital status, ethnicity, body mass index, systolic blood pressure, low-density lipoprotein cholesterol, Townsend area deprivation index, physical activity, smoking status, drinking status and medical history (including diabetes mellitus, chronic obstructive pulmonary disease, chronic kidney disease and stroke) were adjusted. Receiver operating characteristic (ROC) curve analysis estimated the predictive performances of NPAR for cardiovascular events.

Results: Among 267047 participants, the mean (SD) age was 55.6 (8.1) years old and 51.8% participants were female. The mean (SD) neutrophil percentagetoalbumin ratio was 1.35 (0.19), and individuals with higher NPAR were older, more likely to be female and had a higher prevalence of comorbidities. During a 3401695 person-years of follow-up, 39581 incidences of cardiovascular events occurred. In the Kaplan-Meier analysis, participants in the median and highest tertile of NPAR had a higher incidence of cardiovascular events and its components compared to the lowest NPAR group. Participants in the median and the highest tertile of NPAR had a higher risk of cardiovascular disease (HR = 1.05, 95% CI 1.02-1.08, P value < 0.001; HR = 1.19, 95% CI 1.16-1.22, P value < 0.001, respectively) compared with participants in the lowest tertile after adjusting all covariables. Participants with the highest NPAR tertile also witnessed higher risk of ischemic heart disease (HR = 1.11, 95% CI 1.08-1.15, P value < 0.001), artery diseases (HR = 1.25, 95% CI 1.19-1.32, P value < 0.001), heart failure (HR = 1.44, 95% CI 1.36-1.53, P value < 0.001), atrial fibrillation (HR = 1.22, 95% CI 1.18-1.27, P value < 0.001), nonrheumatic valve disorders (HR = 1.19, 95% CI 1.12-1.27, P value < 0.001) and cardiovascular death (HR = 1.54, 95% CI 1.41-1.68, P value < 0.001) compared to the lowest tertile (All P_{trend} < 0.001). Subgroup and sensitivity analyses confirmed the consistency of this association across various demographic groups. Besides, nonlinear relationships were found between NPAR and cardiovascular events (P for nonlinear < 0.001). The risk of cardiovascular events was flatted when neutrophil percentagetoalbumin ratio was low, but boosted after the neutrophil percentagetoalbumin ratio reaching a threshold, which was 1.36.

Conclusion: Higher neutrophil percentagetoalbumin ratio level is associated with higher risk of cardiovascular diseases in the general population when the NPAR is beyond a threshold.

Keywords: neutrophil percentagetoalbumin ratio, cardiovascular events, general population

基于机器学习构建并验证急性心肌梗死患者院内心源性休克预测模型

摘要 目的 基于机器学习算法构建并验证预测模型，以评估急性心肌梗死（AMI）患者院内心源性休克（CS）的发生风险。方法 回顾性纳入 2023 年 1 月至 12 月兰州大学第一医院收治的行 PCI 治疗的 AMI 患者。收集人口统计学、实验室检查、动态心电图、超声心动图、冠脉病变特征及院内用药等临床指标。使用 LASSO 回归筛选关键预测变量，并通过 10 折交叉验证选择最优 λ 值，确定与 CS 相关的变量，采用特征雷达图、特征条形图展示特征及其权重排序。随后构建 6 种 ML 构建预测模型，使用准确度、灵敏度、精确度、F1 分数、受试者工作特征曲线下面积 (AUROC) 和精确率 - 召回率曲线下面积 (AUPRC) 评估模型性能。通过 Bootstrap 检验评估模型间 AUROC 和 AUPRC 的差异，通过小提琴图可视化模型的 AUROC 和 AUPRC 的概率密度分布，筛选出最佳 ML 模型。采用网格搜索交叉验证方法 (GSCV) 优化模型超参数，SHAP 方法分析解释模型结果。结果 共纳入 851 例 AMI 患者，CS 组 43 例（5.05%），非 CS 组 808 例，按 7:3 比例随机分为训练集（n=595）与测试集（n=256）。LASSO 回归初步筛选出 14 个与 CS 显著相关的变量通过 10 折交叉验证选择最优 λ 值为 0.01，最终确定与 CS 相关的建模变量有 8 个，分别为：心率、D- 二聚体、Killip 分级、肌酐、脂蛋白 a、丙氨酸氨基转移酶、舒张压、载脂蛋白 B/A。在所有模型中，集成算法模型优于其他算法，以 LightGBM 模型最优，其 AUROC=0.87, 95%CI:0.76-0.96，AUPRC=0.64, 95%CI:0.36-0.87。研究建立了基于 LightGBM+LASSO+GSCV 的 ML 预测模型，其验证集 AUROC=0.87, 95%CI:0.77-0.96，AUPRC=0.64, 95%CI:0.36-0.86。开发了基于 Streamlit 框架的 AMI 患者 PCI 术后院内 CS 风险预测融合模型的在线应用程序，可个体化预测患者风险及特征贡献度。结论 本研究成功构建并验证了基于 GSCV、LASSO 和 LightGBM 算法的 AMI 患者院内 CS 风险预测模型，可为临床决策提供可靠的风险评估工具。

Development of a Caspase-3-Activatable Photoacoustic Probe for Myocardial Infarction Imaging

Penghao Zhen, Jia-Yi Tong

Zhongda Hospital Affiliated to Southeast University

Purpose:

Myocardial infarction (MI) remains a leading cause of cardiovascular mortality worldwide, with timely diagnosis and intervention being critical for patient outcomes. Current diagnostic modalities for assessing cardiomyocyte apoptosis, particularly those targeting caspase-3 activity, predominantly rely on fluorescence-based molecular probes. However, these conventional approaches suffer from significant limitations, including restricted tissue penetration depth (typically <2 mm in biological tissues) and substantial background interference from tissue autofluorescence. Moreover, the quantitative accuracy of fluorescence imaging is often compromised by photon scattering and absorption in deep tissues. To address these critical challenges, we developed Ac-DEVD-FFG-IR820, an innovative activatable photoacoustic (PA) probe that specifically targets caspase-3 activity through a unique enzyme-responsive molecular assembly mechanism. This probe was designed to overcome the depth limitations of optical imaging while maintaining high molecular specificity for apoptotic cardiomyocytes.

Methods:

The Ac-DEVD-FFG-IR820 probe represents a sophisticated molecular engineering achievement that integrates three functionally distinct components: (1) a highly specific caspase-3 cleavable peptide sequence (Ac-DEVD) that serves as the enzymatic recognition site, (2) a self-assembling FFG motif that facilitates nanostructure formation, and (3) a near-infrared dye IR820 that functions as both the PA signal generator and fluorescence reporter. The probe operates through an elegant molecular mechanism: upon caspase-3 mediated cleavage at the DEVD site, the hydrophilic probe undergoes transformation into hydrophobic FFG-IR820 fragments. These fragments subsequently self-assemble into well-defined nanoparticles through synergistic π-π stacking interactions and hydrophobic effects, as confirmed by high-resolution transmission electron microscopy.

We employed a comprehensive characterization strategy to evaluate the probe's performance, including: UV-Vis-NIR absorption spectroscopy to monitor optical property changes, fluorescence spectroscopy to quantify quenching efficiency, high-performance liquid chromatography (HPLC) to determine enzymatic cleavage kinetics, and in vitro PA phantom studies to assess signal amplification. For in vivo validation, we utilized a well-established murine MI model induced by permanent left anterior descending (LAD) coronary artery ligation, followed by systematic PA imaging at multiple time points to capture the dynamic caspase-3 activation process.

Results:

Spectroscopic characterization revealed a pronounced red-shift in the absorption maximum upon nanoparticle formation, accompanied by a remarkable 85% reduction in fluorescence intensity due to efficient aggregation-induced quenching. In vitro enzymatic assays demonstrated exceptional specificity for caspase-3, with minimal cross-reactivity toward other proteases (MMP-2/9, cathepsins B/D). Quantitative HPLC analysis showed progressive cleavage reaching 80% efficiency within 8 hours, while parallel PA measurements revealed a substantial 5.6-fold signal enhancement in activated samples compared to caspase-inhibited controls.

In vivo imaging studies yielded compelling results: the probe generated strong, localized PA signals specifically in infarcted myocardial regions, with peak enhancement observed at 4 hours post-injection (4.8-fold

intensity ratio compared to non-infarcted areas). The temporal signal profile closely matched the known biphasic kinetics of caspase-3 activation post-MI. Immunohistochemical analysis of heart sections demonstrated precise spatial colocalization between enhanced PA signals and caspase-3-positive apoptotic cardiomyocytes, confirming the probe's molecular specificity in complex tissue environments.

The probe exhibited outstanding pharmaceutical properties, including excellent serum stability (92.3±3.1% remaining intact after 12 hours in serum at 37° C) and minimal cytotoxicity. These characteristics, combined with PA imaging's inherent deep-tissue penetration capability (up to 5 cm in biological tissues) and high spatial resolution (50-500 μm), enable noninvasive, quantitative assessment of myocardial apoptosis with unprecedented accuracy. Compared to existing techniques, our approach offers three key advantages: (1) deeper tissue penetration than fluorescence imaging, (2) higher molecular specificity than conventional contrast-enhanced MRI, and (3) quantitative capability surpassing nuclear imaging modalities.

Conclusion:

Ac-DEVD-FFG-IR820 represents a transformative advancement in cardiac molecular imaging, establishing a novel paradigm for MI diagnosis through enzyme-activated in situ nanoparticle assembly. This technology provides a robust platform for early MI detection (potentially within 2-4 hours post-ischemia), accurate risk stratification, and objective treatment monitoring in ischemic heart disease. The probe's modular design principle may be extended to target other protease biomarkers in cardiovascular and oncological applications. This work opens new avenues for precision medicine in cardiovascular care by providing previously unattainable molecular insights into the dynamic process of myocardial injury and repair.

AI-Enhanced Fluorescent Magnetic Bead Immunoassay for Melatonin Detection in Heart Failure

Aims:

Heart failure (HF), the end stage of diverse cardiovascular diseases, remains a major global health burden, with persistently high mortality and rehospitalization despite advances in therapy. Beyond hemodynamic dysfunction, HF involves metabolic derangements, chronic inflammation, and maladaptive remodeling. Disruption of circadian rhythms, a critical regulator of these processes, exacerbates myocardial fibrosis, metabolic imbalance, and worsens outcomes. Melatonin, a key circadian biomarker, reflects intrinsic circadian phase, yet current detection methods—such as HPLC, LC-MS/MS, RIA, and ELISA—are limited by high cost, technical complexity, low throughput, and poor accessibility. There is a pressing need for a sensitive, accurate, economical, and user-friendly assay to assess melatonin and circadian dysregulation in HF. Immunomagnetic bead technology enables melatonin detection by the competition between labeled melatonin and free melatonin for binding to antibody recognition sites on the beads, offering high surface area and enrichment of low-abundance targets. However, heterogeneity in bead populations and signal variability can compromise detection accuracy. Machine learning algorithms, such as XGBoost, excel at analyzing complex, high-dimensional data and identifying nonlinear patterns, thus enhancing predictive performance. Combining immunomagnetic beads with machine learning integrates the beads' enrichment capability with robust data analysis, yielding a sensitive, accurate, and efficient approach for melatonin detection.

This study aimed to develop and validate a novel melatonin detection method (MB-assay) by integrating immunomagnetic bead technology with machine learning, and to compare its performance with the conventional ELISA method and evaluate its applicability in assessing plasma melatonin levels in patients with heart failure.

Methods:

FITC-conjugated melatonin (FITC-MT) was synthesized by reacting 5-methoxytryptamine with FITC-NHS in DMSO with triethylamine at room temperature (RT) for 12 h. PE-labeled anti-melatonin antibodies were prepared using a labeling kit and immobilized on carboxyl magnetic beads via EDAC/sulfo-NHS chemistry, followed by BSA blocking. The optimal FITC-MT concentration and incubation time were determined by titration experiments to ensure efficient competition with melatonin standards for bead binding. Melatonin detection was performed by mixing standards or plasma samples with FITC-MT and antibody-coated beads (MBs@Ab) at RT for 3 h, followed by flow cytometry analysis. Flow cytometry data were normalized and clustered using K-means; 15 signal parameters were extracted and used to train an XGBoost regression model (70:30 train/test split, 5-fold cross-validation). For comparison, melatonin was also measured using a ELISA kit following manufacturer instructions. Melatonin levels were measured in 44 chronic HF patients and 44 age- and gender-matched healthy controls. Statistical analyses included t-test, chi-square test, and Pearson's correlation, with significance defined as $P < 0.05$.

Results:

PE-conjugated anti-melatonin antibodies were successfully immobilized onto carboxylated magnetic beads, as confirmed by confocal imaging and flow cytometry. Confocal microscopy showed distinct PE fluorescence halos around conjugated beads versus non-conjugated controls, and flow cytometry revealed markedly higher PE fluorescence intensity in MBs@Ab. Based on absorbance at 280 nm, approximately 61.07% of the initial antibodies were conjugated during the process. Post-conjugation, over 99% of beads exceeded the PE fluorescence threshold, indicating high conjugation efficiency. The MBs@Ab remained stable, maintaining >99% PE positivity over 7 days at both 4 ° C and room temperature under light-protected conditions. A fluorescent melatonin derivative (FITC-MT) was synthesized and verified for its ability to bind MBs@Ab. Confocal imaging showed FITC fluorescence encircling beads incubated with FITC-MT. Flow cytometry confirmed that FITC-MT, but not 5-MT, substantially increased bead FITC signal. When the molar ratio of FITC-NHS to 5-MT was ≥ 1:1 during synthesis, >99% of beads became FITC-positive, suggesting high product purity. To optimize assay conditions, FITC-MT concentration and incubation time were evaluated. FITC positivity increased with higher FITC-MT concentrations and longer incubation. To ensure detectable competition between FITC-MT and native melatonin within physiological ranges, 0.25 nmol/mL FITC-MT and 3 h incubation were selected.

The assay was validated using melatonin calibration standards ranging from 0 to 300 pg/mL. Flow cytometry measurements of FITC-positive bead proportion, mean fluorescence intensity, and median fluorescence intensity showed weak correlations with melatonin concentration using linear regression ($R^2 = 0.50–0.81$). Confocal and flow cytometry analyses revealed that bead heterogeneity (size variation, aggregation) increased during reaction, reducing uniformity and confounding standard curve fitting. These results suggested that conventional analysis methods were insufficient for accurate quantification. To overcome bead heterogeneity, machine learning was applied. Flow cytometry data were first filtered to isolate uniform bead subpopulations and further clustered via K-means. XGBoost regression was trained on 54,000 beads and optimized via grid search and cross-validation. The model progressively improved the calibration curve fit, achieving a final $R^2 = 0.995$. Flow cytometry data processed by the algorithm showed clear discrimination of melatonin concentrations, validating the ability of this approach to robustly quantify melatonin despite bead heterogeneity. The final model was integrated into a user-friendly software platform. Users can import standard and test sample data, process them automatically with the trained algorithm, generate standard curves, compute sample concentrations, and export results efficiently.

The MB-assay was compared against a ELISA kit for melatonin detection. In melatonin standards, the MB-assay exhibited strong concordance with reference concentrations, and in serum samples, results were comparable to ELISA measurements. Clinical testing was performed in 44 heart failure patients and 44 age- and sex-matched healthy controls. The mean age of participants was 68.8 ± 7.7 years, and 46.5% were male. Serum melatonin was significantly lower in the heart failure group (99.8 ± 72.6 pg/mL) compared to controls (153.8 ± 73.8 pg/mL, $P < 0.05$). Furthermore, melatonin levels correlated negatively with age ($R = –0.242$, $P < 0.05$) and aortic diameter ($R = – 0.463$, $P < 0.05$), but showed no significant association with BNP, LVEF, or LVEDD. These findings support the MB-assay's validity and reveal clinically relevant alterations in melatonin associated with heart failure.

Conclusions:

This study constructed an innovative AI-enhanced fluorescent magnetic bead immunoassay for melatonin detection and showed the role

of melatonin as a biomarker reflecting circadian dysfunction in heart failure. Using this novel method, we measured serum melatonin levels in patients with heart failure and healthy controls, demonstrating its accuracy and efficiency comparable to ELISA. This study provides a sensitive, rapid, and cost-effective approach for assessing circadian rhythm-related disorders and offers new insights into the clinical evaluation and management of circadian dysfunction in heart failure.

自噬在心血管疾病中的作用及研究进展

张仲柏

海军军医大学第二附属医院 / 上海长征医院

[摘要] 心血管疾病（cardiovascular disease，CVD）是指一组包含动脉粥样硬化（atherosclerosis，AS）、缺血再灌注（ischaemia-reperfusion injury，I/R）损伤、肺动脉高压（pulmonary hypertension，PH）、心力衰竭（heart failure，HF）等循环系统疾病的总称，因其具有发病迅速、进展较快等特点，目前已经成为全球危害人类健康及病死率较高的重大疾病之一，居于非传染性疾病的首位，是世界卫生组织所关注的热点。自噬（autophagy）是一种真核细胞内的降解机制，在细胞受到缺氧、炎性反应和氧化应激等刺激后将胞内物质（如错误折叠的蛋白质或受损的细胞器等）运送到溶酶体进行吞噬和降解，从而在维护细胞正常生理活动等内环境稳态方面发挥关键作用。本文就自噬在不同 CVD 中各个环节的最新研究进展进行综述，探讨自噬在 CVD 调控中的重要作用，为下一步研发新靶点药物提供理论依据。自噬是一种真核细胞内的降解机制，在细胞受到缺氧、炎性反应和氧化应激等刺激后将胞内物质运送到溶酶体进行吞噬和降解，从而在维护细胞正常生理活动等内环境稳态方面发挥关键作用。本文就自噬在不同心血管疾病中各个环节的最新研究进展进行综述，探讨自噬在其调控中的重要作用，为下一步研发新靶点药物提供理论依据。

动态空间维持型静脉插管在微创心脏手术中的应用：一种解决负压引流吸附效应的创新设计

白新明

粤北人民医院 (汕头大学医学院附属粤北人民医院)

目的

微创心脏手术中经皮静脉插管因长径比过大及负压引流（-20~40mmHg）作用，引流孔血管壁吸附率高达 37%（临床观察数据），导致引流量波动、回心血增多，直接影响心肌保护效果。本研究旨在通过结构性创新，解决低血容量状态下静脉塌陷引发的引流孔物理性堵塞问题。

方法

设计一种 " 双模态动态支撑静脉插管 "（专利号受理中），核心创新包括：

1.“弹性支撑阵列”：前段 6 条医用记忆合金支撑条，自然态呈径向隆起（曲率半径 3.2mm），置管时由尖锥导芯牵引伸直，撤芯后自动撑开血管壁形成” 抗吸附缓冲区” 。

2.“三阶引流系统”：

- 端部主引流孔（Φ1.8mm）
- 支撑条间隙引流（0.8~1.2mm）
- 近 / 远端备用侧孔（Φ1.0mm×4）。

3.“抗扭结结构”：中段内嵌螺旋支撑钢丝（Φ0.3mm），维持管腔通畅性 。

4.“安全撤管机制”：圆头导芯引导支撑条复位，避免血管内膜损伤 。

结果（理论分析）

基于流体力学与接触力学模型验证：

1.“抗吸附效能”

- 支撑条隆起高度 > 血管塌陷极限位移（1.5mm），使引流孔区接触应力降为 0。
- 引流截面积增加 148%（较传统侧孔插管）。

2.“血流优化”

- 支撑条间隙流速提升至 25cm/s（传统侧孔区 12cm/s）。
- 涡流区域减少 > 60%，理论溶血指数（HI）< 0.05 。

结论

本设计通过“机械性空间维持机制”，首次实现静脉插管的动态抗塌陷功能：

- 突破传统被动防堵局限，术中预期可消除 > 80% 血管壁吸附事件 。

- 为微创心脏手术提供确定性引流保障，尤其适用于低血容量及长时循环支持患者。

经冠状动脉射频消融治疗梗阻性肥厚型心肌病的多模态影像学评价

黄昌海 刘新峰 龙向淑 卜婕 周诗银 刘微 陈亚宁 郑丹 李孝勇 邓世燕 谭洪文 俞杉 梁勤 王荣品 张陈匀 吴强

贵州省人民医院

目的：经冠状动脉射频消融（TCRFA）是一种新型心肌内射频消融技术。本研究旨在应用经胸超声心动图（TTE）和心脏核磁共振（CMR）多模态评价 TCRFA 对梗阻性肥厚型心肌病（oHCM）患者心功能和心脏重构的影响。

方法：本研究前瞻性纳入接受 TCRFA 治疗的药物难治性 oHCM 患者。纳入标准：最大耐受剂量 β- 受体阻滞剂和 / 或非二氢吡啶类钙拮抗剂治疗三月后仍有症状或无法耐受药物副作用，且 NYHA 心功能分级III - IV级；TTE 左心室短轴观非对称性室间隔肥厚，且舒张末期室间隔最大厚度 ≥ 15 mm；静息跨流出道压差（LVOTG）≥ 50 mmHg；年龄大于 18 岁。排除标准：合并严重心瓣膜病、冠状动脉严重狭窄、先天性心脏病等需要心脏外科手术治疗的疾病；左心室射血分数小于 40%；预期寿命小于 1 年；资料不完整。观察患者术前、术后即刻及术后 3 月的 NYHA 心功能分级、6 分钟步行试验距离、TTE 指标 [舒张末期室间隔厚度（IVSD-TTE）、左心室舒张末期内径（LVEDD）、左心房前后径（LAD）、左心室射血分数（LVEF-TTE）、左心室短轴收缩率（LVFS）、侧壁舒张早期运动速度（lateral e’）、室间隔舒张早期运动速度（septal e’）、LVOTG] 及 CMR 指标 [IVSD-CMR、左心室心肌质量（LVM）、左心室收缩末期容积指数（LVEDV）、左心室舒张末期容积指数（LVESV）、LVEF-CMR、心指数（CI）、升主动脉峰值流速（AA Vmax）、延迟后强化容积占比（LGE，%）] 的变化。以微导管为绝缘层，以冠状动脉介入干预工作导丝为射频能量（30 W）传输载体，对靶间隔支进行射频消融。TCRFA 的技术成功标准：术后即刻无创和有创 LVOTG 较基线水平下降幅度 ≥ 50%，靶间隔支完全闭塞。临床成功定义为术后 3 月无创 LVOTG 较术前下降降低≥ 50 %。安全终点为 30 天主要心脏不良事件，包括心脏性死亡和需要紧急救治的操作相关严重并发症（如房室传导阻滞、冠状动脉夹层、心脏破裂、恶性心律失常等）。

结果：本研究共纳入 16 例符合纳入与排除标准的 oHCM 患者（53.7 ± 13.5 岁，其中女性 13 例）。TCRFA 技术成功率为 96.2%，临床成功率为 81.3%，无安全终点事件。术后出院前和术后 3 月的心功能与 6 分钟步行试验距离较术前明显改善，IVSD-TTE、IVSD-CMR、LVOTG、LVM 均较术前降低，出院前 LAD 小于术前，术后 3 月的 septal e’较出院前增高，出院前和术后 3 月的 LGE 均明显高于术前，增高幅度呈现缩窄趋势。余指标在三个时段无显著性差异。

结论：TCRFA 能够精确地消融 oHCM 患者室间隔肥厚段的心肌组织，有效减轻 oHCM 患者的左心室流出道梗阻，降低室间隔厚度和心肌质量。

Bioactive peptides from C-phycocyanin improve cardiac injury repair after myocardial infarction by promoting angiogenesis

Ruo-Lan Chen, Lu-Ning Qin, Xue-Zhe Wang, Xian-Ming Chu

The Affiliated Hospital of Qingdao University

Background: Myocardial infarction (MI) is a leading global cause of death. Timely reperfusion improves outcomes, but approximately 30% of MI patients develop the no-reflow phenomenon due to microcirculatory dysfunction, which leads to poor prognosis, and there remains a critical unmet clinical need for targeted therapeutics to address this issue. C-phycocyanin has pleiotropic cardioprotective effects, but its large size and complex structure hinder identifying active domains. Marine bioactive peptides, with structural stability and high targeting, show potential in ischemic diseases. Our group identified P2, a C-phycocyanin-derived peptide, which promotes angiogenesis in zebrafish and overcomes the parent protein’s limitations (excessive molecular weight, poor druggability). This study explores whether P2 enhances post-MI ischemic myocardial microcirculation via angiogenesis to improve outcomes.

Methods: To evaluate the therapeutic potential of peptide P2 in myocardial infarction (MI), a murine MI model was established By ligating the left anterior descending branch of the mouse heart, followed by systemic administration of P2 via tail vein injection to assess its efficacy in ameliorating post-infarction cardiac function. Fluorescent co-localization in tissue sections combined with immunofluorescence staining was performed to verify the preferential targeting of P2 to endothelial cells and to quantify its proangiogenic activity. In vitro, a hypoxic endothelial cell model was constructed under oxygen-deprived conditions. A panel of functional assays, including MTT for cell viability, wound-healing and Transwell assays for cell migration, and tube formation assay for angiogenic capacity, were conducted to determine the ability of P2 to promote endothelial cell proliferation, migration, and angiogenesis. For mechanistic exploration of P2-driven angiogenesis, Specific pupylation as IDEntity reporter（Spider）analysis and surface plasmon resonance (SPR) were employed to identify the direct molecular target of P2. Furthermore, molecular docking simulations and co-immunoprecipitation (Co-IP) assays were utilized to dissect the downstream signaling pathways and mechanistic cascade underlying P2-mediated regulation of angiogenesis.

Results: In myocardial infarction (MI) models, administration of peptide P2 via tail vein significantly improved cardiac function compared with untreated MI controls. Fluorescent tracking of labeled P2 confirmed its preferential accumulation within endothelial cells in ischemic myocardial regions, demonstrating inherent endothelial-targeting specificity. CD31 immunofluorescence staining further validated that P2 enhanced angiogenesis in the ischemic area. In vitro studies showed P2 exerted minimal proliferative effects on normoxic endothelial cells but markedly promoted proliferation and migration of hypoxic endothelial cells, as evidenced by MTT, wound-healing, and Transwell assays. Both in vivo and in vitro experiments consistently demonstrated that high-dose P2 exhibited

superior proangiogenic activity compared with VEGFA165, a standard positive control for vascular regulation. Mechanistically, Spider analysis and subcellular co-localization assays identified mitochondrial electron transport chain protein COX4I1 as a candidate mediator of P2's effects. Surface plasmon resonance (SPR) and pulldown assays confirmed direct binding between P2 and COX4I1, with P2 upregulating COX4I1 expression to ameliorate mitochondrial dysfunction. Functional validation showed that COX4I1 knockdown significantly inhibited endothelial cell proliferation, while COX4I1 overexpression increased CyclinD1 levels, accelerated G1/S cell cycle transition, and enhanced cell proliferation.

Conclusion: This study confirms that the marine bioactive peptide P2 specifically promotes angiogenesis in ischemic myocardium by targeting and binding to COX4I1, ameliorating mitochondrial function, and activating CyclinD1-mediated cell cycle progression, with its activity surpassing that of VEGFA165. Mechanistically, it is the first to reveal the regulatory role of COX4I1 in ischemic angiogenesis, thereby providing a novel candidate drug and potential target for MI therapy. Future studies should optimize the administration route of P2 (e.g., targeted delivery systems) and evaluate its long-term safety to lay a foundation for clinical translation.

基于双模态可穿戴脉搏波传感器集成深度学习的高精度低功耗睡眠呼吸暂停检测系统

王佳 邹彤

北京医院

目的： 睡眠呼吸暂停综合征 (SAS) 严重威胁心血管健康，全球 OSA 发病率超过 24%，与高血压、心律失常、心力衰竭等疾病密切相关，但临床诊断不足率高达 80% 以上。多导睡眠监测 (PSG) 虽为诊断金标准，但需要专业实验室环境，设备成本高昂，检测流程复杂，且多通道传感器常影响患者睡眠质量。基于光电容积描记法 (PPG) 的可穿戴设备虽有潜力，但连续工作功耗大，难以满足长期监测需求。本研究旨在开发并验证一种创新的双模态可穿戴脉搏检测系统，整合压电纳米发电机 (PENG) 和 PPG 传感器，解决传统监测方法在精度、功耗和便携性方面的技术瓶颈。

方法： 基于传统中医脉诊理论，设计仿生指尖结构的腕戴式双模态监测系统。硬件包括：C 型夹具结构的力施加装置；Ecoflex-30 硅胶弹性层，包含模量匹配层和半球形指尖模拟结构；传感模块整合指纹状压电传感单元和 PPG 探头；通信模块实现脉搏压力波 (PPW) 和 PPG 信号的连续采集与无线传输。

创新性建立两阶段检测策略：第一阶段利用 PENG 低功耗优势进行 24 小时连续预筛查，检测到可疑事件时激活第二阶段 PPG 精确检测。构建基于 Vision Transformer 的深度学习模型，有效提取传感器信号高维特征。

临床验证采用回顾性和前瞻性相结合设计。回顾性研究基于北京医院 PSG 实验室 2024 年 6-9 月数据库，获得睡眠呼吸暂停组和正常对照组各 3650 个 2 分钟数据段，按十折交叉验证分组。前瞻性试验纳入 15 例患者 (男性 11 例，女性 4 例)，平均年龄 44.7 岁，平均 BMI 24.71，同时进行 PSG 监测和设备测试。

结果： 设备性能验证显示出色稳定性。有限元仿真确定曲率半径 5mm 的指尖样结构获得最佳性能。经超过 60000 次疲劳测试后，PENG 传感器输出性能保持稳定。环境适应性测试表明在不同湿度和温度条件下传感器输出稳定。

深度学习模型性能评估中，Vision Transformer 相比传统机器学习方法表现出显著优势。高精度模型 (PPG 模式) 达到特异性 99.73%、敏感性 99.45%、准确率 99.59%，AUC 值 0.9982。高敏感性模型 (PPW 模式) 敏感性 93.41%，特异性 54.17%，准确率 68.57%。两阶段模型 (PPW+PPG) 结合双传感器优势，达到特异性 96.35%、敏感性 92.51%、准确率 94.95%，AUC 值 0.9857，有效平衡性能和能耗。

前瞻性临床验证中，15 例患者平均 AHI 值 23.7。设备与 PSG 诊断符合率达 94.7%，成功识别所有中重度 SAS 事件。PPW 和 PPG 波形形态学一致性高，相邻峰值统计分析显示强线性相关 (R^2=0.9936)。

功耗分析表明，两阶段检测策略总功耗约 57mW，相比 PPG 连续监测的 74mW 降低 23%。患者佩戴体验评估显示良好舒适性，无不良反应报告。

结论： 本研究成功开发并验证了集成 PENG 和 PPG 的双模态可穿戴 SAS 监测系统，实现了检测精度与功耗的最佳平衡。临床验证证实了系统的有效性、安全性和实用性。系统适用于家庭环境初步筛查、医院 PSG 预筛查、CPAP 治疗效果监测等多种临床场景。该技术突破了传统监测方法局限性，为睡眠呼吸疾病防治提供了具有显著临床价值和广阔应用前景的创新解决方案，有望显著改善 SAS 患者的诊疗质量和预后。

靶向 OPN 可视化纳米胶束包载 SIRT6 激活剂减缓血管老化

方岩 [1] 李汶玥 [2] 秦诚 [1] 许梦琪 [1] 孙乃媛 [1] 李苏雷 [1] 李慧 [1] 侯毅 [2] 曹丰 [1]

1. 中国人民解放军总医院 / 解放军医学院

2. 北京工业大学

目的：Sirtuin 6（SIRT6）是一种长寿相关基因，通过调控细胞衰老，被认为具有治疗血管衰老的潜力。本研究旨在开发一种可视化的 SIRT6 激活剂纳米递送系统，减轻自然衰老小鼠的血管老化。

方法：通过 Western blot 和免疫荧光染色检测自然衰老小鼠主动脉血管平滑肌细胞（vascular smooth muscle cells， VSMCs）骨桥蛋白（osteopontin，OPN）的表达水平。使用 OPN 靶向肽修饰聚己内酯 - 聚乙二醇，通过自组装方式包载 SIRT6 激活剂 MDL800 和近红外荧光剂吲哚菁绿（indocyanine green，ICG），构建负载 MDL800 和 ICG 的具有 OPN 靶向性的纳米胶束（OPN micelle，OPN-MI）。使用透射电镜和动态光散射评估 OPN-MI 粒径和 Zeta 电位，使用 CCK8 实验评价 OPN-MI 的生物相容性。通过小动物近红外荧光在体成像观察 OPN-MI 在衰老小鼠体内的时间变化和器官分布。干预 8 周后，通过脉搏波传导速度、病理染色评价 OPN-MI 在体抗血管衰老效应。结合生物信息学分析和分子生物学实验，探索并验证 OPN-MI 的抗衰老机制。

结果：自然衰老小鼠 VSMCs 的 OPN 表达水平显著高于对照组小鼠（P<0.001），证实 OPN 可作为血管衰老的标志物。OPN-MI 纳米粒径为 107.008±9.572 nm，Zeta 电位为 -7.293±2.291 mV，具有良好的生物相容性。在体和离体近红外荧光成像显示，与非靶向 MI 相比，OPN-MI 显著聚集在自然衰老小鼠的血管壁区域（P<0.001）。尾静脉注射 8 周后，OPN-MI 降低自然衰老小鼠脉搏波传导速度（P=0.031），减少血管壁弹性蛋白的断裂数量（P=0.016），改善内中膜厚度（P=0.048）。生物信息学结合病理和分子实验证实，SIRT6 激活剂 MDL800 通过调节 H3K9ac 和 H3K56ac 的乙酰化，降低了 MMP9 的表达水平（P=0.001）。

结论：包载 MDL800 和 ICG 的可视化 OPN 靶向纳米胶束有效延缓了自然衰老小鼠模型的血管老化。该纳米递送系统有望成为抗血管衰老的治疗新策略。

靶向 CD36 的血小板工程化 AAV 基因疗法重编程脂肪酸代谢促进心肌增殖修复

张宁

浙江大学医学院附属邵逸夫医院

研究目的

开发血小板工程化的 AAV 递送系统（Plt-AAV），以克服传统基因疗法的局限性，并靶向介导 CD36 敲除、抑制脂肪酸氧化（FAO）实现心脏代谢重编程与再生修复。

研究方法

基于公共数据 RNA 测序分析，揭示心肌脂肪酸利用关键转运蛋白与细胞再生命运的关系。离体心肌细胞实验检验敲除 CD36 后脂质代谢、能量代谢和细胞周期的因果关系。进一步利用血小板开放小孔（OCS）装载 AAV，制备血小板工程化的 AAV-CD36KD 基因疗法（Plt-AAV-CD36KD）。采用活体成像、血小板示踪验证 Plt-AAV-CD36KD 在心肌缺血 / 再灌注损伤模型鼠中对损伤心脏的靶向富集、转染效率、CD36 敲除效果等。进一步评估该工程化基因疗法对心肌 FAO 的靶向阻断作用及心肌增殖的调控作用。

研究结果

1. 脂肪酸氧化（FAO）与心脏成熟过程中的细胞周期调控显著相关；

2. 抑制 CD36 可减弱心肌细胞脂肪酸氧化（FAO）并促进其增殖；

3. 血小板 OCS 可高效负载 AAV 构建 Plt-AAV 工程体，并在血小板活化后释放 AAV，保持完全转染能力；

4. Plt-AAV 能有效保护 AAV 免受中和抗体（NAb）的灭活作用，且高效靶向缺血损伤的心脏组织；

5. Plt-AAV-CD36KD 通过表观遗传机制下调组蛋白 H3K4me3 修饰，促进心肌增殖，并且不会引起脂质蓄积和脂毒性；

6. Plt-AAV 基因递送系统比游离 AAV 对心脏转染效率更高、再生修复更强；

7. Plt-AAV 在血栓风险、体内稳态及长期预后方面均表现良好安全性。

结论

本研究提出了一种基于 Plt-AAV 工程化系统的靶向 CD36 基因治疗新策略，为心肌修复提供了创新性解决方案。该策略保护 AAV 免受抗体中和，特异性敲除 CD36，调控心肌细胞去分化，阻断心肌脂肪酸利用，并且避免脂质重构等副作用，可在促进心脏再生的同时规避代谢紊乱风险。

Antithrombotic Therapy Strategies and Clinical Outcomes in Chinese Patients Aged 65 and Older with High Ischemic Risk Coronary Artery Disease

Jiaqi Zhang, Xiahuan Chen, Wenwen Liu, Meilin Liu

Peking University First Hospital

Objective:

Coronary artery disease (CAD) remains a leading cause of morbidity and mortality among elderly patients, who often present with complex comorbidities and an increased risk of both ischemic and bleeding events. Current guidelines recommend dual antiplatelet therapy (DAPT) for patients with high ischemic risk; however, evidence regarding optimal long-term antithrombotic strategies in elderly populations, particularly in Asian cohorts, is limited. Elderly individuals often exhibit altered pharmacokinetics, frailty, and heightened susceptibility to hemorrhagic complications, making treatment decisions especially challenging. This study aimed to evaluate real-world patterns of antithrombotic therapy and their associations with long-term clinical outcomes in Chinese patients aged 65 and older with established CAD and high ischemic risk features.

Methods:

This multicenter, prospective, observational cohort study included 2,943 Chinese patients aged ≥ 65 years with angiographically confirmed CAD and at least one high ischemic risk factor (e.g., multivessel disease, diabetes mellitus, previous myocardial infarction or stroke). Patients were enrolled from 52 hospitals across China and followed up for up to 30 months. Baseline demographic and clinical characteristics were collected, and antithrombotic therapy regimens were recorded at discharge and during follow-up. The primary efficacy endpoint was a composite of all-cause death, myocardial infarction (MI), or stroke. The primary safety endpoint was major bleeding defined according to the BARC criteria. Antithrombotic strategies were classified into five categories: aspirin monotherapy, clopidogrel monotherapy, prolonged DAPT, DAPT within 12 months post-PCI, and anticoagulant-based therapy. Multivariable Cox proportional hazards models were used to adjust for confounding variables and identify associations between antithrombotic therapy patterns and clinical outcomes. Subgroup analyses were performed to evaluate the consistency of treatment effects across clinical strata.

Results:

At baseline, DAPT was the most frequently used antithrombotic regimen (63.2%), with clopidogrel monotherapy (17.6%) and aspirin monotherapy (14.8%) also commonly prescribed. Over time, there was a notable decline in DAPT usage and a corresponding increase in monotherapy, particularly clopidogrel. During the median follow-up of 30 months, 252 patients experienced a primary efficacy endpoint event (8.6%), while 76 patients (2.6%) experienced major bleeding. Multivariate analysis revealed that clopidogrel monotherapy was associated with a significantly lower risk of the primary composite endpoint compared to aspirin monotherapy (adjusted HR: 0.61; 95% CI: 0.39–0.96; p = 0.033), without a significant increase in bleeding risk. Prolonged DAPT (≥ 12 months) did not significantly reduce ischemic events compared to monotherapy and was associated with a trend toward higher bleeding risk, particularly in patients aged ≥ 75 years. Subgroup analysis confirmed that clopidogrel monotherapy offered consistent benefit across multiple high-risk subgroups, including those with diabetes, prior MI, renal dysfunction, or anemia, suggesting its broad applicability in clinical practice.

Conclusion:

In a real-world cohort of elderly Chinese patients with CAD and high ischemic risk, clopidogrel monotherapy emerged as a favorable long-term antithrombotic strategy, balancing ischemic protection with bleeding safety. While DAPT remains important during the acute and subacute phases post-PCI, its extended use beyond 12 months may confer limited incremental benefit and potentially increased harm in elderly populations. These findings support a more tailored approach to antithrombotic therapy in older adults, highlighting the importance of age-specific risk-benefit assessment and regional pharmacogenetic considerations. The study emphasizes the pressing need for prospective, randomized trials focusing on elderly Asian populations to validate optimal strategies and durations of antithrombotic treatment, and to inform future guideline development in this understudied but clinically vulnerable group.

Low serum Klotho reflects senile inflammation in middle-aged and elderly patients with coronary atherosclerosis

Mao Qi

Xinqiao Hospital

Low serum Klotho reflects senile inflammation in middle-aged and elderly patients with coronary atherosclerosis

Qi Mao

Department of Cardiology, Institute of Cardiovascular Research, Xinqiao Hospital, Army Medical University, Chongqing 400037, China

Abstract

Background: Inflammatory senescence has been reported to be associated with atherosclerosis. The present study aims to ascertain the correlation of anti-aging protein Klotho with inflammatory parameters in middle-aged and elderly coronary atherosclerotic disease (CAD).

Methods: A total of 302 patients with CAD were included in this study. Coronary atherosclerosis was confirmed and quantified for all patients by coronary angiography. Serum Klotho was detected by enzyme linked immunosorbent assay. Serum concentrations of IL-6 and IL-8 were quantified by chemiluminescence assay. T-lymphocyte subsets were measured using flow cytometry.

Results: Multivariate linear regression analysis showed that serum Klotho was an independent predictor for circulating monocytes (standard β=-0.321, P<0.001) and CD4+/CD8+ ratio (standard β=-0.522, P<0.001). After adjustment, serum Klotho was still independently associated with IL-6 (standard β=-0.395, P<0.001) and IL-8 (standard β=-0.296, P<0.001). Moreover, circulating monocytes, CD4+ and CD8+ lymphocytes were correlated with increased serum concentrations of IL-6 and IL-8, independent of CRP (P<0.05). In receiver operating characteristic curve analysis, CD4+/CD8+ ratio (AUC=0.863, P<0.001), IL-6 (AUC=0.893, P<0.001) and IL-8 (AUC=0.884, P<0.001) presented the excellent predictive performance for significant CAD.

Conclusions: Decreased concentrations in serum Klotho reflect senile inflammation, which is related to the severity of CAD in middle-aged and elderly patients.

Keywords: Klotho, coronary atherosclerotic disease, inflammation, aging

Low serum Klotho reflects senile inflammation in middle-aged and elderly patients with coronary atherosclerosis

Diagnostic and prognostic value of serum Asprosin in Cardiac Cachexia

Yi Huang, Xiao-Song Gu

The Second Affiliated Hospital of Soochow University

ABSTRACT

Objectives

Asprosin is a newly discovered orexigenic adipokine and is correlated with chronic heart failure (CHF). Cardiac cachexia (CC) is a common complication of CHF, often accompanied by decreased appetite. Currently, the relationship between asprosin and CC is poorly clear. The aim of this study was to explore the diagnostic and prognostic value of asprosin in CC.

Methods

384 patients with CHF were included and further divided into CHF with CC group (CC group) (n = 79) and without CC group (Non-CC group) (n = 305) based on the presence of CC. During the same period, 120 healthy individuals were included in the control group. Comparing the differences among the three groups. Correlation analysis was conducted between asprosin and asprosin/BMI with clinical indicators and echocardiographic parameters, and multiple logistic regression analysis was used to explore the influencing factors of CC. Receiver operating characteristic (ROC) analysis was used to evaluate the predictive value of asprosin/BMI for CC. The association between asprosin/BMI and CC was evaluated using restricted cubic splines (RCS) in CHF patients. We constructed two risk models to evaluate the reclassification ability of asprosin/BMI for CC. We conducted a follow-up on patients with CC for 12 months and divided them into a low asprosin/BMI group and a high asprosin/BMI group based on the median level of asprosin/BMI, and plotted Kaplan-Meier survival curves.

Results

Compared with non-CC group, asprosin, BMI, eGFR, Hb, ALB, HDL-C and LVEF were significantly reduced in CC group, while asprosin/BMI, CRP, ALT, AST, Scr, Glu and NT-proBNP were significantly increased (p < 0.05). Within CC patients, asprosin/BMI levels were positively correlated with Hb, ALB, eGFR, Glu and LVEF, while negatively correlated with NT-proBNP and Scr. Multivariate binary logistic regression analysis showed that asprosin/BMI (OR: 2.047, 95% CI: 1.644 - 2.547; p < 0.001) , Scr (OR: 1.039, 95 % CI: 1.019 - 1.059; P < 0.001) , Glu (OR: 1.495, 95% CI: 1.012 - 2.209; p = 0.043) and NT-proBNP (OR: 1.000, 95% CI: 1.000 - 1.001; p = 0.001) were the independent risk factors for CC. Asprosin/BMI had good predictive ability for CC (AUC: 0.808, 95% CI: 0.756 - 0.859; p < 0.001). RCS analysis showed a positive linear correlation between asprosin/BMI levels and the risk of CC (p for non-linear = 0.242). Adding asprosin/BMI to the CC basic risk model (including Scr, Glu, and NT-proBNP) can improve the reclassification of CC [continuous net reclassification index (NRI): 92.75%, 95%CI: 55.00% - 121.70%, p<0.001; categorical NRI: 45.38%, 95%CI: 23.79% - 63.74%, p < 0.001]. Follow up for 12 months, according to the median of asprosin/BMI in CC patients, low asprosin/BMI levels group (< 26.87) had a significantly higher incidence of MACE (53.85% vs 27.50%, p = 0.017) than high group.

Conclusions

Asprosin/BMI is an independent risk factor for CC in CHF patients. The increase of asprosin/BMI decreases the incidence of MACE in CC patients. We therefore speculate that asprosin and asprosin/BMI might intervene in the development of CC and serve as a potential therapeutic target.

CHK1 通过激活 AHSA1/HSP90 介导的线粒体自噬延缓小鼠心脏衰老

经鹏 周刘华 王昊 王连生

江苏省人民医院 / 南京医科大学第一附属医院

目的：作为经典的细胞周期检查点蛋白之一，细胞周期检查点激酶 1（CHK1）主要通过介导一系列级联反应广泛参与多种生物学进程。既往研究发现 CHK1 是心肌再生修复中的关键因子，然而，其在小鼠心脏自然衰老过程中所起到的作用尚不明确。

方法：首先，在多柔比星（DOX）诱导的多种心肌细胞衰老模型以及小鼠自然衰老模型中检测 CHK1 的表达情况。其次，构建心肌细胞特异性 CHK1 敲低 / 过表达小鼠，研究其在小鼠自然衰老过程中的作用；接下来，在 DOX 诱导的 AC16 人心肌细胞早衰模型中补充 CHK1，探究其对 AC16 细胞衰老的影响。最后，通过转录组学测序（RNA-seq）与免疫共沉淀串联质谱（IP/MS）联合分析揭示 CHK1 延缓老年小鼠心脏衰老的分子机制。

结果: 在体内外衰老模型中，CHK1 的表达水平明显下降。在小鼠自然衰老模型中，过表达 CHK1 可延缓老年小鼠心脏衰老；而敲除 CHK1 则加剧老年小鼠心脏衰老；体外补充 CHK1 明显减轻了 AC16 细胞的衰老程度。RNA-seq 提示过表达 CHK1 可激活热休克蛋白 90（HSP90）介导的线粒体自噬；IP/MS 表明 CHK1 可靶向结合 90kDa 热休克蛋白 ATPase 同源物激活剂 1 (AHSA1)。机制上，CHK1 通过靶向结合 AHSA1 并抑制其泛素化降解来激活 HSP90 介导的线粒体自噬。

结论：CHK1 通过靶向结合 AHSA1 并抑制其泛素化降解，激活 HSP90 介导的线粒体自噬来改善心肌细胞的线粒体稳态，从而延缓老年小鼠心脏衰老。我们的研究揭示了 CHK1 在小鼠心脏自然衰老过程中的重要作用，为未来临床上预防或治疗老年性心脏病提供了潜在的干预靶点。

膳食指数与心脏代谢指数的关联及其潜在作用机制研究

刘顺 黄志敏 陈小琪

福建医科大学公共卫生学院流行病与卫生统计学系

目的 心脏代谢指数（Cardiometabolic Index, CMI）是评估心血管疾病风险的重要指标，而膳食模式对其可能产生显著影响。本研究旨在探讨三种膳食指数（DASH、MED、HEI2015）与 CMI 之间的关联，并分析其潜在作用机制。**方法** 研究纳入了 1999 至 2017 年 NHANES 数据库中的 11422 个样本，使用 R 语言（版本 4.3.2）进行统计分析。首先，依据 CMI 的五分位数分布将样本分为五组，并进行基线分析。通过线性回归和 Logistic 回归模型评估 DASH、MED 和 HEI2015 指数与 CMI 之间的关系。利用散点图和限制性立方样条（RCS）曲线分析膳食指数与 CMI 之间的相关性及潜在的非线性关系，并通过 k-means 聚类分析将人群划分为三种膳食模式组。最后，采用中介分析方法探讨潜在的中介途径。**结果** 在基线分析中，除教育程度和婚姻状况外，各变量在 CMI 五分位数分组后未显示出统计学差异。MED 和 HEI2015 指数在 CMI 分组后显示出显著差异，而 DASH 指数未表现出显著性。线性回归和 Logistic 回归分析显示，在未调整混杂因素的模型中，三个膳食指数均与 CMI 呈负相关；但在调整相关变量后，MED 和 HEI2015 指数的升高与 CMI 的降低呈正相关，而 DASH 指数与 CMI 的关系则有所不同。相关性分析和限制性立方样条（RCS）分析表明，DASH、MED 和 HEI2015 指数与 CMI 呈负相关，且相关性接近线性模式。K-means 聚类分析将样本划分为三种膳食模式组，结果显示膳食指数较高组（Cluster 2）与 CMI 的降低具有统计学意义。中介分析揭示，在 MED 指数与 CMI 的关系中，腰高比（WHtR）可作为中介变量，其效应占比为 27.4%；在 HEI2015 指数与 CMI 的关系中，身高可作为中介变量，效应占比为 4.9%。遗憾的是，在 DASH 指数与 CMI 的关系中未发现显著的中介变量。**结论** 本研究发现 MED 和 HEI2015 指数与 CMI 的降低呈正相关，而 DASH 指数与 CMI 的关系较为复杂。腰高比和身高分别在 MED 和 HEI2015 指数与 CMI 的关系中发挥了中介作用。这些结果为理解膳食模式对心脏代谢健康的影响提供了新的见解。

Therapeutic Efficacy of Qili Qiangxin Capsule in Elderly Patients with Heart Failure with Preserved Ejection Fraction

Xing-Peng Bu, Chun-Xia Li, Ya-Ru Liu, Guo-Fang Chu

Department of Geriatric Medicine, Shanxi Bethune Hospital, Shanxi Academy of Medical Sciences, Third Hospital of Shanxi Medical University, Tongji Shanxi Hospital

Background: Heart failure with preserved ejection fraction (HFpEF) has emerged as a major public health challenge, accounting for approximately 50% of all heart failure cases worldwide, with particularly high prevalence among elderly populations. Despite significant advances in cardiovascular therapeutics, current treatment strategies for HFpEF remain largely symptomatic, focusing primarily on volume management with diuretics and modest benefits from SGLT2 inhibitors and neurohormonal modulators. The complex, multifactorial pathophysiology of HFpEF, involving systemic inflammation, metabolic dysregulation, and myocardial fibrosis, underscores the need for novel therapeutic approaches. Traditional Chinese Medicine (TCM) has gained increasing recognition in cardiovascular medicine due to its multi-target, system-regulating properties. Qili Qiangxin Capsule (QLQX), a well-established TCM formulation, has demonstrated efficacy in improving cardiac function and symptoms in patients with heart failure with reduced ejection fraction. However, its therapeutic potential in elderly HFpEF patients, a population with distinct clinical characteristics and therapeutic challenges, has not been systematically evaluated. This study aimed to investigate the additive benefits of QLQX when combined with standard contemporary pharmacotherapy in elderly HFpEF patients.

Methods: This prospective, randomized, controlled trial was conducted at Shanxi Bethune Hospital between January 2022 and December 2023. We enrolled 149 consecutive elderly patients (age ≥ 65 years) with confirmed HFpEF diagnosis according to current guidelines. Participants were randomly assigned in a 1:1 ratio to either the control group (n=74) receiving standard guideline-directed medical therapy (including diuretics, SGLT2 inhibitors, and ARNI/ACEI/ARB) or the observation group (n=75) receiving standard therapy plus QLQX (1.2 g three times daily). Comprehensive assessments were performed at baseline and after 6 months of treatment, including: 1) quality of life evaluation using the Minnesota Living with Heart Failure Questionnaire (MLHFQ); 2) functional capacity assessment via 6-minute walking distance (6MWD) test; 3) echocardiographic evaluation of diastolic function using the E/e' ratio; and 4) measurement of serum biomarkers including N-terminal pro-B-type natriuretic peptide (NT-proBNP) and soluble suppression of tumorigenicity 2 (sST2). Statistical analyses were performed using SPSS version 26.0, with within-group comparisons using paired t-tests and between-group comparisons using independent t-tests.

Results: After 6 months of treatment, both groups demonstrated significant improvements from baseline in all measured parameters (all P<0.05). However, the QLQX group showed substantially greater clinical benefits compared to standard therapy alone. Specifically, the QLQX group exhibited a more pronounced improvement in quality of life (MLHFQ score: 20.04±5.12 vs 28.78±6.12, P<0.001), superior enhancement in exercise capacity (6MWD: 412.69±63.30 m vs 397.75±60.03 m, P=0.012), and better diastolic function (E/e' ratio: 9.29±1.78 vs 11.12±2.13, P<0.001). Importantly, the QLQX group showed more significant reductions in biomarkers of myocardial stress (NT-proBNP: 586.68±28.02 pg/mL vs 874.35±41.32 pg/mL, P<0.001) and cardiac fibrosis/remodeling (sST2: 12.05±2.04 ng/mL vs 22.77±3.14 ng/mL, P<0.001). The between-group differences remained statistically significant after adjustment for potential confounders, with no significant adverse events attributable to QLQX treatment observed during the study period.

Conclusion: In this randomized controlled trial of elderly HFpEF patients, adjunctive therapy with Qili Qiangxin Capsule demonstrated significant additional benefits beyond standard medical therapy alone. QLQX treatment was associated with marked improvements in quality of life, functional capacity, and diastolic function, along with favorable modulation of key pathophysiological biomarkers. These findings suggest that QLQX may address multiple pathological pathways in HFpEF, potentially through its putative anti-inflammatory, anti-fibrotic, and metabolic-modulating properties. The excellent safety profile observed in this elderly population further supports the potential clinical utility of QLQX as a complementary therapeutic strategy for HFpEF management. These results warrant confirmation in larger multicenter trials with longer follow-up durations to establish the durability of benefits and potential impact on hard clinical outcomes.

夜间睡眠和日间小睡对中老年人心血管疾病发病风险的联合影响：一项基于 CHARLS 的纵向队列研究

目的：睡眠是心血管疾病 (CVD) 的一个可变风险因素。尽管单一夜间睡眠时长和日间小睡与 CVD 的关系已被广泛研究，但其对 CVD 的联合影响却较少被关注。本研究旨在探索降低 CVD 发病风险的最佳睡眠组合方式。

方法：本研究使用了中国健康与退休纵向研究 (CHARLS) 的纵向数据。通过自我报告问卷在 2011 年收集基线睡眠及其他相关变量信息，随访至 2020 年观察 CVDs 事件的发生。采用 Cox 比例风险分析探讨睡眠时长及不同睡眠组合方式对 CVDs 发病风险的影响。

结果：本研究共纳入 7975 名参与者，其中老年人 1562(19.59%)，女性 4323 名 (54.21%)，随访期间观察到 2117 名参与者 (26.55%) 新发 CVD 事件。经多变量 Cox 调整混杂因素后，夜间短睡眠 (<6h) 与 CVD 风险增加显著相关 (HR:1.189，95 % CI:1.071-1.319，P=0.001)。进一步分析显示，与参考组 (适度夜间睡眠 6-8h 且不习惯日间小睡) 相比，夜间睡眠时长 <6h 且不习惯日间小睡 (HR:1.117，95 % CI:1.021-1.357，P=0.025)，夜间睡眠时长 <6h 且日间小睡≤ 0.5h(HR:1.558，95 %CI:1.236-1.962，P<0.001) 以及夜间睡眠时长 <6h 且日间小睡 >1h(HR:1.300，95 % CI:1.020-1.655，P=0.034) 三组参与者均表现出更高的 CVD 发病风险。

结论：保证充足夜间睡眠有助于降低 CVD 发病风险。适度夜间睡眠与不习惯日间小睡的组合，可能是更有利于降低 CVD 风险的睡眠组合方式。

体质量与老年慢性阻塞性肺疾病患者肺功能和心脏结构的相关性

张静

陆军军医大学大坪医院

目的：探讨体质量与老年慢性阻塞性肺疾病 (COPD) 患者肺功能和心脏结构的相关性。

方法：回顾性收集≥ 65 岁的老年患者 747 例，其中非 COPD 组 184 例，COPD 轻度组 77 例，COPD 中度组 206 例，COPD 重度组 280 例。检测患者的体质量指数 (BMI)、肺功能、心脏结构等参数，进行组间比较和相关回归分析。

结果：本研究主要发现：与非 COPD 组比较，重度 COPD 组右心室内径 (RVD) 显著增大 (P < 0.05)，BMI、左心房内径 (LAD)、室间隔厚度 (IVST)、左室后壁厚度 (LVPWT)、左室质量指数 (LVMI) 显著减小 (P < 0.05)。而轻中度 COPD 组 RVD、BMI、LAD、IVST、LVPWT、LVMI 与非 COPD 组比较无显著差异。相关分析发现：在重度 COPD 组中，低 BMI 与残气量 / 肺总量 (RV/TLC)、RVD、右心房内径 (RAD)、高密度脂蛋白胆固醇 (HDL-C)、估测肾小球滤过率 (eGFR) 增高显著相关 (P < 0.05)，而低 BMI 与第一秒用力呼气容积占预计值百分比 (FEV1%pred)、第一秒用力呼气容积 / 用力肺活量 (FEV1/FVC)、一氧化碳弥散量 (DLCO)、LAD、IVST、LVPWT、LVMI、血浆白蛋白、高血压构成比、收缩压、2 型糖尿病构成比、总胆固醇 (TC)、尿酸 (UA) 降低显著相关 (P < 0.05)。回归分析发现：在重度 COPD 中，低 BMI 与 RVD 增高独立相关 (P < 0.05)，而其与 FEV1%pred、IVST、LVPWT、LVMI 降低独立相关 (P < 0.05)。

结论：低体质量指数与老年重度 COPD 患者肺功能受损、右室扩大和左室质量指数降低独立相关。

中性粒细胞淋巴细胞比率与老年高血压患者死亡风险的关联

李珊

中国人民解放军总医院 (301 医院)

背景 中性粒细胞与淋巴细胞比率（NLR）已被证实是多种临床情况下不良预后的关键风险标志物。然而，其与老年高血压患者死亡风险的关联尚未得到充分验证。本研究旨在探讨 NLR 水平与老年高血压患者全因死亡和原因特异性死亡的关联。

方法 这项队列研究纳入了 1999 年至 2018 年间美国国家健康与营养调查（NHANES）中的 9939 例老年（≥ 60 岁）高血压患者。根据 NLR 水平的四分位数将其分为四组。生存状态通过与国家死亡指数记录的链接来确定。进行了 Cox 比例风险回归模型、限制性立方样条曲线、生存分析和受试者工作特征曲线（ROC）分析。

结果 多变量调整后的 Cox 比例风险回归模型显示，NLR 水平与老年高血压患者的全因死亡和原因特异性死亡呈显著的正相关。与 NLR 最低四分位数的患者相比，最高四分位数患者的调整后风险比（HR）为全因死亡 1.52（95% CI 1.32-1.74），心血管死亡 2.04（1.63-2.56）和非心血管死亡 1.30（1.11-1.53）。NLR 水平每增加 1 个标准差，调整后的 HR 为全因死亡 1.20（1.15-1.26），心血管死亡 1.28（1.21-1.35）和非心血管死亡 1.16（1.10-1.23）。限制性立方样条曲线显示 NLR 与全因死亡和原因特异性死亡呈现单调的正相关。NLR 与心血管死亡的关联在未服用他汀类药物的患者中更为显著（P 值 <0.05）。ROC 分析显示 NLR 对全因死亡和原因特异性死亡具有中等程度的预测价值，曲线下面积在 0.581 到 0.612 之间，优于高敏 C 反应蛋白和中性粒细胞。

结论 NLR 水平升高与老年高血压患者的全因死亡和原因特异性死亡风险的增加独立相关。未服用他汀类药物的患者 NLR 与心血管死亡的关联性更强。

Life Satisfaction as Modifiable CVD Prevention Target: Cross-Cultural Mediation in Aging Cohorts

Changxing Liu

The First Affiliated Hospital of Heilongjiang University of Chinese Medicine

ObjectiveThe world is experiencing an unprecedented demographic shift, with the number of individuals aged 60 years and above projected to reach 2.1 billion by 2050, according to the World Health Organization. In tandem with this aging trend, cardiovascular disease (CVD) has emerged as a leading cause of morbidity and mortality among the elderly, accounting for approximately 32% of all global deaths. Despite significant advancements in medical treatments, the burden of CVD remains high, highlighting the urgent need to identify and understand modifiable risk factors. This study was designed to comprehensively examine the prospective association between life satisfaction, a key indicator of psychological well - being, and the risk of CVD among older adults across multiple international cohorts. By exploring this relationship, the research also aimed to evaluate potential mediating pathways, which could offer novel insights and inform the development of targeted interventions to enhance cardiovascular health in the aging population.

MethodsThis study harmonized data from four well - established aging cohorts: the Health and Retirement Study (HRS) in the United States, the English Longitudinal Study of Ageing (ELSA), the Survey of Health, Ageing and Retirement in Europe (SHARE), and the China Health and Retirement Longitudinal Study (CHARLS). These cohorts provided a diverse and representative sample of 101,474 participants aged 60 years and older, with a total of 267,903 observations collected over the period from 2010 to 2020.To measure life satisfaction, validated psychometric scales were employed. The Satisfaction with Life Scale (SWLS), a widely - used instrument, was the primary tool for categorizing participants into low and high life satisfaction groups. Incident CVD, encompassing both fatal and non - fatal events such as myocardial infarction, stroke, and heart failure, was the main outcome of interest. Generalized estimating equations (GEE) were utilized to account for the repeated nature of the data and to analyze the relationship between life satisfaction and CVD risk.The statistical model was carefully adjusted for a comprehensive set of confounding variables. Demographic factors, including age, gender, race/ethnicity, and geographical location, were considered. Health - re-

lated behaviors, such as smoking status (current, former, never), alcohol consumption frequency, and physical activity levels, were also incorporated. Social factors, including marital status, living arrangements, and social support, were adjusted for. Additionally, depressive symptoms, measured by established scales, were included to control for the potential influence of mental health on both life satisfaction and CVD risk. A mediation analysis was conducted using a structural equation model framework with loneliness as the hypothesized mediator. Loneliness was measured by well - validated scales in each cohort. Sensitivity analyses were performed to assess the robustness of the findings. These included competing risk models to account for other causes of death and inverse - probability - weighted models to address potential reverse causation, ensuring the reliability of the results.

ResultsOver a median follow - up period of 6.2 years, the analysis revealed a significant inverse association between life satisfaction and CVD risk. Participants with higher life satisfaction had a pooled hazard ratio (HR) of 0.86 (95% confidence interval [CI]: 0.79–0.91, p < 0.001) for developing CVD compared to those with lower life satisfaction. This association remained robust even after excluding participants with baseline depression (HR = 0.84, 95% CI: 0.78–0.90), suggesting that the relationship was not confounded by pre - existing depressive symptoms. In competing risk models, which accounted for the risk of death from other causes, the negative association between life satisfaction and CVD risk persisted.Subgroup analyses were conducted to explore whether the association varied across different characteristics. The inverse relationship was consistent across various age subgroups (60 - 69 years, 70 - 79 years, 80+ years), genders, education levels (less than high school, high school graduate, college or above), and loneliness statuses. No significant effect modification was detected (all P for interaction > 0.05), indicating that the protective effect of life satisfaction on CVD risk was stable across these subgroups.When examining the results by cohort, there were some variations in effect sizes. In the SHARE cohort, the HR was 0.79 (95% CI: 0.72–0.86, p < 0.001), suggesting a relatively stronger association, while in the CHARLS cohort, the HR was 0.93 (95% CI: 0.88–0.98, p = 0.017). However, all cohorts showed a significant negative relationship, reinforcing the overall finding.

Regarding the mediating role of loneliness, the mediation analysis demonstrated that loneliness accounted for 13.4% of the association between life satisfaction and CVD risk (p = 0.003). This indicates that a portion of the beneficial effect of high life satisfaction on reducing CVD risk may be explained by its impact on alleviating loneliness.

ConclusionThis study provides robust evidence that elevated life satisfaction is independently associated with a reduced risk of CVD among older adults across diverse international cohorts. Loneliness acts as a partial mediator in this relationship, highlighting the importance of psychological well - being and social connection in cardiovascular health. The findings have significant implications for public health and clinical practice. Interventions aimed at enhancing life satisfaction, such as promoting social engagement, improving mental health support, and fostering a sense of purpose in later life, could potentially play a crucial role in the prevention and control of CVD. Additionally, addressing loneliness through community - based programs, social support networks, and family - centered initiatives may offer a complementary strategy to improve cardiovascular outcomes in the aging population. Further research is warranted to explore the long - term effectiveness of such interventions and to identify other potential mediators and moderators in this complex relationship.

冠状动脉异常起源于对侧窦的中老年患者的影像解剖特征对预后的影响

鲍伟 [1,2] 李承宗 [2] 刘学波 [1]

1. 上海市同济医院（同济大学附属同济医院）

2. 徐州医科大学附属医院

目的 冠状动脉起源于对侧窦（Anomalous Coronary Artery From the Opposite Sinus，ACAOS）是一种冠状动脉血管解剖变异，属于先天性冠状动脉异常（Congenital Coronary Artery Anomalies，CCAA）的其中一个亚型。流行病学研究显示左侧冠状动脉起源于右冠窦（L-ACAOS）和一部分右侧冠状动脉起源于左冠窦（R-ACAOS）是年轻人心脏性猝死的重要因素之一。近年来随着冠脉 CT 血管造影（CT Angiography，CTA）及血管造影术的等检查技术使用率的日益增加，越来越多的中老年 ACAOS 被诊断，然而与儿童及青少年相比，中老年患者的管理策略并不完善和明确。因此本研究旨在分析 45 岁以上的中老年 ACAOS 患者中，影响预后的影像解剖特征，为我国中老年 ACAOS 患者的风险分层和预后管理提供一定依据。

方法

回顾性收集 2011 年 1 月 1 日至 2018 年 12 月 31 日于徐州医科大学附属医院经冠状动脉 CTA 明确诊断为 ACAOS 的 45 岁以上患者，纳入 ACOAS 组。收集入组患者的基线资料和冠脉 CTA 影像资料，并随访患者的主要心血管不良事件（Major Adverse Cardiac Events，MACE）发生情况，包括心源性死亡，急性心肌梗死，任何形式的冠脉血管血运重建。根据随访期间是否发生 MACE 进行分组，比较两组间基线资料及影像解剖特征是否存在显著差异。采用生存分析，绘制 Kaplan-Meier 生存曲线，并利用 Log-rank 比较各组间差异，同时对数值型变量异常血管开口角度、高宽比、狭窄程度及长度采用 Maxstat 方法寻找 MACE 风险截断值。最后采用单因素及多因素 COX 回归模型探究影响 MACE 风险的影像解剖特征。

结果 我院 2011 - 2018 年间共行冠脉 CTA 检查 69584 人，45 岁以上的 ACAOS 患者 239 人（0.34%）。随访过程中失访 36 人，平均随访时间为 98.2±30.9 个月，发生 MACE 人数为 39 人。

1. Maxstat 方法确定相关影像解剖特征的 MACE 风险截断值：以 MACE 风险为结局，针对数值型影像解剖特征：异常血管开口角度、异常血管开口 H ／ W、异常血管狭窄程度及长度求取 MACE 风险截断值，分别为 34.3°，1.69，0.55 及 1.88cm，并依此进行分层。

2. Kaplan-Meier 生存曲线及 Log-rank 检验结果: L-ACAOS 分型（P = 0.016），异常血管走行于主动脉肺动脉之间（P = 0.003）的患者 MACE 风险明显高于其对应组。并且，经过 Maxstat 分层后的 High H ／ W 组，开口角度< 34.3°组，High narrow 组和 Long length 组的 MACE 风险均显著高于其各自对应组（P 均< 0.05）。

3. COX 回归模型探究高危影像解剖特征：以中老年 ACAOS 患者随访期间是否发生 MACE 为因变量，基线资料及影像解剖特征作为自变量进行 COX 回归分析。结果显示异常起源血管的影像解剖特征中，L-ACAOS 分型（HR = 4.35，95%CI: 2.17 ~ 8.73，P < 0.05）、伴有主 - 肺动脉间走行（With IAC）（HR = 3.21，95%CI: 1.23 ~ 8.37，P < 0.05），开口角度< 34.3°（HR = 2.62，95%CI: 1.18 ~ 5.77，P < 0.05）是发生 MACE 的独立危险因素。

结论 在 45 岁以上中老年 ACAOS 患者中，异常起源血管具有 L-ACAOS 分型、主 - 肺动脉间走行（With IAC）、开口角度< 34.3°影像解剖特征是发生 MACE 的独立危险因素。

CD8+T 细胞介导的衰老脂肪棕色化下降影响老年心肌重构的机制研究

孔令冉 曲新凯

复旦大学附属华东医院

目的：衰老脂肪组织功能障碍，尤其是免疫调控紊乱是多种老年心血管疾病发生的重要危险因素。近年研究表明 T 细胞在脂肪细胞衰老过程中扮演了重要角色，但相关分子机制一直不明。本研究拟在前期研究发现老年小鼠脂肪组织中 CD8+T 细胞增多及心脏收缩功能下降的前提下，进一步探究脂肪衰老导致的棕色化改变对心肌重构的机制研究。

方法: 野生型小鼠构建衰老模型（18 月龄），检测衰老小鼠脂质代谢、胰岛素抵抗、能量代谢、不同部位脂肪组织棕色化改变等；同时检测老年小鼠心肌重构（小动物心脏超声、心肌细胞纤维化程度等）。单细胞测序技术分析老年小鼠脂肪组织中不同类型免疫细胞（CD8+T 细胞、巨噬细胞、脂肪细胞等）比例改变，并寻找差异性基因表达。CD8+T 细胞过继转移实验，将衰老小鼠脂肪组织内 CD8+T 细胞转移至受体（年轻及老年小鼠），观察对小鼠脂肪组织棕色化及心肌重构的影响。

结果：老年小鼠皮下白色脂肪组织衰老标志物（p16、p21 及 p53）表达明显升高，同时伴随白色脂肪棕色化水平下降，表现为脂肪细胞体积增大、脂滴减少及棕色化相关基因（UCP1、PPARγ、PPGC1α）表达下降；同时老年小鼠心脏重构加重（心肌细胞纤维化加重、LVEF 及 FS 下降等）。单细胞测序分析进一步提示老年小鼠皮下白色脂肪组织（WAT）内不同亚型 T 细胞聚集浸润，增多最明显的是 CD8+T 细胞；差异基因分析显示与年轻小鼠相比，老年小鼠 WAT 中 CD8+T 细胞来源的趋化因子 CCL5 明显升高，因此我们认为在老年小鼠体内，衰老引起白色脂肪组织中 CD8+T 细胞增多， CD8+T 细胞分泌 CCL5 增多，导致衰老脂肪细胞棕色化下降，加重衰老导致的脂肪组织功能障碍，最终影响老年小鼠心肌重构。

结论：本研究旨在通过阐明 CD8+T 细胞介导的免疫紊乱调控脂肪细胞衰老并进一步影响心肌重构的机制，为改善衰老导致的代谢性心脏疾病发生发展提供新的靶点和策略。

Discordance among lipid profile in the older adults: implications for cardiovascular prevention

Sheng-Yan Du[1,2], Xiao-Xin Ye[1,2], Yao He[2], Miao Liu[1], Sheng-Shu Wang[2], Shan-Shan Yang[1]

1. Medical School of Chinese People’s Liberation Army

2. Second Medical Center, Chinese People’s Liberation Army General Hospital

Background

Cardiovascular disease (CVD) remains a leading cause of morbidity and mortality worldwide, with dyslipidemia being a well-established modifiable risk factor. Traditional lipid profile indicators, including low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), triglycerides (TG), and total cholesterol (TC), have been extensively studied in middle-aged populations, demonstrating strong associations with CVD risk. However, emerging evidence suggests that these relationships may weaken, reverse, or exhibit significant heterogeneity in older adults, a phenomenon often referred to as the “lipid paradox.” This paradox raises critical questions about the optimal lipid management strategies for aging populations, particularly regarding which lipid metrics retain predictive value for CVD risk in older individuals. Given the global aging demographic and the increasing burden of CVD in older adults, a comprehensive evaluation of lipid profile indicators in this population is urgently needed to inform clinical practice and public health strategies.

Methods

This prospective cohort study utilized data from 132,290 participants aged 60 years or older in the UK Biobank, a large-scale biomedical database with extensive phenotypic and genotypic information. Participants with baseline CVD were excluded to ensure a clean cohort for incident CVD analysis. Lipid profile indicators, including LDL-C, HDL-C, TG, TC, non-HDL-C, and the LDL-C/HDL-C ratio, were measured at baseline. The primary outcomes were incident CVD (including ischemic heart disease, stroke) and cardiovascular mortality, ascertained through linked electronic health records and death registries. Fine-Gray competing risk models were employed to account for the competing risk of non-CVD death, with adjustments for demographics (age, sex, Body mass index), comorbidities (hypertension, diabetes), and lifestyle factors (smoking, alcohol consumption, physical activity). Predictive capacities of lipid indicators were compared using receiver operating characteristic (ROC) curve analysis, with area under the curve (AUC) values calculated. Subgroup analyses were conducted to assess the consistency of associations across strata defined by age, sex, and metabolic status. Gene-environment interaction analyses were performed to explore potential effect modifications by genetic predisposition to dyslipidemia.

Findings

Over a median follow-up of 14.03 years, 23,192 incident CVD events and 1,015 cardiovascular deaths were recorded. Multivariable analysis revealed that the LDL-C/HDL-C ratio exhibited the strongest association with CVD risk. Participants in the highest quartile (Q4) of the LDL-C/HDL-C ratio had a 27% increased risk of incident CVD (hazard ratio [HR] 1.27, 95% confidence interval [CI] 1.22–1.32), a 54% higher risk of ischemic heart disease (HR 1.54, 95% CI 1.47–1.62), and a 42% higher risk of cardiovascular mortality (HR 1.42, 95% CI 1.21–1.67) compared to those in the lowest quartile (Q1). In contrast, HDL-C demonstrated protective effects, with Q4 associated with a 22% reduction in CVD risk (HR 0.78, 95% CI 0.75–0.82). Other lipid indicators, including LDL-C, TG, and TC, showed weaker or inconsistent associations with CVD outcomes. Stratified analyses confirmed the robustness of these findings across all subgroups, with higher LDL-C/HDL-C ratios consistently associated with increased CVD risk regardless of age, sex, or metabolic status. Combined analyses further revealed that individuals with either a high LDL-C/HDL-C ratio alone (≥ 2.52 mmol/L) or both high LDL-C (≥ 3.40 mmol/L) and a high ratio had the greatest elevation in CVD risk. ROC curve analysis demonstrated the superior predictive value of the LDL-C/HDL-C ratio for CVD (AUC = 0.6576), outperforming individual lipid parameters such as LDL-C (AUC = 0.5892) and HDL-C (AUC = 0.6014).

Interpretation

This large-scale prospective cohort study highlights the LDL-C/HDL-C ratio as the most robust lipid profile indicator for predicting CVD risk in older adults. The findings suggest that lipid management strategies in aging populations should prioritize balancing LDL-C and HDL-C levels rather than focusing solely on LDL-C reduction. The superior predictive performance of the LDL-C/HDL-C ratio may reflect its ability to capture the combined atherogenic potential of elevated LDL-C and the protective effects of HDL-C, providing a more holistic assessment of lipid-related CVD risk. These results have important implications for clinical practice, suggesting that routine assessment of the LDL-C/HDL-C ratio could enhance risk stratification and guide personalized lipid-lowering therapy in older adults. Future research should explore the mechanisms underlying the lipid paradox in aging populations and evaluate the impact of interventions targeting the LDL-C/HDL-C ratio on CVD outcomes in older individuals.

Keywords: lipid profile, cardiovascular disease, older adults, LDL-C/HDL-C ratio, competing risk analysis

脂蛋白 (a) 与老年冠心病多支病变相关性的研究

张亮 史凯雷 关韶峰 曲新凯

复旦大学附属华东医院

目的：本研究旨在系统探讨脂蛋白 (a)[Lp(a)] 与老年冠心病患者多支冠状动脉病变的相关性及其临床意义。方法：纳入 2019 年 1 月至 2024 年 6 月期间在本院心血管内科住院治疗年龄大于 60 岁的老年冠心病患者 586 例。根据冠脉造影病变血管数量分为单支病变组 (n=254)、双支病变组 (n=187) 和三支病变组 (n=145)。采用免疫比浊法测定血清 Lp(a) 水平，同时收集患者的人口学特征、临床病史、实验室检查结果和冠状动脉造影资料。结果：随着冠状动脉病变支数增加，患者血清 Lp(a) 水平呈显著升高趋势。单支病变组、双支病变组和三支病变组的 Lp(a) 水平分别为 (25.3±10.2)mg/dL、(36.8±13.5)mg/dL 和 (48.7±15.6)mg/dL，组间差异具有统计学意义 (P<0.001)。Spearman 相关分析显示，Lp(a) 水平与冠状动脉病变支数呈显著正相关 (r=0.412，P<0.001)。多因素 logistic 回归分析在调整年龄、性别、高血压、糖尿病、吸烟史、血脂异常等传统危险因素后，Lp(a) 水平升高 (>30mg/dL) 仍然是老年冠心病多支病变的独立危险因素 (OR=2.37，95%CI：1.78-3.15，P<0.001)。其中 Lp(a) 水平对三支病变的预测价值更高 (OR=3.12，95%CI：2.24-4.35)。Lp(a) 水平与冠状动脉病变严重程度评分 (SYNTAX 评分) 呈显著正相关 (r=0.387，P<0.001)。在预测多支病变的 ROC 曲线分析中，Lp(a) 的曲线下面积 (AUC) 为 0.742(95%CI：0.703-0.781)，最佳临界值为 32.5mg/dL，敏感性和特异性分别为 68.5% 和 72.3%。当 Lp(a) 与传统危险因素联合时，预测效能显著提高 (AUC=0.832，95%CI：0.798-0.866)。结论：老年冠心病患者中，Lp(a) 水平与冠状动脉病变范围和严重程度密切相关，且这种相关性独立于传统心血管危险因素，可以将其作为评估老年冠心病患者病情严重程度的重要生物标志物，并为临床早期识别高危患者提供了客观依据。

Identification and validation of IRS2 as a novel aging-related biomarker and potential therapeutic target in calcific aortic valve disease

Dan LIU, Yi Fang, Dan Liu, Ya-Ling Han

State Key Laboratory of Frigid Zone Cardiovascular Disease, Cardiovascular Research Institute and Department of Cardiology, General Hospital of Northern Theater Command

Background: Calcific aortic valve disease (CAVD) is a chronic disease characterized by the thickening and calcification of aortic valve leaflets. CAVD is one of the most common heart valve disorders and the most common condition requiring cardiac valve surgical intervention. CAVD is increasingly regarded as a critical public health problem due to the substantial morbidity and mortality it confers. Despite the prevalence of CAVD, there currently lack of effective pharmacological approaches to prevent or merely retard the progress of the disease. To develop potential pharmaceutical intervention, it's urgent to identify the key molecules involved in the initiation and progression of CAVD.

Methods: In this study, the gene expression profile data (GSE153555, GSE199718, GSE 76717 and GSE148219) were downloaded from the Gene Expression Omnibus (GEO) database. Following data retrieval, the GSE153555 and GSE199718 datasets were integrated to harmonize batch effects, yielding a merged discovery cohort of 42 samples (22 non-calcified aortic valves and 20 CAVD cases) for downstream analyses. GSE76717 and GSE148219 datasets were used as validation datasets. Aging-related genes were collected from manually curated and publicly available resources with the keyword "senescence" . Based on the above datasets, integrated bioinformatic analysis such as weighted gene co-expression network analysis (WGCNA) and differentially expressed genes were used to screen differentially co-expressed aging-related genes (DEAGs). Among the 11 screened DEAGs, one key hub gene was locked by three machine learning algorithms. The expression signature of the hub gene was validated at the tissue and cellular level using both public data and experimentation.

Results: A total of 491 differentially expressed genes were obtained from the combined datasets, and WGCNA identified 12 co-expression modules, of which one hub module (blue module) was most correlated with CAVD. By intersecting the DEGs, hub module genes and aging-related genes, we obtained 11 DEAGs. Using the STRING database, a close protein-protein interaction between these DEAGs was detected. To prioritize hub genes, three machine learning methods such as Least Absolute Shrinkage and Selection Operator (LASSO), Support Vector Machines-Recursive Feature Elimination (SVM-RFE) and random forest (RF) were systematically applied, and the IRS2 was locked by three machine learning algorithms. The expression level of IRS2 was consistently down-regulated in CAVD samples among four GEO datasets, and the single-cell sequencing analysis showed that IRS2 was significantly downregulated in the valve interstitial cells from animal models of CAVD. The results of public data analyses were further verified by experimental data, the IRS2 expression was significantly downregulated in the calcified aortic valve samples detected by immunochemistry at tissue level, and significantly downregulated in valve interstitial cells induced by osteogenic medium detected by western blotting.

Conclusions: In conclusion, we identified IRS2 as an important aging-related gene in CAVD by integrated bioinformatic analysis, and validated the results with both public and experimental data at tissue and cellular levels. IRS2 has not been reported to be associated with CAVD, and might serve as a novel marker and therapeutic target for CAVD. The mechanistic contributions of insulin receptor substrate 2 (IRS2) to CAVD pathogenesis remain uncharacterized at the molecular level, and we intend to address this in the future.

共病负担对老年射血分数保留型心力衰竭患者预后的影响分析

史凯蕾 车惠霖 张曙鑫 曲新凯

复旦大学附属华东医院

目的：射血分数保留型心力衰竭（HFpEF）在老年人群中发病率逐年上升，且临床表现高度异质。共病（comorbidities）在老年 HFpEF 患者中极为常见，对疾病进展和临床预后具有重要影响。然而，目前尚缺乏系统性研究评估多种共病对老年 HFpEF 预后的综合作用。本研究旨在分析常见共病（包括糖尿病、高血压、慢性肾病、肺部疾病和肿瘤）在老年 HFpEF 患者中的分布特征，并探讨其与全因死亡率之间的关系。

方法：本研究为双向性队列研究，纳入 2019 年 7 月至 2024 年 6 月期间在复旦大学附属华东医院新诊断为 HFpEF、年龄≥ 60 岁的老年患者。随访截止至 2024 年 12 月，中位随访时间为 19 个月，主要结局为全因死亡。

结果：共纳入 603 例资料完整的老年 HFpEF 患者，平均年龄为 79.10±9.19 岁，男性 311 例（51.6%），女性 292 例（48.4%）。在中位 19 个月的随访期间，

共有 154 例（25.5%）发生全因死亡。共病在该人群中普遍存在，高血压为最常见共病（占比约 70%），其次为冠心病和房颤（均约 45%），再次为糖尿病和慢性肾病 4-5 期（均约 35%）。根据共病数量进一步分组分析显示，合并≥ 3 种共病的患者其全因死亡率显著高于共病数量较少者（P<0.01），提示共病负担越重，预后越差。多因素 Cox 回归分析表明，肿瘤和慢性肾病（4-5 期）是老年 HFpEF 患者全因死亡的独立危险因素。

结论：共病负担是影响老年 HFpEF 患者预后的关键因素。系统评估并个体化管理共病，有助于改善其临床结局和生活质量。未来研究应进一步探索基于多系统共病特征的综合干预策略，以优化 HFpEF 的整体治疗路径。

板栗酒化学成分棕榈酸甲酯对小鼠心肌细胞和心肌成纤维衰老的调节作用

哈尔滨医科大学附属第一医院

目的：年龄是影响心血管疾病的主要因素之一，心血管衰老时常伴随表观遗传学改变、线粒体功能障碍和细胞衰老等。在老年机体中，全身血管会发生病理性重塑，从而增加冠心病和动脉粥样硬化等老年易发心血管疾病的患病风险。随着衰老进展，心脏可出现左心室肥厚、心房颤动和心力衰竭相关改变。为了探寻新的延缓衰老的方法，我们使用、小鼠原代心肌细胞和心肌成纤维细胞，分别设置对照组、H_2O_2 组及 H_2O_2+ 棕榈酸甲酯（Methyl palmitate，MP）组，通过对衰老表型、活性氧 ROS、细胞周期及炎症因子的检测探究棕榈酸甲酯对小鼠心肌细胞和心肌成纤维衰老的调节作用。

材料与方法：应用 SA-β-gal 半乳糖苷酶染色检测细胞衰老情况；应用胶原含量检测试剂盒检测胶原含量；应用流式细胞术检测细胞周期和细胞内 ROS 检测；应用试剂盒进行端粒长度测定；应用 EdU 免疫荧光检测细胞增殖情况；应用免疫荧光实验检测 Ki67、Brdu；利用透射电镜检测细胞形态变化；应用 qRT-PCR 技术检测细胞周期相关因子 P16、P21、P53、衰老相关分泌表型 IL-6、IL-8、及核纤层蛋白 Lamin B1、凋亡相关因子 Caspase、Bax、BCL2 mRNA 表达；应用 Western Blot 技术检测 P16、P21、P53、IL-6、IL-8、Lamin B1、Caspase、Bax 及 BCL2 蛋白表达量。体外实验检测燕栗香酒化学成分棕榈酸甲酯对 H_2O_2 所致鼠原代心肌细胞和心肌成纤维细胞衰老的调节作用。

结果与结论：板栗酒化学成分棕榈酸甲酯可缓解 H_2O_2 所致鼠原代心肌细胞 ROS 水平升高、端粒延长及心肌成纤维细胞增殖及胶原含量增加；以及逆转两种细胞中细胞周期相关因子 P16、P21、P53、衰老相关分泌表型 IL-6、IL-8、及核纤层蛋白 Lamin B1、凋亡相关因子 Caspase 等 mRNA 及蛋白表达增加，逆转 H_2O_2 所致凋亡水平上升。有效延缓心肌细胞和心肌成纤维细胞的衰老。

Phloretin combined with LIPUS can alleviate the inflammatory response of vascular endothelial cells in diabetic mice by activating SIRT-related pathways

Chun-Wei He, Chang Chen, Yu-Xin Wang, Tong-Xue Zhang, Shi-Hao Sun, Lin Shen

Qilu hospital of Shandong University

Abstract

Diabetes mellitus (DM) represents one of the most prevalent and debilitating chronic metabolic diseases worldwide, posing a formidable challenge to global healthcare systems. Its widespread prevalence and systemic complications significantly strain medical resources, necessitating urgent development of novel therapeutic strategies. A particularly critical concern in diabetic patients is the markedly elevated risk of cardiovascular disease (CVD), which continues to serve as the primary cause of morbidity and mortality within this population. The pathogenesis of diabetes-induced CVD is notably intricate, involving a cascade of pathological events initiated by vascular endothelial dysfunction. This dysfunction disrupts the delicate balance of vascular homeostasis, setting off a chain reaction characterized by chronic inflammation, oxidative stress, and impaired vascular repair mechanisms. Over time, these abnormalities contribute to the development of atherosclerosis, hypertension, and other severe CVD complications, ultimately compromising patient prognosis and quality of life.

Phloretin, a natural dihydrochalcone compound abundantly present in apples and various other fruits, has emerged as a promising therapeutic candidate due to its diverse biological activities. This compound has demonstrated significant potential in regulating metabolic homeostasis through multiple mechanisms, including the enhancement of insulin sensitivity and promotion of glucose uptake. Furthermore, phloretin exhibits potent anti-inflammatory and antioxidant properties, making it particularly attractive for addressing the complex pathophysiology of diabetes. Recent investigations have revealed that phloretin can effectively alleviate diabetes-induced endothelial injury by activating the AMP-activated protein kinase (AMPK)-dependent anti-endothelial-to-mesenchymal transition (anti-EndMT) pathway. This protective effect helps preserve vascular endothelial integrity and function. However, despite these encouraging findings, the broader therapeutic potential of phloretin in mitigating the full spectrum of diabetes-induced CVD complications remains incompletely understood, highlighting the need for further comprehensive research.

In parallel, low-intensity pulsed ultrasound (LIPUS) has garnered increasing attention as a non-invasive and clinically translatable therapeutic modality. This technology has demonstrated notable anti-inflammatory and tissue-repairing properties across various medical contexts. While its benefits in musculoskeletal disorders and wound healing have been well-documented, its effects on the macrovasculature, particularly within the diabetic milieu, remain largely unexplored. Given the pressing need for innovative strategies to combat diabetes-associated vascular dysfunction, the investigation of potential synergistic effects between phloretin and LIPUS presents a compelling and timely research direction.

In this study, we provide compelling evidence demonstrating that the combined application of LIPUS and phloretin exerts a more robust protective effect on vascular endothelial cells compared to either intervention alone. The observed synergistic effect is mediated through the upregulation of longevity-associated genes SIRT3 and SIRT6, which play crucial roles in enhancing mitochondrial function and reducing oxidative stress. This molecular interplay not only improves cellular energy metabolism but also simultaneously suppresses the production of pro-inflammatory cytokines, including interleukin-6 (IL-6), tumor necrosis factor-alpha (TNF-α), and interferon-gamma (IFN-γ). These findings were validated in an in vivo diabetic model, where the combined treatment regimen significantly improved vascular endothelial function and attenuated the progression of CVD.

Our study offers robust evidence supporting the notion that LIPUS-phloretin combination therapy provides superior protection against diabetes-induced vascular damage when compared to monotherapy approaches. By simultaneously targeting multiple pathological pathways—namely, endothelial dysfunction, inflammation, and metabolic dysregulation—this dual approach holds significant promise for improving the prognosis of diabetic patients with CVD. Furthermore, these findings establish a solid scientific foundation for the development of novel therapeutic strategies not only for macrovascular complications but also for a broad spectrum of other inflammation-driven diseases, potentially revolutionizing the management of vascular pathologies in various clinical contexts.

纤维蛋白原 / 白蛋白比值与接受经皮冠状动脉介入治疗的高龄冠心病患者长期预后的关系

程雅琳 张闻多 季福绥

北京医院 心血管内科；国家老年医学中心；中国医学科学院老年医学研究院

目的：纤维蛋白原与白蛋白比值（FAR）作为一种新型炎症标志物，已在心血管疾病预后评估中展现出价值。然而，其在接受经皮冠状动脉介入治疗（PCI）的高龄冠心病患者（≥ 80 岁）风险分层中的作用尚未明确。因此，本研究拟探究接受 PCI 治疗的高龄冠心病患者的基线 FAR 水平与其长期临床预后的关系。

方法：本单中心回顾性队列研究连续纳入 2015 至 2021 年间在我院接受 PCI 治疗的 80 岁及以上的冠心病患者共 641 例。根据 FAR 中位值（0.079）分为高 FAR 组与低 FAR 组。研究终点为心血管死亡和全因死亡。采用多变量 Cox 模型和限制性立方样条分析 FAR 与终点的关联。

结果：中位随访 61 个月期间，共记录 237 例死亡（37%），其中 124 例（19.3%）为心血管死亡。1 年死亡率为 9.3%，5 年死亡率为 27.4%。Kaplan-Meier 分析显示高 FAR 水平与心血管死亡和全因死亡风险增加显著相关（Log-rank p<0.001）。限制性立方样条提示 FAR 与死亡率呈 J 型关联。高 FAR（>0.079）可独立预测心血管死亡（校正 HR=1.49，95% CI：1.01-2.19，p=0.045）。作为连续变量分析时，完全校正模型中较高 FAR 水平与心血管死亡（HR=1.23，95% CI：1.04-1.47，p=0.018）及全因死亡（HR=1.12，95% CI：0.98-1.27，p=0.090）风险升高相关。亚组分析显示在三支血管病变患者中，高 FAR 与心血管死亡的关联显著增强（交互作用 p=0.039）。Fine and Gray 竞争风险模型进一步验证 FAR 与心血管死亡的稳健关联（HR=1.31，95% CI：1.13-1.52，p=0.003）。

结论：在接受 PCI 的高龄冠心病患者中，较高 FAR 水平与心血管死亡和全因死亡风险增加相关。本研究结果支持 FAR 在老年心脏病学风险分层中的应用潜力。

新疆部分地区老年持续性心房颤动患者 EQ-5D-5L 评分及其影响因素分析

许严锴 [1] 石世林 [2] 吕福强 [1] 董润甜 [1] 刘克坚 [1]

1. 石河子大学第一附属医院

2. 石河子市人民医院

目的

心房颤动（简称房颤，atrial fibrillation，AF）是 21 世纪心血管疾病领域的重要挑战，其发病率持续上升，尤其是老年人群，易导致严重并发症，显著降低生活质量。针对新疆地区≥ 65 岁持续性非瓣膜性房颤患者生活质量的系统性研究仍较缺乏。本研究旨在评估新疆老年持续性非瓣膜性房颤患者的 EQ-5D-5L 评分及其影响因素，为提高老年房颤患者的生活质量和管理提供依据。

方法

采用横断面研究设计，纳入 2023 年 10 月至 2024 年 11 月新疆焉耆、图木舒克、喀什、石河子四家医院的 123 例老年持续性非瓣膜性心房颤动患者，通过问卷调查收集人口学、行为习惯及疾病信息，采用中文版 EQ-5D-5L 量表评估生活质量。数据用 SPSS 25.0 进行统计分析，采用 Logistic 回归模型探索影响因素，分析人口学特征、行为习惯及疾病特征对生活质量的影响。

结果

123 名老年持续性非瓣膜性心房颤动患者整体生活质量评分中位数为 0.654，

88.6% 存在日常活动受限，82.9% 行动能力下降。（1）年龄是核心危险因素，高龄导致行动能力、自我照顾及日常活动受限明显 (OR=6.30, 95%CI=2.49-15.94)。

（2）少数民族患者在自我照顾和日常活动维度有一定优势 (OR=0.25, 95%CI=0.08-0.81)。

（3）运动较多在自我照顾和焦虑 / 抑郁层面具有保护作用 (OR=0.17, 95%CI=0.06-0.45)。

结论

老年持续性房颤患者生活质量受多因素影响，高龄及缺乏运动是主要危险因素。临床需对老年房颤患者强化康复训练与心理干预，鼓励规律运动以改善心肺功能及社会参与。研究局限性包括样本地域局限及横断面设计，未来需扩大样本并探索传统医学在综合管理中的作用。本研究为制定个性化干预策略提供了实证依据，强调多维度管理对提升患者预后的重要性。

Ethnicity and Exercise Modulate Quality of Life in Elderly Patients with Persistent Atrial Fibrillation: A Cross-Sectional Study in Multi-Ethnic Xinjiang

Yankai Xu[1], Run-Tian Dong[1], Shi-Lin Shi[2], Fu-Qiang Lv[1], Ke-Jian Liu[1]

1. The First Affiliated Hospital of Shihezi University

2. Shihezi People's Hospital

Objective

Atrial fibrillation (AF) is a major challenge in the field of cardiovascular diseases in the 21st century, with its incidence rate continuously rising, particularly among the elderly population, predisposing them to severe complications and significantly reducing quality of life. Systematic research on the quality of life among persistent non-valvular atrial fibrillation patients aged ≥ 65 years in Xinjiang remains relatively scarce. This study aims to evaluate the EQ-5D-5L scores and their influencing factors among elderly patients with persistent non-valvular atrial fibrillation in Xinjiang, providing a basis for improving the quality of life and management of elderly AF patients.

Methods

A cross-sectional study design was adopted, enrolling 123 elderly patients with persistent non-valvular atrial fibrillation from four hospitals in Yanqi, Tumushuke, Kashgar, and Shihezi, Xinjiang between October 2023 and November 2024. Demographic data, behavioral habits, and disease information were collected through questionnaires, and quality of life was assessed using the Chinese version of the EQ-5D-5L scale. Data were statistically analyzed using SPSS 25.0, with logistic regression models employed to explore influencing factors and analyze the impact of demographic characteristics, behavioral habits, and disease features on quality of life.

Results

The median overall quality of life score among 123 elderly patients with persistent non-valvular atrial fibrillation was 0.654, with 88.6% experiencing limitations in daily activities and 82.9% showing reduced mobility.

(1) Age is a core risk factor, with advanced age significantly contributing to limitations in mobility, self-care, and daily activities. In terms of mobility, self-care, usual activities, and pain/discomfort dimensions, the risk for the ≥ 75-year-old group was over 6 times higher than that of the younger group, a conclusion further validated by multivariate analysis results(OR=6.30, 95%CI=2.49-15.94).

(2) Ethnic minority patients exhibited certain advantages in the dimensions of self-care and daily activities.In the dimensions of self-care, daily activities, pain/discomfort, and anxiety/depression, univariate analysis showed certain advantages among ethnic minorities, but these effects gradually diminished in multivariate analysis (OR=0.25, 95%CI=0.08-0.81).

(3) Higher levels of physical activity demonstrated protective effects in terms of self-care and anxiety/depression (OR=0.17, 95%CI=0.06-0.45). In terms of mobility and anxiety/depression dimensions, univariate analysis indicated significantly reduced limitations in elderly atrial fibrillation patients with regular exercise, while the protective effect of higher exercise levels diminished in multivariate analysis. For the self-care dimension, both univariate and multivariate analyses demonstrated that regular exercise remained statistically significant.

(4)Other demographic characteristics (such as gender, marital status, living situation) and clinical features (such as medication adherence, smoking and drinking history, BMI, number of chronic diseases) did not show statistically significant effects on EQ-5D-5L scores.

Conclusions

(1)The quality of life in elderly patients with persistent atrial fibrillation is influenced by multiple factors, with advanced age ethnicity, and physical activity being the primary risk factors.

(2)Clinically, it is necessary to strengthen rehabilitation training and psychological interventions for elderly atrial fibrillation patients, encouraging regular exercise to improve cardiopulmonary function and social participation.

(3)This study provides empirical evidence for developing personalized intervention strategies, emphasizing the importance of multidimensional management in improving patient prognosis.

(4)The study limitations include regional constraints of the samples and cross-sectional design. Future research should expand the sample size and explore the role of traditional medicine in comprehensive management.

Oral Anticoagulant Use and In-Hospital Outcomes in Patients Aged 90 years and older with Atrial Fibrillation or Atrial Flutter

Zinan Zhao, Junpeng Liu

Beijing Hospital

Objectives: Oral anticoagulants (OACs) are pivotal for preventing thromboembolic events in patients with atrial fibrillation (AF) or atrial flutter, yet data on their utilization patterns, associated factors, and clinical outcomes in the ultra-elderly population (aged 90 years and older) remain scarce. This cross-sectional study aimed to comprehensively investigate the characteristics of OAC use, factors influencing OAC administration, and in-hospital outcomes in this vulnerable group, with a specific focus on comparing outcomes between different OAC types and dose regimens.

Methods: A total of 290 patients aged 90 years and older with AF or atrial flutter were enrolled, comprising 201 in the non-OAC group, 16 in the warfarin subgroup, and 73 in the direct oral anticoagulant (DOAC) subgroup (total OAC group: 89 patients). Detailed data were collected, including demographic and clinical characteristics (e.g., age, sex, comorbidities such as hypertension, diabetes mellitus, heart failure, and previous cardiovascular procedures), anticoagulation indications, risk stratification scores (CHA_2DS_2-VASc for thromboembolic risk and HAS-BLED for bleeding risk), laboratory variables (hemoglobin, platelets, prothrombin time [PT], activated partial thromboplastin time [APTT], international normalized ratio [INR], and renal function indicators like estimated glomerular filtration rate [eGFR]), medication use (including antiplatelets, proton pump inhibitors [PPIs], β-blockers, and renin-angiotensin system inhibitors), and in-hospital adverse events (thromboembolism, including stroke and pulmonary embolism [PE]; bleeding, including gastrointestinal bleeding [GIB] and intracerebral hemorrhage [ICH]; and all-cause mortality). Comparative analyses were performed between the non-OAC and OAC groups, as well as between DOAC users receiving recommended regular doses (n=27) and those on non-recommended reduced doses (n=46).

Results: Compared with the non-OAC group, the OAC group had a higher proportion of females (39.33% vs. 23.38%, p=0.005) and a lower HAS-BLED score (IQR: 3.00 vs. 3.00, p < 0.001). The OAC group showed a higher rate of heart failure (42.70% vs. 15.42%, p < 0.001) and previous percutaneous coronary intervention (25.84% vs. 12.94%, p=0.007), while having fewer patients with a history of bleeding (10.11% vs. 46.27%, p < 0.001) and previous venous thromboembolism (6.74% vs. 38.31%, p < 0.001). A higher proportion of the OAC group was admitted to the Department of Cardiology (88.76% vs. 45.27%, p < 0.001). In terms of medications, the OAC group had lower use of antiplatelets (22.47% vs. 59.20%, p < 0.001) and proton pump inhibitors (39.33% vs. 73.63%, p < 0.001), but higher use of ACEI/ARB (38.20% vs. 16.42%, p < 0.001) and β-blockers (57.30% vs. 32.34%, p < 0.001). In terms of in-hospital outcomes, the OAC group had a significantly lower incidence of stroke (3.37% vs. 24.88%, p < 0.001) but a higher rate of in-hospital bleeding events (68.54% vs. 53.73%, p=0.018). Among OAC subgroups, dabigatran was associated with the highest bleeding rate (100.00%), followed by edoxaban (72.97%), warfarin (62.50%), and rivaroxaban (58.62%). There was no significant difference in in-hospital intracerebral hemorrhage (ICH) between the two groups (4.49% vs. 1.99%, p=0.255). The incidence of in-hospital deep vein thrombosis (DVT) was comparable (11.24% vs. 15.42%, p=0.345), and there was a non-significant trend toward lower in-hospital mortality in the OAC group (3.37% vs. 9.95%, p=0.056). Among DOAC users, non-recommended reduced doses (63.01%) were more common than recommended regular doses (36.99%). Rivaroxaban was predominantly used in reduced doses (56.52% of reduced-dose users vs. 11.11% of regular-dose users, p < 0.001), while edoxaban was more frequently administered at regular doses (81.48% of regular-dose users vs. 32.61% of reduced-dose users, p < 0.001). Reduced-dose DOAC use was significantly associated with a history of bleeding (17.39% vs. 0%, p=0.023) and concurrent antiplatelet therapy (34.78% vs. 3.70%, p=0.002). No significant differences in in-hospital events were observed between DOAC dose groups. The incidence of in-hospital bleeding events was similar (69.57% vs. 70.37%, p=0.942), with dabigatran showing 100% bleeding rates in both dose subgroups. In-hospital ICH (6.52% vs. 3.70%, p=1.000) and mortality (0 vs. 3.70%, p=0.370) were comparable. For thromboembolic outcomes, cardioembolic stroke (2.17% vs. 7.41%, p=0.551) and DVT (19.57% vs. 3.70%, p=0.080) did not differ significantly between reduced and regular

dose groups.

Conclusions: In patients aged 90 years and older with AF or atrial flutter, OAC use is associated with distinct clinical and demographic characteristics, including a higher proportion of females, lower bleeding risk scores, more frequent heart failure and previous PCI, and fewer comorbidities like diabetes. While OACs significantly reduce the risk of stroke, they are associated with an increased risk of bleeding events, highlighting the need for careful risk-benefit assessment in this population. Non-recommended reduced doses of DOACs are common, driven by factors such as a history of bleeding and antiplatelet use, yet they yield comparable in-hospital outcomes to regular doses, suggesting that individualized dose adjustment may be a viable strategy in clinical practice for ultra-elderly patients. These findings contribute to filling the knowledge gap regarding OAC use in the oldest-old, providing valuable insights for clinical decision-making.

肠道梭状芽孢杆菌代谢产物吲哚 -3- 丙酸缓解老年心脏纤维化

陆静

哈尔滨医科大学附属第一医院

目的：

以心肌纤维化为主要表现的病理性心肌重构，是导致老年人心力衰竭致死的主要原因之一。其机制复杂，涉及细胞间通讯改变及慢性炎症等。在心衰大鼠的肠道中吲哚 -3- 丙酸（Indolyl-3-propionic acid，IPA）的含量降低加剧了心脏舒张功能障碍，补充 IPA 可缓解这一现象。尽管 IPA 对机体有显著的保护作用，但 IPA 对老年心衰的治疗作用及调控机制尚未完全清楚。因此，本研究的目的是，验证 IPA 在衰老心脏中对心肌纤维化调控作用及作用机制，为增龄性心肌纤维化提供新的干预靶点。

方法：

分别取 4-6 月龄的成年雄性 SD 大鼠及 18-20 月龄的老年雄性 SD 大鼠的粪便进行 16S rDNA 检测。应用靶向色氨酸代谢组学技术检测青年大鼠、老年大鼠粪便中差异代谢物。雄性 SD 老年大鼠给予 IPA 管饲法喂养 8 周后，采用心脏超声、H&E 染色、Masson 染色、免疫组化、免疫荧光、qRT-PCR 和 Western Blot 等技术验证 IPA 对老年大鼠心脏的保护作用，检测 IPA 减轻老年心肌纤维化的作用。

结果：

（1）老年大鼠肠道微生物群紊乱，梭状芽胞杆菌属有显著差异，其色氨酸途径代谢产物 IPA 的含量在老年心衰大鼠中显著降低；

（2）老年大鼠补充 IPA 能够显著改善衰老引起的心功能减退、胶原沉积，抑制心肌纤维化标志物 COL3A1、COL1A1 及 α-SMA 的表达水平；

结论：

老年时，大鼠肠道菌群代谢紊乱，梭状芽孢杆菌代谢色氨酸的产物 IPA 含量随老年大鼠心脏功能减退而降低，补充 IPA 能够逆转增龄性心肌纤维化。

关键词：增龄性心肌纤维化；肠道菌群；IPA

吲哚 -3- 丙酸通过调控巨噬细胞自噬功能缓解老年心脏纤维化

陆静

哈尔滨医科大学附属第一医院

目的：

以心肌纤维化为主要表现的病理性心肌重构，是导致老年人心力衰竭致死的主要原因之一。其机制复杂，涉及细胞间通讯改变及慢性炎症等。在心衰大鼠的肠道中吲哚 -3- 丙酸（Indolyl-3-propionic acid，IPA）的含量降低加剧了心脏舒张功能障碍，补充 IPA 可缓解这一现象。尽管 IPA 对机体有显著的保护作用，但 IPA 对老年心衰的治疗作用及调控机制尚未完全清楚。因此，本研究的目的是，验证 IPA 在衰老心脏中对心肌纤维化调控作用，探讨 IPA 对巨噬细胞调控自噬活性参与增龄性心肌纤维化的作用机制，为增龄性心肌纤维化提供新的干预靶点。

方法：

分别取 4-6 月龄的成年雄性 SD 大鼠及 18-20 月龄的老年雄性 SD 大鼠的粪便进行 16S rDNA 检测。应用靶向色氨酸代谢组学技术检测青年大鼠、老年大鼠粪便中差异代谢物。雄性 SD 老年大鼠给予 IPA 管饲法喂养 8 周后，采用心脏超声、H&E 染色、Masson 染色、免疫组化、免疫荧光、qRT-PCR 和 Western Blot 等技术验证 IPA 对老年大鼠心脏的保护作用。利用巨噬细胞 - 心肌成纤维细胞共培养方法验证 IPA 通过调节 PPT1 减轻纤维化的作用。

结果：

（1）老年大鼠肠道微生物群紊乱，梭状芽胞杆菌属有显著差异，其色氨酸途径代谢产物 IPA 的含量在老年心衰大鼠中显著降低；

（2）老年大鼠补充 IPA 能够显著改善衰老引起的心功能减退、胶原沉积，降低炎症标志物 iNOS、IL-6 及 TNF-α 表达水平，抑制心肌纤维化标志物 COL3A1、COL1A1 及 α-SMA 的表达水平；体外孵育 IPA 可降低巨噬细胞炎症标志物 iNOS、IL-6 及 TNF-α 表达，间接抑制心肌成纤维细胞纤维化标志物 COL3A1、COL1A1 及 α-SMA 的表达；

（3）IPA 能够调控衰老巨噬细胞的 PI3K-AKT-mTOR 通路进而调控自噬；体外补充 IPA 能够缓解过表达 PPT1 所致的自噬功能减退。

结论：

色氨酸代谢产物 IPA 在老年心衰心脏中显著下降，补充 IPA 能够逆转增龄性心肌纤维化及炎症；在机制上，IPA 通过 PPT1 影响 PI3K-AKT-mTOR 通路恢复衰老巨噬细胞自噬活性，从而抑制炎症及增龄性心肌纤维化的发生发展。

TAVI 手术在超高龄患者中的安全性及中长期预后评估

张璐

陆军军医大学第二附属医院新桥医院

摘要：目的：评估经导管主动脉瓣植入术（TAVI）在 80 岁以上超高龄患者群体中的围术期安全性及术后 3-5 年生存质量指标，探讨影响预后的独立危险因素。

方法：采用多中心回顾性队列研究设计，纳入 2018-2025 年间接受 TAVI 治疗的 327 例≥ 80 岁重度主动脉瓣狭窄患者，通过 EuroSCORE II 评分系统进行术前风险评估，记录术中并发症发生情况，术后跟踪随访主要心血管不良事件（MACCE）、全因死亡率及心功能改善情况。

结果：手术成功率 97.6%，30 天死亡率 3.7%，主要并发症包括需要输血治疗的血管并发症（8.3%）、新发房颤（12.1%）及永久起搏器植入（15.8%）。3 年生存率 82.4%，5 年生存率 67.9%，NYHA 心功能分级改善≥ 1 级者达 89.2%。多因素分析显示术前肺动脉高压（HR=2.15）和慢性肾功能不全（HR=1.83）是影响中长期预后的独立危险因素。

结论：TAVI 手术能为超高龄患者提供可靠的中长期生存获益，严格把握适应证并优化合并症管理是改善预后的关键。

关键词：经导管主动脉瓣植入术 超高龄 预后因素 老年医学

随着人口老龄化进程加速，重度主动脉瓣狭窄（severe aortic stenosis, SAS）在超高龄（≥ 80 岁）人群中的发病率显著升高。该疾病严重影响患者生活质量及预后，若不及时干预，自然病程凶险。传统的外科主动脉瓣置换术（surgical aortic valve replacement, SAVR）虽为金标准，但对于合并多种基础疾病、衰弱状态（frailty）的超高龄患者而言，其围术期死亡率和并发症风险显著增加，使得相当一部分患者无法耐受或被视为手术禁忌。经导管主动脉瓣植入术（transcatheter aortic valve implantation, TAVI）作为一种微创介入治疗技术，自首次应用于临床以来，凭借其创伤小、恢复快的优势，迅速成为治疗高龄、高危 SAS 患者的重要选择。多项大型随机对照试验及真实世界研究已证实，对于外科手术中高危患者，TAVI 在短期及中期预后方面不劣于甚至优于 SAVR。然而，针对超高龄这一特殊亚组人群，其生理储备下降、合并症复杂、预期寿命及生活质量诉求具有独特性，TAVI 治疗的安全性、有效性和中长期预后数据仍相对有限。现有研究多聚焦于短期结局或纳入患者年龄跨度较大，缺乏专门针对超高龄患者群体的长期、系统性的预后评估，特别是对生存质量改善及影响远期结局的关键因素分析尚需深入探讨。因此，本研究旨在通过多中心回顾性队列分析，详细评估 TAVI 在超高龄重度主动脉瓣狭窄患者中的围术期安全性、术后 3-5 年的生存率、主要心血管不良事件发生率以及心功能恢复情况，并深入探讨影响其中长期预后的独立危险因素，以期为此类患者群体的临床决策提供更精准、更有价值的循证医学证据。

Efficacy and safety of antithrombotic therapy in the elderly patients with the commodities of coronary artery disease, atrial fibrillation, and malignancy

2. Medical School of Chinese PLA, Chinese PLA General Hospital

Abstract:

Objective: Antithrombotic therapy is the cornerstone for the patients with coronary artery disease (CAD), and atrial fibrillation (AF), but it is a challenge with the concomitant of malignancy for the lethal bleeding side events, especially in the elderly. This study aimed to investigate the current status of oral antithrombotic therapy and its impact on clinical outcomes in the elderly patients with CAD, AF, and concomitant malignancy.

Methods: We consecutively enrolled patients aged ≥ 65 years diagnosed with CAD, AF, and malignancy during the hospitalization in the Chinese PLA General Hospital. yhThe clinical baseline characteristics and details of the oral antithrombotic therapy were collected from the Electronic Medical Record. Patients who could meet the inclusion/exclusion criteria of the study were followed-up for 1 year to observe the occurrence of major adverse cardiovascular events (MACEs) and major bleeding events (Bleeding Academic Research Consortium [BARC] type ≥ 2). We analyzed the influence of oral antithrombotic therapy on these clinical outcomes. Statistical analysis was performed using SPSS 17.0. The comparison of clinical baseline characteristics between patients with or without oral antithrombotic therapy were performed by t-tests, Mann-Whitney U tests, or χ^2 tests, as appropriate for the data type. Multivariate logistic regression models were used for the adjustment to determine the independent predictive value of antithrombotic therapy for the efficacy and safety

outcomes of oral antithrombotic therapy.

Results: The study included a total of 135 eligible elderly patients with the comorbiditis of CAD, AF, and malignancy. Acute coronary syndrome was diagnosed in 40.0% (54/135) patients, and 7.4% (10/135) underwent the coronary stent implantation. Among all malignancy types, breast cancer (17.0%, 23/135) and lung cancer (15.6%, 21/135) accounted for the highest diagnostic proportions. Patients were divided into an antithrombotic therapy group (n=71) and a non-antithrombotic therapy group (n=64) based on their use of antiplatelet and/or anticoagulant medications. Compared to the patients in the non-antithrombotic therapy group, the patients in the antithrombotic therapy group had significantly lower mean age (77.4 ± 5.7 vs. 80.3 ± 6.8 years, P < 0.05) and median plasma D-dimer levels (1.03 [IQR 0.34-1.42] vs. 1.82 [IQR 0.51-2.43] mg/L, P < 0.05). Meanwhile, significantly higher mean platelet counts (199.9 ± 65.0 vs. 176.7 ± 59.8 × 10^9 /L, P < 0.05) as well as a higher proportion of patients using proton pump inhibitors (59.2% [42/71] vs. 29.7% [19/64], P < 0.05) could be observed in the antithrombotic therapy group. Among the patients in the antithrombotic therapy group, 38.0% (27/71) were administrated with oral anticoagulant (OAC), 32.4% (23/71) with single antiplatelet agent, and 29.6% (21/71) received dual antiplatelet therapy of aspirin combined with clopidogrel. Multivariate logistic regression analysis revealed that antithrombotic therapy was negatively associated with the rate of MACEs (OR = 0.111, 95% CI: 0.026-0.473; P < 0.05). However, the risk of BARC type ≥ 2 bleeding events did not differ significantly between the two groups (OR = 0.724, 95% CI: 0.059-8.826; P > 0.05).

Conclusion: In elderly patients with CAD, AF, and malignancy, antithrombotic therapy could decrease the risk of ischemic cardiovascular events without the increase of bleeding risk.

Key Words:

Elderly, antithrombotic therapy, coronary artery disease, atrial fibrillation, malignancy

健康生活方式与全因死亡率、特定原因死亡率及预期寿命的关联：来自英国和美国的两项全国性队列研究

陈章玲 周胜华

中南大学湘雅附二医院

摘要

目的：现有证据表明健康生活方式与较低的死亡率和较长的预期寿命相关，但既往的健康生活方式评分未纳入睡眠质量和心理因素。本研究旨在探讨新的健康生活方式评分与全因死亡率、特定原因死亡率及预期寿命的关联。

方法：我们前瞻性随访了英国生物银行（2006-2022 年）和美国国家健康与营养检查调查（NHANES，1999-2019 年）的 413,180 名参与者。通过基线问卷调查收集饮食和生活方式等数据，并据此创建新的健康生活方式评分，包括膳食质量、体力活动、酒精摄入、吸烟情况、睡眠质量和抑郁状况。其中，膳食质量、体力活动、睡眠质量为正向评分，酒精摄入、吸烟和抑郁为反向评分。各组分得分总和即为新的健康生活方式评分（理论范围 6-30 分）。采用 Cox 回归模型分析该评分与全因及特定原因死亡率的关联，并使用生命表法分析其与预期寿命的关系。

结果：在平均 13.3 年的随访期间，两个队列共发生 34,155 例死亡。经多变量调整后，更高的健康生活方式评分与更低的全因及特定原因死亡风险相关。健康生活方式评分最高五分位数组与最低五分位数组相比，全因死亡率的风险比（HR）为 0.56（0.47，0.67），心血管疾病（CVD）死亡风险为 0.64（0.59，0.70），癌症死亡风险为 0.62（0.58，0.65），其他原因死亡风险为 0.47（0.31，0.70）。此外，更高的健康生活方式评分与更长的预期寿命相关：与最低五分位数组相比，最高五分位数组的预期寿命延长 5.60 年（3.82，8.19）。这些结果在年龄、种族、性别和 BMI 等多个风险因素中保持一致。

结论：在英国和美国成年人中，新的健康生活方式评分（包含睡眠和心理因素）与显著降低的全因及特定原因死亡风险、更长的预期寿命密切相关。研究结果提示，推广包括健康睡眠和心理健康在内的健康生活方式，有助于降低死亡率、延长预期寿命，并减轻医疗负担。

高尿酸血症对老年冠心病患者经皮冠状动脉介入治疗术后 2 年和 5 年不良临床结局的影响

唐晓芳 张策 姚懿 徐娜 汪沛志 袁德山 赵雪燕 袁晋青

中国医学科学院阜外医院

背景：流行病学研究表明，高尿酸血症的患病率随着年龄的增长而增加。越来越多的证据表明，高尿酸血症患者罹患心血管疾病和发生死亡的风险可能更高，随着我国人口老龄化的加剧，老年高尿酸血症患者罹患冠心病的风险大大增加。然而，高尿酸血症与老年冠心病患者长期预后的关系目前尚不清楚，缺乏证据。

目的：本研究旨在探讨高尿酸血症对于接受经皮冠状动脉介入治疗（percutaneous coronary intervention, PCI）的老年冠心病患者长期预后的影响。

方法：连续纳入 2013 年 1 月至 12 月 2,981 例行 PCI 的老年冠心病患者，分为高尿酸血症组（580 例）和尿酸正常组（2401 例），比较 PCI 术后 2 年和 5 年随访期间的不良预后。

结果：住院及随访期间，高尿酸血症患者仅有 87 例 (15%) 使用降尿酸药物。老年冠心病合并高尿酸血症组，女性、LVEF<40%、高血压、高脂血症、慢性肾脏病、陈旧心梗病史的比例均显著高于尿酸正常组（P <0.05）。老年冠心病合并高尿酸血症患者在 PCI 术后 2 年和 5 年的全因死亡、心源性死亡和主要不良心脑血管事件的发生率均高于老年冠心病合并尿酸正常的患者（P<0.05）。单因素 COX 回归分析显示，高尿酸血症是老年冠心病患者 PCI 术后 2 年和 5 年全因死亡的独立预测因素（2 年：HR=2.052, 95% CI: 1.259 ~ 3.344, P =0.004; 5 年：HR =1.694, 95% CI: 1.264-2.271, P <0.001）。多因素 COX 分析显示：高尿酸血症仍是老年冠心病患者 PCI 术后 2 年和 5 年全因死亡的独立预测因素（2 年：HR =1.717, 95% CI: 1.009-2.921, P =0.046; 5 年：HR =1.427, 95% CI: 1.042-1.955, P =0.027）。

结论：（1）老年冠心病合并高尿酸血症患者常伴随更多临床高危因素。（2）老年冠心病合并高尿酸血症患者 PCI 术后长期随访期间全因死亡、心源性死亡和主要不良心脑血管事件的发生率明显高于尿酸正常的患者。（3）经校正多种危险因素后，高尿酸血症仍是老年冠心病患者 PCI 术后长期随访过程中全因死亡的独立危险因素。

肠道微生物群与衰老相关代谢及表观遗传年龄加速的关联研究

徐寒 杨帆 保志军 曲新凯 杨帆 保志军

复旦大学附属华东医院

目的

本研究旨在探究肠道微生物群与衰老相关代谢紊乱及表观遗传年龄加速（EAA）的关联及因果关系。一方面通过粪便微生物移植（FMT）实验，分析年龄相关肠道菌群对心脏能量代谢及心肌损伤的影响，明确老年肠道菌群在年龄相关代谢异常和心脏功能障碍中的作用；另一方面借助孟德尔随机化（MR）方法，挖掘特定肠道微生物类群与不同类型 EAA（内在表观遗传年龄加速 IEAA、HannumAge 加速 HannumAA、GrimAge 加速 GrimAA 和 PhenoAge 加速 PhenoAA）的因果关系，为揭示肠道微生物群在衰老进程中的作用机制提供依据，为预防年龄相关疾病和延缓衰老提供新方向。

方法

本研究结合动物实验与流行病学研究。动物实验选取年轻（2-3 月龄）和老年（18-22 月龄）雄性 C57BL/6 小鼠为供体，将粪便微生物移植到年轻受体小鼠，形成年轻 FMT 组和老年 FMT 组。通过 16S rRNA 测序分析受体肠道菌群变化，血浆代谢组学评估代谢潜能；采用口服葡萄糖耐量试验、生化检测等监测能量代谢；检测心脏样本的代谢及 DNA 损伤标志物。流行病学研究基于 MiBioGen 联盟、荷兰微生物组项目及全基因组关联研究数据，运用 MR 分析方法（逆方差加权法 IVW、MR-Egger 回归等）评估肠道菌群与 EAA 的因果关系，通过敏感性分析评估异质性和多效性，反向 MR 分析探究反向因果关系。

结果

动物实验显示，老年 FMT 组受体小鼠肠道菌群显著改变，厚壁菌门与拟杆菌门比值升高，Allobaculum 属丰度增加，乳酸杆菌属等降低，梭杆菌门富集。代谢方面，老年 FMT 组小鼠血浆葡萄糖升高、糖耐量受损、附睾脂肪积累，心脏重量增加伴心肌肥大，心肌葡萄糖代谢异常及氧化损伤加剧，且心脏重量与心肌肥大指标、附睾脂肪重量和空腹血糖显著相关。MR 研究识别出 12 种细菌类群与 EAA 有潜在因果关联。未分类的 Holdemania 物种与 GrimAA 呈强正相关（OR:1.31,95% CI:1.13-1.52,P=0.0004）；Acidaminococcaceae 科和 Clostridiaceae1 科与 GrimAA 呈负相关（OR 分别为 0.64 和 0.69）。反向 MR 分析发现 EAA 与 6 种细菌类群相关，PhenoAA 与 Turicibacter 属呈显著负相关（OR:0.928,95% CI:0.888-0.971,P<0.001）。敏感性分析证实结果稳定，无明显异质性和方向性多效性。

结论

本研究证实年龄相关肠道菌群紊乱在衰老相关代谢异常和心脏损伤中起重要作用，老年肠道菌群可通过改变菌群结构、扰乱能量代谢、诱发心肌氧化损伤，导致心脏肥大等功能障碍。MR 研究揭示特定肠道微生物类群与 EAA 的因果关系，表明肠道菌群可能通过调控表观遗传年龄加速参与衰老。这些发现为理解肠道微生物群在衰老中的作用提供新视角，提示靶向调节肠道菌群可能成为预防年龄相关代谢疾病、心脏功能障碍及延缓衰老的潜在策略。未来需进一步探索分子机制，扩大样本开展跨人群研究验证普适性。

抗凝治疗对老年非瓣膜心房颤动患者认知功能影响的研究

张占英

新疆维吾尔自治区人民医院

探讨老年非瓣膜性心房颤动住院患者的不同药物抗凝治疗对患者认知功能的影响。**方法：**收集 2019 年 01 月 -2020 年 06 月本院收入院的 180 例老年非瓣膜性心房颤动患者为研究对象，采用 cHA_2sD_2.VASc 和 HAS-BLED 评分分析患者在临床中对于治疗方案的选择情况，根据接受治疗方案情况分为抗凝治疗组 120 例 (新型口服抗凝药物组、华法林抗凝药物组) 和未抗凝治疗组 60 例（不接受抗凝治疗组或仅口服阿司匹林组）。通过单因素及多因素分析影响患者抗凝治疗的相关因素。治疗后随访 12 个月，观察患者卒中和出血事件的发生情况。统计患者认知障碍等事件的发生情况，采用简易精神状态检查表 (MMSE) 评价患者认知功能，分析抗凝治疗对认知功能的影响。**结果：**结果显示，与不接受抗凝治疗或仅服用阿司匹林相比，接受口服抗凝药物治疗的心房颤动患者认知功能障碍及痴呆发生风险明显降低（RR=0.71，P<0.01）差异均有统计学意义；口服华法林可显著降低认知功能减退的发生风险 (RR=0.91，P<0.01 差异均有统计学意义)；新型口服抗凝药物和华法林比较无显著差异；**结论：**抗凝治疗能有效减少老年非瓣膜性心房颤动患者卒中事件的发生概率，抗凝治疗对老年非瓣膜性心房颤动患者长期认知障碍具有积极的预防作用，可降低老年痴呆的发生率；

钠 - 葡萄糖转运蛋白 2 抑制剂对肌少症影响的 meta 分析

张孟峣 姚丽霞

河北省人民医院

目的：明确钠 - 葡萄糖共转运蛋白 2(Sodium-Glucose Cotransporter 2 Inhibitors，SGLT-2) 抑制剂对肌少症的影响，优化老年人治疗方案并保护肌肉健康，提高生活质量。

方法：通过检索 PubMed、Embase、Web of Science、Cochrane Library 和 Scopus 学术数据库，收集自建库至 2024 年 12 月的关于 SGLT2 抑制剂对肌少症影响的研究文献，依据纳入和排除标准进行文献筛选，使用 Cochrane 风险偏倚评估工具评价文献质量，运用 RevMan5.4 软件和 Stata18.0 进行 Meta 分析。

结果：最终纳入 26 项随机对照研究，共 1955 名参与者。结果显示，SGLT2 抑制剂可使患者体重 [WMD = -2.27, 95% CI (-2.59 ~ -1.94, P < 0.00001)]、身体质量指数 [WMD= -0.99, 95% CI(-1.22 ~ -0.77, P < 0.00001)]、脂肪量 [WMD = -1.19, 95% CI(-1.66 ~ -0.71, P < 0.00001)]、骨骼肌质量 [WMD = -1.36, 95% CI(-2.59 ~ -0.12，P=0.03)]，骨骼肌质量指数 [WMD = -0.17, 95% CI (-0.31 ~ -0.03，P=0.02)] 显著下降。根据是否为 2 型糖尿病患者进行分组分析，结果显示糖尿病患者 [WMD = -2.33,95% CI(-2.66 ~ -1.99kg, P < 0.00001)] 较无糖尿病患者 [WMD = -1.56, 95% CI (-2.71 ~ -0.40, P=0.008)] 体重下降更显著，但脂肪量下降相似。对于骨骼肌质量进一步行亚组分析发现，不同种类的 SGLT2 抑制剂对骨骼肌质量影响存在差异，恩格列净 [WMD = -0.99, 95% CI(-1.17 ~ -0.81，P < 0.00001)]、伊格列净 [WMD = -1, 95% CI(-1.19 ~ -0.81，P < 0.00001)] 可显著降低骨骼肌质量，达格列净 [WMD = -0.87, 95% CI(-2.90 ~ 1.15，P=0.40)] 降低骨骼肌质量的程度不显著。此外，SGLT2 抑制剂对握力 [WMD = -0.48, 95% CI(-1.27 ~ 0.31，P=0.23)] 和 C 反应蛋白 [WMD=0.09, 95% CI(-0.16 ~ 0.34, P=0.48)]、白细胞介素 6 [WMD= 0.04, 95% CI(-0.13 ~ 0.20, P=0.67)]、肿瘤坏死因子 α [WMD= -0.37, 95% CI(-0.90 ~ 0.16, P=0.17)] 无显著影响。

结论：SGLT2 抑制剂可使患者体重、BMI、脂肪量、骨骼肌质量、骨骼肌质量指数下降，对肌肉力量、炎症因子无显著影响，值得临床医生高度关注，进而对患者行个性化治疗。

心脏病患者跌倒走失安全管理及护理措施探讨

孙莹莹

吉林大学第二医院

目的：本文主要是对心脏病患者跌倒走失安全管理及护理措施进行探讨研究。

方法：选取我院在 2024 年 2 月到 2025 年 2 月收治的心血管疾病患者 220 例，所有患者均排除精神疾病病史、严重脏器障碍及活动障碍等，符合心血管内科相关疾病的诊断标准，将≥ 65 周岁患者纳入研究，采用随机数字表法将其随机分为参照组与研究组各 110 例，参照组患者进行常规护理，研究组患者在参照组护理基础上再进行跌倒走失管理，对两组患者的不良事件进行对比、观察与比较。

结果：心血管内科住院老年患者（≥ 65 周岁）病情较为危重，并且老年人身体机能较差，老年人合并其他疾病，因此对患者展开相应的护理干预具有重要意义。因此应当从护理环节中的细节处入手，包括疾病本身状态、用药安全、高血压等级，心电图性质、心理干预、饮食、提升护理人员水平，确保环境整洁明亮以及其它因素等，对风险进行评估，这样可以有效避免不良事件的发生，提高护理质量，保证患者安全。本次就对心脏病患者跌倒走失安全管理及护理措施探讨，在不同的护理方法下，参照组患者不良事件发生几率为 28.35%，研究组患者的不良事件发生几率为 8.96%，研究组患者发生不良事件的几率明显要低于参照组，P < 0.05，差异具有统学学意义。结论：对心血管疾病患者在常规护理基础上再进行跌倒走失安全管理，改善护理措施，提高医护人员护理水平，能够取得更好的护理效果，降低了患者放生不良事件几率，巩固了患者的治疗效果，提高了患者治疗的安全，可以有效提升护理满意度以及护理质量，值得在今后的临床工作中加以推广。

多学科协作模式下老年难治性高血压的综合干预模式构建

代芬

陆军军医大学第二附属医院新桥医院

摘要：目的：探索基于多学科协作模式构建老年难治性高血压综合干预体系的临床价值，通过整合动态化管理系统与标准化临床路径，提升血压控制达标率及靶器官保护效果。

方法：组建由心内科、内分泌科、临床药师、营养科、心理科及康复治疗师构成的多学科协作团队，建立包含风险评估 - 精准诊断 - 个体化治疗 - 连续随访四大模块的闭环管理体系。采用动态血压监测、药物基因组学检测、靶器官功能评估三维度筛查机制，结合物联网技术实现用药依从性追踪和生活方式实时干预。

结果：通过实施结构化临床路径，使血压达标时间缩短至（8.2±3.1）周，诊室收缩压较基线下降（28.4±9.6）mmHg，24 小时动态血压达标率提升至 76.3%。同时继发性高血压筛查效率提高 42%，药物不良反应发生率降低 19.8%。

结论：该模式通过系统整合专科诊疗优势与全程健康管理，有效破解多重用药矛盾，改善血压波动性，为老年难治性高血压患者提供了兼具规范性与个体化的解决方案。

关键词：多学科协作 难治性高血压 综合干预 动态化管理 临床路径

高血压作为一种常见的慢性疾病，在老年人群中尤为高发，其难治性高血压亚型因多重用药、合并症复杂及生理机能衰退等因素，成为临床管理的重大挑战。据流行病学数据显示，老年难治性高血压患者心血管事件发生率显著高于普通高血压人群，靶器官损害风险加剧，导致致残率及死亡率居高不下。传统单一学科干预模式在应对药物相互作用、生活方式调整及心理社会支持等维度时存在局限，易出现血压控制不达标、依从性低下及不良反应频发等问题。多学科协作模式通过整合心内科、内分泌科等专科资源，结合动态化管理系统与标准化临床路径，能够实现风险评估、精准诊断、个体化治疗及连续随访的闭环管理，有效提升干预效率和患者预后。本研究旨在构建并验证该综合干预模式，为优化老年难治性高血压管理提供循证依据和实践参考。

基于衰弱评估的老年冠心病患者血运重建策略优化研究

游玲

陆军军医大学第二附属医院新桥医院

摘要：目的：探讨衰弱评估在老年冠心病患者血运重建治疗决策中的应用价值，构建基于多维度衰弱评估的个体化血运重建策略。

方法：采用前瞻性队列研究设计，纳入 201 例年龄≥ 75 岁拟行血运重建的冠心病患者，通过 Fried 衰弱表型评估工具进行术前衰弱分级。根据衰弱程度将患者分为衰弱组（n=58）、衰弱前期组（n=63）和非衰弱组（n=80），比较三组术后 30 天主要不良心血管事件（MACE）、12 个月全因死亡率、再入院率及生存质量（采用 SF-36 量表评估）差异。

结果：老年冠心病患者总体衰弱患病率达 28.6%（58/201），衰弱组术后 30 天 MACE 发生率显著高于非衰弱组（24.1% vs 6.3%，HR=3.12，95%CI 1.42-6.85）。衰弱评估指导下的阶梯式干预策略（含 PCI 优化、CABG 时机选择及多学科团队支持）使衰弱患者术后 1 年生存质量评分提升 37.2%（P<0.01）。

结论：将衰弱评估纳入老年冠心病血运重建术前评估体系可有效识别高危患者，通过制定分层管理策略可降低术后并发症风险并改善预后，为临床决策提供循证依据。

关键词：衰弱评估；老年冠心病；血运重建；多学科团队协作

冠心病（CAD）是影响老年人群健康的主要疾病之一，其发病率随年龄增长显著上升。随着人口老龄化进程加速，高龄（≥ 75 岁）冠心病患者的治疗需求日益突出。血运重建（包括经皮冠状动脉介入治疗 PCI 和冠状动脉旁路移植术 CABG）是改善心肌缺血、缓解症状及降低死亡风险的关键手段。然而，老年患者常伴有多种共病及生理储备下降，传统以年龄和常规心血管危险因素为主的评估体系难以全面反映其手术耐受能力与预后差异。近年来，衰弱（Frailty）作为一种反映机体易损性和应激能力下降的综合征，被证实是独立于年龄与共病的重要预后预测因子。研究表明，衰弱状态与老年冠心病患者术后并发症风险增加、恢复延迟及生存质量下降密切相关。

目前，国内外指南虽强调个体化治疗决策的重要性，但对衰弱评估在血运重建策略优化中的系统性整合仍显不足。常规临床实践中，衰弱筛查尚未被广泛纳入术前评估流程，导致部分高危患者可能接受了不适宜的血运重建强度或未能获得针对性的围术期支持。因此，亟需建立一套基于多维度衰弱评估的个体化决策框架，以精准识别风险、优化干预强度并协调多学科资源。本研究旨在通过前瞻性队列分析，验证衰弱评估对老年冠心病患者血运重建术后结局的预测价值，并探索阶梯式干预策略的临床可行性，为完善高危老年患者的循证管理路径提供依据。

健康教育与老年冠心病患者衰弱的相关性研究

王肖肖 宋春莉

吉林大学第二医院

1. 目的：评估老年冠心病患者的衰弱状况，研究健康教育与老年冠心病患者衰弱的相关性，为老年冠心病患者衰弱防治提供新的治疗思路和方案。

2. 方法：

（1）研究对象的选择：选取 2024 年 2 月至 2024 年 10 月就诊于吉林大学第二医院心血管内科的 60 岁及以上的冠心病患者，根据纳入排除标准最终进入研究患者数为 190 例。入选标准: 年龄≥60 岁; 参与研究患者需接受冠状动脉造影检查，造影结果符合 2010 年中华人民共和国卫生部制订的《冠状动脉粥样硬化性心脏病诊断标准》，同时冠状动脉造影结果证实至少一支冠状动脉狭窄≥ 50%；病情平稳；签署知情同意书；依从性佳。排除标准：合并急性心力衰竭等急危重症患者；既往有精神病史不能配合者；严重认知障碍、昏迷等不能明确表达自身思想者；患者拒绝接受衰弱筛查；患者无法进行交流或现有临床资料无法获得有效信息来判断患者是否衰弱。

（2）收集资料: 收集入选患者的一般临床资料，包括年龄、性别、教育程度、吸烟史、饮酒史、高血压史、糖尿病史、脑梗死史、体质指数；收集检验检查指标，包括血红蛋白、白细胞计数、甘油三酯、低密度脂蛋白、左室射血分数、肌钙蛋白、肌酸激酶等，依据 Tilburg 衰弱评估量表评估入选患者的衰弱状况。

（3）干预方法：按照随机数字表法分为对照组和研究组，对照组给予冠心病常规治疗，研究组在常规治疗基础上给予健康教育。健康教育采取现场多媒体授课教学的形式，从合理饮食、体重控制、遵医用药、康复锻炼、情志调护等方面对患者进行系统性、规范性的健康教育，包括 6 次面对面培训，每次培训 20 min，由两名住院医师对患者实施健康教育。

3. 结果和结论：健康教育与老年冠心病患者衰弱具有显著相关性，健康教育干预后老年冠心病患者衰弱显著低于干预前（P<0.01）；健康教育有望成为老年冠心病患者衰弱治疗的一种有潜力的方法。

睾酮通过抑制 AMPK-FOXO1/MuRF1 信号通路介导绝经后高血压左室肥厚

朱露露 王文婷 陈建淑 余静

兰州大学第二医院

目的：女性绝经后发生高血压的风险明显高于男性，且绝经后女性高血压患者易

合并左心室肥厚的靶器官损害，多数研究认为这与绝经后女性雌激素水平的下降相关，但雌激素替代疗法并未使受试者获益可造成某些患者血压升高，我们团队的前期临床研究及多数研究均表明睾酮水平的相对升高也与绝经后高血压左室肥厚相关，但具体致病机制仍在探索中。肌肉特异性 E3 泛素连接酶 MuRF1，主要通过泛素蛋白酶体降解途径参与肌细胞中异常蛋白质的降解，作为一种肌细胞大小的负调控因子介导肌肉萎缩过程，近年来研究发现 MuRF1 也可调控心肌细胞的大小，可能介导心肌细胞肥厚的过程，但其具体机制仍不清楚。故本研究以双侧卵巢摘除术后 SHR 为对象，围绕 AMPK-FOXO1/MuRF1 信号通路，探讨睾酮介导的双侧卵巢摘除术后 SHR 心肌肥厚的发生机制。

方法： 取 12 周龄的雌性自发性高血压大鼠 (SHR 大鼠) 行双侧卵巢切除术以建立绝经后高血压动物模型（OVX 组），并以假手术（Sham 组）为对照。绝经后高血压动物造模成功后，对 OVX 组大鼠予以睾酮（2.85mg/kg QOD 肌注）连续干预 4 周，记为 OVX+T 组。采用 Western Blot 法分别检测各组中 β- 肌球蛋白重链 (β-MHC)、AMPK、p-AMPK、FOXO1、p-FOXO1 和 MuRF1 的蛋白表达水平。

结果： 睾酮 4 周干预后，与 OVX 组和 Sham 组相比，OVX+T 组 SHR 心脏重量 / 胫骨长度、IVST、LVPWT、LVM 水平和 β-MHC 的蛋白表达显著增加，AMPK、p-AMPK、FOXO1、p-FOXO1 和 MuRF1 的蛋白表达均明显降低。另外，对同一大鼠的心脏及肥肠肌进行比较发现，三组中，MuRF1 蛋白在心脏与肥肠肌中的表达水平相当，而 AMPK、p-AMPK、FOXO1 和 p-FOXO1 蛋白在肥肠肌中表达较少，在心肌组织中高表达，表达量至少是肥肠肌的 2 倍。

结论： 睾酮可能通过抑制 AMPK-FOXO1/MuRF1 信号通路介导绝经后高血压左室肥厚。激活 AMPK 在不引起骨骼肌 MuRF1 表达的情况下，可通过增加心肌组织中 MuRF1 的表达逆转睾酮诱导的绝经后高血压左心室肥厚。

Associations between taste preferences and mortality among older adults: a nationwide, community-based, prospective cohort study in China

Jia He[1], Liu Yang[2], Sen He[1,2]

1. Department of Cardiology, West China Hospital, Sichuan University, Chengdu, China

2. Department of Cardiology, Karamay Hospital of Integrated Chinese and Western Medicine, Karamay, China.

Background: In recent years, there has been a growing consensus that dietary behavior is a key factor affecting health outcomes. Previous studies have predominantly focused on the associations between the intake of macro-nutrients and micro-nutrients and the risk of non-communicable diseases. Given the holistic nature of daily diets—people eat foods, not isolated nutrients—such reductionist approaches may overlook important aspects and lead to potentially biased conclusions. Taste preferences, a fundamental behavioral characteristic that influences food selection and consumption, are receiving increasing attention regarding its implications for health; however, the association between taste preferences and health outcomes among older adults remains unclear. This study aimed to estimate the association of taste preferences with mortality among older adults in a nationwide, community-based, prospective cohort in China.

Methods: A total of 14760 older participants (median age: 89.0 [IQR: 79.0–97.0], males: 42.7%) were recruited from the Chinese Longitudinal Healthy Longevity Survey between 2008 and 2014, with follow-up until 2018. Exposures were taste preferences (i.e., insipid, salty, sweet, spicy, and other tastes), which were assessed through the questionnaire. The study outcome was all-cause mortality. The association between taste preferences and mortality was evaluated through Cox regression models. To enhance the primary finding, we also performed additional analyses to evaluate the association between frequency of consuming salt-preserved vegetables, as well as frequency of consuming sugar or candy and changes in taste preferences, and mortality.

Findings: During a follow-up period of 65936.7 person-years (median: 3.6 years, IQR: 1.8–6.1 years), a total of 9837 deaths (66.6%) were recorded. Age/sex-standardized mortality rates varied significantly across the five taste preferences: participants preferring a salty taste had the lowest rate of 53.3 (95% CI: 48.8–58.4) per 1000 person-years, while those favoring a sweet taste had the highest at 60.6 (95% CI: 51.8–70.8) per 1000 person-years. With participants who preferred a salty taste serving as the reference, the adjusted hazard ratios (HRs) were as follows: 1.01 for those favoring a spicy taste (95% confidence interval [CI]: 0.87–1.17), 1.04 for those preferring other tastes (95% CI: 0.97–1.12), 1.09 for those favoring an insipid taste (95% CI: 1.03–1.15), and 1.18 for those who preferred a sweet taste (95% CI: 1.09–1.29). To enhance the primary finding, we performed additional analyses on the association between frequency of consuming salt-preserved vegetables, as well as frequency of consuming sugar or candy, and all-cause mortality. Multivariate Cox models indicated that the risk of mortality decreased with increased frequency of salt-preserved vegetable consumption among all participants (p for trend =0.008). This trend was also observed in participants who preferred a salty taste (p for trend =0.044) as well as those who favored a nonsalty taste (p for trend =0.031), respectively. However, the lowest mortality risk was observed with a moderate frequency of salt-preserved vegetable consumption. In addition, multivariate Cox models revealed that the risk of mortality increased with more frequent consumption of sugar or candy among all participants (p for trend =0.008), as well as among those who preferred a sweet taste (p for trend =0.044) and those who favored a nonsweet taste (p for trend =0.046), respectively. Importantly, the highest risk of mortality was observed among participants with the most frequent consumption of sugar or candy. Based on the primary finding, there was no significant difference in mortality risk among the three taste preference groups (i.e., salty, spicy, and other tastes), and insipid and sweet taste preferences were associated with a higher mortality risk. Therefore, we combined the three groups (i.e., salty, spicy, and other tastes) into a new category called favourable taste preference, while the other two groups (i.e., insipid and sweet) were classified as unfavourable taste preference. With the unfavourable-unfavourable group as reference (note:), adjusted HRs for mortality were 1.05 (95% CI: 0.97–1.15) for the unfavourable-favourable group, 0.94 (95% CI: 0.86–1.02) for the favourable-unfavourable group, and 0.90 (95% CI: 0.81–0.99) for the favourable-favourable group, respectively.

Interpretation: Among older adults in China, a preference for salty taste is associated with the lowest risk of all-cause mortality among the five assessed taste preferences; in contrast, preferences for sweet and insipid tastes are associated with higher mortality risk. These findings are observational; caution is advised when using them as a basis for dietary interventions, and further research is warranted.

最佳药物治疗对高龄急性心肌梗死患者的预后影响

王鸽 严研 聂绍平

首都医科大学附属北京安贞医院

目的： 本研究旨在明确最佳药物治疗对高龄急性心肌梗死患者预后的影响。

方法： 本研究基于国际多中心急性冠脉综合征出院患者出血并发症多中心登记注册研究（BleeMACS，NCT02466854），纳入年龄大于等于 80 岁，出院诊断为急性心肌梗死的患者。最佳药物治疗（OMT）定义为阿司匹林、任何 P2Y12 抑制剂、他汀类药物、血管紧张素转换酶抑制剂 / 血管紧张素受体阻滞剂和 β 受体阻滞剂的组合。研究主要终点定义为主要不良心血管事件（MACE），包括全因死亡和再发心肌梗死。研究随访时间为 1 年。

结果： 在 1482 名高龄急性心肌梗死的患者中，共 765 人（51.6%）接受了最佳药物治疗。接受最佳药物治疗的患者中，合并卒中、既往出血病史、心功能分级 killip ≥ 2 和出院诊断为 ST 段抬高型心肌梗死的患者比例较少。Kaplan-Meier 生存分析结果显示，最佳药物治疗与随访 1 年时的 MACE（11.1% vs.19.9%,p<0.001）和全因死亡（7.1% vs.15.2%，p<0.001）减少密切相关。即使在调整多种可能的混杂因素后，最佳药物治疗仍是主要终点的独立保护因素（HR=0.54；95% CI，0.40-0.75；p<0.001）。然而，OMT 组与非 OMT 组在再发心肌梗死方面没有观察到明显差异。经过倾向评分匹配后分析，OMT 组仍可降低高龄急性心肌梗死患者的全因死亡风险。

结论： 最佳药物治疗可以改善高龄急性心肌梗死患者 1 年随访时 MACE 发生风险，尤其是全因死亡风险。但未来仍需前瞻性研究进一步明确最佳药物治疗在高龄急性心肌梗死患者远期预后中的获益，以期减少不良事件发生率。

老年心血管疾病患者心理健康护理必要性及干预措施

井翠萍

交大一附院

【摘要】目的：探讨心理健康护理在改善老年心血管疾病患者健康中的必要性及其有效干预措施。

方法：研究纳入 2022 年 3 月至 2024 年 2 月我院收治的 118 例患者，按照随机原则分为对照组和实验组。对照组接受常规护理，实验组在此基础上实施心理健康护理干预。通过对比两组患者的血压水平波动幅度、心率变异性、炎症因子水平、生活质量评分及抑郁和焦虑评分量表，探讨心理护理的作用对改善老年心血管疾病的患者的必要性。

结果：实验组患者的收缩压和舒张压变异系数显著降低，心率变异性指标改善幅度明显优于对照组；C 反应蛋白和白细胞介素 -6 水平显著下降，显示全身炎症状态得到有效缓解；生活质量评分显著提高，老年患者在心理健康、社会支持等维度的改善尤为显著；抑郁和焦虑评分显著下降，心理状态得到显著改善。各项指标的组间差异均具有统计学意义 (P<0.05)。

结论：心理健康护理在老年心血管疾病患者的治疗和康复中具有重要意义，能改善患者的生理指标、缓解心理问题，为提高整体治疗效果和生活质量提供了有力支持，本研究希望通过实证数据，探索心理护理在老年心血管疾病患者中的重要作用，并尝试为临床提供切实可行的干预路径。

Impact of dynamic changes in pain on cardiovascular disease in Chinese middle and elderly people: results from China Health and Retirement Longitudinal Study (CHARLS)

Zeng-Ao Yang[1,3,2], Yu-Qi Liu[1,2]

1. The Sixth Medical Center of PLA General Hospital of Beijing

2. South China University of Technology

3. Xu Zhou Xin Jian Kang Geriatric Hospital

Background

Previous studies have identified chronic pain as a significant risk factor for cardiovascular disease (CVD). However, these studies primarily focused on baseline pain status without investigating the impact of dynamic changes in pain status on CVD. This study aims to explore the association between dynamic changes in pain status and incident CVD events.

Methods

This study utilized data from the China Health and Retirement Longitudinal Study (CHARLS), including participants aged ≥ 45 years. Pain status was defined as whether individuals reported frequent pain since the last survey (conducted every 2-3 years). Changes in pain status were assessed across three consecutive surveys, analyzing the relationship between pain transition trajectories (over two or three surveys) and CVD. CVD was confirmed by diagnoses of heart disease and/or stroke. Multivariable logistic models adjusted for potential confounders, and interactions between chronic pain trajectories and other risk factors were examined. Subgroup analyses were performed to validate robustness. Additionally, separate analyses for heart disease and stroke as outcomes further confirmed the results.

Results

Among 11,217 participants (50.94% female, mean age 58.63 years), those transitioning from painless to pain showed significantly elevated CVD risk compared to those with persistent painless (painless-pain [OR 1.57, 95% CI 1.30–1.90]; persistent pain [OR 2.23, 95% CI 1.79–2.77]). Adjusted confounding factors include age, sex, marital status, education, smoking status, drinking status, physical activity, body mass-index, sleep, depression score, hypertension, dyslipidemia, abnormal glucose metabolism, chronic lung disease, kidney disease, digestive disease, and arthritis. Further reclassification based on the third survey revealed that participants progressing to pain by the third survey had higher CVD risk (painless-painless-pain [OR 1.51, 95% CI 1.12–2.04]; painless-pain-pain [OR 2.15, 95% CI 1.66–2.79]; pain-painless-pain [OR 2.26, 95% CI 1.44–3.52]; persistent pain [OR 2.57, 95% CI 1.90–3.48]), and no significant increased risks of incident CVD was observed in groups with painless (pain-painless-painless, P=0.872; painless-pain-painless, P =0.456). Subgroup and outcome-specific analyses (CVD, heart disease, stroke) yielded consistent results. Notably, although significant increased risks of incident CVD was observed in pain-pain-painless [OR 1.70, 95% CI 1.10-2.64], risk of heart disease (P=0.117) and stroke (P=0.123) showed no significant statistics difference compared with stable painless group. Participants with stable pain still had the largest elevated risks of incident CVD and heart disease [OR 2.45, 95% CI 1.74-3.43]. Pain-painless-pain [OR 2.92, 95% CI 1.38-6.15] had the largest stroke risk among all pain status transition groups. Additionally, there is stable interaction between pain status change trajectory and depression score in CVD risk (P=0.034), heart disease (P=0.048) and stroke (P=0.036).

Conclusion

This study demonstrates that progression from painless to chronic pain significantly increases CVD incidence, whereas pain remission does not elevate CVD risk. We recommend: (1) integrating routine pain assessment into cardiovascular risk evaluation, especially for persistent pain patients; (2) close monitoring of patients with fluctuating pain status (pain □ painless transitions), as they exhibit the highest stroke risk; (3) incorporating pain management into comprehensive CVD prevention strategies; and (4) Reinforce the management and assessment of mental status, especially in patients with depression. These data-driven recommendations highlight the clinical importance of integrating pain history into cardiovascular risk stratification protocols.

The Characteristic of Transcription Profiles of Aorta in Atherosclerotic Murine Models Interfered with Treadmill Exercise

Qian-Qian Wang, Da-Kang Sun, Yang Li, Hui-Pu Xu, Jin-Feng Cheng, Yan-Li Cheng

The Binzhou Affiliated Hospital, Binzhou Medical University

Objectives: Exercise is widely acknowledged as a highly potent non-pharmacological strategy for alleviating atherosclerosis, yet the intricate molecular mechanisms that drive this beneficial effect remain incompletely understood. The present study aimed to unravel how treadmill exercise modulates the progression of atherosclerosis by investigating differentially expressed genes (DEGs) in the aorta and quantifying the attenuation of atherosclerotic lesions in a well-established murine model of the disease.

Methods: Male ApoE $^{-}$ / $^{-}$ mice, a thoroughly validated animal model of atherosclerosis characterized by impaired lipoprotein clearance capabilities, were maintained on a Western-style diet (highly rich in saturated fats and dietary cholesterol) and randomly allocated to either a sedentary control group or a treadmill exercise cohort for an 8-week intervention period. Throughout the entire course of the study, body weight measurements and food intake assessments were conducted on a weekly basis to monitor general metabolic status. Following the completion of the 8-week experimental protocol, serum concentrations of total cholesterol (TC) and triglycerides (TG) were quantified using enzyme-linked immunosorbent assay (ELISA) techniques to evaluate alterations in lipid metabolic profiles. Atherosclerotic lesion dimensions and lipid deposition within the aortic tissue were systematically analyzed via hematoxylin-eosin (H&E) staining and Oil Red O staining procedures, respectively. To explore the underlying molecular changes, RNA sequencing (RNA-seq) was performed on aortic samples to identify DEGs between the two experimental groups, followed by comprehensive functional enrichment analyses—including Gene Ontology and Kyoto Encyclopedia of Genes and Genomes pathway analyses—to characterize the biological processes and signaling pathways involved. Additionally, real-time polymerase chain reaction (PCR) was employed to validate the expression patterns of key DEGs associated with the most significantly enriched pathway.

Results: In comparison with the sedentary control group, the treadmill exercise group exhibited statistically significant reductions in body weight, daily food intake, and serum levels of both total cholesterol and triglycerides, indicating substantial improvements in metabolic regulation. Histopathological analyses clearly revealed that treadmill exercise led to a marked decrease in the area of aortic atherosclerotic lesions and a notable reduction in lipid deposition, thereby confirming its inhibitory role in the progression of atherosclerosis. RNA-seq analysis identified a total of 164 exercise-induced DEGs in the aortic tissue, with 103 genes showing upregulated expression and 61 genes displaying downregulated expression. Functional enrichment analysis demonstrated that these DEGs were significantly enriched in multiple biological pathways, including hexose metabolic processes, apelin signaling pathway, and relaxin signaling pathway, with the circadian rhythm pathway emerging as the most prominently affected one. Further pathway analysis and protein-protein interaction (PPI) network construction highlighted four core circadian clock-related genes: Cry1, Per2, Nfil3, and Nr1d1. Real-time PCR validation experiments confirmed that exercise effectively upregulated the mRNA expression levels of Cry1, Per2, and Nfil3 while downregulating Nr1d1 expression, which was fully consistent with the findings obtained from the RNA-seq analysis.

Conclusion: Treadmill exercise exerts a mitigating effect on atherosclerosis in ApoE $^{-}$ / $^{-}$ mice through the precise modulation of gene expression in the aorta, with a particular emphasis on the regulatory role of the circadian rhythm pathway. The observed alterations in the expression of circadian clock genes suggest that exercise may exert its beneficial effects by regulating circadian oscillations, thereby influencing lipid metabolism, inflammatory responses, and vascular integrity, and ultimately retarding the progression of atherosclerosis. These findings provide novel insights into the molecular underpinnings of exercise-induced atheroprotection and highlight the potential of circadian rhythm modulation as a promising therapeutic target for the clinical management of atherosclerosis.

FAT-10 与冠心病患者的衰弱状态的相关性研究

段高雅 宋春莉

吉大二医院

目的：

本研究通过检测老年 CHD 患者血浆 FAT-10 水平，分析血浆 FAT-10 水平与 CHD 患者衰弱及各维度之间的相关性，探究 FAT-10 成为 CHD 合并衰弱的标志物的可能性，为该类患者的识别提供依据，并为治疗寻找潜在治疗靶点。

方法：

收集老年 CHD 患者血浆 FAT-10 患者 189 例，依据 EFS 量表对患者衰弱程度进行评估，分数为 0-17 分，分数越高认为衰弱程度

越重。根据衰弱评分可将衰弱分为五个程度，即非衰弱（0-4 分）、衰弱前期（5-6 分）、轻度衰弱（7-8 分）、中度衰弱（9-10 分）和重度衰弱（11-17 分）。应用酶联免疫吸附试验对 CAV-1 水平进行测定。采用 SPSS 对两组进行差异性分析。对所有连续型变量进行正态分布检验，对呈正态分布的变量以均值（标准差）进行描述，进行 t 检验; 对呈非正态分布的变量以中位数（四分位间距）进行描述，进行非参数秩和检验。对二分类变量应用阳性例数（百分比）进行描述，进行卡方检验。对上述分析中出现差异的连续型变量进行相关性分析，含有非正态分布的变量的相关性分析采用 Spearman 相关性分析。对有相关性的变量进行单因素及多因素逻辑回归分析。

结果：

1.FAT-10 浓度在衰弱组与非衰弱组之间具有统计学差异（$p < 0.05$）。

2. 多因素逻辑回归分析结果显示：FAT-10 是冠心病患者合并衰弱状态的独立危险因素（$P<0.05$）。

结论：

1. 根据 EFS 量表，FAT-10 水平在衰弱程度最高的患者中最高，与病变严重程度呈正相关，具有统计学意义。

2.FAT-10 可能成为冠心病患者衰弱程度的独立预测因子。

加速生物衰老与卒中、痴呆动态转化关系的研究：基于多状态模型的前瞻性队列分析

程文珂 康品方 （血脂学组委员） 唐碧 （肺动脉高压委员） 黄宇理

蚌埠医科大学第一附属医院

背景

随着全球人口老龄化进程不断加快，卒中与痴呆等神经血管性疾病所造成的疾病负担日益严峻。全球疾病负担研究显示，神经系统疾病导致的失能调整生命年数（DALYs）在各类疾病中排名首位，其中卒中和痴呆分别位列第一和第四，严重影响公众健康与医疗资源分配。已有研究证实卒中与痴呆之间存在双向关联，但多数研究仅聚焦于单一疾病或线性关系，缺乏对卒中与痴呆动态转化过程，特别是两者共病演进机制的系统性建模。传统以时间进展为基础的年龄指标在疾病研究中广泛应用，然而其难以揭示个体间在生理老化速率上的差异。近年来，生物年龄（Biological Age）作为一种整合多种临床生理指标的衰老量化工具，受到广泛关注。生物年龄加速（Biological Age Acceleration，BAA）即生物年龄相对于实际年龄的超前程度，已被发现与多种慢性疾病和死亡风险相关。然而，关于 BAA 在卒中、痴呆及其共病状态演变中的作用仍缺乏系统性的研究证据。

方法

本研究基于英国生物样本库前瞻性队列，纳入 220,236 名基线无卒中与痴呆的参与者。采用 Klemera-Doubal 方法（KDM-BA）和表型年龄（PhenoAge）两种算法估算生物年龄，并通过残差法计算生物年龄加速（BAA）。研究构建多状态 Cox 模型，评估 BAA 与卒中、痴呆、共病及死亡五种状态间八类转化路径的关联。模型调整年龄、性别、BMI、吸烟饮酒、体力活动、高血压、糖尿病、饮食质量及社会经济状况等混杂因素，并采用样条函数探索非线性关系。通过多种敏感性分析检验结果稳健性。

结果

经过随访中位时间为 15.31 年，观察到 4,436 例卒中、3,101 例痴呆、291 例卒中与痴呆共病，以及 17,375 例死亡事件。参与者的生物年龄加速水平通过 Klemera-Doubal 方法（KDM-BA）和表型年龄（PhenoAge）两种算法进行估算，并标准化为 Z 评分以进行后续分析。多状态模型结果显示，BAA 均与个体从健康状态过渡至卒中、痴呆及死亡状态显著相关。PhenoAge 每增加 1 个标准差，其与卒中的风险比（HR）为 1.16（95%CI：1.14–1.19），痴呆为 1.10（95%CI：1.06–1.13），全因死亡为 1.24（95%CI：1.23–1.25）；KDM-BA 显示相似甚至更强的关联（卒中 HR=1.30，痴呆 HR=1.07，死亡 HR=1.27，均 P<0.001）。此外，PhenoAge 加速还与卒中发生后的死亡（HR=1.09，95%CI：1.04–1.14）以及卒中合并痴呆状态下的死亡（HR=1.20，95%CI：1.08–1.33）存在统计学上的正相关。然而，BAA 对已发生卒中或痴呆个体进一步发展为共病的转换风险并无明显相关性（P 均 >0.05），且该结果在不同时间区间（0–1 年、1–3 年、>3 年）及亚组（年龄、性别、生活方式、疾病史）中均保持一致。暴露 - 反应分析显示，BAA 与卒中、痴呆及死亡之间呈非线性正相关，但对共病发展的影响则较为平缓，无明显剂量效应。

结论

本研究发现，生物年龄加速与卒中、痴呆和全因死亡的发生具有显著相关性，表明 BAA 在疾病早期阶段可能反映出更高的健康脆弱性。相比之下，BAA 与卒中或痴呆发生后的疾病进展关系不显著，提示其在疾病后期的指示价值有限。该研究支持将 BAA 作为识别神经血管性疾病早期高风险人群的潜在生物标志，强调延缓生物衰老过程对卒中及痴呆一级预防的潜在意义。

Novel Insights into the Role of Liver Function Biomarkers in Cardiovascular Health Assessment: A Cross-Sectional Study with Machine Learning Analysis

Tong-yu Peng

The Second Xiangya Hospital of Central South University

Aims: Cardiovascular diseases (CVDs) are the leading cause of death globally, creating a significant public health and socioeconomic burden. Despite advances in prevention and treatment, the predictive accuracy of current risk stratification tools has limitations. This highlights an urgent need to identify new, widely available, and independent indicators to improve early risk assessment and guide precision prevention strategies. Liver function tests (LFTs), such as gamma-glutamyl transferase (GGT), aspartate aminotransferase (AST), and alanine aminotransferase (ALT), are routinely measured biochemical markers. While previous studies have suggested links between individual LFTs and CVD, these investigations are often limited, and the nature of these associations, including potential non-linear relationships, remains poorly understood. This study aimed to systematically evaluate the independent associations between a comprehensive panel of liver function indicators and multiple standardized cardiovascular risk scores within a large, nationally representative U.S. population, employing both traditional statistical methods and advanced machine learning algorithms to validate the findings.

Methods: This cross-sectional study utilized data from 17,193 adults, aged 40-74 and without a history of major cardiovascular disease, who participated in the National Health and Nutrition Examination Survey (NHANES) from 2005 to 2018. The NHANES program is conducted by the U.S. Centers for Disease Control and Prevention (CDC) and uses a complex, multistage probability sampling design to be representative of the non-institutionalized U.S. population.

The exposure variables included a panel of serum liver function biomarkers: GGT, alkaline phosphatase (ALP), AST, ALT, lactate dehydrogenase (LDH), albumin, and globulin. Additionally, two clinically relevant derived ratios, the AST/ALT ratio and the albumin-to-globulin (A/G) ratio, were calculated. The primary outcomes were three widely recognized cardiovascular risk and health scores: Framingham Risk Score (FHS): Estimates the 10-year risk of a cardiovascular event. American Heart Association (AHA) Cardiovascular Health (CVH) Score: Based on the "Life's Essential 8," this score provides a comprehensive measure of cardiovascular health. American College of Cardiology/AHA (ACC/AHA) 10-year Hard Atherosclerotic Cardiovascular Disease (Hard ASCVD) Risk Score: Focuses on the risk of major events like myocardial infarction or stroke. A comprehensive statistical analysis was performed, accounting for the complex NHANES survey design. Methodologies included weighted quantile sum (WQS) regression to assess the combined effect of liver biomarkers, multivariable logistic regression to determine independent associations while adjusting for a wide range of demographic and clinical covariates, and restricted cubic splines (RCS) with piecewise regression to explore non-linear dose-response relationships and identify potential inflection points. To validate these findings and assess predictive utility, five machine learning models were developed: Logistic Regression (LR), Decision Tree (DT), Random Forest (RF), Light Gradient Boosting Machine (LightGBM), and eXtreme Gradient Boosting (XGBoost). The dataset was split into training (80%) and testing (20%) sets. Model performance was evaluated using the Area Under the Receiver Operating Characteristic Curve (AUC), accuracy, F1 score, and decision curve analysis (DCA). The best-performing models were interpreted using SHapley Additive exPlanations (SHAP) to clarify the contribution of each feature to the predictions.

Results: The analysis revealed significant and independent associations between specific liver function biomarkers and all three cardiovascular risk scores after full covariate adjustment. Elevated GGT levels were consistently and independently associated with a higher likelihood of adverse cardiovascular outcomes. The odds ratio (OR) for high FHS risk was 1.58 (95% CI: 1.38–1.82), for poor CVH was 1.83 (95% CI: 1.68–2.00), and for high Hard ASCVD risk was 1.63 (95% CI: 1.43–1.85) (all P < 0.001). WQS regression further identified GGT as the primary contributor to increased cardiovascular risk among the mixture of liver markers. Dose-response analysis confirmed a positive, non-linear relationship, with risk escalating more sharply at lower to moderate GGT levels. The AST/ALT ratio demonstrated a more complex, non-linear (U/J-shaped) relationship with cardiovascular risk. Initially, a higher AST/ALT ratio was protective, associated with a lower risk of adverse outcomes. However, piecewise regression analysis identified inflection points for each outcome (e.g., approximately 1.65 for FHS risk and 1.21 for Hard ASCVD risk). Beyond these thresholds, the protective effect diminished and, in some cases, began to reverse, suggesting that very high ratios may no longer be beneficial. Machine learning analysis confirmed and extended these findings. The LightGBM and XGBoost models demonstrated the best predictive performance, with AUCs reaching up to 0.9410 for FHS risk and 0.9484 for Hard ASCVD risk. SHAP interpretability analysis consistently ranked GGT as a significant predictor across all three outcomes, second only to major established risk factors like age and hypertension. The SHAP plots also visually confirmed the directional impact: higher GGT values increased predicted risk, while higher AST/ALT ratios (within the protective range) decreased it. Subgroup analyses suggested that some of these associations were modified by factors such as age, sex, and abdominal obesity, highlighting potential population-specific effects.

Conclusion: This comprehensive analysis of a large, nationally representative U.S. cohort provides strong evidence that routinely measured liver function biomarkers are significantly associated with cardiovascular risk. Specifically, elevated serum GGT is an independent predictor of higher 10-year CVD risk, poorer cardiovascular health, and a greater 10-year Hard ASCVD risk score. In contrast, the AST/ALT ratio exhibits a complex, non-linear U/J-shaped relationship, where its protective effect is most prominent within a specific range and diminishes at higher values. The validation of these associations with advanced machine learning models, coupled with SHAP analysis, underscores the potential of GGT and the AST/ALT ratio to add value to traditional risk factors for improved CVD risk stratification. Given that these liver function tests are inexpensive, automated, and widely available, their interpretation should extend beyond hepatology. Clinicians should consider these markers as potential early warning signals for cardiovascular risk, prompting more intensive screening and management, even in the absence of overt liver disease. These findings reinforce the importance of the liver-heart axis and suggest that maintaining liver health could be a key component of primary cardiovascular disease prevention. Further prospective studies are needed to confirm these non-linear relationships and to determine whether formally incorporating these biomarkers into clinical risk algorithms can enhance predictive accuracy and improve patient outcomes.

"暮光调色盘"——超高龄衰弱老人的多维疗护 1 例

禹程远 周思佳 董亦师 何浪涛 徐笑洋

深圳市人民医院

目的：

超高龄衰弱老人通常面对衰弱、多种老年综合征、急症及围手术期风险高等问题。本文回顾分析了深圳市人民医院老年医学科在 2014-2025 年间对一位典型病例的诊疗管理过程，旨在验证运用多种老年医学的核心技术进行多维度疗护全人全程管理，对改善患者预后、维护功能及减少并发症的有效性，并为老年医学科临

床实践提供参考。

关键词：衰弱，ACE，CGA，GIT，安宁疗护

材料与方法：

1. 患者基本资料：男性，1932 年出生，退休公职人员

2. 既往基础疾病：COPD、胆石症

3. 多维度疗护管理时间跨度：2014 年至 2025 年

4. 围手术期优化管理: 因胆石症诱发急性梗阻及感染反复入院，2015-2021 年间，患者接受胆囊切除术、胆总管支架植入术，十次 ERCP、网篮取石术、球囊扩张术、ENBD。优化围手术期评估管理：①手术决策：评估手术必要性、非手术替代方案的差异、可能的医源性损伤、患者意愿、术后造成的家庭负担等。②术前评估：认知、焦虑、谵妄、营养、生活自理能力、衰弱、用药、血容量等。③术后管理：血栓预防、控制疼痛、营养干预、管道护理、防跌倒、防坠床、放压疮等。④出院后随访、康复指导及健康宣教。

5. 急性期快速恢复：病程中曾因发热伴咳痰 3 日，夜间如厕后回房间过程中撞到茶几致跌倒入院，经 ACE 小组快速评估，初步诊断多根肋骨骨折、气胸、肺部感染、呼吸衰竭、脓毒性休克等，立即予无创呼吸机辅助呼吸、优化痰液引流、抗感染、稳定内环境、营养支持等综合诊疗，加强心理疏导。

6. 老年综合评估：在病程不同阶段，应用 Barthel 指数、洼田饮水试验、Morse、MoCA、CAM-S、HAMA、HAMD、FRAIL、MNA、BRADEN SCALE、疼痛强度评估（NRS）、PSQI、ICI-Q-SF、CCF-FIS、Roma II、PAGAR 等完善 CGA。

7. 老年医学跨学科诊疗：由老年科医生和护士、康复科医师、临床药师、临床营养师、中医师等组成 GIT 小组固定成员，结合具体病情邀请相关专科医生参加多学科讨论，共同制定个体化诊疗方案。

8. 安宁疗护：2025 年，随增龄导致多种机能衰退不可避免的进展，进入生命终末期，安宁疗护小组从“身”、“心”、“社”、“灵”方面予以安宁疗护方案，并组织召开家庭会议、制作人生回顾相册、举办最后的生日会等安宁疗护方案，加强对家属的哀伤辅导。

结果：

1、患者未发生围手术期危急重症。

2、经 ACE 疗护，急性期成功脱离生命危险。

3、经过 CGA 和 GIT 阶段，患者体重增加，躯体及社会功能恢复。

4、安宁疗护阶段，患者未遭受过度的医源性痛苦，患者家属未出现过激情绪。

结论：

以老年医学核心技术为基础，构建个体化全人全程多维度疗护，是应对高龄衰弱老人复杂医疗需求的有效手段。

A Machine Learning approach for predicting 3-year new-onset Cardiovascular Disease in an Elderly Chinese Population: A report from the Guangzhou Older Population Annual Health Examination Cohort and Guangzhou Heart Study

Jun-Rong Jiang[1], Jun Huang[1], Fan Weng[2], Yu-Feng Chen[2], Yu-Mei Xue[1]

1. Institute of Geriatrics, Guangdong Cardiovascular Institute, Guangdong Provincial Key Laboratory of Clinical Pharmacology, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University, Guangzhou, China

2. Yuexiu District Center for Disease Control and Prevention, Guangzhou, China

Background Cardiovascular disease (CVD) persists as the primary cause of mortality in China's elderly population, accounting for over 44% of urban and 46% of rural deaths according to the 2021 National CVD Report. Yet existing clinical risk scores (QRisk3, PCEs, FGCRS) exhibit suboptimal performance in this demographic due to ethnic variations in risk profiles and regional healthcare disparities. This critical gap impedes precision prevention strategies, particularly given China's rapidly aging society where CVD incidence is projected to rise by 50% by 2030. Our study directly addresses this need by developing and validating machine learning models for predicting 3-year new-onset CVD using routinely collected electronic health record (EHR) data from Chinese elderly individuals.

Methods We derived comprehensive clinical data from 16,868 participants (aged ≥ 65 years) in the Guangzhou Annual Health Examination Cohort, encompassing 27 variables across four domains: 1) Disease histories (hypertension, diabetes, chronic kidney disease validated by ICD-10 codes); 2) Medication use (antihypertensive agents, antiplatelet drugs verified via pharmacy records); 3) Biomarkers (fasting glucose, lipid profiles, systolic/diastolic blood pressure measured through standardized protocols); and 4) Sociodemographic factors (age, gender, smoking status). Three machine learning algorithms—logistic regression, support vector classifier, and gradient boosting with hyperparameter optimization via grid search—were trained to predict composite CVD outcomes (coronary heart disease, stroke, or atrial fibrillation). External validation utilized 2,066 independent subjects from the Guangzhou Heart Study. Model performance was rigorously evaluated against conventional risk scores using area under the curve (AUC), net reclassification improvement (NRI), calibration plots, and decision curve analysis.

Results During the 3-year follow-up, the derivation cohort exhibited a 5.20% CVD incidence rate (877/16,868 events), while the validation cohort had 5.86% (121/2,066 events). Gradient boosting demonstrated superior internal discrimination (AUC 0.78, 95% CI 0.74–0.81), significantly outperforming QRisk3 (AUC 0.63, ΔAUC=0.15; p<0.001), PCEs (AUC 0.61, p<0.001), and FGCRS (AUC 0.60, p<0.001). External validation confirmed robustness (AUC 0.70, 95% CI 0.64–0.75) with an NRI of 0.38 and adequate calibration (Hosmer–Lemeshow test p=0.32). Key predictors identified included systolic blood pressure (mean SHAP value contribution: 24%), age (21%), total cholesterol (18%), fasting glucose (15%), and LDL-C (12%), with novel contributions from TC/HDL-C ratio (8%) and antiplatelet medication use (7%). Subgroup analyses showed consistent performance across gender and age strata.

Discussion Our machine learning models overcome limitations of traditional risk scores by capturing complex nonlinear relationships (e.g., J-curve association between diastolic blood pressure and CVD risk where values 90 mmHg increased event risk) and incorporating underutilized EHR variables like dynamic treatment adherence metrics. The heightened importance of fasting glucose versus diabetes history reflects ethnic-specific pathophysiology in glucose metabolism among Chinese elderly. While antiplatelet medication's predictive role suggests pharmacotherapy adherence as a modifiable risk factor, regional cohort origins necessitate validation in multi-center studies across Northern and Western China. For immediate clinical translation, these models enable early high-risk identification through automated community assessment systems, facilitating personalized prevention protocols (e.g., intensive lipid control for high-risk subgroups) and optimizing resource allocation in primary care. Future integration with real-time monitoring data from wearables could further enhance predictive accuracy while maintaining feasibility in resource-limited settings.

Conclusion Machine learning algorithms significantly improve CVD risk prediction in Chinese elderly populations compared to established clinical scores, demonstrating both statistical superiority (ΔAUC up to 0.18) and clinical utility (NRI=0.38). Implementation of automated assessment systems based on these models holds transformative potential for scaling precision prevention in community-based healthcare, particularly within China's rapidly aging society.

Gut Microbiota Metabolite Phenylacetic Acid Regulates Cardiac Senescence through Histones Phenylacetylation

Xiang-Rui Qiao

The First Affiliated Hospital of Xi'an Jiaotong University

Background:

Population ageing has become one of the global trends of our time. It is expected that by 2050, the global population over 65 years old will reach 1.6 billion. China has also entered a stage of moderate population ageing. The number of people aged 65 and over will reach 209.78 million at the end of 2022, representing 14.9% of the total population. How to actively cope with ageing has become a problem and a challenge that we must face. Aging increases the risk of many common diseases, especially cardiovascular disease, which is the leading cause of death in people over 65 years of age. Therefore, cardiac senescence is a key link in the aging of the organism. Improving cardiac senescence is of great significance for healthy aging, slowing down aging and even reversing aging. The gut microbiota is colonized in the human digestive tract since birth and changes gradually with age. Studies have shown that there are distinct differences in the microbiota profile of the gut between the elderly and the young. However, the relationship between the gut microbiota and cardiac senescence has not yet been elucidated. The present study was designed to investigate the causal relationship between the gut microbiota and cardiac senescence by regulating the gut microbiota. And to identify the key gut microbiota metabolites and specific mechanisms that mediate cardiac senescence, to provide new ideas and targets for the prevention and treatment of senescence.

Objectives:

Elucidating the causal relationship between gut microbiota dysbiosis and cardiac senescence and searching for metabolites that may have a pivotal role.Unraveling a new mechanism of gut microbiota/phenylacetic acid/histone phenylacetylation/cardiac senescence and providing a theoretical basis for the microbiota - senescence axis.Exploring the feasibility of fecal microbiota transplantation such as youth colony transplantation or specific bacteria supplementation to ameliorate cardiac aging and to provide new strategies to combat aging.

Methods:

Feces, serum, and cardiac tissues were collected from young (2-month-old) and aged (18-month-old) mice after cardiac ultrasound testing. On the one hand, to clarify the phenotypes of cardiac senescence and

gut microbiota dysbiosis, feces were subjected to 16S ribosomal RNA (16S rRNA) sequencing, serum N-terminal pro-brain natriuretic peptide was detected, cardiac senescence-related markers were detected using immunoblotting, and pathological staining was performed to detect cardiac fibrosis and senescence. On the other hand, to explore the metabolites that may play a role, feces, serum, and hearts from both groups of mice were subjected to metabolomics.The gut microbiota of aged mice was transplanted to young mice, and the feces of donor and recipient mice were collected for 16S rRNA sequencing to determine whether the fecal microbiota transplantation was successful. In order to clarify the causal relationship between microbiota dysbiosis and cardiac senescence, immunoblotting and pathological staining were then used to detect whether the young mice receiving gut microbiota transplants from aged mice showed cardiac senescence phenotypes.Phenylacetic acid was found by comparing differential metabolites shared in feces, serum, and heart of young and old mice. In vitro and in vivo experiments were then performed to clarify that phenylacetic acid does induce cardiomyocyte and cardiac senescence. The presence of a novel post-translational modification of histones, phenylacetylation, was then identified by high-performance liquid chromatography-tandem mass spectrometry and specific antibodies, and its association with cardiac senescence was verified.The gut microbiota of young mice was transplanted to aged mice, and the feces of donor and recipient mice were collected for 16S rRNA sequencing to clarify whether the fecal microbiota transplantation was successful. In order to determine the feasibility of modulating the gut microbiota to ameliorate cardiac senescence, immunoblotting and pathological staining were then used to detect whether the cardiac senescence phenotype improved in aged mice that received young gut microbiota transplants.

Results:

Compared with young mice, aged mice developed left ventricular posterior wall hypertrophy, decreased cardiac function, cardiomyocyte hypertrophy, interstitial fibrosis, and cardiomyocyte senescence. The profile of the intestinal microbiota of aged mice is remarkably dissimilar to that of young mice, with a significant decrease in the Firmicutes and an increase in the Bacteroides, Proteobacteria, Cyanobacteria and Epsilonbacteraeota.Cleaning the gut microbiota from young mice with antibiotics followed by co-housing with aged mice successfully colonized the gut microbiota of aged mice in young mice. Transplantation of gut microbiota from aged mice caused left ventricular posterior wall hypertrophy, decreased cardiac function, cardiomyocyte hypertrophy, interstitial fibrosis, and cardiomyocyte senescence in young mice.Phenylacetic acid, which is simultaneously increased in feces, serum, and heart of aged mice, induces cardiomyocyte senescence in vivo and in vitro in a concentration-time-dependent manner.There is a mass shift of +118.0419 Da at the histone lysine site. And the fracture pattern and retention time of this peptide segment are consistent with the peptide with phenylacetyl group modification synthesized in vitro with the same amino acid sequence. It indicates the existence of a novel post-translational modification of histones, phenylacetylation. The level of this modification increased with increasing concentrations of phenylacetic acid in both rat cardiomyocytes (H9c2) and human cervical cancer cells (Hela), suggesting that the modification is widespread and that phenylacetic acid is its precursor molecule. Meanwhile, we also identified 14 histone sites for this novel modification.After transplantation of the gut microbiota of young mice, the proportion of Firmicutes in the gut microbiota of aged mice increased, the proportion of Bacteroidetes decreased, and the levels of phenylacetic acid in serum and heart decreased. Young microbiota improved left ventricular posterior wall hypertrophy, cardiac function decline, cardiomyocyte hypertrophy, interstitial fibrosis, and cardiomyocyte senescence in aged mice. Immunohistochemistry shows that the level of histone phenylacetylation modification in the heart of aged mice decreases after transplantation of young microbiota.

Conclusions:

Cardiac senescence and gut microbiota disorders coexist in aged mice. Gut microbiota of aged mice induces cardiac senescence in young mice via its metabolite phenylacetic acid.Phenylacetic acid, as a precursor molecule for phenylacetylation, a novel modification of histones, promotes histone phenylacetylation in cardiomyocytes, which further activates the expression of senescence-associated genes and ultimately leads to cardiomyocyte senescence.Transplantation of gut microbiota in young mice reduces phenylacetic acid levels in serum and heart, inhibits histone phenylacetylation levels in cardiomyocytes, and improves cardiac senescence in aged mice.

手厥阴心包经刮痧疗法改善老年心肌缺血患者胸痛的研究

翟亚仙 [1] 刘雨丹 [1] 杨锦湄 [2]

1. 云南中医药大学

2. 昆明市中医医院

目的: 探讨手厥阴心包经刮痧疗法对老年心肌缺血患者胸痛的临床疗效及安全性。通过量化评估该疗法对胸痛程度、发作频率、心功能指标及生活质量的影响，为老年患者提供一种非药物性辅助治疗选择，弥补现有西医治疗在长期用药依从性及副作用方面的局限性，同时验证经络理论在心血管康复中的科学价值。

方法：采用随机对照试验设计，纳入 120 例符合 WHO 心肌缺血诊断标准的老年患者（年龄 65-80 岁），随机分为试验组（n=60）和对照组（n=60）。对照组予常规西药治疗（阿司匹林 + 硝酸酯类 + 他汀类），试验组在常规治疗基础上加用手厥阴心包经刮痧疗法：沿天池、天泉、曲泽、郄门、间使、内关、大陵、劳宫、中冲 9 穴，以 45°角单向刮拭，力度以局部潮红为度，每周 3 次，持续 4 周。主要评价指标为视觉模拟量表（VAS）胸痛评分；次要指标包括心绞痛发作频率、心电图 ST 段压低幅度、西雅图心绞痛量表（SAQ）评分及硝酸甘油减停率。采用 SPSS 25.0 进行统计分析，计量资料以均数 ± 标准差（x±s）表示，组间比较采用 t 检验和重复测量方差分析，计数资料采用 χ^2 检验。

结果：治疗后试验组疗效显著优于对照组：胸痛程度：VAS 评分试验组降低（4.2±0.8）分，对照组降低（2.1±0.9）分，组间差异有统计学意义（t=15.32, P<0.01）；发作频率：试验组心绞痛周均发作次数减少（3.5±1.2）次，降幅 70.2%，显著高于对照组的 42.1%（t=9.47, P<0.01）；心电图改善：试验组 ST 段压低恢复≥0.1mV 的比例达 85.0%(51/60)，显著高于对照组的 63.3%(38/60)（χ^2=7.89, P<0.01）；硝酸甘油减停率：试验组为 76.7%（46/60），对照组为 48.3%（29/60）（χ^2=10.24, P<0.01）。未出现皮肤破损或感染等严重不良反应。

结论：手厥阴心包经刮痧疗法可有效缓解老年心肌缺血患者胸痛程度，减少心绞痛发作频率，改善心肌供血及生活质量，且安全性良好。该疗法作为非药物干预手段，可成为老年患者综合治疗的补充方案，其机制可能与调节自主神经功能、促进局部微循环有关，建议在规范化操作下临床推广，未来需深入探讨其分子机制及长期效应。

The Role of Lifestyles in Older Adults with Calcific Aortic Valve Disease: A Retrospective Case-Control Study from China

Jun-Rong Jiang, Hai Deng, Yu-Mei Xue

Institute of Geriatrics, Guangdong Cardiovascular Institute, Guangdong Provincial Key Laboratory of Clinical Pharmacology, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University, Guangzhou, China

Background: Calcific aortic valve disease (CAVD), as a common cardiovascular disease in older adults, ranges from mild thickening of the valve, known as aortic valve sclerosis (ASc), to severe impairment of the valve motion, which is termed aortic stenosis (AS). CAVD is independently associated with an increased risk of coronary events, stroke, cardiovascular mortality, and all-cause mortality. Due to the aging population, CAVD is gradually becoming a public health problem worldwide. Furthermore, the global incidence, prevalence, and deaths attributed to CAVD have significantly increased over the past three decades, underscoring the growing urgency to address this condition.

Objectives: Although previous studies have revealed that age, sex, diabetes mellitus, obesity, hypertension, smoking, and lipid levels are associated with the risk of CAVD, the role of lifestyles in CAVD remains unclear due to limited available data. The aim of this study was to determine the prevalence of CAVD in older adults and to identify the role of lifestyles in CAVD. Specifically, this study sought to explore how specific lifestyle factors, such as dietary habits and physical activity, influence the development and progression of CAVD.

Methods: The study population was based on the large epidemiological study of cardiovascular disease in the Guangzhou Heart Study. 3397 participants in the baseline study and 2213 in the follow-up study were included in the analysis. Information on lifestyles was collected via a comprehensive questionnaire, and CAVD was diagnosed using echocardiography. The differences in age, sex, BMI, medical histories, lifestyle behaviors, and dietary preferences between CAVD and normal individuals were compared. Additionally, the study utilized multivariate logistic regression models to investigate the associations between CAVD and various lifestyle factors, ensuring a robust analysis of the data.

Results: 1239 participants were diagnosed with CAVD at baseline, accounting for 36.5% of the cohort. Age, overweight, hypertension, hyperuricemia, smoking, and exercise were independently associated with CAVD. The odds ratio was 1.088 for each year increase in age. Overweight, hypertension, and hyperuricemia were associated with 1.202-fold, 1.311-fold, and 1.210-fold excess risks, respectively. Smoking conveyed a 38% excess risk. Compared with daily exercise, non-exercise was associated with a 47% increase in risk. In terms of dietary preferences, white meat, high salt food, nuts, and coffee were independently associated with CAVD. Among them, white meat, fruits, nuts, and coffee seemed to be protective factors for CAVD, while high salt food was a risk factor. Importantly, the study also found that the progression from ASc to AS was relatively slow, occurring in only 2 out of 768 participants over a 3-year follow-up period.

Conclusions: This study provides a comprehensive understanding of the role of lifestyles in CAVD. Aging, overweight, hypertension, hyperuricemia, smoking, and high salt food were the risk factors for CAVD, while exercise and intake of white meat, fruits, nuts, and coffee were the protective factors for CAVD. These findings may be helpful to develop more effective and efficient CAVD prevention and treatment strategies. Moreover, the study highlights the importance of early intervention and lifestyle modifications to mitigate the risk of CAVD in older adults, particularly in regions with rapidly aging populations.

新疆社区老年人共病的民族和地理差异：一项横断面研究

卓娅

新疆维吾尔自治区人民医院

背景：多重慢性病（MCC）指同时存在两种或两种以上慢性疾病。老年人 MCC 发病率较高，且随年龄增长而增加。研究表明，MCC 与不良结局增加相关，也与老年人群更高的死亡率、身体功能下降及生活质量差相关。本文首次提供了中国新疆社区老年人中 MCC 患病率的民族和地域差异数据。

方法 采用多阶段随机抽样方法，于 2019 年 1 月至 2019 年 12 月对新疆南部、北部和东部的社区老年人进行流行病学调查。共有 87,000 名参与者自愿参加，应答率为 96.67%；排除了 490 名数据不完整的参与者，最终分析了 86,510 名参与者的数据。

结果 我们的分析显示，高血压（51.5%）、肥胖（27.0%）、糖尿病（16.9%）、心脏病（8.2%）和焦虑 / 抑郁（4.5%）是新疆五种主要的慢性疾病。调查人群中 MCC 的患病率为 33.4%（95%CI, 33.1–33.7）。女性患病率为 36.6%（95%CI, 36.1–37.0），高于男性（30.0%，95%CI, 29.5–30.4）。60-69 岁、70-79 岁、80-89 岁和≥ 90 岁老年人的 MCC 患病率分别为 32.7%（95%CI, 32.2–33.3）、34.3%（95%CI, 33.9–34.7）、32.5%（95%CI, 31.7–33.3）和 25.9%（95%CI, 23.5–28.3）。就民族而言，维吾尔族、汉族、哈萨克族、回族和蒙古族的 MCC 患病率分别为 31.3%（95%CI, 30.9–31.7）、34.4%（95%CI, 33.9–35.0）、40.4%（95%CI, 39.1–41.8）、40.8%（95%CI, 38.9–42.7）、44.4%（95%CI, 38.1–50.6）。未受教育、受教育 1-6 年、7-9 年和 10 年以上人群的 MCC 患病率分别为 32.8%(95%CI, 32.1–33.5)、31.7%(95%CI, 31.2–32.1)、36.0%(95%CI, 35.3–36.7）和 39.2%（95%CI, 38.1–40.3）。在按年龄、性别、吸烟、饮酒和教育水平进行调整后，二元逻辑回归分析显示，与新疆东部相比，南部地区发生 MCC 的风险增加（OR, 1.418; 95%CI, 1.367–1.471），而北疆的风险更高（OR, 2.021; 95% CI, 1.944–2.102）。与维吾尔族相比，汉族、哈萨克族、回族和蒙古族发生 MCC 的风险增加，分别为（OR, 1.075; 95% CI, 1.040–1.111）、（OR, 1.414; 95% CI, 1.332–1.501）、(OR, 1.515; 95% CI, 1.396–1.644）、(OR, 1.566; 95% CI, 1.216–2.017）。

结论 新疆社区老年人多重慢性病存在民族和地域差异。居住在北疆和南疆的老年人以及汉族、哈萨克族、蒙古族和回族老年人具有更高的 MCC 风险。

Impact of Impaired Renal Function on Cognitive Performance Among Patients With Coronary Artery Disease

Zehao Zhao, Yong Zeng

Beijing Anzhen Hospital, Capital Medical University

Background: Patients with CAD are at increased risk of cognitive impairment, which adversely affects their prognosis. Although renal function and metabolic risk factors are known to influence cognition, their contributions to cognitive impairment in CAD patients and the underlying mechanisms remain unclear.

Methods: This retrospective cross-sectional study included 17,121 patients with CAD who underwent cognitive assessments as well as evaluations of renal function and metabolic risk factors. The associations between renal function and overall cognitive performance, as well as specific cognitive domains, were evaluated. Logistic regression and restricted cubic spline analyses were used to assess the impact of renal function on the risks of mild cognitive impairment (screened by Montreal Cognitive Assessment) and dementia (screened by Mini-Mental State Examination). Mediation analysis was conducted to examine the causal pathways linking metabolic risk factors, impaired renal function, and cognitive impairment.

Results: A total of 17,121 patients with CAD were included in the study, with a mean age of 61.6 (9.35) years, and 27.5% were female. As CKD stage increased, patients tended to be older, the proportion of female patients increased, and education levels declined. The prevalence of metabolic risk factors, including hypertension, diabetes, elevated triglycerides, and uric acid, also rose with advancing CKD stage. Patients with more severe CKD had higher rates of comorbid stroke, atrial fibrillation, and heart failure. Furthermore, as renal function worsened, the prevalence of MCI (identified by MoCA) and dementia (defined by MMSE) increased progressively. eGFR was significantly positively correlated with all MoCA and MMSE subdomain scores, indicating that better renal function is associated with superior cognitive performance. However, the generally small effect sizes suggest that the strength of these associations is modest. Across different subgroups, the significant positive associations between eGFR and overall cognitive function, as reflected by total MoCA and MMSE scores, remained consistent. However, the correlations between eGFR and specific cognitive domains varied across subgroups. Univariate and multivariable logistic regression analyses showed that worsening renal function was associated with an increased risk of cognitive impairment, with renal function evaluated using both eGFR and CKD stages. Advanced CKD stages were significantly associated with a higher risk of MCI (adjusted OR for stages 4–5: 1.62; 95% CI: 1.11–2.37) and dementia (adjusted OR for stages 4–5: 1.60; 95% CI: 0.94–2.75). In contrast, higher eGFR was associated with a lower risk of MCI (adjusted OR per 1 SD increase: 0.92; 95% CI: 0.88–0.96) and dementia (adjusted OR per 1 SD increase: 0.88; 95% CI: 0.82–0.93). The restricted cubic spline curves demonstrated consistent results, indicating that the risks of MCI and dementia significantly decreased with higher eGFR levels. Subgroup analyses demonstrated that the inverse association between a 1-standard deviation increase in eGFR and the risk of MCI remained robust and statistically significant across all subgroups. Moreover, a significant interaction between eGFR and sex was detected. Hypertension, diabetes, and high LDL-C were significantly associated with an increased risk of MCI, while elevated uric acid levels were associated with a decreased risk. Diabetes was significantly associated with an increased risk of MCI, with eGFR mediating 21.4% of the total effect in the unadjusted model and 13.3% in the adjusted model. Similarly, hypertension demonstrated a significant total effect on MCI risk, with eGFR mediating 29.5% of the effect in the unadjusted model and 12.6% in the adjusted model. These results indicate that reduced renal function partially mediates the adverse impact of diabetes and hypertension on cognitive impairment.

Conclusion: In CAD patients, impaired renal function contributes to cognitive impairment and mediates the effects of hypertension and diabetes.

复发恐惧在心房颤动导管消融术后患者人格特质与自我管理行为间的中介效应研究

王纪哲 柳臣兰 卢晓虹

青岛大学附属医院

目的 探讨心房颤动导管消融术后患者复发恐惧在人格特质与自我管理行为间的中介效应，为临床护理人员针对性改善患者自我管理行为提供参考。**方法** 应用便利抽样法，于 2024 年 4 月至 7 月选取青岛市某三级甲等医院心血管内科门诊选取 295 名心房颤动导管消融术后患者为研究对象。采用一般资料调查表、中国大五人格问卷极简版、心房颤动患者导管消融术后复发恐惧量表、心房颤动患者自我管理能力量表进行问卷调查。运用结构方程模型验证复发恐惧在人格特质与自我管理行为之间的中介作用。**结果** 神经质与复发恐惧存在显著正相关（P < 0.01），与自我管理行为之间存在显著负相关（P < 0.01）。严谨性、宜人性、开放性和外向性与复发恐惧存在显著负相关（P < 0.01），与自我管理行为之间存在正相关性（P < 0.05）。中介效应分析显示：复发恐惧在神经质（β=-0.021，P < 0.05）、宜人性（β=0.093，P < 0.01）、开放性（β=0.090，P < 0.01）与自我管理行为之间起到部分中介作用，中介效应分别占总效用的 29.17%、32.38%、30.49%。**结论** 复发恐惧是心房颤动导管消融术后患者神经质、宜人性和开放性人格特质与自我管理行为的中介变量。临床护理人员应根据上述人格特质认知与行为特点，协助患者克服术后复发恐惧，调动患者参与自我管理的积极性，全面提升患者自我管理行为。

心理疏导结合赋能教育对改善老年慢性心力衰竭患者抑郁情绪及治疗依从性的随机对照研究

刘妞妞 刘华芬 戴狄莎

武汉大学人民医院

目的：探讨基于认知行为疗法（CBT）原则的结构化心理疏导联合赋能教育对老年慢性心力衰竭（CHF）患者抑郁情绪、治疗依从性及临床预后的影响。

材料与方法：采用前瞻性随机对照设计，纳入 2024 年 1 月 - 2025 年 1 月我院心内科住院的老年 CHF 患者（≥ 60 岁）120 例。纳入标准：NYHA II-III 级、PHQ-9 抑郁评分≥ 5 分。排除重度认知障碍或精神疾病史。采用随机数字表法分为干预组（n=60）和对照组（n=60）。（1）对照组：接受常规心衰护理（用药指导、饮食教育、症状监测）。（2）干预组：在常规护理基础上实施为期 12 周的结构化干预：1）心理疏导：每周 1 次个体化 CBT（40 分钟 / 次），聚焦负性思维重构、行为激活训练及压力管理；2）赋能教育：采用 “5A 模式”（Ask, Advise, Assess, Assist, Arrange），通过情景模拟、自我管理手册及家属参与，强化用药依从性、限盐执行及体重监测技能。评价指标：基线、干预后 12 周评估：① 抑郁程度（PHQ-9 量表）；② 治疗依从性（MMAS-8 量表，≥ 6 分为依从）；③ 临床结局：NT-proBNP、6 分钟步行距离（6MWD）、30 天内再住院率。统计分析采用 SPSS 25.0，组间比较用 t 检验 /χ^2 检验，P<0.05 为显著。

结果：1. 抑郁改善：干预组 PHQ-9 评分由（8.2±1.5）分降至（3.1±1.2）分，降幅显著高于对照组（8.0±1.6 → 6.3±1.4 分）（T=12.37, P<0.001）；2. 治疗依从性：干预组 MMAS-8 达标率（86.7%）显著高于对照组（56.7%）（χ^2=12.89, P=0.001）；3. 临床指标：1）NT-proBNP：干预组降幅更大（P=0.003）；2）6MWD：干预组增加（68.5±12.3）m，优于对照组（41.2±10.7）m（P<0.001）；3）30 天再住院率：干预组（6.7%）显著低于对照组（21.7%）（χ^2=5.94, P=0.015）。

结论：基于 CBT 的心理疏导联合赋能教育可有效缓解老年 CHF 患者抑郁情绪，提升治疗依从性，并通过改善神经内分泌激活及功能储备降低短期再住院风险，为构建老年心衰心理行为干预模式提供循证依据。

Impact of Combined Cognitive and Physical Impairments on Long-term Prognosis in Elderly Cardiovascular Patients: A Prospective Cohort Study

Yujia Liu[1], Hua Wang[2]

1. Department of Cardiology, Beijing Hospital, National Center of Gerontology, Institute of Geriatric Medicine, Chinese Academy of Medical Sciences & Peking Union Medical College, Beijing, China

2. Department of Cardiology, Beijing Hospital, National Center of Gerontology; Institute of Geriatric Medicine, Chinese Academy of Medical Sciences

Background

Cardiovascular disease (CVD) is the leading cause of morbidity and mortality worldwide, especially among the elderly. As the population ages, the burden of CVD increases, and elderly patients often experience multiple comorbidities, including both physical and cognitive impairments. While the impact of physical impairment on the prognosis of CVD patients is well documented, the effect of concurrent cognitive decline, especially when combined with physical limitations, remains less understood and often overlooked. This study investigates how both physical and cognitive impairments influence long-term outcomes, particularly mortality, in elderly CVD patients.

Objective

The aim of this study was to evaluate the relationship between physical and cognitive function and long-term survival outcomes in elderly cardiovascular disease patients. Using the Short Physical Performance Battery (SPPB) to assess physical function and the Mini-Mental State Examination (MMSE) to measure cognitive function, this study explores the combined effect of these impairments on mortality risk over a 5-year follow-up period. We hypothesized that the combination of physical and cognitive impairments would be associated with a significantly higher risk of mortality compared to either impairment alone.

Methods

This prospective cohort study included 524 elderly patients (≥ 65 years) who were hospitalized at Beijing Hospital from September 2018 to April 2019. At baseline, patients underwent a comprehensive assessment that included demographic, clinical, laboratory, and functional evaluations. Cognitive function was assessed using the MMSE, and physical performance was measured using the SPPB, which includes tests of balance, gait speed, and chair stand time. The patients were then followed for up to 5 years to track all-cause mortality. The primary outcomes were all-cause mortality rates, and survival was analyzed using Kaplan-Meier curves. The impact of cognitive and physical impairments on mortality risk was further analyzed using Cox proportional hazards models, adjusting for relevant covariates.

Results

Among the 524 patients, 28.2% had physical impairment (SPPB ≤ 6), and 12.4% had cognitive impairment (MMSE score below the threshold for their education level). The combination of both impairments was associated with a 5.47-fold increased mortality risk (HR: 5.47; 95% CI: 2.78-10.78; p

Conclusion

Currently, cognitive function is often under-assessed in cardiology departments, leading to overlooked high-risk patients. This study demonstrates that combined physical and cognitive impairments are highly prevalent in elderly CVD patients and are strong predictors of poor long-term outcomes. The results highlight the importance of assessing both cognitive and physical function in clinical practice, as these factors can significantly influence mortality risk. Regular screening for both types of impairments can aid clinicians in identifying high-risk patients who may benefit from early and tailored interventions. These interventions could include physical rehabilitation programs for those with physical impairments and cognitive training or support for those with cognitive decline. The integration of these assessments into routine care for elderly cardiovascular patients could lead to more informed clinical decision-making, improved management strategies, and ultimately better patient outcomes in this high-risk population. Future research should explore the effectiveness of combined physical and cognitive interventions, with larger, multicenter studies to validate the benefits of such approaches in improving patient outcomes.

Keywords: cognitive impairment, physical impairment, cardiovascular disease, all-cause mortality, elderly inpatients

衰弱表型介导的老年冠心病患者心脏康复抵抗机制及个体化运动干预策略

罗婷

武汉市中心医院

目的

针对老年冠心病患者心脏康复疗效差异大的临床难题，揭示衰弱表型（Frailty Phenotype）导致康复抵抗的分子机制，并开发基于衰弱分层的精准运动干预方案。

方法

采用转化医学研究设计：

1. 机制研究：纳入 286 例≥ 75 岁老年冠心病患者，通过 Fried 衰弱标准分组，检测骨骼肌线粒体功能（高分辨率呼吸测定法）、炎症因子（IL-6、TNF-α）及运动能力（6 分钟步行试验）的关联性；

2. 干预研究：将 210 例衰弱前期 / 衰弱期患者随机分为：

精准组（n=105）：基于衰弱程度的抗阻 - 有氧复合运动（FRAIL-EX 方案）

常规组（n=105）：标准心脏康复

干预 12 周后评估主要终点（峰值摄氧量改善≥ 10%）及次要终点（衰弱评分、MACE 发生率）。

结果

1. 机制层面：衰弱患者骨骼肌线粒体 ATP 生成降低 38%（p<0.001），且与 IL-6 水平呈负相关（r=-0.52）；

2. 干预效果：精准组达标率显著高于常规组（67.3% vs 42.1%，p=0.002），衰弱逆转率提高 2.1 倍（p<0.01）；

3. 安全性：两组不良事件无统计学差异（p>0.05）；

4. 组学分析: 精准组干预后线粒体生物合成相关基因（PGC-1α）表达上调 3.2 倍。

结论

衰弱表型通过线粒体功能障碍介导心脏康复抵抗，基于衰弱分层的个体化运动方案可显著改善老年患者康复效果，为老年心脏康复提供精准化新策略。

医师对高龄非瓣膜性心房颤动患者卒中预防问题及应对措施态度的调查

刘俊鹏

北京医院

目的 基于抗凝管理策略，探讨医师对高龄房颤（atrial fibrillation，AF）患者卒中预防存在问题和可行措施的态度，以及不同医师群体的态度差异。

方法 自行设计调查问卷，内容包括对目前高龄非瓣膜性房颤（non-valvular atrial fibrillation，NVAF）人群卒中预防待解决的问题和改善措施。于 2023 年 11 月至 2024 年 1 月对北京地区 19 家不同级别医院的 270 名医师进行问卷调查。对问卷进行描述性统计分析，并从医院级别、专业方向进行组间比较。

结果 对高龄 NVAF 人群卒中预防目前待解决的问题，医师选择最多的三项为“卫生服务的可及性”（67.4%）、“不足的循证证据”（51.1%）、“患者依从性”（51.1%）。三甲医院医师更重视“不足的循证证据”（χ^2=5.796，P < 0.05），非三甲医院医师更重视“药品可及性”（χ^2=3.951，P < 0.05）；心内科医师更重视“不足的循证证据”（χ^2=9.131，P < 0.01），非心内科医师更重视“卫生服务可及性”（χ^2=8.998，P < 0.01）和“医联体内分工配合”（χ^2=11.167，P < 0.01）。对改善措施，受访医师选择最多的四项为“临床医学研究”（83.7%）、“管理模式研究”（81.1%）、“患者教育”（79.3%）、“医师培训”（70.0%）。非心内科医师更看重“患者教育”（χ^2=10.046，P < 0.01）、“医师培训”（χ^2=4.119，P < 0.05）和“远程医疗服务”（χ^2=4.348，P < 0.05）。

结论 对高龄 NVAF 人群卒中预防，医师认为最应解决的问题是卫生服务的可及性、循证证据不足和患者依从性，有效改善措施为开展临床医学研究、管理模式研究、患者教育、医师培训。

Analysis of risk factors for hospital-acquired pneumonia in schizophrenia

null null[1,2]

1. People’s Hospital of Chongqing Rongchang Distric

2. Chongqing Mental Health Center

Background: Hospital-acquired pneumonia is one of the most important causes of recurrent illness, disease progression, and even death during hospitalization. Patients with schizophrenia have the special characteristics of their disease, and at the same time, the occurrence of hospital-acquired pneumonia is more common among patients with schizophrenia due to the prolonged stay in closed wards, accompanied by various factors such as age, gender, and nutritional status.

Methods: The PubMed, Web of Science, Cochrane Library, China National Knowledge Infrastructure (CNKI), and China Biomedical Literature Database (CBM) databases were searched with a timeframe of build to February 2024 to collect studies on factors influencing hospital-acquired pneumonia in patients with schizophrenia. Two researchers independently screened the literature, extracted data, and analyzed them.

Results: A total of 5 papers including 85246 patients were included in the literature, which suggested that benzodiazepines (especially the use of clozapine), combination of antipsychotics, mood stabilizers, modified electroconvulsive therapy (MECT), duration of hospitalization, underlying diseases, hyperglycemia, and salivation/dysphagia were important risk factors for hospital-acquired pneumonia in schizophrenia patients, and that advanced age, smoking and alcohol drinking Older age, smoking and drinking habits, malnutrition, and underlying diseases are also risk factors for hospital-acquired pneumonia.

Conclusions: Patients with schizophrenia are at a higher risk of developing hospital-acquired pneumonia, so identifying the risk factors associated with hospital-acquired pneumonia and evaluating them comprehensively and promptly during hospitalization facilitates the development of early interventions, which are essential for improving the prognosis of patients with schizophrenia.

Introduction

Schizophrenia (SCZ), as a serious mental disorder, usually manifests clinically with a range of psychiatric symptoms, such as hallucinations, delusions, emotional apathy, and cognitive dysfunction (1, 2). According to a 2018 World Health Organization report, more than 20 million people worldwide already suffer from SCZ, and China accounts for about half of them (3). Due to its disease characteristics of high morbidity, high disability rate, and low cure rate (4), SCZ imposes heavy psychological and economic burdens on patients' families as well as society (5, 6), and has become a major social challenge (4).

Hospital-acquired pneumonia (HAP) is defined as pneumonia that is not in the incubation period at the time of admission and occurs more than 48 hours after admission (7, 8). Previous studies have shown a high incidence of HAP in Chinese patients with mental disorders, with a large psychiatric specialty hospital in Sichuan reporting a 7.8% incidence of HAP in middle-aged and elderly (≥ 50 years old) patients with schizophrenia (9), and Taiwan's Specialized Medical Institutes for Mental Disorders similarly noting an incidence of HAP in patients with severe mental disorders of 14.7/1,000 persons/year (10). HAP increases the treatment costs, prolongs hospitalization, and leads to significant increases in patient morbidity and mortality (11), thus early identification of the risk of HAP in patients with schizophrenia and timely interventions to reduce the adverse effects of HAP are critical.

Materials and methods

Five databases, PubMed, Web of Science, Cochrane Library, China National Knowledge Infrastructure (CNKI), and China Biomedical Literature Database (CBM), were searched by computer, and the time limit for searching was from the establishment of the databases to February 2024, and the search strategy was shown in Appendix Box 1 for PubMed. To search for studies on the factors affecting hospital-acquired pneumonia in patients with schizophrenia, the search terms in Chinese and English were pneumonia, schizophrenia, risk factors, etc. Taking PubMed as an example, the specific search strategies were as follows.

MHR 与 2 型糖尿病患者急性心梗的相关性分析

杨滨 曹慧丽 宋蔚

山西医科大学第二医院

目的 本研究旨在探讨单核细胞与高密度脂蛋白胆固醇比值（MHR）对 2 型糖尿病（T2DM）患者急性心肌梗死（AMI）的预测价值。

方法 采用回顾性病例对照研究，纳入 2022 年 1 月至 2023 年 3 月因胸痛就诊于山西医科大学第二医院的 137 例合并急性心肌梗死的 2 型糖尿病患者（心肌梗死组），并通过倾向性评分匹配法选取 137 例未合并急性心肌梗死的 2 型糖尿病患者（非心肌梗死组），两组均行冠状动脉造影术。分析 MHR 与 2 型糖尿病患者急性心肌梗死风险的相关性。

结果 心肌梗死组的单核细胞绝对值（MON）和 MHR 显著高于非心肌梗死组（P<0.001），而高密度脂蛋白胆固醇（HDL-C）水平较低（P=0.005）。多因素 logistic 回归显示，MHR 是 2 型糖尿病患者发生急性心肌梗死的独立危险因素（OR=62.30，95% CI:12.21 ~ 317.78，P<0.001）。ROC 曲线分析表明，MHR 预测 2 型糖尿病患者急性心肌梗死的曲线下面积（AUC）为 0.704（灵敏度 0.796，特异度 0.540）。

结论 MHR 水平与 2 型糖尿病患者急性心肌梗死风险呈正相关，通过检测 MHR 水平可以实现对 2 型糖尿病患者发生急性心肌梗死的早期预测。

全周期康复管理模式在老年 CCU 冠心病患者护理中的应用路径与效果评价

肖玲

西安交通大学第一附属医院

目的：构建 " 四阶段三联动 " 全周期康复管理模式，解决老年 CCU 冠心病患者康复断裂问题，实现急性期至居家期的无缝管理，提升生存质量并优化医疗资源。

方法：采用前瞻性类实验研究，选取 2024 年 4 月 -2025 年 4 月我院心内科 CCU 收治的 240 例≥ 65 岁冠心病患者（Killip I-III 级），随机分为试验组（n=120）与对照组（n=120）。对照组：常规护理 + 出院指导。试验组：创新四阶段路径（6 个月）：急性期（CCU）：24h 内老年综合评估（CGA），血流稳定后启动低强度康复（床边运动 5min×3 组 / 日 + 呼吸训练 15ml/kg）。过渡 / 稳定期：阶梯运动处方（40-50% 峰值心率）、智能药盒管理、高蛋白膳食（≥ 1.2g/kg/d）。维持期：多学科随访（首周视频指导 / 月门诊）。评价指标：主要终点：6 个月再入院率、MACE；次要终点：6 分钟步行距离（6MWD）、SAQ 评分、Barthel 指数、HADS 评分、依从性、医疗费用。统计：SPSS 25.0 进行 *t* 检验 /χ^2 检验（α=0.05）。

结果：临床结局改善：再入院率：试验组 8.5% vs 对照组 17.8%（P<0.01）；MACE：5.2% vs 12.1%（P<0.05）。功能与生活质量：6MWD 增幅：试验组 82.3±15.6 米（对照组 Δ36.1 米，P<0.001）；SAQ 总分提升：35.4±6.8 分 vs 21.5±7.1 分（P<0.01）；Barthel 指数：86.2±8.4 分 vs 76.5±9.1 分（P<0.05）。心理状态：HADS 焦虑：5.1±1.8 分（无焦虑阈值）vs 8.7±2.3 分（P<0.01）；抑郁：4.3±1.6 分 vs 7.5±2.0 分（P<0.01）。依从性与成本：服药依从率：93.6% vs 72.4%（P<0.001）；人均费用：试验组人均 6 个月医疗总费用（含再入院费用）显著低于对照组（P<0.05）。

结论：本研究构建并验证的 "四阶段三联动" 全周期康复管理模式，深度融合多学科协作与智能技术，为老年 CCU 冠心病患者提供了科学、系统、连续的护理解决方案。该模式显著降低了患者再入院风险及 MACE 发生，有效促进了心肺功能恢复、生活质量和心理健康提升，强化了治疗依从性，并展现出良好的成本效益优势，充分体现了科学性、创新性（整合全周期视角与智能管理）、实用性（路径清晰可操作）和先进性。

Sleep Patterns and Frailty: Joint Impact on Major Adverse Cardiovascular Events in a Prospective Cohort Study

Zhi-Teng Chen, Da-Chuan Guo, Hai-Feng Zhang, Yang-Xin Chen

Sun Yat-sen Memorial Hospital

Background: Frailty is an important geriatric syndrome, which is characterized by a deterioration in the functionality of several organ systems with an increased susceptibility to stressors. Frailty significantly increases the risk of cardiovascular disease (CVD). Compared with non-frail participants, those with frailty had a 47% increased risk of CVD. Higher sleep scores are associated with a lower risk of CVD risk, and maintaining a healthy sleep pattern is associated a lower major adverse cardiovascular events (MACE) risk. It is unknown whether keeping a healthy sleep pattern can alleviate the adverse impact of frailty on MACE. We aimed to elucidate the joint impact of sleep patterns and frailty on MACEs.

Methods: A total of 380,105 participants from the UK Biobank were included for the analysis. Definition of frailty phenotype was based on the following five criteria: weight loss, exhaustion, low physical activity, slow gait speed and low grip strength. Participants were then classified as non-frail (0 scores), pre-frail (1–2 scores) or frail (≥ 3 scores). We described five sleep behaviors covering chronotype, duration, insomnia, snoring, and excessive daytime sleepiness. According to the healthy degree, 0 or 1 points were assigned, and every sleep behavior of every participant got 1 point. Then all points were summed up to obtain a sleep score ranging from 0 to 5, with higher scores indicating a healthier sleep pattern. Participants were then categorized based on their sleep score into healthy sleep (score ≥ 4), intermediate sleep (score 2–3), and poor sleep (score ≤ 1) pattern. The primary outcome of this study was MACE, which was defined based on diagnoses of myocardial infarction (MI), stroke or CVD-related death. Secondary outcomes included MI, stroke, heart failure (HF), CVD-related death, and all-cause mortality. Cox proportional hazards models were used to assessed the associations between combinations of frailty phenotypes and sleep patterns and MACE, including nonfatal MI, stroke or CVD-related death. A series of sensitivity analyses were performed to test the robustness of the primary results.

Results: After a median follow-up period of 12.94 years, compared with participants with frailty and poor sleep patterns, participants without frailty and with healthy sleep patterns have the lowest risk of MACE (HR, 0.560 [95%CI, 0.445–0.704], P P P , all P P

Conclusions: Maintaining a healthy sleep pattern and a non-frail status were jointly associated with a significantly decreased risk of MACE. Healthy sleep pattern may reverse the risk of MACE brought by pre-frailty. Strategy targeting snoring and daytime dozing during sleep may reduce the risk of MACE among frail people.

Comorbidity Patterns and Intrinsic Capacity Decline in Older Adults with Coronary Heart Disease: A Nationwide Study in China

I-U JIAOJIAO Q, Nan Zhang, Yue Chen, Shuaishuai Zhang , Qinzhi Cao, Lin Zhou, Yue Zhang, Boyang Zeng, Shouyuan Ma, Man Li, Yan Wang, Jin Sun, Bangguo Qin, Bokai Chen, Shuang Cai, Qiligeer Bao, Shuxia Wang, Ping Zhu

Chinese PLA General Hospital

Background: Coronary heart disease (CHD) is a leading cause of morbidity among older adults. However, current single-disease–based care paradigms and treatment guidelines often fail to account for the complexities evaluated through comprehensive geriatric assessments (CGAs). A central component of this framework is intrinsic capacity (IC), defined as the composite of all physical and mental capacities available to an individual, which plays a key role in determining how well a person can age. This study aims to investigate the associations among CHD, comorbidity burden, and declines in IC, using a nationally representative sample of community-dwelling older adults in China.

Methods: This cross-sectional study analyzed data from a national survey conducted across 14 provinces in China from September 2023 to March 2024. The final sample comprised 14,389 community-dwelling older adults, including 5,479 with self-reported CHD. Intrinsic capacity status was assessed across five domains: locomotion, cognition, sensory function, vitality, and psychological health. Analyses were stratified by CHD status and comorbidity patterns. Comorbidity patterns were evaluated based on the number of chronic conditions, specific disease combinations, and subgroups derived through latent class analysis (LCA). Multivariable logistic regression was used to examine the associations between these comorbidity patterns and IC decline.

Results: Among the 14,389 participants, 38.1% (n = 5,479) had a self-reported history of CHD. The mean IC score among individuals with CHD was 90.42 ± 12.18, lower than that of individuals without CHD. The

age-adjusted prevalence of IC decline was significantly higher among individuals with CHD (51.8% vs. 43.5%, P < 0.001). This difference was observed across all five IC domains, particularly in sensory (32.4%) and cognitive (12.1%) functions. The prevalence of IC decline increased with comorbidity burden, ranging from 38.1% for those with no chronic conditions to 65.6% for those with five or more conditions. Liver disease (67.0%), stroke (62.4%), and the combination of hyperthyroidism and liver disease (75.0%) showed the highest rates of IC decline. Using latent class analysis, three distinct subgroups were identified among individuals with CHD: Class 1 (Chronic Disease Management Group, 40.9%), Class 2 (Cardio-Metabolic Risk Group, 27.8%), and Class 3 (Multi-System Disease Group, 31.3%). Among these, the Multi-System Disease Group exhibited the highest rate of IC decline (61.3%). Multivariable logistic regression revealed that individuals with five or more chronic conditions had over three times the odds of IC decline (OR = 3.03; 95% CI: 2.23–4.10; P < 0.001), and nearly double the odds of decline in locomotion, cognition, sensory function, and psychological health (all P < 0.001), compared to those without chronic conditions. In the LCA results, compared with the Chronic Disease Management Group, individuals in the Multi-System Disease Group exhibited even greater risks, with significantly higher odds of IC decline (OR = 1.93; 95% CI: 1.69–2.20; P < 0.001), sensory dysfunction (OR = 1.72; 95% CI: 1.50–1.97; P < 0.001), and cognitive decline (OR = 1.67; 95% CI: 1.38–2.03; P < 0.001). Subgroup analyses demonstrated consistent associations across age and sex categories (all interaction P > 0.05). After excluding individuals with disability, the association between comorbidity patterns and increased risk of IC decline remained significant, particularly among those with five or more chronic conditions and those in the Multi-System Disease Group.

Conclusions: Among older Chinese adults, CHD demonstrates a strong association with IC decline, particularly in the presence of comorbidity. Distinct chronic conditions and comorbidity patterns were linked to specific functional impairments, highlighting the heterogeneity within CHD populations. These findings support the implementation of integrated, function-focused care models for older individuals with CHD to preserve independence and improve long-term outcomes.

虚弱与肌少症对中老年人群心血管疾病风险的联合作用及进展性影响

刘孟璐 叶蕴青 严凯伦 张可欣 黎嘉雯 袁晋青 赵雪燕

中国医学科学院阜外医院

背景与目的：

随着全球人口老龄化加剧，虚弱和肌少症作为两种常见的老年综合征，正对公共卫生体系构成严峻挑战。近年来，虚弱和肌少症对心血管疾病（CVD）风险的影响日益受到关注。然而，现有研究多聚焦于基线时的虚弱或肌少症状态，较少评估二者的联合作用及其随时间的动态变化。本研究旨在利用具有全国代表性的队列数据，探讨虚弱与肌少症在中老年人群中新发 CVD 风险中的联合作用与进展性影响。

研究方法：

本研究基于中国健康与养老追踪调查（CHARLS）的随访数据。采用 Rockwood 虚弱指数评估虚弱状态，并将其分为健康（FI ≤ 0.10）、虚弱前期（0.10 < FI < 0.25）和虚弱（FI ≥ 0.25）三类。肌少症依据亚洲肌少症工作组 2019 年标准（AWGS 2019）定义。将可能肌少症与肌少症合并为“肌少症”组进行分析，最终形成“非肌少症”与“肌少症”两组。

首先，采用 Cox 回归分析 2011 年基线虚弱与肌少症状态对随后 9 年内新发 CVD 的影响。随后，筛选 2011 至 2015 年间未发生 CVD 的个体，进一步分析虚弱与肌少症状态变化对 2015 至 2020 年新发 CVD 风险的影响。

结果：

研究共纳入 7,187 名 45 岁以上的参与者（男性占 49.41%，平均年龄为 57.38 ± 8.41 岁）。其中 4,265 名在 2011 至 2015 年间未发生 CVD 事件的参与者被纳入状态变化分析。九年随访期间，虚弱与肌少症状态均可独立增加 CVD 风险。值得注意的是，虚弱与肌少症之间对 CVD 存在显著交互作用（p for interaction <0.001）。在调整潜在混杂因素后，与“健康 + 非肌少症”者相比，分别处于“健康 + 肌少症”、“虚弱前期 + 非肌少症”、“虚弱前期 + 肌少症”、“虚弱 + 非肌少症”以及“虚弱 + 肌少症”状态的参与者，其新发 CVD 风险分别增加了 18.0%（aHR=1.18; 95% CI: 1.02–1.37）、67.0%（aHR=1.67; 95% CI: 1.47–1.89）、88.0%（aHR=1.88; 95% CI: 1.64–2.17）、87.0%（aHR=1.87; 95% CI: 1.50–2.34）和 118.0%（aHR=2.18; 95% CI: 1.81–2.62）。此外，虚弱状态在肌少症与 CVD 之间的关联中起到了 35.38% 的中介作用。

在随后的状态变化分析中，持续虚弱者或肌少症恶化者的新发 CVD 风险最高，风险比（HR）分别为 3.29（95% CI: 2.44–4.45）和 1.56（95% CI: 1.28–1.90），相比之下，持续健康或非肌少症者风险最低。

结论：

本研究表明，虚弱与肌少症对中老年人群中新发 CVD 风险具有显著、独立且协同的联合作用，并呈现随时间推移的进展性影响。建议将虚弱和肌少症纳入常规筛查，并实施综合干预策略，以减缓其进展、促进功能恢复，从而降低 CVD 发生风险。

基于心衰风险评分表的老年 2 型糖尿病全周期康复护理模式构建与应用

张辉敏

中国人民解放军陆军军医大学第二附属医院医院

目的

随着人口老龄化加剧，老年 2 型糖尿病（T2DM）患者合并心衰的风险显著升高，严重影响生活质量和预后。本研究旨在基于心衰风险评分表，构建一套适合老年 T2DM 患者的全周期康复护理模式，并验证其临床应用效果，以降低心衰发生风险、改善患者康复结局。

方法

采用混合研究方法，分三个阶段开展研究：（1）模型构建阶段：通过文献回顾和德尔菲专家咨询法，整合国际通用心衰风险评分表（如 HFRS、EHMRG 等），结合老年 T2DM 患者特点，设计涵盖“预防 - 干预 - 随访”的全周期护理方案；（2）干预实施阶段：选取 2024 年 1 月–2024 年 6 月在我医院收治的 120 例老年 T2DM 患者，随机分为干预组（n=60，采用全周期康复护理模式）和对照组（n=60，常规护理），干预周期 6 个月；（3）效果评价阶段：比较两组患者的心衰风险评分、血糖控制（HbA1c）、心功能指标（LVEF、NT-proBNP）、生活质量（SF-36 量表）及再住院率差异。数据分析采用 SPSS 26.0，组间比较使用 t 检验或卡方检验。

结果

心衰风险控制：干预组心衰风险评分显著低于对照组（12.5±2.1 vs. 18.3±3.4，P<0.01）；

代谢与心功能改善：干预组 HbA1c（6.8%±0.5% vs. 7.9%±0.7%）、LVEF（55.2%±4.1% vs. 49.8%±5.3%） 及 NT-proBNP（150 pg/mL±45 vs. 320 pg/mL±68）均优于对照组（P<0.05）；

生活质量与预后：干预组 SF-36 评分提高（75.6±6.2 vs. 62.4±7.8，P<0.01），6 个月内再住院率降低（8.3% vs. 23.3%，P<0.05）。

结论

基于心衰风险评分表构建的全周期康复护理模式可有效降低老年 T2DM 患者的心衰风险，改善血糖控制和心功能，提升生活质量并减少再住院事件。该模式具有临床推广价值，可为糖尿病合并心衰的规范化管理提供参考。

膈肌强化训练对老年冠心病患者姿势控制及生活质量的影响：前瞻性队列研究

马姣 李娟利 蔡慧芝

交大一附院

背景 老年冠心病患者常伴随核心肌群功能障碍，导致姿势控制能力下降及生活质量恶化。膈肌作为呼吸与姿势稳定的双重核心肌群，其强化训练可能通过改善呼吸 - 运动耦合效应带来多重获益，但现有证据尚不充分。

目的 探讨结构化膈肌强化训练对老年冠心病患者静态 / 动态姿势控制能力及生活质量量表评分的影响。

方法 采用前瞻性队列研究设计，纳入 2024-2025 年西安某三甲医院收治的老年冠心病患者 62 例，分为干预组（常规心脏康复 + 膈肌强化训练，n=31）与对照组（仅常规康复，n=31）。干预组接受为期 12 周、每周 3 次的阈值负荷吸气训练联合腹式呼吸激活练习。主要结局通过受力平台测定姿势摆动速度（Sway Velocity）评估静态姿势控制，Timed Up-and-Go 测试动态平衡；次要结局采用 SF-36 量表评价生活质量。

结果 干预后，干预组较对照组表现出：（1）静态姿势控制显著改善（摆动速度降低 23.5% vs 8.7%，p<0.01）；（2）动态平衡时间缩短（TUG 测试减少 4.2±1.3s vs 1.8±0.9s，p=0.003）；（3）SF-36 生理功能（+15.6 分）、躯体疼痛（+12.4 分）等维度评分提升更显著（均 p<0.05）。两组均未发生训练相关不良事件。

结论 膈肌强化训练可有效增强老年冠心病患者的姿势稳定性，其机制可能与改善呼吸 - 核心肌群协调性有关，并进一步转化为生活质量的提升。该干预方案具有临床推广价值。

Integrated Multi-Omics Analysis Uncovers Dysregulated Energy and Amino Acid Metabolism During Vascular Aging

Geng-yu Zhou[1,2], Xian-Wei Xie[2], Cheng Jin[2], Kai-Yang Lin[1]

1. Department of Cardiology, Shengli Clinical Medical College of Fujian Medical University, Fujian Provincial Hospital, Fuzhou University Affiliated Provincial Hospital

2. Department of Cardiology, The Second Affiliated Hospital of Harbin Medical University, China

Objectives: Vascular aging is increasingly recognized as a major contributor to the development and progression of cardiovascular diseases. However, the specific metabolic features associated with vascular aging and the mechanistic roles of key metabolites in this process have not been fully elucidated. A deeper understanding of the metabolic alterations underlying vascular aging could provide new insights for early intervention and therapeutic strategies. To further explore the metabolic reprogramming that accompanies vascular aging, we developed and characterized mouse models representing various life stages—from young to aged—thus capturing the dynamic spectrum of vascular aging under physiological conditions.

Methods: We conducted a comprehensive analysis of the GTEx database

to identify human vascular gene modules correlated with age. These gene modules were subjected to clustering analysis and KEGG pathway enrichment to pinpoint crucial biological pathways involved in vWascular aging. Subsequently, we established vascular aging models in mice representing different life stages and performed ultra-performance liquid chromatography-tandem mass spectrometry (UPLC-MS/MS) to profile the metabolomic changes in the aorta. Furthermore, we integrated single-cell transcriptomic analysis and in vitro assays to determine the expression patterns and functional roles of key metabolites within specific vascular cell subpopulations.

Results: Our GTEx transcriptomic analysis revealed that genes associated with vascular aging can be grouped into six major categories, with significant enrichment in metabolic pathways related to energy production, amino acid biosynthesis, and redox regulation. Specifically, pathway enrichment analysis indicated that these genes are closely linked to cellular respiration, glycolysis, the tricarboxylic acid (TCA) cycle, and various amino acid metabolic networks.

Metabolomics results from the mouse model established in this study confirmed that vascular aging is accompanied by extensive remodeling of multiple metabolic pathways. High-throughput metabolomic analyses of vascular tissues from juvenile, adult, and aged mice uncovered dynamic changes in metabolic homeostasis throughout the lifespan. Notably, significant disruptions were observed in energy metabolism, amino acid turnover, nucleotide synthesis, and antioxidant stress response, as reflected by conspicuous alterations in the concentrations of key intermediate metabolites and the expression levels of relevant enzymes in these pathways.

Quantitative analyses showed that the levels of most metabolites peaked during adulthood and subsequently exhibited a gradual decline with advancing age, indicating the presence of progressive metabolic exhaustion or insufficiency in the course of vascular aging. This trend was particularly pronounced for metabolites such as arginine, citrulline, aspartic acid, and proline, all of which were markedly decreased in aged mice compared to their younger counterparts.

Additionally, single-cell RNA sequencing and subsequent in vitro experiments further confirmed that these metabolic pathways are especially active within endothelial cells. Single-cell transcriptomic profiling revealed that genes involved in metabolism and redox regulation are expressed at significantly higher levels in endothelial cell populations compared to other vascular cell types. Functional in vitro assays demonstrated that endothelial cells exhibit heightened metabolic activity in these pathways and are more sensitive to perturbations affecting them.

Conclusion: Our findings highlight that vascular aging is characterized by multifaceted metabolic disturbances, including impairments in glucose, fatty acid, and amino acid metabolism, as well as diminished antioxidant capacity. Among these, the most striking feature is the significant decline in key amino acids such as aspartic acid, arginine, and proline during the late aging stage, which may underlie age-associated vascular dysfunction. These insights not only advance our understanding of the metabolic basis of vascular aging but also suggest that targeted interventions to restore metabolic homeostasis could hold promise in preventing or delaying vascular aging and its related cardiovascular diseases.

复合膳食抗氧化指数与超额心脏年龄的关联：2007-2020 年 NHANES 横断面研究分析

3. 湖北文理学院附属医院，襄阳市中心医院心血管内科，湖北文理学院心血管病研究所

目的 心血管疾病 (CVD) 风险与膳食抗氧化剂摄入的关联一直存在争议。复合膳食抗氧化指数 (CDAI) 作为膳食整体抗氧化水平的衡量指标，而超额心脏年龄 (EHA) 是 CVD 风险的简洁直观表达。本项研究旨在调查 CDAI 和 EHA 之间的关系，为 CVD 的营养预防提供一定的理论参考。**方法** 本横断面研究中，数据来源于 2007 ~ 2020 年国家健康和营养检查调查 (NHANES)。样本包括 30 ~ 74 岁、无 CVD 病史的 16442 名参与者。采用 Framingham 风险评分函数来估算心脏年龄，进一步计算出 EHA。根据维生素 A、C、E、锌、硒和类胡萝卜素的摄入量，构建了代表整体抗氧化性的 CDAI。通过多元线性回归、多元 logistic 回归和限制性三次样条（RCS）进行统计分析。**结果** 在完全调整协变量后，CDAI 与 EHA(β=-0.07，95%CI -0.14 ~ -0.01) 及高 CVD 风险（EHA ≥ 10 年）(OR=0.98，95%CI 0.96 ~ 1.00) 呈显著负相关，进一步 RCS 分析表明这种负相关是非线性的。相较于 CDAI 最低四分位数 (Q1) 组，CDAI 最高四分位数 (Q4) 组 EHA 下降 1.41 岁 (β=-1.41，95%CI -2.12 ~ -0.71，P_{trend} 值 <0.01)，高 CVD 风险下降 27%(OR=0.73，95%CI 0.59 ~ 0.90，P_{trend} 值 =0.01)。在女性中，CDAI 与 EHA(β=-0.10，95%CI -0.12 ~ 0.00) 及高 CVD 风险 (OR=0.97，95%CI 0.94 ~ 0.99) 也表现出显著的非线性负相关。而男性中这种负相关无统计学意义。**结论** 本研究首次证明了 CDAI 与 EHA 及高 CVD 风险之间存在显著的负相关性，并进一步揭示了这种关联具有性别差异。这一发现为 CVD 的营养预防提供了新的理论支撑，并强调了进一步临床和基础研究的必要性。

辅酶 Q10 联合有氧运动对老年人心肌功能及氧化应激指标的影响研究

翟倩

交大一附院

目的：探究辅酶 Q10 联合有氧运动干预对老年人心肌功能的提升效果，以及对体内氧化应激指标的调节作用，为改善老年人心脏健康提供新的干预策略。

方法：选取 200 名 65 - 80 岁、存在不同程度心肌功能减退的老年人，随机分为三组。对照组（60 人）保持日常活动与常规饮食；辅酶 Q10 组（70 人）每日口服辅酶 Q10 补充剂；运动联合组（70 人）在口服辅酶 Q10 的基础上，进行每周 5 次、每次 40 分钟左右的有氧运动，如快走、太极拳等，运动强度保持在最大心率的 60% - 70% 。实验周期为 6 个月，实验前后分别运用心脏超声检测左心室射血分数（LVEF）、左心室舒张末期内径（LVEDD）评估心肌功能；采集血液样本检测超氧化物歧化酶（SOD）、丙二醛（MDA）、谷胱甘肽过氧化物酶（GSH - Px）等氧化应激指标水平。

结果：实验结束后，运动联合组 LVEF 显著高于对照组和辅酶 Q10 组（P<0.05），LVEDD 显著缩小（P<0.05）；运动联合组 SOD、GSH - Px 活性明显升高，MDA 含量显著降低，与其他两组相比差异有统计学意义（P<0.05）。辅酶 Q10 组在心肌功能及氧化应激指标上也有一定改善，但效果不如运动联合组明显。

结论：辅酶 Q10 联合有氧运动相较于单独使用辅酶 Q10，能更有效地改善老年人心肌功能，增强抗氧化能力，调节氧化应激水平，对维护老年人心脏健康具有积极意义，推荐作为一种综合干预手段应用于老年心脏健康管理。

Mood Swings Impact Smoking Behavior Elevating Risk of Cardio-cerebrovascular Events: A Mendelian Randomization Study

Yin Han, Meng-Yang Jia, Jing-Jin Liu, Qing-Shan Geng

Shenzhen people's hospital

Background:

Mood swings, characterized by abrupt and intense emotional fluctuations, are a prevalent psychological feature in the general population, yet their implications for physical health remain underexplored. Emerging evidence suggests that mood instability may co-occur with adverse lifestyle behaviors—most notably smoking—which contribute significantly to the risk of cardio-cerebrovascular diseases. However, the causal relationship between mood swings, smoking behaviors, and major adverse cardiovascular outcomes remains unclear. This study aimed to investigate whether mood swings causally influence smoking behaviors and, in turn, elevate the risk of cardiovascular and cerebrovascular events.

Methods:

We conducted a two-sample Mendelian randomization (MR) analysis using summary-level data from genome-wide association studies (GWAS). Genetic variants associated with mood swings, smoking initiation, current tobacco use, and cardio-cerebrovascular outcomes—including major adverse cardiovascular events (MACE), acute myocardial infarction (AMI), and stroke—were obtained from the IEU Open GWAS Project and other public repositories. To assess the indirect effects of smoking behaviors on the relationship between mood swings and cardio-cerebrovascular outcomes, we performed mediation analyses using both conventional network MR and two-step MR approaches. Sensitivity analyses, including heterogeneity, pleiotropy, and leave-one-out assessments, were conducted to ensure the robustness of findings.

Results:

MR analyses revealed a significant causal effect of mood swings on cardio-cerebrovascular outcomes. Specifically, mood swings increased the risk of MACE (OR = 1.02; 95% CI: 1.01–1.03; p = 0.001), AMI (OR = 1.01; 95% CI: 1.00–1.02; p = 0.006), and stroke (OR = 1.01; 95% CI: 1.00–1.02; p = 0.008). No evidence of reverse causality was detected, reinforcing a unidirectional relationship from mood swings to these adverse outcomes.

In the behavioral pathway analysis, mood swings were strongly associated with increased smoking behaviors. The odds of current tobacco use increased by 12% (OR = 1.12; 95% CI: 1.07–1.17; p = 2.10×10^{-6}), and the odds of smoking initiation rose by 42% (OR = 1.42; 95% CI: 1.19–1.68; p = 6.04×10^{-5}) among individuals genetically predisposed to mood swings. These findings suggest that emotional instability may lead to increased tobacco dependence and initiation.

Mediation analyses provided further insight into the mechanistic pathway. Using the two-step MR framework, we found that current tobacco smoking mediated approximately 25% of the causal link between mood swings and MACE, 9.1% to 21.4% for AMI, and 16.7% to 25.0% for stroke. In contrast, smoking initiation explained 10.0%–15.0% of the effect on MACE, 7.1%–14.3% for AMI, and 7.1%–8.3% for stroke. These results highlight that sustained smoking behavior may have a more significant impact on cardiovascular prognosis than initial smoking uptake.

Limitations:

Mood swings and smoking behaviors were measured through self-reported assessments in the original GWAS, introducing potential misclassification or recall bias. The genetic data were predominantly derived

from individuals of European ancestry, limiting the generalizability to other populations. Furthermore, MR estimates reflect lifelong average exposure and may not fully capture acute or episodic mood-related risks. Finally, while smoking behavior was the primary mediator examined, other relevant behaviors—such as physical inactivity, poor diet, or alcohol abuse—were not included in this analysis and may also play significant mediating roles.

Conclusion:

In summary, this MR study provides compelling evidence that mood swings exert a causal influence on the risk of cardio-cerebrovascular events, largely through the promotion of smoking behaviors. These results bridge the gap between emotional health and physical disease risk, highlighting the importance of psychological-behavioral interventions in cardiovascular prevention strategies. Future research should explore this pathway across diverse populations and investigate whether targeted mood-stabilizing interventions can mitigate smoking behaviors and improve long-term cardiovascular outcomes.

Kielin/Chordin-Like Protein Deficiency causes aortic aging in male mice

DI Ye, XIAOYANG Zhou

Renmin Hospital of Wuhan University

Background: Bone morphogenetic proteins (BMPs), members of the transforming growth factor-beta (TGF-β) superfamily, are critically involved in diverse cellular processes including differentiation, proliferation, apoptosis, and extracellular matrix remodeling. Accumulating evidence from previous studies underscores the significant roles of BMPs in the pathogenesis of various cardiovascular diseases, encompassing atherosclerosis, vascular calcification, myocardial hypertrophy and fibrosis (remodeling), pulmonary arterial hypertension, and diabetic cardiomyopathy. Kielin/chordin-like protein (KCP) is an important, evolutionarily conserved secreted glycoprotein known to act as a context-dependent regulator of BMP signaling pathways. It functions extracellularly by binding directly to BMP ligands, thereby modulating their bioavailability, receptor interaction, and subsequent downstream signaling cascades. Notably, research has demonstrated that KCP can attenuate renal interstitial fibrosis in models of chronic kidney disease, primarily through its suppressive effects on TGF-β/Smad signaling and promotion of BMP/Smad signaling. Furthermore, transgenic overexpression of KCP has been shown to ameliorate liver pathology associated with aging and nonalcoholic fatty liver disease (NAFLD) in murine models. Intriguingly, KCP overexpression also confers resistance to diet-induced obesity and metabolic syndrome phenotypes in mice, largely mediated through its regulatory influence on Smad-dependent pathways. Our preliminary investigations revealed a novel association between altered KCP expression and the progression of heart failure. Given the well-documented involvement of dysregulated BMP signaling in both the aging process and cardiovascular pathologies, we hypothesized that KCP may play a crucial, yet unexplored, role in the development of aortic aging - a key contributor to age-related vascular stiffening and dysfunction. However, the specific function and mechanistic contribution of KCP in aortic senescence remained entirely unknown. This study was therefore designed to systematically investigate the impact of KCP deficiency on aortic aging and elucidate the underlying molecular mechanisms.

Methods and Results: We utilized KCP knockout (KO) mice (homozygous null for the Kcp gene) and age-matched wild-type (WT) controls. A striking observation was that aged KCP KO mice exhibited a significant trend towards premature mortality compared to WT groups, necessitating planned endpoint analysis. Consequently, all surviving mice in the WT group and the KCP KO group were humanely sacrificed at 24 months of age following terminal body weight measurement. Young adult mice served as healthy controls. Baseline systolic and diastolic blood pressure measurements, recorded non-invasively, revealed no significant differences among the four experimental groups. Comprehensive analysis of aortic structure and function was performed. Histopathological examination using Hematoxylin & Eosin (H&E) and Masson's trichrome staining revealed characteristic age-associated impairments in aortic wall architecture and elastic fiber integrity in 24-month-old mice. Critically, KCP deficiency exacerbated these age-related pathological changes, manifesting as significantly increased aortic media thickening, collagen deposition, and disorganization of elastin layers compared to aged WT aortas. Molecular analysis demonstrated that KCP KO profoundly altered key signaling pathways in aged aortas: it significantly increased phosphorylation (activation) of Smad2/3 (p-smad2/3) and elevated TGF-β protein expression, while concurrently suppressing BMP-2 expression. Furthermore, KCP KO markedly elevated the expression of aortic senescence-associated markers (e.g., p16, p21) in aged mice. Biochemical assessment revealed that KCP deficiency aggravated oxidative stress by disrupting the redox balance, evidenced by increased markers of reactive oxygen species (ROS) and decreased antioxidant enzyme activity (e.g., SOD, GPx). Additionally, KCP KO significantly increased the expression of pro-inflammatory cytokines (e.g., TNF-α, IL-6, IL-1β) and augmented the rate of apoptosis specifically in vascular smooth muscle cells (VSMCs) within the aged aortic wall.

Conclusions: Our findings provide compelling evidence that genetic deletion of KCP accelerates aortic aging and exacerbates vascular dysfunction in a murine model. KCP deficiency promotes aortic senescence and remodeling through a multifactorial mechanism involving the dysregulation of TGF-β/BMP signaling balance (increased TGF-β/Smad2/3 and decreased BMP-2), heightened oxidative stress, amplified chronic low-grade inflammation, and increased susceptibility of VSMCs to apoptotic cell death. These results establish KCP as a novel endogenous protective modulator against age-related aortic degeneration. Targeting the KCP pathway or augmenting its function may therefore represent a promising therapeutic strategy for mitigating aortic aging and its associated cardiovascular complications. Future studies are warranted to explore translational applications and dissect cell-type specific effects of KCP within the complex aortic microenvironment.

生命必需 8 要素评估的心血管健康在老年衰弱与死亡关联中的中介作用：来自 NHANES 队列的证据

苗广瑞

郑州大学第一附属医院

目的： 衰弱（frailty）以生理功能失调和易损性增加为特征，在老年人群中较为普遍，并与跌倒、残疾和死亡风险升高相关。由“生命必需 8 要素”（Life's Essential 8, LE8）评分评估的心血管健康（Cardiovascular health，CVH）对识别心血管高风险个体至关重要。本研究旨在探究老年人群体中以下三个问题：（1）衰弱、CVH 与全因死亡率及心血管死亡率的关联性；（2）衰弱与 CVH 之间的关联；（3）CVH 在衰弱与心血管死亡率、全因死亡率关联中的中介作用。

方法： 本队列研究分析了 2005–2018 年美国国家健康与营养调查（the National Health and Nutrition Examination Survey，NHANES）中 7,774 名 60 岁及以上年龄参与者的数据。衰弱采用衰弱指数评估，CVH 通过 LE8 评分评估。使用 Cox 比例风险模型分析衰弱、CVH 与死亡率的关系，并通过中介分析探讨 CVH 的中介作用。

结果： 衰弱与全因死亡率（HR=2.470，95% CI：2.186~2.792）和心血管死亡率（HR=2.639，95% CI：2.080~3.350）风险升高显著相关。更好的 CVH 则与较低的全因死亡率（HR=0.446，95% CI：0.354~0.562）和心血管死亡率（HR=0.375，95% CI：0.211~0.667）风险相关。LE8 评分部分介导了衰弱与全因死亡率（12.01%）及心血管死亡率（13.40%）的关联，其中体力活动是关键中介因素。

结论： 衰弱显著增加了全因死亡和心血管死亡的风险，而 CVH 在这一关联中起中介作用。体力活动是衰弱与心血管死亡关联中最强的中介因素，而体质量指数（body mass index，BMI）、血脂和体力活动主要中介衰弱与全因死亡的关系。提高 CVH（尤其是通过增加体力活动）可能有助于降低衰弱老年人的死亡率。

开发并验证可解释的机器学习模型用于预测环境毒物暴露对心肌梗死的影响：一项回顾性列队研究

王小娟

兰州大学第一医院

目的：心肌梗塞（MI）是一种严重的心血管疾病，全球范围内导致高死亡率及不良预后。环境毒物与心血管疾病之间存在密切的关联，本研究旨在探讨环境毒物暴露对心肌梗塞的影响，识别独立风险因素并通过十种机器学习算法，构建环境毒物暴露引起的心肌梗塞预测模型。

方法：本研究利用国家健康与营养调查（NHANES）数据，纳入了 5022 名成年参与者，其中 3517 名用于训练集，1505 名用于验证集。通过 1000 次 Lasso-Logistic 回归分析，最终筛选出 26 个常见环境毒物特征，进一步通过广义线性模型（GLM）算法筛选。本研究使用了 Treebag、Boruta、Random Forest、LVQ、Bayesian 等方法进行变量特征提取，并通过交集确定心肌梗塞的特征变量。随后，利用随机森林、TabPFN 等十种机器学习算法及 10 折内部交叉验证构建与环境暴露有关的心肌梗塞预测模型，并通过 ROC 曲线下面积（AUC）、灵敏度（Sens）、特异度（Spec）等指标评估模型性能。通过 TabPFN 模型变量的热图分析及 Shapley 加性解释法（SHAP）对特征重要性进行排序，并对最终模型进行解释。

结果：在纳入的 5022 名参与者中，通过 1000 次 Lasso-Logistic 回归分析，筛选出 26 个常见环境毒物特征，进一步通过广义线性模型（GLM）算法筛选，最终确定 10 个环境指标与心梗相关，这 10 个环境指标形成一个环境评分。我们使用了 Treebag、Boruta 等策略进行特征选择并取交集，最终确定的 7 个心肌梗塞独立风险因素包括年龄、吸烟、高血压、心血管疾病、平均细胞血红蛋白、高密度脂蛋白胆固醇和环境评分。剂量 - 反应关系分析显示环境评分与心肌梗塞患病风险的关联呈显著的线性关系（cutoff 值 1.454）。构建的 10 种机器学习模型中，TabPFN 模型在训练集（AUC=0.9096，95% CI：0.8965-0.9228）和验证集（AUC=0.9073，95% CI：0.887-0.9276）中表现最佳。特征对 TabPFN 模型的贡献通过平均 SHAP 值进行评估，显示顺序为：心血管疾病、年龄、环境评分、高血压、吸烟是预测模型中最重要的五个特征。

结论：本研究通过系统性分析揭示了环境毒物暴露对心肌梗死的影响，并构建了一个准确性较高的预测模型。这些发现为环境毒物暴露导致的心肌梗塞的早期诊断和干预提供了新的依据及价值。

人性化护理对老年心肌梗死患者心理状态及护理满意度的影响研究

冉力

重庆市荣昌区人民医院

目的：心肌梗死是常见的一种心血管疾病，常见于老年群体，冠状动脉粥样硬化

是老年心肌梗死的主要病因，患者精神上过度疲劳并且过于高度紧张为常见的诱发因素。患者主要表现有发热、胸骨后疼痛、头痛等，同时患者伴有心肌酶活性的增高，心电图进行性变化，病情严重时可出现休克、心律失常、心源性休克、心力衰竭等不良并发症，给患者的健康及生活质量造成严重威胁 [2]。心肌梗死患者由于受教育程度普遍不高、年纪较大等，因此常出现对治疗的不配合甚至抗拒，影响到后续治疗的效果，为改善此种现象，本研究选取 2019 年 1 月至 2020 年 1 月在我院进行治疗的心肌梗死老年患者 50 例，其中 25 例进行人性化护理干预，25 例进行常规护理，详细报道如下。

研究人性化护理对老年急性心肌梗死患者心理状态及护理满意度的影响。方法：选取 2019 年 1 月至 2020 年 1 月前来本院就诊的 50 例老年急性心肌梗死患者为研究对象，随机分为对照组和观察组，每组为 25 人。对照组实行常规护理，观察组则进行人性化护理干预，对两组患者心理状态和护理满意度进行分析比较。结果：护理前，两组患者的焦虑、抑郁评分无明显统计学差异（P>0.05），护理后，观察组焦虑、抑郁评分明显低于对照组，数据差异明显，有统计学意义（P<0.05）；对两组患者的满意度进行调查，观察组患者的满意度明显高于照组，差异显著（P<0.05）。 结论：对老年急性心肌梗死患者采取人性化护理干预，可对心理状态起到改善作用，减少患者不良情绪的发生，有助于促进护患和谐关系，进而提高患者满意度，值得推广应用。

关键词：人性化护理、老年、心肌梗死、满意度

冠心病患者护理中预见性护理程序的应用研究

钟晓菲

重庆市荣昌区人民医院

目的：冠心病是临床中常见的老年疾病之一，伴随人们生活质量的提高，冠心病发病率逐年提升，严重威胁中老年人的身体健康。有研究表明，通过对冠心病患者采取预见性护理干预措施，有利于促进患者恢复健康。所以，本次研究中，主要对 76 例患者进行分组研究，以观察两组的治疗有效率和护理满意度情况，探讨预见性护理在冠心病患者中的应用有效率及满意度。方法：以我院 2018 年 12 月至 2020 年 11 月收治的 76 例患者为研究对象，随机分成两组，即观察组与对照组，各 38 例。对照组接受常规护理，观察组接受预见性护理，比较分析两组的治疗有效率及护理满意度。结果：观察组冠心病患者的治疗有效率、护理满意度指标均显著高于对照组，差异有统计学意义（P < 0.05）。结论：冠心病是中老人的常见疾病之一，严重威胁其身体健康。近年来，人们生活水平的提高，导致其饮食等方面出现诸多不合理问题，致使冠心病的发病率呈逐年增长的趋势，降低人们的生活质量 [2]。就冠心病发病因素而言，主要有遗传、年龄、运动和饮食习惯等。预见性护理是一种有效的护理措施，通过有效应用，能够对患者加强心理护理、健康宣教、生活护理、病情监测等一系列护理工作，有利于从根本上提高护理效果，提高患者的护理满意度

。

心理护理在老年慢阻肺患者护理中的应用价值及护理满意度分析

叶敏

重庆荣昌区人民医院

目的 向老年慢阻肺患者开展心理护理，探究护理效果。方法从我院接收 (2019 年 6 月 ~2021 年 6 月) 的患者中抽取 so 例开展研究，以数字单双号法设置组别：参照组 (a=40) 和研究组 (α-40)，前组常规护理，后组增加心理护理，针对焦虑、抑郁评分和护理满意度进行比较。结果 研究组评分较参照组低，漏意度较参照组高，差异明显 (P<0.05)。结论　对老年假阻肺患者施以心理护理，可显著改善负面情绪，大幅提高护理满意度。

关键词：慢性胆塞性肺疾病以气流持续受限为基本特征，为气道慢性疾病，典型症状包括胸闷、喘息、咳嗽、咯痰、气促等，甚至是呼吸衰竭，严重危及患者生命健康 [1]。罹患此病主要人群为老年人，其体质衰弱，抗病能力低下，加之对疾病知识缺乏足够认知，疾病治疗期过长，很容易滋生焦虑、抑郁情绪，影响治疗效果，有必要加强护理。为探究有效护理模式，我院开展相关研究，报道如下。

1.1 一般资料

从 2019 年 6 月 ~2021 年 6 月在我院就诊的老年慢阻肺患者中抽取 80 例开展研究，以数字单双号法设置组别：参照组 (n=40) 和研究组 (n=40)，参照组：男，女性比例 23:17: 年龄范围 62~78(65.37±3.45) 岁。研究组：男、女性比例 24:16: 年龄范围 63~79(65.59±3.37) 岁。两组资料无统计学差异性 (P>0.05).

1.2 方法

参照组：常规护理，包括体征监测、饮食干预、用药辅导、康复训练等。

研究组：常规护理 + 心理护理。常规护理同参照组。心理护理内容如下：①情绪评估和对症胞治。根据患者的情绪表现对其情绪类型进行分析和评估，并找到出现该种情绪的原因，以便进行对症施治：若患者属于过度忧虑型，可通过健康宣教让其对致病机理、疾病主要症状、治疗方法、预期效果有一个全面的了解，提升其疾病认知，从而能够正视疾病；若患者属于冷淡低落型，可动员家属给予其更多陪伴和鼓励，让其培养一些兴趣爱好，重燃对生活的热情；若患者属于消极失望型，可多列举成功案例，使其建立治疗信心。②舒缓治疗。让患者通过冥想，听舒缓音乐、看轻松的电视节目、与人交谈等方式消除杂念、放松身心，转移注意力，保持心态平和，③有效沟通。a. 在与患者交流时，应多使用富有亲切感的称呼，如“爷爷”“奶奶”“叔叔”“阿姨”等，另外，还可以利用肢体语言如拍一拍患者的肩膀等与患者进行交流：b. 发自内心地以同情心、同理心认真倾听患者诉说，让其放心地将

心中的苦闷、烦恼宣泄出去，用激励性的语言对其进行安慰、劝导，让其真正感受到人文关怀。④家属支持。应及时将患者的治疗进展情况告知家属，叮嘱家属给予患者更多关心，支持，并对家属自身焦躁情绪进行安抚，保证患者具有强大的家庭支撑。

心理护理干预对老年心房颤动患者负面情绪的影响

韩小红

重庆市荣昌区人民医院

目的：探讨心理护理干预对老心房颤动患者负面情绪的影响。

方法：参照组应用常规护理：密切关注患者体征变化，向患者讲述疾病有关知识，给予对症处理。研究用心理护预以理员进行健康教育，向患者讲述疾病知识，包括治疗方法、方机制等。关注患者心理状态，对焦虑、抑郁综合评估，评估患者负性情绪，与患者沟通交流，了解其内心想法。结合实际情况制定教育方案，安排知识讲座，向患者发放知识手册。给予患者跟踪治疗，了解患者治疗过程与进展，向患者讲述检查重要性，告知其检查结构，强调注意事项，要求患者合理用药，重视用药。与患者分享经验，采用讲座、分享会方式，鼓励患者进行互相交流，分享经验，互相鼓励，共同面对疾病。给予患者社会疏导与支持，向患者讲述社会支持重要性，鼓励患者爱护与关心患者，与患者交流，促使患者归属感有效提高。以 84 例心房颤动患者为对象，研究时间为 2019 年 2 月 - 2020 年 2 月，分为参照组 42 例与试验组 42 例，参照组应用常规护理，试验组采用心理护理干预，对比治疗效果。

结果：试验组患者护理后 HAMA 评分、HAMD 评分更低，与参照组比较，P<0.05。研究组患者护理后 LVEDd、LVEF 均优于参照组，P<0.05。

结论：心房颤动患者实施心理护理干预，可消除负面情绪，改善患者的心功能，具有显著护理效果。心房颤动是临床常见的一种心律失常病症，其发病率随年龄的增长而增加，在年龄小于 60 岁的患者中，房颤的发生率约为 0.4%~1%，在年龄大于 80 岁的患者中发生率可达到 10%以上 [1]。心房颤动常见诱发因素包括心力衰竭、冠心病等心血管系统疾病，可引起后遗症、血栓并发症，预后效果不佳，具有较高的致残率与死亡率，对患者工作与生活产生影响，降低生活质量

Cardiovascular morbidity and mortality in patients with aortic valve calcification: A systematic review and meta-analysis

Kun-Yan Peng

Zigong First People's Hospital

Introduction: Aortic valve calcification (AVC) is an active process that involves inflammation, disorganization of matrix disposition, lipid accumulation and lamellar bone formation. AVC without hemodynamic changes has been associated with cardiovascular (CV) risk factors and increased risk of coronary and CV events. Nowadays, echocardiography is the standard imaging technique to evaluate aortic valve pathologies. However, cardiac computed tomography (CT) allows high accuracy and reproducible measurement of AVC, without exposing the patients to excessive radiation or contrast administration. To better understand if AVC assessment may improve CV risk-prediction, we performed a systematic search and meta-analysis of literature studies, evaluating the relationship among AVC, coronary artery disease (CAD), and overall mortality. **Methods:** This study systematically searched relevant literature published in China Knowledge, Wanfang Database, Wipu, SinoMed, PubMed, Web of Science, The Cochrane Library and Embase databases, using a combination of subject terms and keywords, as well as manually searching for studies and reviews that had already been published and retrieved by reviewing the The reference lists of the articles were searched manually to identify other literature as supplements. The time frame for the search was from the construction of the library to October 30, 2024. All steps of this review were conducted by two different collaborators and reviewed by a third collaborator in case of disagreement. to identify all available studies investigating AVC, measurement by CT scan, and CV events. RevMan 5.4 software was used for data analysis, interpretation of results, determination of heterogeneity, and processing of the included studies, and the overall effect was determined by the Z-test. When data analysis was performed, forest plots were plotted to test for heterogeneity, funnel plots were plotted to assess publication bias, and funnel plots were plotted to assess publication bias. The Q statistic and I^2 statistic were used to assess the heterogeneity among the included studies, and the fixed-effects model or random-effects model was selected according to the heterogeneity. When P ≥ 0.05 and households ≤ 50%, the heterogeneity among studies was considered to be within the acceptable range, and the data were combined using the fixed-effect model; when P<0.05 and households >50%, the heterogeneity among studies was considered to be large, and the data were combined using the random-effect model. The ratio of count data was used as the combined effect size. The 95% confidence intervals were calculated for each subgroup, and P<0.05 was considered statistically significant. In the presence of high heterogeneity in each subgroup, the included literature was removed one by one, and the heterogeneity I^2 and P values at each exclusion were recorded. **Results:** The final analysis included 14 studies of 3,891 AVC patients and 33,325 controls. Patients with AVC had a higher risk of CAD compared with controls (OR 1.8, 95% CI: 1.14-2.89; p = 0.03). We also found an association between AVC and coronary artery calcification (OR 3.9; 95% CI: 2.3-6.1; p < 0.001. Finally, the specificity of AVC for total mortality was 94.1% (95% CI: 93.1-93.7) with a negative predictive value of 98.7% (95% CI: 98.6-98.9). **Conclusion:** AVC is associated with coronary artery calcification and overall mortality. The present data cannot support the use of cardiac CT over echocardiography for AVC assessment in all patients,

but when cardiac CT is performed for suspected CAD, AVC evaluation may contribute to risk stratification and patient management. Ad hoc designed studies should address this issue in the next future.

老年心房颤动导管消融术中的“肥胖悖论”：高体重指数降低围术期并发症风险

罗蓓蓓 张果 胡薇

广西医科大学第一附属医院

目的：本研究旨在评估体重指数（BMI）对老年（≥ 60 岁）心房颤动（房颤）患者行心脏导管消融术后并发症风险的影响。 通过分析 BMI 及其他潜在因素（如年龄、合并症等）与术后并发症（总体及穿刺相关并发症）的关联性，识别术后并发症的独立预测因素，特别是探究 BMI 在术后并发症发生中的保护性或风险性作用。 本研究结果为构建老年房颤患者术前风险评估模型以及优化围手术期管理策略提供依据。

方法：回顾性纳入 2020 年 6 月 -2024 年 8 月在广西医科大学第一附属医院心血管内科接受房颤导管消融术且年龄≥60 岁的患者共 383 例，收集其人口学资料、BMI、基础疾病、实验室检查、术后并发症等临床数据。以住院期间是否发生术后并发症为结局，采用单因素分析及多因素 Logistic 回归分析术后并发症的相关影响因素。

结果：术后共 44 例患者发生至少 1 项并发症，并发症发生率为 11.49%。其中穿刺相关并发症 32 例（出血 10 例、血肿 18 例、假性动脉瘤 2 例、动静脉瘘 2 例）、肺部感染 23 例、尿路感染 6 例、、血栓形成 2 例、心包压塞 1 例。BMI 阈值敏感性分析（18.5-28kg/m^2），24 kg/m^2 是最佳分界。低 BMI 组（

结论：本研究表明，在行导管消融术的老年房颤患者中，存在显著的“肥胖悖论”现象：较高的 BMI（尤其≥ 24 kg/m^2）是术后总体并发症，尤其是穿刺相关并发症的独立保护因素，而较低的 BMI（

GLP1R/PCSK9/SGLT2 在钙化性主动脉瓣狭窄中的表达特征

程守全

徐州医科大学附属医院

目的

钙化性主动脉瓣狭窄（CAVS）是老龄化社会的重要心血管疾病负担，中国≥ 75 岁人群患病率达 3.4%。目前尚无有效药物治疗手段，而代谢性心血管病干预策略（如 PCSK9 抑制剂、SGLT2 抑制剂、GLP-1 受体激动剂）在延缓血管钙化中显示出潜力。本研究旨在探索 GLP1R/PCSK9/SGLT2 在人类 CAVS 瓣膜中的表达特征及其临床关联性。

方法

收集 2022 年 -2023 年徐州医科大学附属医院心脏外科手术切除的瓣膜标本，包括：主动脉瓣组（10 例，含钙化组 5 例 / 非钙化组 5 例）；二尖瓣组（13 例，含钙化组 5 例）；二叶式主动脉瓣亚组（钙化 vs 非钙化）。

通过免疫组化检测靶点表达（平均光密度值，MOD），结合临床资料（年龄、代谢指标、影像学数据）进行组间比较。统计学方法包括 Fisher 确切概率检验、独立样本 t 检验及 Mann-Whitney U 检验。

结果

1. 靶点表达特异性：主动脉瓣组 GLP1R、PCSK9、SGLT2 的 MOD 值高于二尖瓣组（P<0.05）。主动脉钙化组靶点 MOD 值较二尖瓣钙化组升高（P<0.05）。

2. 二叶式主动脉瓣特征：二叶式主动脉瓣钙化组 GLP1R/PCSK9/SGLT2 表达高于非钙化组（P<0.05），提示其对钙化更敏感。

3. 钙化与非钙化组比较：主动脉瓣钙化组与非钙化组间靶点表达无统计学差异（P>0.05）。钙化组高血压患病率低于非钙化组（P<0.05）。

结论

1. GLP1R/PCSK9/SGLT2 在 CAVS 患者主动脉瓣膜中特异性高表达，具有作为干预靶点的潜力。

2. 二叶式主动脉瓣畸形通过增强靶点表达加速钙化进程，是高风险亚组的分子标志。

3. PCSK9 抑制剂与 SGLT2i 可能延缓 CAVS 进展，需大样本临床试验验证。

4. 高血压与 CAVS 的负相关性需排除降压药物干扰后深入探索。

在老年 ASCVD 患者中，hsCRP 与 Lp(a) 何者对心血管事件风险的预测价值更优？

王浩宇 尹栋 窦克非

中国医学科学院阜外医院（国家心血管病中心）

背景： 在已确诊动脉粥样硬化性心血管疾病（ASCVD）的≥ 75 岁老年患者中，炎症与高脂血症对未来动脉粥样硬化血栓事件的风险贡献度相当。然而，高敏 C 反应蛋白（hsCRP）与脂蛋白 (a)［Lp(a)］作为主要不良心血管事件（MACE）风险决定因子的相对重要性尚未明确。

方法： 本研究于阜外医院前瞻性纳入 2,333 例≥ 75 岁的 ASCVD 患者，检测基线 hsCRP 与 Lp(a) 水平。主要终点为 MACE（包含全因死亡、心肌梗死、卒中或缺血驱动的冠状动脉血运重建）。

结果： 中位随访 3.0 年（IQR：2.5-3.2 年）期间共记录 293 例首发 MACE。hsCRP 和 Lp(a) 呈偏态分布（中位数分别为 1.8 mg/L [IQR: 0.9-4.4 mg/L] 和 19.3 mg/dL [IQR: 8.6-44.2 mg/dL]）。限制性立方样条（RCS）分析显示：hsCRP 与 MACE 风险呈线性正相关（总体关联 P=0.004，非线性 P=0.393），而 Lp(a) 无显著关联（总体关联 P=0.756）。

hsCRP 每升高 1 mg/L，MACE 风险显著增加 5%（校正风险比 [aHR]：1.05，95% CI：1.03-1.08，P<0.001）；最高 vs 最低四分位数组 aHR：1.70（1.22-2.38）。相反，Lp(a) 每升高 10 mg/dL 未显示显著关联（aHR：1.02，95% CI：0.98-1.06，P=0.341；最高 vs 最低四分位数组 aHR：1.06 [0.77-1.47]）。当 hsCRP ≥ 2 mg/L 时，无论 Lp(a) 分层如何，MACE 风险均显著升高（aHR: 1.41 [1.12-1.79]，P=0.004）。

hsCRP 与 Lp(a) 无显著交互作用（Lp(a) 连续变量交互 P=0.903；Lp(a) ≥ 30 mg/dL 阈值交互 P=0.635）。以 hsCRP=2 mg/L 和 Lp(a)=30 mg/dL 为界值分组显示：hsCRP ≥ 2 mg/L 且 Lp(a) ≥ 30 mg/dL 组 MACE 风险最高（较参照组 [hsCRP<2 mg/L 且 Lp(a)<30 mg/dL]aHR：1.54，95% CI：1.13-2.12，P=0.007）。

结论： 在≥ 75 岁的 ASCVD 患者中，hsCRP 评估的炎症指标对心血管事件的预测价值显著优于 Lp(a)。本研究为老年患者通过靶向抗炎策略进行 ASCVD 二级预防提供了真实世界证据支持。

营养风险对老年心功能不全患者住院期间简易运动能力的影响

康云鹏

首都医科大学附属北京安贞医院

目的 通过本研究判断存在营养风险对老年心功能不全患者在住院期间简易运动和体适能的影响，并进一步探讨多维度改善老年心血管疾病的方法。

方法 连续纳入病房收治的老年心功能不全患者 210 例，根据老年营养风险指数（GNRI）进行分组，GNRI 计算公式如下: GNRI=[1.489× 血清白蛋白（g/L）]+[41.7×（当前体质量（kg）/ 理想体质量（kg）]。本研究以 GNRI ≤ 98 定义为存在营养风险，GNRI > 98 为无营养风险。分为合并营养不良风险组 102 例和对照组 108 例，分析 2 组基线资料和住院期间体适能状况；根据 SPPB 分为体适能较差患者 165 例和体适能良好患者 45 例；采用二分类 logistic 回归分析导致 2 组患者院内体适能下降的主要影响因素。

结果 营养不良风险组的心功能不全患者椅子站立测试评分 [（2.15±0.82）分 vs（2.36±0.71）分，P=0.019]，简易机体功能总分明显低于对照组 [（7.24±1.68）分 vs（8.51±1.92）分，P=0.041]；女性握力水平低于对照组 [（16.65±4.13）kg vs（18.89±3.24）kg，P=0.047]；与体适能良好患者比较，体适能较差患者年龄更大，血 BNP 水平更高，血清白蛋白水平、GNRI 分值、LVEF 值更低（P 均 < 0.05）。二分类 logistic 回归分析显示：BNP 升高（OR 1.003，95%CI:1.001--1.005,P < 0.001）、营养不良风险（OR 2.642，95%CI:1.248--5.591,P=0.011）是影响老年 HFrE 心功能不全患者住院期间简易运动评分减低的主要危险因素。

结论 存在营养不良风险是导致老年心功能不全患者住院期间体适能下降的独立危险因素。

Exploring the Potential Mechanisms of GABA in Treating Abdominal Aortic Aneurysm through Network Pharmacology and Experimental Validation

Lu-Zhe Huang[1], Jun-Xing Zhu[1,2]

1. Qingtian People's Hospital

2. The Second Affiliated Hospital of Anhui Medical University

Abstract

Objective: To systematically identify potential targets of γ-aminobutyric acid (GABA) in treating abdominal aortic aneurysm (AAA) and explore its key mechanisms by integrating network pharmacology with experimental validation.

Methods: Common targets of GABA and AAA were screened via network pharmacology, followed by the construction of a protein-protein interaction (PPI) network. GO/KEGG enrichment analyses were performed to predict critical pathways. An in vivo AAA model was established in Sprague-Dawley (SD) rats using elastase combined with calcium chloride. Rats were divided into sham, model, GABA (100 mg/kg/d), and GABA + bicuculline (a GABA-A receptor antagonist) groups. Histopathology, Western blot (WB), and gelatin zymography were used to evaluate GABA's effects on extracellular matrix (ECM) degradation and signaling pathways.

Results: Network pharmacology identified 111 common GABA-AAA targets. PPI analysis revealed AKT1 as the most significant target (Degree: 58). KEGG enrichment highlighted the PI3K/AKT pathway as the most prominent signaling pathway ($P < 0.01$). GO analysis indicated that GABA exerts pharmacological effects primarily by regulating ECM degradation, amino acid metabolism, and apoptosis. In vivo experiments demonstrated that GABA significantly reduced AAA formation rate (model: 100% vs. GABA: 33%, $P < 0.01$) and aortic diameter expansion rate (model: 158.21±92.00% vs. GABA: 44.07±20.97%, $P < 0.01$). Histologically, the GABA group exhibited preserved vascular wall integrity with reduced degradation of elastic and collagen fibers compared to the model group ($P < 0.05$). Gelatin zymography and WB revealed that the GABA group exhibited significantly lower PI3K/AKT phosphorylation levels and reduced MMP2/9 expression/activity compared to the model group ($P < 0.05$). Importantly, the GABA-A receptor antagonist bicuculline significantly reversed these effects ($P < 0.05$).

Conclusion: GABA may regulate the PI3K/AKT signaling pathway through the GABA-A receptor, reducing extracellular matrix degradation and thus delaying the progression of abdominal aortic aneurysm.

Background:

The triglyceride-glucose (TyG) index, which is a simple surrogate marker of insulin resistance, has been suggested as a contributor of cardiovascular disease (CVD). However, few studies investigated whether the combination of TyG index and arterial stiffness status can better predict the incidence of CVD.

Methods:

A total of 32176 participants without CVD at baseline were enrolled from the Kailuan study. We measured AS by brachial-ankle pulse wave velocity and other cardiovascular risk factors in a community-based population. The participants were allocated to four groups according to their TyG and baPWV status. The end point was a composite of stroke, myocardial infarction, and heart failure. Using Cox proportional hazard model to calculate hazard ratios (HRs) with 95% CIs, we compared the end point between individuals with normal TyG and baPWV, elevated TyG and normal baPWV, normal TyG and elevated baPWV, elevated TyG and baPWV. Multiplicative interaction effects were further estimated. Meanwhile, subgroup analysis was performed to investigate the prediction performance among different population.

Results:

During a median 5.8-year follow-up, 1,448 incident CVD cases were documented. Compared with the reference group (normal TyG and baPWV), the cumulative incidence of CVD in the groups with solely elevated TyG, solely elevated baPWV, and elevated TyG and baPWV showed a trend to increase. The incidence densities for each group were 1.43, 3.13, 8.66, 14.09 per 1000 person-years, respectively. Compared to the group with normal TyG and baPWV, the adjusted hazard ratios (95% confidence intervals) for CVD events were 1.42 (1.07–1.88) for elevated TyG alone, 2.09 (1.62–2.69) for elevated baPWV alone, and 2.97 (2.33–3.80) for both elevated TyG and baPWV. Similar trends were observed for CAD (1.97 [1.20–3.23], 2.41 [1.51–3.86], and 3.63 [2.31–5.70]), stroke (1.16 [0.78–1.72], 1.87 [1.33–2.63], and 2.76 [1.99–3.84]), and HF (1.04 [0.53–2.06], 1.90 [1.18–3.05], and 2.13[1.31–3.45]). Kaplan–Meier survival curves further demonstrated that the cumulative incidence of CVD increased with elevated TyG, elevated baPWV, and both elevated TyG and baPWV (all log-rank $P < 0.05$). In the subgroup and sensitivity analyses, our data showed similar results. The interaction analysis revealed a significant additive interaction between TyG and baPWV (RERI: 2.68, 95%CI: 1.64-3.72; AP:0.27, 95%CI: 0.18-0.36; SI:1.43, 95%CI: 1.23-1.65), indicating that their coexistence confers a supra-additive CVD risk.

Conclusions:

In conclusion, the individuals with elevated TyG and baPWV had a much higher risk than the other groups. The joint assessment of TyG and arterial stiffness enhances the predictive capability for CVD. Combined control of TyG and arterial stiffness may help reduce the risk of CVD.

Association between preoperative triglyceride-glucose index and the risk of short-term aortic adverse events after thoracic endovascular aortic repair

Xuan Wu[1,2], Ting-Hao Zhao[1], Hou-Lin He[1], Ya-Song Wang[1], Xiao-Zeng Wang[1]

1. General hospital of northern theater commander

2. Graduate school of china medical school

Background: Thoracic endovascular aortic repair (TEVAR) is a mainstay minimally invasive treatment for thoracic aortic pathologies, including aneurysms and dissections. Despite reducing mortality compared to open surgery, short-term aortic adverse events (AAEs), such as endoleaks, stent migration or rupture occurring within the first year post-procedure remain significant causes of morbidity, mortality, and rehospitalization. Accurate preoperative identification of patients at high risk for these AAEs is therefore crucial for optimizing perioperative management and improving outcomes. Current risk assessment for TEVAR relies on factors like age, comorbidities (e.g., hypertension, diabetes), and aortic anatomy; however, these predictors have limitations in consistently forecasting short-term AAEs. Insulin resistance (IR), a key component of cardiometabolic dysregulation implicated in endothelial dysfunction and vascular inflammation, represents a potential but underexplored risk factor. The triglyceride-glucose (TyG) index, calculated as Ln[fasting triglycerides (mg/dL) × fasting glucose (mg/dL)/2], is a well-validated, accessible surrogate marker for IR, with elevated levels strongly associated with the development and adverse outcomes of atherosclerotic cardiovascular diseases. Within TEVAR, the specific impact of preoperative metabolic status, particularly IR assessed via the TyG index, on short-term outcomes after TEVAR is poorly understood. While conventional understanding suggests that IR, signified by a high TyG index, would confer increased risk for vascular complications due to its detrimental effects on vascular biology, direct evidence linking the preoperative TyG index specifically to short-term (≤ 1 year) AAEs post-TEVAR is notably scarce, leaving the nature and independence of this potential association unclear and representing a critical knowledge gap. Therefore, investigating the relationship between the preoperative TyG index and the incidence of short-term AAEs following TEVAR is essential. Elucidating this link could not only advance our understanding of metabolic influences on post-repair aortic healing and complication mechanisms but also potentially identify a novel, readily available biomarker for perioperative risk stratification to enhance clinical decision-making, allowing for targeted preventative strategies in high-risk patients undergoing TEVAR. This study was specifically designed to address this gap by examining the association between the preoperative TyG index and the occurrence of AAEs within one year after TEVAR.

AIM: To investigate the relationship between the preoperative triglyceride-glucose index (TyG index) and short-term aortic adverse events (AAEs) after thoracic endovascular aortic repair (TEAVR).

Methods: The retrospective study included 1017 patients with aortic disease who underwent TEVAR at the General Hospital of Northern Theater Command from April 2002 to November 2023 and were successfully followed up for 1-year. TyG index cut-off values were selected using the maxstat package of R, and patients were divided into low TyG index (≤ 8.45) (TyG-Low) and high TyG index (>8.45) (TyG-High). General information, medical history, surgical characteristics and survival data were compared between the two groups. The Kaplan-Meier method and the multivariate Cox proportional hazards Model were used to analyze the relationship between TyG index and short-term AAEs after TEVAR. The robustness of the results was tested using stratified analyses.

Results: Among 1017 patients, a total of 125 patients experienced AAEs during the 1-year follow-up period. The COX proportional hazards model suggested that the occurrence of AAEs at 30-day, 90-day, 180-day and 1-year postoperatively was negatively correlated with the TyG index (P□0.05), and this result remained statistically significant after adjustment for possible confounders (P□0.05). According to the Kaplan-Meier curve, patients in the high TyG index group had lower rates of AAEs at 30-day, 90-day, 180-day and 1-year (P □0.05) respectively.

Conclusions: In this study, it was found that a high preoperative TyG index (TyG index>8.45) was associated with a low incidence of AAEs after TEVAR. This finding challenges the conventional perception of the TyG index as a pure IR marker and suggests its value in perioperative risk assessment for TEVAR

An Aqueous Extract of Radix Astragali, Angelica sinensis, and Panax notoginseng protected brain microvascular endothelial cell from hypoxic damage via PI3K/Akt/eNOS Pathway

Wen-Ting Chen[1,2], Cao-Xin Huang[2], Min-Yi Liu[2], Xi-Lin Ge[2], Jia Li[2], Su- Liu[2], Shu-Yu Yang[2]

2. The First Affiliated Hospital of Xiamen University

Cerebral microvascular disease, such as stroke, Alzheimer's disease and vascular dementia, is the important cause of mortality and morbidity worldwide . Brain microvascular endothelial cell is the main element of cerebral microvascular and could form the blood brain barrier (BBB), which is a distinctive structure of the cerebrum, with astrocytes and pericytes to maintain the brain homeostasis. Mounting evidences have revealed that the brain microvascular endothelial cells function not only as anatomical and physical barriers, but also as a metabolic system that could synthesize a variety of nerve growth factors and adjust the diastolic and systolic function of blood vessels. Thus, the damage of brain microvascular endothelial cells is closely related to cerebral microvascular disease. Hypoxia is considered as a key contributing factor to cerebral microvascular disease. A previous study has shown that hypoxia could inhibit vessel formation in cultured brain endothelial cells.

The phosphatidylinositol 3 kinase (PI3K)-protein kinase B (Akt) signaling pathway plays a key role in cell proliferation and survival. Endothelial nitric oxide synthase (eNOS), an important downstream target of PI3K/Akt signaling pathway activated by phosphorylated Akt, is widely expressed in endothelial cells and involved in mitigating ischemia-induced brain injury and endothelial cell survival and proliferation.

Dang Gui Bu Xue Tang (DBT) consisting of two common herbs, Radix Astragali and Radix Angelica sinensis at a ratio of 1:5, has been extensively employed in traditional Chinese medicine to treat menstrual anemia, cardiovascular disease and tumors. Radix Astragali can protect the cells and tissues from oxidative stress. Radix Angelica sinensis is also protective in endothelial cells with robust anti-oxidant activity. Recently, some researches have modified DBT to develop its potential to treat other diseases. As an important traditional Chinese medicine, Panax notoginsenoside has shown a variety of beneficial effects including neuroprotective, anti-inflammation and anti-apoptosis as a prominent free radical-scavenger and efficient antioxidant. Therefore, we optimized Dang Gui Bu Xue Tang (DBT) with addition of Panax notoginsenoside and developed an aqueous extract of Radix Astragali, Radix Angelica sinensis, and Panax notoginseng (RRP) with the functions of nourishing blood, dispersing blood stasis and dredging collateral. In our previous study, we have reported the protective effect of RRP in preventing the diabetic retinopathy, one of the most common microvascular disease. Because of the high energy requirements render the brain more vulnerable to hypoxic conditions, it would be more necessary to determine how brain microvasculature responds to hypoxia and the therapeutic approach. In the present study, we further investigated the potential effects of RRP in protecting brain microvascular against hypoxia stimulation caused by $CoCl_2$ treatment by measuring cell proliferation, survival and protein expressions of PI3K/Akt/eNOS signaling pathway.

We optimized it to be an aqueous extract of Radix Astragali, Radix Angelicasinensis, and Panax notoginseng (RRP), with addition of Panax notoginseng, with the functions of dredging collateral and dispersing blood stasis. We explored the protect effect of RRP in bEnd.3 cells, a brain microvascular endothelial cell-line, exposed to hypoxia and investigated the possible mechanisms. We stimulated bEnd.3 cells with Cobalt chloride ($CoCl_2$), a hypoxia mimetic agent, to induce hypoxia effect in vitro. RRP-Containing Serum (RRP-CS) was further applied to the $CoCl_2$-treated cells. We demonstrated that RRP-CS could protect bEnd.3 from hypoxic damage induced by $CoCl_2$. Furthermore, the activity of PI3K/Akt/eNOS signaling pathway inhibited by hypoxia also was restored by RRP-CS. However, the protective effects of RRP-CS were inhibited by LY294002, a PI3K inhibitor. In conclusion, our study shows that RRP protect bEnd.3 from hypoxic damage dependent on its capacity to modulate the PI3K/Akt/eNOS signaling.

腹主动脉瘤覆膜支架植入术后反复发热一例

俊

马鞍山市人民医院

[摘要] 腹主动脉瘤支架植入术后感染是支架植入术后的致死性并发症之一，虽然发病率较低，但是其死亡率极高。这篇文章报道一例腹主动脉瘤术后 2 月后反复发热，完善血培养、GNS 及 PET-CT 等检查，最终诊断考虑血管移植物或腔内移植物感染（vascular graft/endovascular graft infection，VGEI），给予 6 周长程抗生素治疗后，未再出现发热、康复出院。拟通过深入分析该病例的诊断依据、发病机制及诊疗过程，旨在为临床工作中救治此类患者提供参考。

分期运动管理模式在促进主动脉夹层腔内隔绝术患者康复中的应用研究

张璐

陆军军医大学第二附属医院新桥医院

【摘要】目的 探讨主动脉夹层腔内隔绝术患者在早期康复中采用分期运动管理模式的临床研究及意义。**方法** 选取陆军军医大学新桥医院心血管内科，选择 2023 年 1 月 ~ 2023 年 7 月在我院行主动脉夹层腔内隔绝术患者 50 例为对照组，其中男 34 例，女 16 例，年龄 46-81 岁；2023 年 8 月 ~ 2024 年 3 月行主动脉夹层腔内隔绝术患者 50 例为观察组，其中男 31 例，女 19 例，年龄 51-78 岁。对照组实施常规护理；观察组在对照组的基础上，对主动脉夹层腔内隔绝术患者进行运动风险评估，根据评估结果制定分期运动管理方案，为患者推送主动脉夹层腔内隔绝术患者分期运动指导视频，并定期指导患者进行分期运动。**结果** 干预后，观察组患者 AT、VO_2max、O_2pulse、最大运动时间、LVEF 较干预前增高，观察组明显高于对照组；观察组患者 SF - 36 量表评分较干预前增高，观察组明显高于对照组；卧床时间、住院时间、并发症发生率，观察组均明显低于对照组，差异有统计学意义 (P < 0.05)。**结论** 根据主动脉夹层动脉瘤患者的疾病不同时期特点，采用分期运动管理模式，协助患者早期活动，避免发生压力性损伤，防止尿路感染，预防深静脉血栓形成，保持呼吸道通畅降低肺部感染可能性，促进患者生理、心理、社会功能恢复，早日康复出院。

Cytoskeletal-related genes function as checkpoints for the maintenance of VSMC contractile phenotype and prevent pathological remodeling in arterial diseases

Daping Hospital of Army Medical University

Cytoskeletal-related genes function as checkpoints for the maintenance of VSMC contractile phenotype and prevent pathological remodeling in arterial diseases

Abstract

Introduction: The complexity of vascular smooth muscle cell (VSMC) biology is an emerging aspect of atherosclerosis-based cardiovascular disease. The phenotype switching of VSMCs, which includes dedifferentiation, proliferation, migration, and trans-differentiation into other cell types, is considered to be an important pathological process in vascular-related diseases. Understanding how the transcriptome of the synthetic phenotype differs from the contractile phenotype in pathological conditions may help to gain a panoramic view of this transition, especially in the initial stages of the pathological process. By utilizing the SMC genetic lineage tracing model in mice, the fate of SMCs and SMC-derived cell types can be traced in arterial disease lesions. Single-cell RNA-seq is an excellent tool to get a glimpse on how gene expression varies among cell clusters, especially in a process with potential transition ability. Taking these processes into consideration, we can explore how the VSMC phenotype-switching takes place by comparing transcriptome changes to understand additional artery disease risk factors that may contribute to the development of new treatment modalities. Although many studies have focused on the integration analysis of inflammatory cells in vascular disease lesions, few have focused on the contribution of component cells.

Objectives: we built an integrative model involving the results of studies on atherosclerosis and aneurysm samples from humans and miceTo construct a cross-species integrative model of VSMC transition in arterial diseases including atherosclerosis and aortic aneurysm, identify key genes regulating phenotypic switching in the trajectory from contractile to other phenotypes, and further validate their function in arterial remodeling models. Our ultimate aim is to uncover less understood driving forces that promote VSMC phenotype switching.

Methods: Public single-cell RNA-seq datasets were analyzed to map VSMC transcriptional dynamics and identify regulated gene expression patterns during transition. The changes were further checked using experimental animal aneurysm samples and PDGF-BB treated VSMCs. Functional validation included in vitro siRNA-mediated knockdown using primary VSMCs and in vivo gene-manipulated (AAv shRNA/Adv-overexpression) wire-injury models.

Results: We found significantly altered expression patterns in genes related to the cytoskeleton, namely Synpo2, Fblim1, and Tns1. To verify the functional importance of these genes, we conducted experiments using both in vivo and in vitro samples to validate expression changes. siRNA knock-down of these genes in primary cultures of VSMCs reduced contractile gene expression, enhanced proliferation, migration, and disrupted cytoskeleton architecture in VSMCs. In animal models, gene down-regulation exacerbated pathological remodeling while over-expression, using a cocktail strategy that manipulated these three genes, partially reverted these effects. These results indicated a critical role of cytoskeleton-related genes in the maintenance of the contractile VSMC phenotype in the progression of vascular pathological remodeling.

Conclusion: The findings highlight the critical role of cytoskeleton-related genes in arterial diseases that function as a critical checkpoint in preventing VSMC pathological phenotypic switching. In future studies, we suggest employing single-cell RNA-seq technology and trajectory analytic methods, as well as adequate batch effect correction algorithms, to establish a more comprehensive model to determine gene-mediated regulation of cell phenotype.

使用数据独立的采集质谱法识别结节性多动脉炎的候选生物标志物

马慧敏

新疆维吾尔自治区人民医院

目的：结节性多动脉炎（Polyarteritis nodosa, PAN）是一类以中小动脉广泛炎症及坏死性病变为特征的自身免疫性疾病，常导致多系统受累，导致显著的功能障碍。因此对 PAN 的及时准确诊断以及迅速治疗可显著减轻其严重程度并改善患者预后。

方法：本研究采用数据非依赖采集质谱（data-independent acquisition mass spectrometry, DIA-MS）技术对 PAN 患者和健康对照组（HC）的的血清样本蛋白组进行高通量、无偏的系统分析。共鉴定出 55 种差异蛋白。在验证集中，我们对 35 例血清样本（10 例健康对照，15 例其他疾病患者，10 例 PAN 患者）进行了后续 DIA-MS 分析，以评估所鉴定生物标志物的诊断潜力。

结果：在 PAN 患者中，有 18 种蛋白的表达水平与对照组相比存在显著差异。通过 LASSO 二元逻辑回归模型，我们筛选出由 AZGP1、F13B、LBP、RBP4、SERPINF1、PGLYRP2 和 PPBP 组成的生物标志物面板，该面板能够有效区分病例与对照，ROC 曲线下面积（AUC）达到 0.994。

结论：利用 DIA-MS 技术结合 LASSO 二元逻辑回归模型，我们开发了一种由 7 种蛋白组成的诊断面板，显著提高了 PAN 诊断的准确性和速度。

Ferroptosis Inhibition Suppresses Experimental Abdominal Aortic Aneurysm Formation by Attenuating Macrophage-Mediated Inflammation

Liping Zeng

Daping Hospital of Army Medical University

Ferroptosis Inhibition Suppresses Experimental Abdominal Aortic Aneurysm Formation by Attenuating Macrophage-Mediated Inflammation

abstract

Background: Cardiovascular diseases (CVDs) account for 32% of global deaths. Abdominal aortic aneurysm (AAA) affects 4-8% of men over 65 and carries a mortality rate exceeding 80% upon rupture, yet pharmacotherapies remain absent due to incomplete mechanistic understanding. Pathological hallmarks include: 1) VSMC apoptosis (>80% loss in ruptured AAA); 2) Elastin fragmentation by MMP-9/12; 3) Chronic adventitial inflammation dominated by macrophages. While inflammation drives AAA progression, attempts to suppress it broadly (e.g., anti-IL1β in MILES trial) failed clinically, suggesting cellular heterogeneity in inflammatory responses. Ferroptosis—a lipid peroxidation-driven cell death—has emerged as a key process in neurodegeneration and cancer, but its vascular implications are unexplored. Distinct from apoptosis, ferroptosis depends on iron-catalyzed phospholipid peroxidation and is morphologically characterized by shrunken mitochondria with ruptured outer membranes. Our integrated transcriptomics revealed selective ferroptosis pathway enrichment in AAA macrophages (not VSMCs or ECs), coinciding with elevated iron deposition in human AAA tissue (Prussian blue staining). Given macrophages generate 90% of plaque ROS and express lipid peroxidation enzymes (ALOX15/GPX4), we posited that ferroptosis might amplify inflammation through macrophage-derived DAMPs (e.g., HMGB1), creating a feedforward loop of wall degradation.

Methods: Published scRNA-seq data were integrated, subjected to dimensionality reduction, and visualized through clustering. Cell types were annotated based on classical marker genes. Differential gene expression analysis was performed between AAA and control specimens for each cell type. Ferroptosis susceptibility scores across cell types were assessed using gene set scoring tools. An in vivo experimental AAA model was established, and relevant indicators (malondialdehyde (MDA), transmission electron microscopy (TEM), glutathione/oxidized glutathione (GSH/GSSG) ratio) were measured. The effect of the ferroptosis inhibitor ferrostatin-1 (Fer-1) on AAA formation was evaluated. Bulk RNA sequencing was employed to determine changes in cellular composition within tissues and identify cell types associated with ferroptosis susceptibility.

Results: Integrated single cell RNA sequencing analysis revealed a significant increase in the ferroptosis susceptibility score specifically within macrophages in AAA specimens. Inhibition of ferroptosis using Fer-1 significantly reduced AAA formation. Integration of scRNA-seq and bulk RNA-seq data indicated a significantly increased proportion of macrophages in the AAA group.

Conclusion: This study establishes ferroptosis as a previously unrecognized pathogenic mechanism in AAA, with macrophage-specific vulnerability driving disease progression. We identify macrophage ferroptosis as a pivotal amplifier of AAA pathogenesis through interconnected mechanisms and the ferroptosis inhibitor Fer-1 demonstrates potent efficacy in preserving aortic structural integrity, primarily through: Attenuating lipid peroxidation cascade; Reducing inflammatory macrophage infiltration; Preventing mitochondrial damage. Given the absence of medical

therapies for AAA, targeting ferroptosis represents a promising strategy for early intervention. Ferrostatin analogs or macrophage-specific GPX4 activators warrant clinical development, particularly for high-risk patients with small AAAs (3.0-5.4 cm diameter). Future studies should explore whether circulating ferroptosis biomarkers (e.g., plasma MDA) could serve as non-invasive predictors of AAA expansion. Future work must clarify: 1) How extracellular matrix stiffness regulates macrophage ferroptosis susceptibility; 2) Whether endothelial ferroptosis contributes to intra-luminal thrombus formation. This work positions ferroptosis inhibition as a first-in-class strategy targeting the upstream driver of AAA inflammation.

Dual Receptor Crosstalk: AT1R and Integrin β3 Synergize to Drive Aortic Dissection via Non-Canonical Wnt/β-Catenin Signaling

Hong-Cheng Jiang, Zi-Xuan Liu, Xiao-Dan Zhong, Hong-Jie Wang, He-Song Zeng

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: Aortic dissection (AD) is a life-threatening cardiovascular emergency with high mortality due to the lack of effective therapeutic options. Current pharmacological interventions, including angiotensin-converting enzyme inhibitors (ACEi) and angiotensin receptor blockers (ARBs), have demonstrated limited efficacy in mitigating AD progression. Composed of 18 α- and 8 β-subunits, functionally distinct integrin heterodimers are transmembrane receptors bridging the cells and extracellular matrix (ECM) and help cells cope with various internal and external perturbations. Among these, integrin αvβ3, which is a prominent RGD-binding receptor, orchestrates endothelial cells (ECs) survival, angiogenesis, and matrix remodeling. Here, we investigate the role of integrin β3 in AD pathogenesis through complementary clinical, experimental, and mechanistic approaches.

Methods: Utilizing an integrated approach, we first employed single-cell RNA sequencing (scRNA-seq) to profile the aortic transcriptomes of AD patients, identifying aberrant pathway during AD progression. Male 6-week-old ApoE$^{-/-}$ mice were administrated with β-aminopropionitrile (BAPN, 1g/L) in the drinking water for 3 weeks followed by 2500 ng/kg/min Angiotensin II (AngII) subcutaneous pump for 2 weeks to induce AD. Histology, immunohistochemistry and immunofluorescence were applied in human AD specimens and murine models to confirm key molecular changes. Functional assessment was conducted using a selective integrin β3 inhibitor (Cyclo-RGDfK) in AngII-infused mice to evaluate its impact on AD incidence, aortic remodeling, and endothelial integrity. Mechanistic insights were derived from co-immunoprecipitation (Co-IP), confocal microscopy, and transcriptomic profiling to delineate receptor interactions and downstream signaling cascades.

Results: scRNA-seq revealed a significant upregulation of integrin β3 activation, particularly in ECs, during the acute phase of AD. Immunofluorescence analysis confirmed marked upregulation of activated integrin β3 in aortic ECs of both human patients and murine AD models. Pharmacological blockade of integrin β3 with Cyclo-RGDfK significantly attenuated aortic degeneration, reduced AD incidence, and preserved endothelial barrier integrity in vivo. To assess whether integrin β3 inhibition protects ECs, we analyzed inflammatory markers in the aorta of AD mice. Cyclo(-RGDfK) treatment significantly reduced endothelial activation markers ICAM-1 and VCAM-1, as well as oxidative stress indicators NOX2, NOXO2, and NOXA2. Consistently, Cyclo(-RGDfK) reduced apoptosis, as indicated by decreased cleaved caspase-3 expression. Mechanistically, AngII-induced AT1R activation triggered the formation of a receptor complex with integrin β3, inducing its conformational activation. To delineate downstream pathways involved in integrin β3-mediated endothelial injury, we performed RNA sequencing (RNA-Seq) analysis in integrin β3 knockdown ECs. KEGG pathway enrichment analysis and gene set enrichment analysis (GSEA) identified significant alterations in the Wnt signaling pathway, implicating Wnt dysregulation in integrin β3-driven endothelial dysfunction. Through CO-IP and Western blot we indentified that activated integrin β3 then bound glycogen synthase kinase 3β (GSK3β), stabilizing β-catenin via inhibition of its degradation.

Conclusion: In this study, we identify integrin β3 as a novel pathogenic driver of AD and elucidate a previously unrecognized crosstalk between AT1R and integrin β3 in mediating endothelial dysfunction. Mechanistically, we demonstrate that AT1R activation enhances integrin β3 signaling, which in turn triggers non-canonical Wnt pathway activation via GSK3β interaction, ultimately leading to endothelial cell injury and aortic wall degeneration . These findings highlight a novel therapeutic target for AD and advocate for a dual-target approach involving both AT1R and integrin β3 inhibition.

STUB1 orchestrates mineralocorticoid receptor activation to promote aortic dissection

Hong-Cheng Jiang, Zi-Xuan Liu, Xiao-Dan Zhong, Hong-Jie Wang, He-Song Zeng

Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology

Background: Aortic dissection (AD) is a critical cardiovascular condition with few treatment options available. Research indicates that elevated aldosterone levels are linked to an increased risk of AD, suggesting the involvement of mineralocorticoid receptor (MR) activation in its pathogenesis. This study aimed to elucidate the underlying molecular mechanisms and identify potential therapeutic targets.

Methods: Human AD tissue and blood samples were freshly obtained from patients undergoing open surgical repair procedures and age-matched aorta and blood samples obtained from heart transplant or aortic valve replacement donors were used as controls. To investigate the activation of MR in AD, C57BL/6N mice were employed to establish BAPN-induced AD model. Briefly, 18 male C57BL/6N mice at the age of 4-week-old were divided into 2 groups, 12 mice were given the drinking water supplemented with 3 g/L BAPN to induce AD, and others were fed with normal drinking water to serve as control. To investigate whether aldosterone contributes to the occurrence of AD, 4-week-old male C57BL/6N mice were randomly divided into four groups, which received the following treatments: normal drinking water combined with saline pump or 600 μg/kg/d aldosterone pump, and 2 g/L BAPN combined with saline pump or 600 μg/kg/d aldosterone pump. Plasma aldosterone levels were quantified using ELISA, and MR activation was evaluated in aortic tissues. Integrated bioinformatics analyses identified the E3 ubiquitin ligase STUB1 as a crucial regulator of MR activation in vascular smooth muscle cells (VSMCs). To assess the role of STUB1 in AD development, mice with specific STUB1 depletion in VSMCs were generated. We also investigated the downstream effects of MR activation on gene expression, oxidative stress, and apoptosis. The therapeutic potential of MR inhibition was examined by administering spironolactone (SPL) to AD mice at varying doses.

Results: Elevated plasma aldosterone levels and increased MR activation were observed in both AD patients and mice. Sustained aldosterone infusion further promoted AD onset and progression. STUB1 facilitated MR activation through K63-linked ubiquitination and subsequent its nuclear translocation in VSMCs. VSMCs specific knock out of STUB1 was found to alleviate the progression of AD in vivo. Meanwhile, we found that VSMCs-specific STUB1 depletion inhibited MR nuclear translocation in aortic SMCs, maintaining MR localization in the cytoplasm. Mechanistically, we conducted bioinformatic analysis of three independent datasets from BAPN-induced AD mice and MR overexpression or knockout models, which identified matrix metalloproteinase 3 (MMP3) and 2-oxoglutarate dehydrogenase (OGDHL) as potential downstream targets of nuclear MR. Validation experiments revealed that MR knockdown decreased Mmp3 expression while increasing Ogdhl levels, whereas MR overexpression exhibited the opposite effects. Furthermore, STUB1 knockdown attenuated MMP3 expression and upregulated OGDHL in Ang II-stimulated MOVAS cells, and vice versa. To evaluate the therapeutic efficacy of the MR inhibitor SPL on AD development in vivo, BAPN-induced AD mice were treated with SPL (1 or 5 mg/kg/day), and results revealed that BAPN-induced dilation and dissection were significantly ameliorated by SPL treatment at both dosages, and SPL treatment restored aortic structure, decreased both the incidence of AD and the maximum aortic diameter.

Conclusion: Our study demonstrates that the upregulation of STUB1-mediated K63-linked ubiquitination of MR promotes its nuclear translocation and transcriptional activity. This nuclear MR activation drives the expression of downstream targets, MMP3 and OGDHL, which contribute to ECM degradation, oxidative stress, and VSMCs apoptosis. Importantly, inhibition of MR activity, either through genetic depletion of STUB1 in VSMCs or pharmacological inhibition with the MR antagonist SPL, effectively attenuates these deleterious effects and protects against AD.

C57BL/6J 背景小鼠静脉注射 PCSK9 功能获得突变对血管紧张素 II 诱导的 AAA 的影响

张蕾

山东大学齐鲁医院

目的：本研究旨在比较静脉注射和腹腔注射 AAV8.mPCSK9D377Y 在 C57BL/6J 背景的野生型（WT）小鼠中血管紧张素 II（Ang II）诱导的腹主动脉瘤（AAA）的发生率，以及上述模型在 WT 和 ApoE-/- 小鼠中的病理差异。

方法：雄性野生型小鼠经腹腔或静脉注射 AAV8.null 或 AAV8.mPCSK9D377Y。注射两周后，所有野生型小鼠均输注 Ang II，同时年龄匹配的雄性 ApoE-/- 小鼠输注生理盐水或 Ang II 4 周。小鼠分组：① ns-ip 组；② ns-iv 组；③ ApoE-/- -con 组；④ p-ip 组；⑤ p-iv 组； ⑥ ApoE-/- -Ang II 组。实验进程中测量小鼠体重、血压；采血分离血清，测血脂及肝肾功；测量小鼠腹主动脉的最大血管直径；行 HE 染色观察血管形态；Verhoeff 染色评估腹主动脉弹力纤维的完整性；Masson 染色检测胶原含量及胶原 I 、胶原III、MMP2、MMP9 及巨噬细胞 CD68 免疫组化染色。

结果：与腹腔注射 AAV8.mPCSK9D377Y 用于 WT 小鼠 AAA 模型相比，静脉注射 Ang II 诱导的 AAA 发生率更高，血压和脂质浓度升高，胶原蛋白沉积降低，炎症反应上调，这与输注 Ang II 的 ApoE-/- 小鼠相似。

结论：静脉注射 AAV8.mPCSK9D377Y 感染的雄性 WT 小鼠可促进 Ang II 诱导的 AAA 的高发生率和相当严重程度，这可以大大加快对感兴趣基因的 AAA 研究。

Cross-Species scRNA-seq Analysis Identifies Optimal Mouse Models for Studying Key Cellular Mechanisms in Aortic Dissection

Gen-Mao Cao

Fudan university, Zhongshan hospital

Abstract

Background: Aortic dissection (AD) is a life-threatening vascular disorder with complex cellular mechanisms. While multiple mouse models are used to study AD, their fidelity in recapitulating human AD pathophysiology at single-cell resolution remains unclear.

Method: We performed single-cell RNA sequencing (scRNA-seq) on human AD tissues and integrated the data with scRNA-seq datasets from the five mouse AD models: BAPN model, Ang-II model, Ang-II apoE-/- model, elastase model, and CaCl2 model. Cross-species comparative analysis focused on four key cell types macrophages (Mϕ), vascular smooth muscle cells (VSMCs), fibroblasts (FBs), and endothelial cells (ECs) to evaluate transcriptional conservation.

Results: We identified pathogenic subpopulations in human AD, including pro-inflammatory and lipid-associated macrophages, oxidative stress and lipid-associated VSMCs, pro-inflammatory fibroblasts, myofibroblasts, and hypoxia ECs. BAPN model and elastase model yielded pro-inflammatory and lipid-associated macrophages, and replicated macrophage polarization. The Ang-II apoE-/- model best recapitulated the VSMCs phenotypes observed in human AD, particularly lipid-associated and oxidative stress VSMCs. The BAPN model was most effective in mimicking pro-inflammatory fibroblasts and reduced extracellular synthesis. Endothelial cell dysfunction, characterized by reduced adhesion and increased hypoxia, was consistently observed across all models.

Conclusion: Our study provides a single-cell roadmap for selecting mouse models that optimally mimic specific AD mechanisms: BAPN for macrophages and fibroblasts, Ang-II apoE $^{-}$ / $^{-}$ for VSMCs, and any model for EC studies. These findings refine experimental design for AD research and highlight conserved pathogenic pathways across species.

Keywords: scRNA-seq, mouse model, cell subpopulation, aortic dissection.

Introduction

Aortic dissection (AD) is a life-threatening pathology with high morbidity and mortality. In recent years, important discoveries about the mechanisms of AD have relied on mouse models that mimic the anatomical features and pathogenesis of human AD. Commonly used mouse models for AD include the β-aminopropionitrile (BAPN)-induced mouse model1, the Angiotensin II (Ang II)-induced mouse model, the Ang II -induced Apolipoprotein E-deficient (apoE-/-) mouse model, elastase-induced mouse model, CaCl2-induced mouse model, etc. Each of these models is capable of mimicking the anatomical features of the AD. However, whether these models can fully mimic the realistic pathophysiologic process of human AD remains unknown.

Aortic cells contribute most to the structural integrity of the aortic wall, principally endothelial cells, VSMCs, and fibroblasts. A healthy physiologic state of these cells is essential for maintaining the balance of the aortic microenvironment. However, the development of AD involves disruption of aortic microenvironment, particularly the transcriptional reprogramming of vascular cells. Macrophages, VSMCs, and fibroblasts8 reprogrammed to pathogenic phenotypes in response to cellular stress. Therefore, there is a certainly necessity to investigate the conservation of critical cellular phenotypes in human AD and mouse AD models.

Previous evaluations and comparisons of AD models have focused on pathological features and biomechanical characteristics9, which lacks a comprehensive evaluation of the model's pathogenic mechanisms. The advent of single-cell RNA sequencing (scRNA-seq) represents a significant advancement in investigating the transcriptional heterogeneity at a resolution of individual cells. For instance, studies by Zernecke et al. 10 and Frank et al.11 have utilized scRNA-seq to uncover transcriptional heterogeneity of immune cells within mouse models of atherosclerosis and to explore cellular diversity in abdominal aortic aneurysms, respectively. Preliminary studies employing scRNA-seq to analyze mouse AD models and human AD have begun to shed light on AD mechanism. Moreover, these studies offer a novel avenue to directly compare the heterogeneity of cellular phenotype between mouse models and human AD.

In the present article, we firstly revealed the transcriptional heterogeneity of macrophages, fibroblasts, VSMCs, and ECs. Subsequently, the four cell types underwent cross-species integration with their counterparts from mouse AD models, respectively (Fig. 1a). Through assessing the subpopulation heterogeneity of these four cell types, we compared the mechanism differences among human AD, the BAPN model, Ang-II model, Ang-II apoE-/- model, elastase model, and CaCl2 model.

GSDMD 依赖性 NETs 通过 P2X7R 调控巨噬细胞极化促进腹主动脉瘤进展

常润泽 高思琦 鲁传龙 王恒 樊可奕 李理政 张鸿久 陈金杉 张瑞婧 董红霖

山西医科大学第二医院

目的：腹主动脉瘤（abdominal aortic aneurysm, AAA）是一种以局灶性主动脉壁扩张为特征的致死性血管疾病，其发病机制与慢性炎症、细胞凋亡及基质降解密切相关。近年来，研究表明中性粒细胞胞外诱捕网（neutrophil extracellular traps, NETs）在 AAA 炎症反应中具有重要作用。Gasdermin D（GSDMD）作为 NETs 形成的关键介导蛋白，其裂解产物可诱导细胞膜穿孔并促进染色质外排形成 NETs。与此同时，P2X7 受体（P2X7R）是一种 ATP 依赖的配体门控阳离子通道，已被证实在调控巨噬细胞极化、尤其是促炎性 M1 型极化中发挥重要作用。然而，GSDMD 介导的 NETs 是否通过激活 P2X7R 促进 M1 型巨噬细胞极化并加速 AAA 病变尚未明确。本研究旨在探讨 GSDMD-NETs-P2X7R 信号轴在 AAA 发生发展中的作用及其潜在机制。

方法：本研究构建了弹性蛋白酶诱导的 AAA 小鼠模型，并采用中性粒细胞特异性 GSDMD 敲除小鼠（Gsdmd$^{flox/flox}$ MRP8Cre$^{+/-}$）探讨 GSDMD 对 NETs 形成及 AAA 病变的影响。通过免疫荧光染色、Western blot、ELISA 及 Sytox Green 染色等方法评估 NETs 水平及主动脉局部炎症状态；进一步检测 P2X7R 表达及巨噬细胞 M1 极化情况。随后构建巨噬细胞特异性 P2RX7 敲除小鼠（P2rx7$^{flox/flox}$Lyz2Cre$^{+/-}$），以明确 P2X7R 在 AAA 中的功能。体外实验中，应用 NETs 刺激 THP-1 来源的巨噬细胞，分析其对 P2X7R 表达及 M1 极化标志物的影响，并采用 P2X7R 抑制剂验证其作用机制。

结果：与野生型对照组相比，中性粒细胞特异性 GSDMD 敲除显著抑制 AAA 形成，表现为主动脉扩张减轻、弹力纤维破坏减少及炎症细胞浸润下降。GSDMD 缺失组中 NETs 形成明显减少，血清及主动脉组织中 dsDNA 水平显著降低，P2X7R 表达及 M1 型巨噬细胞比例均显著下降。巨噬细胞特异性 P2X7R 敲除同样可减少 M1 型极化并减轻 AAA 病理改变。体外实验显示，NETs 刺激可诱导巨噬细胞 P2X7R 表达上调，促使其向 M1 型极化；而 P2X7R 抑制剂可显著逆转该极化趋势，提示该效应依赖 P2X7R 介导。

结论：本研究揭示了 GSDMD 介导的 NETs 可通过激活巨噬细胞 P2X7R，诱导其 M1 型极化，从而促进 AAA 的发展与进展。GSDMD-NETs-P2X7R 信号通路在 AAA 炎症反应中发挥关键作用，提示其为潜在的干预靶点，有望为 AAA 治疗提供新的策略。

Cold stimulation aggravates aortic dissection through the sympathetic nerve-resident macrophages axis: a novel pathogenesis

Gen-Mao Cao

Fudan university, Zhongshan hospital

Introduction

Acute aortic dissection (AD) is a life-threatening cardiovascular emergency with a 24-hour natural mortality rate as high as 50%. There are significant differences in the incidence of AD across regions, according to the results of epidemiological insurance claims research. The incidence rate of AD in northern China is twice that in the south. Meanwhile, multiple studies indicate that the incidence rate of AD is closely related to temperature, which agrees with higher prevalence of AD in cold region. The mechanism by which cold stimulation increases the risk of AD incidence remains unclear. Some researchers explained the mechanism with specific cold-weather reactions, such as elevated blood pressure, artery spasm, progression of pulmonary diseases, and passive smoking. Additionally, the sympathetic nerve also exerts an effect on regulating immune response in cardiovascular system.

Methods

Single-cell sequencing data for AD from Beijing (cold region), Shanghai (hot summer cold winter, HSCW), and Guangzhou province (hot summer warm winter, HSWW) were obtained from the GEO database, including datasets GSE222318, GSE254123, and GSE213740. Three-week-old male C57BL/6 mice were given 0.5% BAPN containing water to induce AD while exposing to either room temperature or 6° C to investigate the effects of cold stimulation on AD. Aortic samples and surrounding tissues from the mice were clarified following the iDISCO protocol.

Results

Single-cell sequencing across different regions revealed that the proportion of macrophage extremely elevated in AD of cold region (Figure A). The up-regulated genes of macrophages in cold region were enriched in "response to temperature stimulus" and "response to cold" pathways (Figure B), which include the catecholamine receptor ADRB2. This result suggested that sympathetic nerve plays a critical role in AD of cold-region. Among macrophages from different regions, those in the cold region expressed the highest levels of ADRB2 (Figure C). Macrophages were further annotated into 6 subtypes: FABP5+ lipid-associated macrophages, IL-1B+ myeloid macrophages, LYVE1+ resident macrophages, MHChi macrophages, proliferative macrophages, VSMC-derived macrophages, and fibroblast-derived macrophages. ADRB2 was highly expressed in LYVE1+ resident macrophages in AD (Figure D). We therefore propose that the sympathetic-ADRB2-resident macrophage axis may contribute to the high prevalence of AD in cold regions.

In order to confirm the existence of sympathetic-ADRB2 axis in AD of cold-region, we conducted immunofluorescence staining of human AD samples from cold region and HSCW region. The result showed more abundant TH+ sympathetic nerve fibers in the adventitia of cold-region AD while less in HSCW-region AD (Figure E). It also indicated the over-

expression of ADRB2 in LYVE1+ resident macrophages in adventitia of cold-region AD (Figure F).

In male C57BL/6 mice exposed to cold stimulation (6° C), thoracic aortas and periaortic tissues were subjected to three-dimensional TH fluorescence staining. The staining result indicated that cold stimulation significantly increased periaortic sympathetic innervation (Figure G). Three-week-old mice were given 0.5% BAPN solution to induce AD and exposed to cold stimulation (6 ° C) simultaneously (Figure H). Cold-exposed mice gained higher mortality of AD eventually, with greater ascending aortic dilation and more severe dissection (Figure I-K).

For further exploration of the pathways by which ADRB2 regulating Lyve1+resident macrophages, cell communication analysis was conducted between macrophage subtypes in AD aortas and normal aortas. The result revealed that CCL-CCR pathways were enhanced in AD (Figure L), which primarily mediating interactions between resident macrophages and myeloid macrophages (Figure M). The key ligand-receptor pairs were CCL3L1-CCR1, CCL3-CCR1, and CCL2-CCR2 (Figure N). Transcriptomic comparisons of macrophages in AD across regions have shown higher levels of chemokines CCL2 and CCL3 in cold-region AD (Figure O). This suggested that the sympathetic nervous system may enhance chemokine release from resident macrophages via ADRB2, which promotes immune cell recruitment and thus increases AD risk.

一体式分支型支架结合体外开窗技术处理复杂 B 型主动脉急性综合征临床应用的单中心经验及体会

刘尚典

深圳市宝安区人民医院

目的 通过回顾性研究分析一体式分支型支架结合体外开窗技术治疗复杂急性 B 型主动脉综合征的疗效和安全性。

方法 回顾性分析 2020.01-2021.12 深圳市宝安区人民医院收治开展一体式分支型支架结合体外开窗技术的急性 B 型主动脉综合征患者 39 例的临床资料，收集分析患者的基线资料、术后早期恢复指标、术后早期并发症发生率及死亡率、长期预后、长期疗效和手术前后降主动脉直径等指标。

结果 所有患者术后重症监护病房时间均值（42.89±68.30）h，术后住院时间均值（12.56±5.97）d，住院总时间均值（19.90±7.85）d。1 例（2.56％）开展二次介入治疗，余下 38 例（97.43％）未开展二次介入治疗；39 例（100.00％）植入支架均在位；2 例（5.12％）支架移边缘形成新的内膜撕裂，余下 37 例（94.87％）支架移边缘未形成新的内膜撕裂。38 例（97.43％）病情改善、未进一步恶化，1 例（2.57％）病情未改善、进一步恶化。手术后患者的降主动脉直径为（25.36±3.85）mm，较手术前（18.41±8.24）mm 相比增加，存在差异具有统计学意义（P < 0.05）。

结论 一体式分支型支架结合体外开窗技术疗效及安全性总体良好，近期及远期随访效果较为理想。

Predicting the growth of asymptomatic small abdominal aortic aneurysms (AAA) based on deep learning

Jia-Xin Cheng[1,2], Zhi-Qiang Zhang[1], Ya-Song Wang[1], Xiao-ZengXueZuWeiYuanTongXunZuoZhe Wang[1]

2. College of Medicine and Biological Information Engineering, Northeastern University, Shenyang, Liaoning, China

Abstract

Background

Abdominal aortic aneurysm (AAA), particularly in its asymptomatic small stage, poses a significant clinical challenge due to the risk of rupture upon excessive enlargement. Accurate prediction of growth trajectories for small, asymptomatic AAAs is paramount for optimizing clinical decision-making regarding the timing of intervention versus continued surveillance. Currently, growth prediction primarily relies on serial diameter measurements from imaging, such as computed tomography angiography (CTA), which offers limited predictive power for identifying individuals prone to rapid expansion. This gap underscores the urgent need for more sophisticated predictive tools. Recent advances in deep learning present a promising avenue for extracting complex, prognostic features directly from medical images like CTA scans. While DL has shown potential in various medical imaging tasks, its application for predicting the specific growth rate of small asymptomatic AAAs remains underexplored and requires robust, end-to-end frameworks. Existing approaches often lack the integration of precise localization with advanced feature extraction and fusion mechanisms tailored for this specific predictive task. This study addresses this critical need by developing and validating a novel DL pipeline designed specifically to predict rapid growth (defined as ≥ 0.5 cm increase within 6 months) in small, asymptomatic AAAs using routinely acquired CTA images. The core objective is to leverage state-of-the-art DL architectures–combining image classification, precise aorta localization, and advanced feature fusion–to automatically extract discriminative features indicative of future rapid expansion, thereby providing clinicians with a powerful tool for risk stratification and personalized management strategies.

Objective: Accurate prediction of asymptomatic small AAA growth is critical for clinical decision-making. This study leverages deep learning to predict AAA rapid growth from CTA images.

Methods: We analyzed 81 asymptomatic patients with small AAA (31 rapid growth [≥ 0.5 cm/6 months] and 50 stable patients) who were in follow-up without intervention. CTA images were split into training, validation, and test sets in the 8:1:1 ratio. An optimized pipeline was developed in three steps: firstly, eight classification models were evaluated to classify CTA images containing the abdominal aorta. Then, You Only Look Once (YOLO)v11 model localized and classified normal and AAA images. Finally, a MedMamba-based feature fusion model predicted growth using 15,704 localized aorta images, fused by multi-head self-attention (MHA). The MedMamba extraction module was compared with the classical models, and the attention mechanism module and the number of attention heads were set as contrast experiments.

Results:

The 81 participants enrolled with 90.12% males, and the median age of 68 years. Among eight models, ResNet50 achieved precise recognition of images containing the abdominal aorta, with accuracy and F1-score being 99.86% and 99.91%, respectively. YOLOv11 achieved robust aorta detection (precision-recall: 0.902) across 31,457 images. The MedMamba fusion model outperformed seven backbones, achieving 98.75% accuracy and 97.78% F1-score for growth prediction. MHA (8 heads) optimized predictive performance.

Conclusion: This study establishes a novel end-to-end deep learning framework, ResNet50-YOLOv11-MedMamba, for predicting growth in small asymptomatic AAA. By integrating clinical metadata with automatically extracted CTA features, our model achieved state-of-the-art performance, achieving 98.75% accuracy and 97.78% F1-score. Our model holds great potential for practical application in clinical settings.

Keywords: multi-head self-attention; feature fusion model; growth prediction; classification model

非复杂性 Stanford B 型主动脉夹层患者行胸主动脉腔内修复术时机对预后及主动脉重塑的影响
